1. Areas Common to all Alternatives/Corridors: the FHWA shall ensure that PCTPA or its consultants inventory properties within the area(s) common to all Tier 1 corridors according to the following specifications:
   a. Archaeological Properties
      (1) Conduct an inventory of archaeological properties where access has been secured in areas that have not previously been surveyed and those areas deemed by Caltrans PQS in need of resurvey because of the age or condition of the previous survey. Archaeological properties will be identified in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms.
   b. Built Environment Properties
      (1) Conduct a limited inventory of built environment properties within the entire Tier 1 APE. Built environment properties that have the potential to meet NRHP Criterion C will be identified and evaluated in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms. Other built environment properties within the APE that meet the age and integrity criteria will be inventoried and evaluated during Tier 2 studies, as provided for in stipulation III of this Agreement.
2. Areas Unique to Specific Alternatives/Corridors: the FHWA shall ensure that PCTPA or its consultants inventory properties within the area(s) unique to specific Tier 1 alternatives/corridors according to the following specifications:
   a. Archaeological Properties
      (1) Complete a records search for the Tier 1 APE and prepare a predictive model utilizing environmental factors and historic land-use data to assess the archaeological sensitivity of the project corridors including potential for buried resources. Segments of Tier 1 alignments/corridors that are not in common will be inventoried for archaeological properties during Tier 2 studies, as provided for in stipulation III of this Agreement.
   b. Built Environment Properties
      (1) Conduct a limited inventory of built environment properties within the entire Tier 1 APE. Built environment properties that have the potential to meet NRHP Criterion C will be identified and evaluated

in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms. Other built environment properties within the APE that meet the age and integrity criteria will be inventoried and evaluated during Tier 2 studies, as provided for in stipulation III of this Agreement.

3. Tier 1 Reporting and SHPO Consultation
   a. The FHWA shall ensure that PCTPA or its consultants prepare documentation of their findings and determinations pursuant to stipulation XVI of the PA. The reports shall be submitted to Caltrans PQS for review and approval.pursuant to stipulation XVI of the PA.
   b. Eligibility determinations shall be submitted to SHPO pursuant to stipulation VIII.C(5) of the PA.

C. Phased Assessment of Effects

1. The FHWA shall assess the potential for Tier 1 of the Undertaking to effect historic properties in accordance with stipulation X of the PA. As Tier 1 is defined as acquisition of property, the FHWA anticipates there will be no adverse effects during Tier 1. The FHWA shall consult with SHPO on the effect finding pursuant to stipulation X of the PA.

III. TIER 2 PHASED SECTION 106 CONSULTATION

A. Area of Potential Effects: The objective of the Tier 1 EIS is to identify and preserve an approximate 500'- to 1,000'-wide corridor for acquisition. The Tier 1 EIS will focus on broad topics such as general location, mode choice, area-wide air quality and land use, and other environmental issues. Once the corridor is selected, the subsequent Tier 2 environmental review, relying on the work from the Tier 1 EIS, will provide a more detailed analysis of the environmental impacts for the future transportation facility alignment alternatives within the selected corridor. Once a Tier 2 preferred alternative is chosen, the FHWA and PCTPA will delimit an APE for the Tier 2 preferred alternative in accordance with stipulation VIII.A of the PA. If subsequent modifications to the APE are necessary, the FHWA shall follow the procedures of stipulation II.A(2) of this Agreement.

B. Phased Identification and Evaluation.

1. Archaeological Properties
   a. The FHWA shall ensure that PCTPA or its consultants conducts a pedestrian reconnaissance of all lands within the final APE for any Tier 2 preferred alternative. Archaeological properties will be identified and evaluated in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms.
2. Built Environment Properties
   a. The FHWA shall ensure that PCTPA or its consultants conducts an inventory of built environment properties within the final APE for any Tier 2 preferred alternative. Built environment properties will be

evaluated for NRHP eligibility in accordance with stipulation VIII.(B) and (C) of the PA, and documented on appropriate DPR 523 inventory forms.

3. Tier 2 Reporting and SHPO Consultation
   a. The FHWA shall ensure that PCTPA or its consultants prepare documentation of their findings and determinations pursuant to stipulation XVI of the PA. The reports will be submitted to Caltrans PQS for review and approval pursuant to stipulation XVI of the PA.
   b. Eligibility determinations shall be submitted to SHPO pursuant to stipulation VIII.C(5) of the PA.

C. **Assessment of Effects.** The FHWA will assess any Tier 2 preferred alternative for its potential to affect historic properties and will consult with the SHPO pursuant to stipulation IX and X of the PA. Should FHWA find that any Tier 2 preferred alternative will result in an adverse effect, FHWA shall consult with SHPO pursuant to stipulation XI of the PA.

D. **Applicable Requirements.** FHWA will conduct the Section 106 process during Tier 2 in accordance with stipulations of the PA and applicable requirements under Section 106 of the National Historic Preservation Act (16 U.S.C. § 470f) and the Section 106 regulations (36 C.F.R. Part 800), including any subsequent amendments thereto. Nothing in this Agreement is intended to supersede or modify any requirement contained in the Section 106 statute or the Section 106 regulations.

E. **Consulting Parties**. During Tier 2, the same party may be designated as a consulting party for more than one alternative. FHWA will ensure comments of all consulting parties are incorporated into the Section 106 consultation process as provided for in all applicable laws.

IV. TIER 2 SECTION 106 COMMITMENTS AND CONCEPTUAL MITIGATION

A. FHWA and PCTPA agree to implement and/or fund the activities listed in this section as part of any Tier 2 environmental studies. Additional commitments may be made, as appropriate, as an outcome of the Section 106 consultation process for any Tier 2 alternative.

B. **Avoidance and Minimization of Impacts**

1. In General. In accordance with the consultation process required under Section 106 and in accordance with other applicable laws, FHWA, PCTPA, and Caltrans will seek ways to avoid, minimize, and mitigate adverse impacts to the environment, including adverse effects to historic properties.
2. Context-Sensitive Solutions. FHWA, PCTPA, and Caltrans will apply the principles of context-sensitive solutions during project development, in accordance with applicable Caltrans policies. In accordance with those principles and where appropriate, FHWA, PCTPA, and Caltrans will develop any Tier 2 alternative with sensitivity to aesthetic values and the historic context, utilizing the services of professionals with experience in areas related to historic preservation.

C. Should implementation of any Tier 2 alternative result in adverse effects to a historic property important solely for its information value (Criterion D), FHWA will ensure a data recovery plan is prepared according to guidance in Attachment 6 of the PA and submitted to the SHPO for review in accordance with stipulation II.C(3) of this Agreement.

D. The FHWA will not authorize the execution of any Undertaking activity that may effect (36 CFR § 800.16(i)) historic properties in the Undertaking's APE prior to the completion of the Section 106 process provided for in this Agreement.

V. NATIVE AMERICAN CONSULTATION

The FHWA has consulted with the Tribes regarding the proposed Undertaking, will continue to consult with the Tribes, and will afford the Tribes, should the Tribe so desire, the further opportunity to more directly and actively participate in the implementation of the Undertaking; Should any specific Tribe desire to participate in this Agreement as herein set forth, the FHWA shall consult with them to reach consensus regarding the manner in which the Tribe may participate in the implementation of this Agreement and the Undertaking, and regarding any time frames or other matters that may govern the nature, scope, and frequency of such participation.

VI. TREATMENT OF HUMAN REMAINS

The Agreement parties agree that human burials and related items discovered during implementation of the terms of this Agreement and of the Undertaking will be treated in accordance with the requirements of § 7050.5(b) of the California Health and Safety Code. If, pursuant to § 7050.5(c) of the Code, the county coroner or medical examiner determines that the human remains are or may be of Native American origin, then the discovery shall be treated in accordance with the provisions of §§ 5097.98(a)-(d) of the California Public Resources Code.

VII. DISCOVERIES AND UNANTICIPATED EFFECTS

If the FHWA determines, after any future construction of the Undertaking has commenced, that the Undertaking will affect a previously unidentified property that may be eligible for the National Register, or affect a known historic property in an unanticipated manner, the FHWA will address the discovery or unanticipated effect in accordance with 36 CFR § 800.13(b)(3). The FHWA at its discretion may hereunder, and pursuant to 36 CFR § 800.13(c), assume any discovered property to be eligible for inclusion in the National Register.

VIII. ADMINISTRATIVE PROVISIONS

A. PROFESSIONAL QUALIFICATIONS AND STANDARDS

1. **Professional Qualifications**. All activities prescribed by stipulations II, III, IV, V, VI, and VII of this Agreement shall be carried out under the authority of the FHWA by or under the direct supervision of a person or persons meeting at a minimum the Secretary of Interior's *Professional Qualifications Standards* (48 FR 44738-39) (PQS) in the appropriate disciplines. However, nothing in this stipulation may be interpreted to preclude the FHWA or any

agent or contractor thereof from using the properly supervised services of persons who do not meet the PQS.

2. **Documentation Standards.** Written documentation of activities prescribed by stipulations II, III, IV, V, VI, and VII of this Agreement shall conform to *Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation* (48 FR 44716-44740) as well as to applicable standards and guidelines established by the SHPO.

3. **Curation and Curation Standards.** The FHWA shall ensure that, to the extent permitted under §§ 5097.98 and 5097.991 of the California Public Resources Code, the materials and records resulting from the activities prescribed by this Agreement are curated in accordance with 36 CFR Part 79. The FHWA will ensure that, to the extent permitted by applicable law and regulation, the views of the Most Likely Descendant(s) are taken into consideration when decisions are made about the disposition of other Native American archaeological materials and records.

B. **CONFIDENTIALITY.** The Agreement parties acknowledge that historic properties covered by this Agreement are subject to the provisions of section 304 of the NHPA, and section 6254.10 of the California Government Code (Public Records Act), relating to the disclosure of archaeological site information and, having so acknowledged, will ensure that all actions and documentation prescribed by this Agreement are consistent with said sections.

C. **RESOLVING OBJECTIONS.**

1. Should any Agreement party object to the manner in which the terms of this Agreement are implemented, to any action carried out or proposed with respect to the implementation of the Agreement, or to any documentation prepared in accordance with and subject to the terms of this Agreement, the FHWA shall immediately notify the other parties to this Agreement of those objections, and shall consult with the objecting party and with the other parties for no more than 14 days to resolve the objection. The FHWA shall reasonably determine when this consultation will commence. If the objection is resolved through such consultation, the action subject to dispute may proceed in accordance with the terms of that resolution. If, after initiating such consultation, the FHWA determines that the objection cannot be resolved through consultation, the FHWA shall forward all documentation relevant to the objection, including the FHWA's proposed response to the objection, to the ACHP, with the expectation that the ACHP will, within thirty (30) days after receipt of such documentation, do one of the following:

   a. advise the FHWA that the ACHP concurs in the FHWA's proposed response to the objection, whereupon the FHWA will respond to the objection accordingly. The objection shall thereby be resolved; or,

b. provide the FHWA with recommendations, which the FHWA will take into account in reaching a final decision regarding its response to the objection. The objection shall thereby be resolved; or,

c. notify the FHWA that the objection will be referred for comment, pursuant to 36 CFR § 800.7(c), and proceed to refer the objection and comment. The FHWA shall take the resulting comment into account, in accordance with 36 CFR § 800.7(c)(4) and section 110(1) of the NHPA. The objection shall thereby be resolved.

2. Should the ACHP not exercise one of the foregoing options within 30 days after receipt of all pertinent documentation, the FHWA may assume the ACHP's concurrence in its proposed response to the objection and proceed to implement that response. The objection shall thereby be resolved.

3. The FHWA shall take into account any ACHP recommendation or comment provided in accordance with section C.1 of this stipulation, with reference only to the subject of the objection. The FHWA's responsibility to carry out all actions under this Agreement not the subject to the objection will remain unchanged.

4. At any time during the implementation of the measures stipulated in this Agreement, should an objection pertaining to such implementation be raised by a member of the public, the FHWA shall notify the Agreement parties in writing of the objection and take the objection into consideration. The FHWA shall consult with the objecting party and, if the objecting party so requests, with the other Agreement parties for no more than fifteen (15) days. Within ten (10) days following closure of this consultation period, the FHWA will render a decision regarding the objection and notify all consulting parties hereunder of its decision in writing. The objection will thereby be resolved. In reaching its decision, the FHWA will take into account any comments from the consulting parties regarding the objection, including the objecting party. The FHWA's decision regarding the resolution will be final.

5. The FHWA shall provide all Agreement parties, the ACHP when the ACHP has issued comments hereunder, and any parties that have objected pursuant to section C.4 of this stipulation, with a copy of its final written decision regarding any objection addressed pursuant to this stipulation.

6. The FHWA may authorize any action subject to objection under section C of this stipulation to proceed after the objection has been resolved in accordance with the terms of section C.

D. **AMENDMENTS:** Any Agreement party may propose that this Agreement be amended, whereupon the Agreement parties will consult for no more than 30 days to consider such amendment. The FHWA may extend this consultation period.

The amendment process shall comply with 36 CFR §§ 800.6(c)(1) and 800.6(c)(7). This Agreement may be amended only upon the written agreement of the signatory parties. If it is not amended, this Agreement may be terminated by either signatory party in accordance with section E of this stipulation.

E. TERMINATION

1. If this Agreement is not amended as provided for in section D.1 of stipulation VIII, above, or if either signatory party proposes termination of this Agreement for other reasons, the signatory party proposing termination shall, in writing, notify the other Agreement parties, explain the reasons for proposing termination, and consult with the other Agreement parties for at least 30 days to seek alternatives to termination. Such consultation shall not be required if the FHWA proposes termination because the Undertaking no longer meets the definition set forth at 36 CFR § 800.16(y).

2. Should such consultation result in an agreement on an alternative to termination, then the parties shall proceed in accordance with the terms of that agreement.

3. Should such consultation fail, the signatory party proposing termination may terminate this Agreement by promptly notifying the other Agreement parties in writing. Termination hereunder shall render this Agreement without further force or effect.

4. If this Agreement is terminated hereunder, and if the FHWA determines that the Undertaking will nonetheless proceed, then the FHWA shall either consult in accordance with 36 CFR § 800.6 to develop a new Agreement, or request the comments of the ACHP, pursuant to 36 CFR Part 800.

F. DURATION OF THE AGREEMENT

1. Unless terminated pursuant to section F of stipulation VIII above, or unless it is superseded by an amended Agreement, this Agreement will be in effect following execution by the signatory parties until the FHWA, in consultation with the other Agreement parties, determines that all of its stipulations have been satisfactorily fulfilled. This Agreement will terminate and have no further force or effect on the day that the FHWA notifies the other Agreement parties in writing of its determination that all stipulations of this Agreement have been satisfactorily fulfilled.

2. The terms of this Agreement shall be satisfactorily fulfilled within twenty (20) years following the date of execution by the signatory parties. If the FHWA determines that this requirement cannot be met, the Agreement parties will consult to reconsider its terms. Reconsideration may include the continuation of the Agreement as originally executed, amendment of the Agreement, or termination. In the event of termination, the FHWA will comply with section

F.4 of stipulation VIII, above, if it determines that the Undertaking will proceed notwithstanding termination of this Agreement.

3. If the Undertaking has not been implemented within twenty (20) years following execution of this Agreement by the signatory parties, this Agreement shall automatically terminate and have no further force or effect. In such event, the FHWA shall notify the other Agreement parties in writing and, if it chooses to continue with the Undertaking, shall reinitiate review of the Undertaking in accordance with 36 CFR Part 800.

G. **EFFECTIVE DATE.** This Agreement will take effect on the date that it has been fully executed by the FHWA and the SHPO.

EXECUTION of this Agreement by the FHWA and the SHPO, its transmittal by the FHWA to the ACHP in accordance with 36 CFR § 800.6(b)(1)(iv), and subsequent implementation of its terms, shall evidence, pursuant to 36 CFR § 800.6(c), that this Agreement is an agreement with the ACHP for purposes of section 110(1) of the NHPA, and shall further evidence that the FHWA has taken into account the effects of the Undertaking on historic properties and has afforded the ACHP an opportunity to comment on the Undertaking and its effects on historic properties.

HYDROLOGY AND FLOODPLAIN TECHNICAL MEMORANDUM PLACER PARKWAY CORRIDOR PRESERVATION TIER 1 EIS/ PROGRAM EIR

1.0 INTRODUCTION

1.1 TIER 1 EIS/PROGRAM EIR

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

1.2 CORRIDOR SELECTION AND PRESERVATION

The concept for the Placer Parkway is over a decade old. Placer County's 1994 General Plan depicts a "plan line" for it. Two planning studies helped to refine the concept:

- DKS Associates, 2000, Placer Parkway Interconnect Study/Conceptual Plan
- DKS Associates, 2001, Project Study Report (Project Development Support) for Placer Parkway

Placer Parkway is cited as a high-priority regional transportation project by the Sacramento Area Council of Governments (SACOG) 2025 Metropolitan Transportation Plan and the 2027 Placer County Regional Transportation Plan. The project vicinity and surrounding area include some of the fastest growing communities in the Sacramento region. A number of large urban development proposals are being considered by Placer and Sutter counties. New development is expected to add a significant amount of residential, commercial, industrial, and educational uses.

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included representatives from planning and public works departments of all affected cities and counties, environmental, business, agricultural, development, and homeowner interests (the Study Advisory Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report will analyze these five corridor alternatives along with a No-Build Alternative.

Other potential transportation modes such as bus rapid transit may be developed in the corridor in the future, although they are not proposed as part of the current project. The width of the corridor for the Placer Parkway is to vary from approximately 500 feet in the Eastern and Western segments to approximately 1,000 feet in the Central Segment. Depending upon the alternative, the corridor's length ranges from a minimum of 14.2 miles to a maximum of 16.2 miles. The selected corridor would contain the roadway, including the median, travel lanes, shoulder, associated access ramps and a no-development buffer zone

Corridor acquisition may not be completed until after Tier 2, as funding becomes available. Portions of the selected corridor would be preserved as a no-development buffer zone. The buffer would be maintained as a zone where development is either not permitted or is severely restricted. This is intended to restrict access to the proposed interchanges, protect the rural character of agriculturally designated areas in the vicinity of the Parkway as far as possible subject to future development, and to maximize opportunities to incorporate adjacent sensitive areas. It is intended that the buffer would be owned and managed in the future to achieve these objectives. For subsequent Tier 2 (project-level) environmental reviews, the size of this buffer zone could be considered flexible for agriculturally designated land undergoing urban development. In the Tier 2 environmental review, the specific buffer size and location would be determined. This determination would be based on performance standards on a case-by-case basis, depending on the land use needs of future approved development, and taking into account the primary objective of restricting future access to the Parkway.

Project proponents are considering employment of several land management and control mechanisms in order to ensure that the buffer would be effectively maintained as an area where development would either not be permitted, and where construction of any additional access onto the Parkway would not be allowed. These mechanisms could include land use controls, land purchase/leases, general plan amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, urban growth boundaries, etc. "Layering" or using several of these methods would provide more assurance that the buffers would be permanent, or at least more difficult to undo.

1.3 TECHNICAL STUDY OBJECTIVE

This Hydrology and Floodplain Technical Memorandum has been prepared to support the Tier 1 Environmental Impact Statement/Program Environmental Impact Report. It presents a Tier 1/Program level assessment of potential impacts related to hydrology and floodplains for five corridor alternatives and the No-Build Alternative as described in Chapter 2.

The scope of work performed for this report is based on the Caltrans Local Assistance Procedures Manual (Caltrans, 2006), as modified for purposes of Tier 1/Program analysis by agreement of Caltrans; the Caltrans Highway Design Manual (HDM) (Caltrans, 2001b) and the Caltrans Environmental Handbook guidance (Caltrans, 2005) on preparing a Hydrology and Floodplain Technical Memorandum. In addition, the evaluation considered guidance from the FHWA Environmental Checklists for Draft and Final Environmental Documents (FHWA, 1998a; FHWA, 1998b).

This report is organized as follows:

Chapter 2	The Proposed Action
Chapter 3	Regulatory Setting
Chapter 4	Affected Environment
Chapter 5	Potential Direct Impacts
Chapter 6	Secondary and Indirect Impacts
Chapter 7	Cumulative Impacts
Chapter 8	Watt Avenue Interchange
Chapter 9	Avoidance, Minimization and/or Mitigation Strategies
Chapter 10	Analyses to be Undertaken in Tier 2
Chapter 11	References

This report also includes figures and tables, which show the project location, each build alternative, and pertinent technical information prepared to evaluate the build alternatives.

Throughout this document, the Placer Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

2.0 THE PROPOSED ACTION

The Proposed Action for the Placer Parkway Corridor Preservation Project is to select and preserve a 500- to 1,000-foot-wide corridor in the project study area, within which the future four- or six-lane Placer Parkway may be constructed. The ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction, and operation of the Parkway. Although the action taken at Tier 1 on the Placer Parkway Corridor Preservation Project is limited, the underlying project whose effects are studied in this document is the Placer Parkway. To the extent feasible at this early stage, the Tier 1 EIS/EIR addresses the potential effects of construction and operation of the future roadway.

2.1 THE PROJECT STUDY AREA

The project study area is an area of approximately 33,460 acres located in Sutter and Placer counties, with a small section located in Sacramento County (see Figures 1-1 and 2-1). The portion of the study area in Sacramento County is located in the extreme southwest corner of the study area and does not include the area of any of the proposed corridor alignment alternatives. It extends from SR 70/SR 99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego roads.

For the purposes of the analysis the study area is divided into three segments:

- Western Segment: the Western Segment extends from SR 70/99 to Pleasant Grove Road in Sutter County.
- Central Segment: the Central Segment extends from Pleasant Grove Road in Sutter County to approximately 2,300 feet north of Pleasant Grove Creek in Placer County.
- Eastern Segment: the Eastern Segment extends from approximately 2,300 feet north of Pleasant Grove Creek to SR 65 in Placer County.

2.2 CORRIDOR ALTERNATIVES

The following subsections describe the corridor alternatives, which are depicted on Figure 2-1, and are numbered according to location from south to north in the study area.

2.2.1 The No-Build Alternative

Under the No-Build Alternative, the project would not be implemented. A Placer Parkway corridor would not be selected/preserved, and the future Placer Parkway would not be constructed.

2.2.2 Alternative 1 – the Red Alternative

Alternative 1 would extend from SR 70/99 approximately ½ mile north of Riego Road, eastward approximately 1 mile north of Baseline Road to approximately Watt Avenue, proceeding north and transitioning in an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment alternative is 16.2 miles long. This alternative would include six interchanges as described in Section 2.3.3.

2.2.3 Alternative 2 – the Orange Alternative

Alternative 2 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed northeast, then in a northerly direction south of Pleasant Grove Creek, transitioning to an easterly direction before it reaches Sunset Boulevard West, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.4 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.4 Alternative 3 – the Blue Alternative

Alternative 3 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed north along the Sutter/Placer County Line, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.6 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.5 Alternative 4 – the Yellow Alternative

Alternative 4 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.3 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.2.6 Alternative 5 – the Green Alternative

Alternative 5 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 4,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.2 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.3 PARKWAY DESIGN ASSUMPTIONS

Although the Parkway would be designed and construction-level impacts analyzed during Tier 2, for the purpose of this report and the Tier 1 EIS/Program EIR, several assumptions have been made about potential design and configuration concepts. These assumptions would be subject to further development and refinement, and specific decisions about design of the roadway would be made during the Tier 2 process. For example, the number, location, and design of over-crossings would be determined at the time of final Parkway design, in consultation with local jurisdictions. The following sections outline assumptions for the future roadway.

Preliminary costs estimates for the Parkway range from $600 to $650 million (2005 dollars). This includes costs for right-of-way, design, construction and environmental mitigation for the four- to six-lane facility. The funding situation has spurred interest in exploring other more creative funding options.

These include a county-wide sales tax, more developer contributions, and tolling facilities. The Technical Report and Tier 1 EIS/Program EIR do not make any assumptions about funding sources.

2.3.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane facility. A preliminary conceptual cross section (see Figure 2-2) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/Program EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

2.3.2 Conceptual Roadway Elevation

As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on either side of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways, or trails.

Throughout the project study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These over-crossings would not connect to the Parkway. Parkway access would be via the interchanges described below.

2.3.3 Interchange Concepts

The analysis assumes that the location of interchanges (see Figure 2-1) is as follows.

- SR 70/99 (at ½ mile north of Riego Road or at Sankey Road)
- One or two locations to be determined in southern Sutter County
- Fiddyment Road
- Foothills Boulevard
- SR 65 at Whitney Ranch Parkway

The following discussion outlines concepts and assumptions for the six interchanges that could potentially serve Placer Parkway.

2.3.3.1 Western Segment

Within the Western Segment of the Parkway, a high-speed, freeway-to-freeway type interchange would connect the Parkway with SR 70/99 at one of following potential locations depending on the project alternative (see Section 2.2). Placer Parkway would terminate at SR 70/99.

- **Placer Parkway/SR 70/99 Interchange at North of Riego Road.** This alternative concept uses "braided" ramps to eliminate weaving problems or conflicts with the future SR 70/99 at Riego Road interchange being developed by Sutter County and Caltrans.

- **Placer Parkway/SR 70/99 Interchange at Sankey Road.** Under this alternative concept, the existing two-lane Sankey Road would be realigned to the south of Placer Parkway and the proposed freeway-to-freeway interchange, extending from approximately ¼ mile west of SR 70/99 to approximately ¼ mile east of the Union Pacific railroad tracks. There would be no direct access to SR 70/99 or Placer Parkway from the realigned Sankey Road.

Depending on the final alignment selected, one or two additional interchanges would also be located in south Sutter County. Conceptual locations are identified for purposes of this Tier 1/Program analysis (see Figure 2-1). The actual location of these interchanges would be developed in the Tier 2 phase, based on Sutter County requirements.

2.3.3.2 Central Segment

Within the Central Segment of the Parkway, there would not be any access proposed as part of the project in the 7-mile segment between Fiddyment Road and Pleasant Grove Road. Please see Section 2.4 regarding a potential connection to a future extension of Watt Avenue (Figure 2-3) which could be proposed and constructed by others in the Central Segment; such an interchange is not part of the Placer Parkway.

2.3.3.3 Eastern Segment

Within the Eastern Segment of the Parkway, a signalized high-speed freeway-to-freeway and local access interchange would connect the Parkway to SR 65 at Whitney Ranch Parkway (Figure 2-1). From SR 65 eastward Placer Parkway would terminate and become Whitney Ranch Parkway east of the SR 65 exit ramp intersection. Traffic signals would be provided at the exit ramp terminals. This interchange would be approximately 1 mile north of a planned SR 65/Sunset Boulevard interchange and 1.2 miles south of the existing Twelve Bridges interchange.

As part of this interchange, auxiliary lanes would be required on SR 65 in both directions to enhance traffic operations on the north side of the future SR 65/Sunset Boulevard interchange. The southbound SR 65 exit-ramp at Sunset Boulevard is being designed to accommodate an additional auxiliary lane required for the future Placer Parkway/Whitney Ranch Parkway interchange to minimize the reconstruction of this ramp in the future. Within the Eastern Segment of the Parkway, from SR 65 westward, two interchanges with local roadways would be constructed, one at Foothills Boulevard and one at Fiddyment Road, as depicted on Figure 2-1.

The future interchange on Placer Parkway at Fiddyment Road would be located near the existing intersection of Fiddyment Road and Sunset Boulevard West. To provide acceptable traffic operations, additional distance needs to be provided between the Fiddyment Road/Sunset Boulevard West intersection and the Fiddyment Road/Placer Parkway westbound off-ramp intersection. Therefore, Sunset Boulevard West will need to be realigned to the north as it nears Fiddyment Road.

2.3.4 Landscaping Concept

For the purposes of this environmental analysis, preliminary landscaping concepts have been developed for Placer Parkway. These are entirely conceptual and would be subject to further refinement during the Tier 2 environmental process. It is anticipated that landscaping would be used to reflect local topography and vistas in the study area and complement the varying character of land adjacent to the Parkway corridor. Landscape design would vary within the Parkway's three segments depending on corridor width and type and density of surrounding land uses. Landscaping would be used within the median and the Parkway buffer zone to enhance the aesthetics of the Parkway, and would be used to provide screening and enhance local and long-distance views. Where appropriate, more concentrated plantings would be considered to buffer the Parkway from future adjacent land uses that may be incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Landscape design would likely include a mix of compatible native and non-native plants that may require some irrigation. Wherever possible, native plant species would be used in line with Caltrans policy. Where possible and depending on availability, feasibility and cost, recycled water would be used for irrigation.

During a future design phase, lighting elements would be designed for safety and would consider the proposed landscaping plan in order to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower voltage-lighting, and proposing lighting fixtures that conform with the visual character of the area).

2.4 POTENTIAL WATT AVENUE INTERCHANGE

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 2-3). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/Program EIR. However, the connection of Placer Parkway to a potential Watt Avenue extension could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/Program EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges to Placer Parkway.

2.5 AGENCY PERMITS AND APPROVALS

The Proposed Action would preserve a preferred corridor for a future transportation facility. In the future, permits and approvals would be obtained from appropriate agencies prior to construction of the Parkway. These permits and approvals may include specific design or mitigation requirements that would be incorporated into the project.

2.6 SUBSEQUENT TIER 2 INFORMATION

As noted earlier, the design and construction of Placer Parkway—including its interchanges and over-crossings, and ancillary features such as stream crossings, safety devices, stormwater management structures, and similar improvements—would be evaluated in a subsequent Tier 2 environmental review process once a corridor has been identified. Chapter 10 provides more detailed information regarding Tier 2 studies.

3.0 REGULATORY SETTING

3.1 FEDERAL AND STATE REGULATIONS

The regulations that apply to hydrology and floodplains related to transportation projects include the following:

- Federal Executive Order 11988 Floodplain Management;
- Title 23, Code of Federal Regulations, Part 650, Subpart A (23 CFR 650A);
- 23 CFS 771; Environmental Impact and Related Procedures (FHWA); and
- National Flood Insurance Act 1968.

The implementation of Executive Order 11988 in transportation projects is addressed by Title 23, Code of Federal Regulations, Part 650, Subpart A (23 CFR 650A). When transportation improvements encroach on a base floodplain (i.e., 100-year floodplain), the FHWA requires the agency responsible for the project to perform a location hydraulic base floodplain elevation study and assess the risk involved. If the study indicates that there would be significant encroachment within the base floodplain, then the FHWA must make a finding that the project is the "only practicable alternative." FHWA considers a significant encroachment to entail one or more of the following: (1) a significant potential for interruption or termination of a transportation facility which is needed for emergency vehicles or provides a community's only evacuation route; (2) a significant risk; or (3) a significant adverse impact on natural and beneficial floodplain values.

The U.S. Army Corps of Engineers (USCOE) regulates the placement of fill or dredged materials that affect waters of the United States, which include stream courses and jurisdictional wetlands. The USCOE regulates these activities under the authority of Section 404 of the Clean Water Act. The USCOE would regulate any development in the vicinity of the study area that affects jurisdictional wetlands. As part of the 404 permit, coordination with U.S. Fish and Wildlife Service (USFWS) would be required. It is anticipated that the future construction of the Placer Parkway will either likely require an individual USCOE Permit or will be covered by a future permit obtained for the Placer County Habitat Conservation Plan (HCP).

The USCOE has overall authority for the Sacramento River Flood Control Project—a series of engineering measures that are aimed at reducing the risk of flooding in the City of Sacramento. The USCOE is also responsible for regulating use of and impacts to United States waterways. The USCOE regulates modifications to the levees and to discharges to the receiving waters with respect to quantity and quality. The Federal Emergency Management Agency (FEMA) is responsible for determining flood elevations based on USCOE studies. FEMA is also responsible for developing the Flood Insurance Rate Maps, which are used in the National Flood Insurance Program (NFIP). Participation in the NFIP provides an opportunity for property owners in the community to purchase flood insurance, provided that the community complies with FEMA requirements for maintaining flood protection and managing development in the floodplain. Within designated floodplains, the community must not permit any development, new construction or encroachment, which would cause an increase in the 100-year (base) flood elevation. FEMA defines a significant increase to mean a maximum one foot rise in the base flood elevation.

The State Board of Reclamation is responsible for maintenance of a major portion of the Sacramento River Flood Control Project, including the levee system that surrounds the Natomas Basin (see Section 4.1.1 for a detailed description of the basin). The Board of Reclamation is also responsible for flood control in the state of California, and has guidelines and criteria for work in or near levees.

A Section 401 Certification will be necessary to obtain a 404 permit for discharge into waters subject to USCOE jurisdiction. The certification is issued by the Regional Water Quality Control Board. Section 401 Certification will be necessary to obtain a 404 permit for discharge into waters subject to USCOE.

The California Department of Fish and Game's Lake and Streambed Alteration Program (California Fish and Game Code Section 1600-1607) requires any person who proposes a project that will substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake or use materials from a streambed to notify the department before beginning the project. Notification is generally required for any project that will take place in or in the vicinity of a river, stream, lake, or their tributaries. This includes rivers or streams that flow at least periodically or permanently through a bed or channel with banks that support fish or other aquatic life and watercourses having a surface or subsurface flow that support or have supported riparian vegetation.

3.2 LOCAL REGULATIONS

3.2.1 Sutter County

Sutter County is responsible for reviewing and approving development plans within the unincorporated areas of the county. The Sutter County General Plan (1996) contains specific goals and policies intended to minimize potential impacts associated with drainage and flood hazards, which include the following:

Goal 3.D To collect and dispose of stormwater in a safe and efficient manner.

Goal 4.A To preserve and protect the water resources of the County.

Goal 7.C To minimize the risk of personal injury, property damage and the economic and social disruptions associated with floods.

Sutter County has developed Design Standards to regulate and guide the design and preparation of plans for construction of streets, highways drainage facilities.

Sutter County has a Flood Damage Prevention Ordinance that addresses floodplain management. The ordinance limits construction within the 100-year floodplain to prevent damage to structures and to limit the effect of development on base flood elevations.

3.2.2 Placer County

Placer County is responsible for reviewing and approving development plans within the unincorporated areas of the county. The Placer County General Plan (2005) contains specific goals and policies intended to minimize potential impacts associated with drainage and flood hazards, which include the following:

Goal 4.E To collect and dispose of stormwater in a manner that least inconveniences the public, reduces potential water-related damage, and enhances the environment.

Goal 4.F To protect the lives and property of the citizens of Placer County from hazards associated with development in floodplains and manage floodplains for their natural resource values.

Goal 6.A To protect and enhance the natural qualities of Placer County's streams, creeks and groundwater.

The Placer County Flood Control and Water Conservation District (PCFCWCD) formulates regional strategies for flood control management. In the PCFCWCD Stormwater Management Manual, policies,

guidelines, and specific development criteria are presented for stormwater management. The main objective of the PCFCWCD is to reduce the effects of flooding through Best Management Practices (BMPs). The manual addresses the following elements that must be included in a stormwater management project:

- Drainage structure design—The storm drainage shall be planned and designed so that no damage occurs to structures or improvements during the 100-year event and no inundation of developed or to-be-developed portions of private property occurs during the 10-year event;
- Use of detention basins to reduce post-project runoff rates and/or volumes to 90 percent of pre-project levels;
- Floodplain Management Plan;
- System Monitoring Program; and
- Operations and Maintenance Program.

Placer County Flood Damage Prevention Ordinance (Article 15.52) addresses floodplain management. The ordinance limits construction within the 100-year floodplain to prevent damage to structures and to limit the effect of development on base flood elevations.

3.2.3 Reclamation District No. 1000

Reclamation District No. 1000 (RD 1000) operates and maintains facilities that provide drainage and flood protection for lands within the Natomas Basin (see Section 4.1.1 for a detailed description of the Basin). RD 1000's policies and procedures related to drainage are provided in "Reclamation District No. 1000 Proposed Interior Drainage Plan and Procedures" dated August 1993. RD 1000 requires the use of the "Sacramento City and County Drainage Manual Volume 2: Hydrology Standards" (City and County of Sacramento, 1996) as the basis for technical analyses. The "Sacramento City North Natomas Drainage Design and Procedures Manual" (City of Sacramento, 1998) also provides guidance on drainage design within the basin.

RD 1000's policies for development within the Natomas Basin include (RD 1000, 1993):

- Development cannot cause an increase in the 100-year water surface elevation due to floodplain encroachment.
- Development must provide detention such that post-development peak flows do not exceed pre-development peak flows.
- Development must provide additional pumping and conveyance capacity to the extent that demands on RD 1000's pumping plants and canals are increased.
- Fill must not be placed within floodplains where depth is greater than 2 feet.
- Loss of floodplain storage must be mitigated by providing in-kind replacement storage.

3.2.4 Sacramento Area Flood Control Agency

The Sacramento Area Flood Control Agency (SAFCA) comprises the City and County of Sacramento, Sutter County, the American River Flood Control District, and RD 1000. This agency does not own or operate flood control facilities or provide regulations, but coordinates flood control on a regional basis and raises money through assessments to help pay for the local contribution of costs needed to leverage state and federal money for flood-control projects. One of SAFCA's primary focuses is on the levees that are part of the flood control system surrounding the Natomas Basin (see Section 4.1.1). These include levees along the Cross Canal, Sacramento River, American River, the Pleasant Grove Creek Canal, and the Natomas East Main Drainage Canal.

4.0 AFFECTED ENVIRONMENT

This section describes the existing conditions with respect to hydrology and floodplains. The hydrologic setting is based on existing available data, maps and reports. Floodplains within the study area are based on existing Flood Insurance Rate Maps prepared by FEMA.

4.1 HYDROLOGY

The study area is located within the Sacramento River Basin, which is bounded by the Sierra Nevada to the east, the Coast Ranges to the west, the Cascade Range and Trinity Mountains to the north, and the Delta-Central Sierra area to the south. The Sacramento River is the principal stream in the basin. Its major tributaries are the Pit and McCloud Rivers, which join the Sacramento River from the north, and the Feather and American Rivers, which are tributaries from the east.

As shown on Figure 4-1, the majority of the study area is east of the Natomas Basin and is within the watersheds of Pleasant Grove Creek, Curry Creek, and the Natomas East Main Drainage Canal (a.k.a. Steelhead Creek). A small portion of the study area in the northeastern corner is within the Auburn Ravine watershed.

The existing topography of the study area is relatively flat. The area generally slopes from east to west, from elevation 165 feet above mean sea level (msl) in the northeastern corner to less than elevation 10 feet on the western edge within the Natomas Basin. In general, soils within the study area are categorized as hydrologic soil groups C and D, with C soils having zones of hardpan layers occurring less than 4 feet below ground surface (Quad Knopf, 2001). Localized areas with hydrologic soil groups A and B may be present, especially along Pleasant Grove Creek.

4.1.1 Natomas Basin

The western portion of the study area (approximately 23 percent) is located within the Natomas Basin (see Figure 4-1). The Natomas Basin is defined as land in Sacramento and Sutter counties bounded by the Sacramento River on the west and south, the Cross Canal on the north, the American River on the south and the Pleasant Grove Creek Canal and the Natomas East Main Drainage Canal on the east. The basin includes 53,000 acres and is about 15 miles long from north to south and about 6 miles wide from west to east (EDAW, 2005). Land in the basin is generally flat with elevations from 10 to 25 feet msl and some localized areas up to elevation 40 feet.

The Natomas Basin is completely enclosed by levees that prevent natural drainage out of the basin. All storm runoff must be collected and pumped out. Drainage within the basin has relied on the agricultural fields to hold runoff and act as de-facto detention storage facilities. As agricultural land becomes urbanized, with pavement and buildings replacing fields, peak runoff and the volume of storm runoff are increased. City/County of Sacramento, RD 1000 and Sutter County have all established guidelines for drainage and flood control within the Natomas Basin.

4.1.2 Pleasant Grove Creek Watershed

Pleasant Grove Creek (Figure 4-1) discharges to the Pleasant Grove Creek Canal, which conveys flow north to the Cross Canal and ultimately to the Sacramento River near Verona, California east of the study area. The Pleasant Grove Creek watershed has a total drainage area of approximately 47 square miles upstream of the Cross Canal (CH2M Hill, 1993). Approximately 30 percent of the study area is within the Pleasant Grove Creek watershed.

Pleasant Grove Creek historically drained along its natural courses to the Sacramento River. Reclamation District 1001 was formed in 1911 and constructed a canal/levee system to reclaim lands east of the Feather River from flooding. The Pleasant Grove Creek Canal intercepts flow from Pleasant Grove Creek as well as flow from Curry Creek and flow from the Howsley tributaries north of Pleasant Grove Creek.

There are no long-term continuous streamflow measurements for Pleasant Grove Creek. A previous study evaluated potential increases in flooding due to development within the watershed. As part of these studies, flood hydrographs for Pleasant Grove Creek and its tributaries were developed in accordance with PCFCWCD's Stormwater Management Manual. For the 1993 conditions, the 100-year peak flow for Pleasant Grove Creek was estimated to be on the order of approximately 10,000 cubic feet per second (cfs) (CH2M Hill, 1993).

4.1.3 Curry Creek Watershed

Curry Creek (Figure 4-1) also discharges to the Pleasant Grove Creek Canal, which conveys flow north to the Cross Canal and ultimately to the Sacramento River. The total area of the Curry Creek watershed upstream of the Cross Canal is approximately 17 square miles (CH2M Hill, 1993). Approximately 29 percent of the study area is within the Curry Creek watershed.

There are no long-term continuous streamflow measurements for Curry Creek. A previous study evaluated potential increases in flooding due to development within these watersheds. As part of these studies, flood hydrographs for these creeks were developed in accordance with PCFCWCD's Stormwater Management Manual. For the 1993 conditions, the 100-year peak flow for Curry Creek was estimated to be on the order of approximately 1,000 cfs (CH2M Hill, 1993).

4.1.4 Auburn Ravine Watershed

Approximately 4 square miles of the study area, located in the northeastern corner, is within the Auburn Ravine watershed. This portion of the study area drains to Orchard Creek, which is a tributary to Auburn Ravine.

The Auburn Ravine watershed totals approximately 79 square miles and slopes from east to west, ranging in elevation from 1,600 feet in the Sierra Nevada foothills near Auburn, California to 30 feet near Sutter County (Placer County, 2002). Orchard Creek has a watershed of approximately 12 square miles (EIP, 1997). It originates east of the study area, near Sierra College Boulevard in the Twelve Bridges area. Orchard Creek flows westward under Fiddyment Road north of the study area and then joins Auburn Ravine.

The East Side Canal intercepts flow from Auburn Ravine, as well as other creeks farther north, i.e., Coon Creek, Bunkham Slough, Markham Ravine, and King Slough and then joins with the Pleasant Grove Creek Canal. Flows from both the East Side Canal and Pleasant Grove Creek Canal combine to flow into the Natomas Cross Canal, where they ultimately discharge into the Sacramento River.

There are no long-term continuous streamflow measurements for Auburn Ravine or Orchard Creek. Estimated peak flows for Auburn Ravine at the Cross Canal during the winter range from a few hundred cfs to more than 17,000 cfs for a 100-year storm event (Placer County, 2002). The 100-year peak flow for Orchard Creek would be expected to be on the order of less than 3,000 cfs based on drainage area proportioning.

Flows in Auburn Ravine are augmented by water imported from the Yuba, Bear, and American River watersheds (located outside of the study area, discharges from wastewater treatment facilities, and irrigation water. Winter streamflows are comprised primarily of storm runoff supplemented by discharge from wastewater treatment facilities. During the summer months, when natural flows are low due to little

or no rainfall, streamflows consist primarily of irrigation water deliveries and powerhouse discharges. Based on regulated streamflow data from the Nevada Irrigation District's gauge in Auburn Ravine below SR 65 for the period 1985 through 1997, average regulated streamflows vary from 117 cfs in January to 30 cfs in October (City of Lincoln et al., 1998).

4.1.5 Natomas East Main Drainage Canal Watershed

The Natomas East Main Drainage Canal (NEMDC) watershed is approximately 180 square miles, of which 55 percent is drained by Dry Creek, south of the study area (DWR, 2003). Approximately 14 percent of the study area is within the NEMDC watershed, specifically within the Steelhead Creek portion (Figure 4-1). Steelhead Creek drains the southern portion of the study area to the canal/creek, which then conveys the flow towards the south. NEMDC ultimately discharges via pumping into the Sacramento River.

There are no long-term continuous streamflow measurements for Steelhead Creek. Water levels in the canal at the El Camino Avenue bridge were measured from late summer/fall 2001 to June 2002. Stage measurements ranged from 12.47 to 25.55 feet, with the median value at 13.28 feet (DWR, 2003).

4.2 FLOODPLAINS

The majority of the FEMA floodplain areas are located in the western portion of the study area. Other notable FEMA floodplain areas in the study area are associated with Pleasant Grove Creek and Curry Creek. The most recent FEMA Flood Insurance Rate Maps that cover the study area are dated June/July 1998. Both the 100-year and 500-year floodplains are shown on Figure 4-2.

The 100-year floodplains mapped by FEMA are designated as Zone A, for which no detailed studies were performed and no base flood elevations (BFEs) were determined. While not currently mapped by FEMA, smaller streams and creeks or the upper reaches of streams and creeks may have floodplains associated with them, but detailed studies have not been performed to date.

During a 100-year storm event, the capacity of the Pleasant Grove Creek Canal would be exceeded and flow would enter the Natomas Basin at Sankey Road. This area is referred to as the "Sankey Gap." Due to the relatively flat topography west of the canal and lack of well-defined creek channels, the floodplain is shallow and wide. Within the Natomas Basin, north of Riego Road and east of Highway 99, flood depths range from 0.5 foot to 3.5 feet as a result of overflow from the Sankey Gap. East of the canals, the 100-year floodplain areas are located primarily along the creeks and their associated tributaries. The floodplain for Steelhead Creek is a partial floodplain delineation that covers only the lower reach of the creek and not the channels and swales further upstream (Quad Knopf, 2006).

According to Sutter County officials, there are plans to remove the Sankey Gap from the 100-year floodplain (see Figure 4-2). The timing of these potential floodplain improvements to this area is not known.

The Natomas Basin is surrounded by levees. After record floods in 1986, substantial improvements to the levees were made by federal and state agencies in the 1990s. In 1998, the USCOE certified that the levees around the Natomas area provide flood protection exceeding the 100-year flood and hence the designation shown on the FEMA floodplain maps that have an effective date of 1998. Recent engineering studies commissioned by SAFCA, which included geotechnical investigations and seepage evaluation, indicate that the Natomas Basin area may not have 100-year flood protection, and may require additional levee improvements (Kollars and Dahlber, 2006). These recent investigations suggest that underseepage could threaten the stability of the levees (SAFCA, 2006). SAFCA, the USCOE, and the Reclamation Board are currently conducting evaluations to identify and implement the improvements needed to provide the area with protection against a 200-year event. FEMA is currently re-evaluating the level of protection provided by the existing levee system and may revise the Flood Insurance Rate Maps for the Natomas Basin (SACBEE, 2007).

5.0 POTENTIAL DIRECT IMPACTS

Potential impacts to hydrology and floodplains were evaluated through a quantitative comparison of the potential impact of each of the corridor alignment alternatives to relevant parameters affecting surface water hydrology and floodplains.

The criteria used in this analysis were developed to allow comparison of potential impacts to hydrology and floodplains associated with each of the corridor alignment alternatives. The focus of this Tier 1 analysis was to identify potential impacts that differentiate between proposed alternatives. For example, the measurement of linear feet of floodplain crossed by an alternative quantifies the magnitude of that resource in the watersheds that would be potentially impacted. Floodplain crossings that are less than the typical bridge span length would not encroach into the floodplain, while longer crossings would require columns that could potentially impact floodplains elevations and widths. Comparison of the magnitude of floodplain crossing length potentially affected by each alternative is a quantitative approach to comparing the relative potential impact of the various alternatives.

Table 5-1 summarizes the evaluation criteria considered in the analysis of the alternatives. These are described below.

Amount of Impervious Area. The construction of Placer Parkway would result in the construction of paved surface areas in the study area. This would increase the total amount of impervious surface, thereby increasing stormwater runoff. The amount of impervious area includes the road, shoulder, and interchanges. Increased runoff could contribute to downstream flooding, and could exceed the hydraulic capacity of existing drainage facilities, resulting in localized flooding. As a consequence of vegetation removal during construction activities, stormwater runoff may be temporarily increased. Also, soil excavation and grading during construction could increase the risk of erosion and sedimentation of nearby water bodies. The amount of impervious area is indicative of the amount of soil that may be disturbed and require erosion controls and stabilization during and after construction and provides an order of magnitude of the potential increase in runoff. Given the high existing potential for flooding in and downstream of the study area, any increase in runoff associated with the project could contribute to localized and regional flooding.

Stream and Canal Crossings. Stream and canal crossings (see Figure 5-1) may constrict or block natural streamflows, which may affect the hydraulics of the stream or canal. Special considerations must be addressed when construction is performed in or near creeks and canals, such as limiting fill placed in creeks/canals and minimizing alteration of streams.

Length of Floodplain Crossed. The ability of a bridge to cross a floodplain without encroachment depends on the length of the crossing. Since there are no design details for the floodplain crossings, typical Caltrans crossings have been assumed for the Tier 1 analysis (see Section 2.3.2). If the width of the floodplain at the planned crossing exceeds the typical span length for a bridge (assumed to be 150 feet), then columns or piers would be required to support the bridge.

Angle of Crossing of Floodplain. Longitudinal encroachment of the floodplain is a primary impact consideration for FHWA and Caltrans in evaluating the environmental impact of a proposed stream crossing by a roadway facility. The degree of longitudinal impact of the alternative crossings on the existing floodplain is defined by the angle at which the roadway crosses the floodplain area. This angle (in the range of zero degrees to 90 degrees) defines the magnitude of potential impact to the floodplain area. A perpendicular crossing (at 90 degrees) represents the scenario with the least potential impact. As the angle of crossing approaches zero degrees, the crossing becomes more longitudinal and increases the potential for encroachment into the floodplain. The evaluation seeks to minimize the potential impact, so a higher value for the angle of the potential floodplain crossing is considered better (i.e., the angle is more perpendicular than longitudinal).

Table 5-1
Summary of Criteria Used for Evaluation of Alternatives
Hydrology and Floodplains

Evaluation Criteria	Regulatory Concerns (Potential Impacts)	Quantitative Evaluation Approach	Justification
Amount of Impervious Area	• Hydrologic integrity • Increased peak flows and runoff volumes cause flooding downstream	Magnitude of area affected; lower value better	Potential increase in impervious area and resultant increase in runoff may impact downstream areas; objective is to minimize increase of impervious area
	• BMPs required to offset increases in runoff	Magnitude of area potentially available for BMPs; higher value better	Opportunities to site BMPs (e.g., ability to located detention basins/swales within the right-of-way to attenuate peak runoff)
Stream Crossings	• Hydrologic integrity • Constriction or blockage of natural streamflow • Constriction or blockage of natural streambed migration • Modification of downstream natural flooding regime • Reduction in downstream transport of sediment and nutrients • Streambed alteration	Number of streams crossed by each alternative; lower number better	Alternative crossing may affect hydrology of downstream segments; objective is to minimize the number of streams potentially affected Streambed alteration requires permit from California Department of Fish and Game
Canal Crossings	• Hydrologic integrity • Constriction or blockage of canal flow	Number of canals crossed by each alternative; lower number better	Alternative crossing may affect hydrology of canal; objective is to minimize the number canals potentially affected
Length of Floodplain Crossed	• Hydrologic Integrity • Maintenance of beneficial floodplain values • Constriction or blockage of flow	Total length of alternative that crosses 100-year and 500-year floodplain; lower value better	Potential impact to beneficial floodplain values; objective is to minimize the crossing length potentially affecting the floodplain
Angle of Floodplain Crossing	• Minimization of effects to hydraulic and floodplain functions	Average angle of alternative crossing of stream or floodplain (range 0° to 90°); higher value better	Indicator of degree of longitudinal impact to floodplain areas; objective is to minimize the angle of potential effect
Total Floodplain Area Crossed	• Hydrologic integrity • Maintenance of beneficial floodplain values • Constriction or blockage of flow that could increase flood elevation, extend floodplain boundary and reduce storage • Encroachment could raise base flood elevation and reduce flood storage benefits	Magnitude of area affected; lower value better	Potential impact to beneficial floodplain values; objective is to minimize the area potentially affected

Total Area of Floodplain Crossed. Roads, bridges and culverts that cross a designated floodplain may encroach into the floodplain and affect the hydraulics of the creek and its associated floodplain. While a detailed analysis would be required to evaluate the effects of the potential encroachment, the estimated amount of floodplain that may be affected by the project provides an indication of the potential magnitude of the encroachment for comparing the alternatives. In addition, because there are restrictions on construction activities and types of development that can be implemented in a floodplain, the amount of floodplain within a proposed corridor provides an indication of land use limitations. Floodplains in relation to the alternatives and segments are shown on Figure 4-2.

Portions of Placer Parkway would be constructed within designated floodplains. At some major creek crossings, sections of the Parkway would be elevated on a bridge (see Section 2.3.2). Bridges would be designed such that the base of any new bridges within floodplains would be above the 100-year water surface. Encroachment at these crossings from fill placement or column installation within the floodplain could compromise creek capacity for conveyance of the 100-year flow and result in an increase in the base flood elevation and corresponding floodplain width upstream of the proposed crossing. In addition, increased flows due to increased impervious surfaces could also affect the floodplain.

Comparative data were collated and evaluated for each alternative and its segments (i.e., western, central and eastern) using Geographical Information System (GIS) technology. Table 5-2 summarizes the detailed information for each alternative and segment.

5.1 NO-BUILD ALTERNATIVE

Under the No-Build Alternative, land for the future construction of Placer Parkway would not be acquired and Placer Parkway would not be constructed. No impacts to floodplains or other hydrological resources would occur as a result of the No-Build Alternative.

5.2 ALTERNATIVE 1 – THE RED ALTERNATIVE

5.2.1 Alternative 1 – Western Segment

The Western Segment of Alternative 1 is located entirely within Sutter County. Most of this segment is within the Natomas Basin. The total length of this segment is approximately 15,300 feet along the centerline of the corridor. Three interchanges would be included along this segment, as shown on Figure 2-1.

Amount of Impervious Area. The estimated amount of impervious area associated with this segment is 322 acres (see Table 5-2). Most of this is in the Natomas Basin watershed (316 acres), with the remaining 6 acres in the NEMDC watershed.

The increase in impervious area would result in increased peak flows and runoff volumes. Although the amount of impervious area is relatively small (less than approximately 1 percent) compared with the total drainage area of the Natomas watershed (53,000 acres), BMPs would be required to attenuate peak flows to less than pre-project levels and retain the additional runoff volume. Sutter County's General Plan requires that new development must adequately mitigate increases in stormwater flows and volume to avoid increase in downstream flows and must conform to the appropriate county requirements and standards governing drainage. RD 1000 also requires that projects provide detention to attenuate peak flows to pre-project levels so that the capacity of RD 1000's pumping stations are not exceeded.

BMPs to attenuate peak flows and retain runoff volume could be located within the right-of-way of this segment that is located within the 500-year floodplain. Alternatively, BMPs could be placed within upstream watersheds along the Central Segment to provide compensating benefits, or the project could participate in the City of Roseville's Regional Retention Basin project.

Notes:

1. Alternatives and segments are shown on Figures 2-1 and 4-1.
2. Impervious area includes paved road surface, paved shoulders and interchanges. Road surface assumes 6 lanes (three in each direction). NA = not applicable. NB= Natomas Basin. CC = Curry Creek. PGC = Pleasant Grove Creek. SC= Steelhead Creek.

Western Segment impacts for Alternatives 1, 2, and 3 are the same and for Alternatives 4 and 5 are the same.

Eastern Segment impacts are the same for all alternatives.

Stream and Canal Crossings. This segment would cross the Natomas East Main Drainage Canal. The width of this canal at this crossing and its associated wetlands is estimated to be greater than a standard bridge span of 150 feet and would therefore need to be supported by columns. In addition, a railroad ROW is located very close to the canal; this railroad ROW would also need to be spanned. The columns would be placed outside the ordinary high water elevation of the canal, to the extent practical. The bridges would be designed and constructed to minimize potential impacts to the canal. There are no stream crossings along this segment.

Length of Floodplain Crossed. The total length of 100-year floodplain crossed by this segment is approximately 4,100 feet, most of which (approximately 3,500 feet) is in the western portion within the Natomas Basin. The remaining 600 feet of the segment crosses the 100-year floodplain east of the NEMDC.

In order to minimize potential impacts to the floodplain, the portion of road that traverses the 100-year floodplain would be elevated on a bridge. The bridge would be designed such that the bottom of the bridge would be above the 100-year water surface elevation. The encroachment in the floodplain would be limited to the bridge columns. The columns would be placed to minimize potential impacts. Therefore, encroachment within the floodplain would be minimal.

Angle of Crossing of Floodplain. This segment is almost entirely within the floodplain, which is broad and shallow, therefore, the angle of crossing is not applicable to this segment.

Total Area of Designated Floodplain Crossed. As shown on Figure 4-2, the western portion and the very eastern portion of the Western Segment would be within the 100-year floodplain. Roughly half of the corridor associated with this segment would be within the 100-year floodplain. The remainder of this segment is within Zone X500, which is designated as an area inundated by the 500-year flood event. The estimated footprint within the 100-year floodplain is approximately 211 acres. Approximately 172 acres is within the 500-year floodplain.

5.2.2 Alternative 1 – Central Segment

The Central Segment for Alternative 1 is located in Sutter and Placer counties. It traverses three watersheds: the Natomas East Main Drainage Canal, Curry Creek, and Pleasant Grove Creek. The total length of this segment is approximately 40,600 feet along the centerline of the corridor. There are no interchanges proposed along this segment.

Amount of Impervious Area. The estimated amount of total impervious area associated with this segment is 103 acres. Approximately 51, 33, and 19 acres are within the NEMDC, Curry Creek, and Pleasant Grove Creek watersheds, respectively.

The increase in impervious area would result in increased peak flows and runoff volumes. Although the amount of impervious area is relatively small compared with the total drainage area of the watersheds, BMPs would be required to attenuate peak flows to less than pre-project levels and retain the additional runoff. PCFCWCD's Stormwater Management Manual requires that peak flows be reduced to approximately 90 percent of pre-project conditions for 2-year through 100-year storm events. The Stormwater Management Manual also requires that retention be provided for flow volumes exceeding pre-project flow volumes. Also, Sutter County's General Plan requires that new development must adequately mitigate increases in stormwater flows and volume to avoid increase in downstream flows and must conform to the appropriate county requirements and standards governing drainage.

The total width of the proposed Parkway corridor is approximately 1,000 feet in the Central Segment. Accounting for the six travel lanes and the Parkway's shoulders, this leaves approximately 888 feet of

unpaved area along the length of the Parkway in this segment where BMPs, such as detention basins and swales, could be located either within the median or between the proposed shoulders and the corridor edge.

Stream and Canal Crossings. There are nine stream crossings within this segment: four on Steelhead Creek, three on Curry Creek and two on Pleasant Grove Creek. This segment crosses approximately 7,000 feet of Steelhead Creek longitudinally. Depending on the alignment of the road within the corridor, realignment of this section of Steelhead Creek may be required. Culverts may be used at smaller creek crossings. Where creek crossings coincide with floodplain crossings, the road would be elevated on a bridge.

This segment does not cross any existing canals. Therefore, there would be no potential impacts to canals.

Length of Floodplain Crossed. The total length of 100-year floodplain crossed by this segment is approximately 2,800 feet. At the western edge, the Central Segment would start in the eastern edge of the 100-year floodplain associated with the NEMDC and extend for approximately 1,000 feet.

This segment crosses the 100-year floodplain associated with Curry Creek in one location. The width of the floodplain at this crossing is approximately 500 feet. Because the floodplain width exceeds the typical maximum bridge span length of 150 feet, columns would be required to support the roadway. The columns would be placed outside the ordinary high water elevation of the creek. The bridges and columns would be designed and constructed to minimize potential impacts to the floodplain.

The eastern portion of this segment crosses the 100-year floodplain associated with Pleasant Grove Creek. There are two crossings. The widths of the floodplain at these crossings are approximately 200 and 300 feet. Because the floodplain widths exceed the typical maximum bridge span of 150 feet, columns would be required. The columns would be placed outside the ordinary high water level of the creek. The bridges and columns would be designed and constructed to minimize potential impacts to the floodplain.

Angle of Crossing of Floodplain. This segment crosses Steelhead Creek longitudinally, i.e., the angle of the crossing is essentially zero. The floodplain for Steelhead Creek has not been fully delineated; however, it may extend further upstream than is designated on the current FEMA FIRM. Detailed studies would need to confirm the 100-year water levels for Steelhead Creek in the vicinity of the creek crossings

The Curry Creek floodplain crossing and both of the Pleasant Grove Creek floodplain crossings are at approximately 90-degree angles.

Total Area of Designated Floodplain Crossed. As described above, this corridor crosses through several floodplains. The total amount of 100-year floodplain area crossed by this segment is approximately 46 acres. In addition, this segment crosses the 500-year floodplain associated with the NEMDC; approximately 14 acres are within this 500-year floodplain.

5.2.3 Alternative 1 – Eastern Segment

All of the Eastern Segment of Alternative 1 is within Placer County. Most of this segment is within the Pleasant Grove Creek watershed, with the portion nearest SR 65 located within the Auburn Ravine watershed. The total length of this segment is approximately 29,600 feet measured along the centerline of the corridor. Approximately 21,600 feet is within the Pleasant Grove Creek watershed and the remaining 8,000 feet is within the Auburn Ravine watershed. Three interchanges would be included along this segment as shown on Figure 4-1; two of the three interchanges would be within the Pleasant Grove Creek watershed.

Amount of Impervious Area. The estimated amount of impervious area associated with this segment is 321 acres, of which approximately 218 acres are within Pleasant Grove Creek watershed and the remaining 102 acres are within Auburn Ravine watershed. The increase in impervious area would result in increased peak flows and runoff volumes. Although the amount of impervious area is relatively small compared with the total drainage area of the watersheds, BMPs would be required to attenuate peak flows to less than pre-project levels and retain the additional runoff. PCFCWCD's SWMM requires that peak flows be reduced to below pre-project conditions for 2-year through 100-year storm events. The Stormwater Management Manual also requires that retention be provided for flow volumes exceeding pre-project flow volumes.

The total width of the proposed Parkway corridor is approximately 1,000 feet west of Fiddyment Road and approximately 500 feet east of Fiddyment Road segment. The corridor includes a 100-foot unpaved median, six travel lanes, and the Parkway's shoulders. BMPs, such as detention basins and swales, could be located within the median. There also would be opportunity to locate BMPs between the proposed shoulders and the corridor edge (approximately 888 feet of unpaved area west of Fiddyment Road and approximately 388 feet of unpaved area east of Fiddyment Road).

Stream Crossings. Six new stream crossings are within this segment: four on tributaries of Pleasant Grove Creek and two on tributaries of Orchard Creek. All of these crossing are in the headwaters of the creeks; therefore, culverts would be used at these crossings. In addition, this segment includes three existing stream crossings along SR 65. These crossings would require modifications, such as extension of existing culverts, as part of adding the auxiliary lanes.

Canal Crossings. This segment does not cross any existing canals. Therefore, there would be no potential impacts to canals.

Length of Floodplain Crossed. This segment crosses the 100-year floodplain associated with a tributary to Pleasant Grove Creek. The floodplain width at this crossing is approximately 800 feet. Because the floodplain width exceeds the typical maximum bridge span length of 150 feet, columns would be required. The columns would be placed outside the ordinary high water level of the creek. The bridges and columns would be designed and constructed to minimize potential impacts to the floodplain.

Angle of Crossing of Floodplain. This segment crosses the floodplain associated with a tributary of Pleasant Grove Creek at approximately a 90-degree angle.

Total Area of Designated Floodplain Crossed. The total amount of 100-year floodplain area crossed by this segment is approximately 11 acres. In addition, this segment crosses approximately 3 acres within the 500-year floodplain.

5.3 ALTERNATIVE 2 – THE ORANGE ALTERNATIVE

5.3.1 Alternative 2 – Western Segment

The Western Segment of Alternative 2 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.3.2 Alternative 2 – Central Segment

The Central Segment for Alternative 2 is located in Sutter and Placer counties. It traverses three watersheds: the Natomas East Main Drainage Canal, Curry Creek, and Pleasant Grove Creek. The total length of this segment is approximately 36,400 feet along the centerline of the corridor. There are no interchanges along this segment.

Amount of Impervious Area. The estimated amount of impervious area associated with this segment is 94 acres. Approximately 41, 35, and 19 acres are within the NEMDC, Curry Creek, and Pleasant Grove Creek watersheds, respectively.

The increase in impervious area would result in increased peak flows and runoff volumes. Although the amount of impervious area is relatively small compared with the total drainage area of the watersheds, BMPs would be required to attenuate peak flows to less than pre-project levels and retain the additional runoff. PCFCWCD's Stormwater Management Manual requires that peak flows be reduced to approximately 90 percent of pre-project conditions for 2-year through 100-year storm events. The Stormwater Management Manual also requires that retention be provided for flow volumes exceeding pre-project flow volumes. Also, Sutter County's General Plan requires that new development must adequately mitigate increases in stormwater flows and volume to avoid increase in downstream flows and must conform to the appropriate county requirements and standards governing drainage.

The total width of the proposed Parkway corridor is approximately 1,000 feet in the Eastern Segment. Accounting for the six travel lanes and the Parkway's shoulders, this leaves approximately 888 feet of unpaved area along the length of corridor in this segment where BMPs such as detention basins and swales could be located either within the median or between the proposed shoulders and the corridor edge.

Stream Crossings. Five stream crossings are within this segment: one on Steelhead Creek, two on Curry Creek and two on Pleasant Grove Creek. Culverts may be used at smaller creek crossings. Where creek crossings coincide with floodplain crossings, the road would be elevated on a bridge.

Canal Crossings. This segment does not cross any existing canals. Therefore, there would be no potential impacts to canals.

Length of Floodplain Crossed. The total length of 100-year floodplain crossed by this segment is approximately 3,500 feet. The western edge of the Central Segment would start in the eastern portion of the 100-year floodplain associated with the NEMDC and extend for approximately 1,000 feet.

This segment crosses the 100-year floodplain associated with Curry Creek in two locations. The approximate widths of the floodplains are on the order of 1,000 feet at the first crossing and approximately 200 feet at the second crossing. Because the floodplain widths exceed the typical maximum bridge span length of 150 feet, columns would be required. The columns would be placed outside the ordinary high water elevation of the creek. The bridges and columns would be designed and constructed to minimize potential impacts to the floodplain.

In addition, the eastern portion of this segment crosses the 100-year floodplain associated with Pleasant Grove Creek. The two crossings are the same as those described for the Central Segment of Alternative 1. Because the floodplain widths exceed the typical maximum bridge span of 150 feet, columns would be required. The columns would be placed outside the ordinary high water elevation of the creek. The bridges would be designed and constructed to minimize potential impacts to the floodplain.

Angle of Crossing of Floodplain. This segment crosses the floodplain associated with Steelhead Creek at approximately a 45-degree angle. The Curry Creek floodplain crossings are at approximately 45- and 90-degree angles. Both of the Pleasant Grove Creek floodplain crossings are at approximately 90-degree angles.

Total Area of Designated Floodplain Crossed. As described above, this corridor crosses several floodplains. The total amount of 100-year floodplain area crossed by this segment is approximately

80 acres. In addition, this segment crosses the 500-year floodplain associated with the NEMDC; approximately 26 acres are within this 500-year floodplain.

5.3.3 Alternative 2 – Eastern Segment

The Eastern Segment of Alternative 2 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.4 ALTERNATIVE 3 – THE BLUE ALTERNATIVE

5.4.1 Alternative 3 – Western Segment

The Western Segment of Alternative 3 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.4.2 Alternative 3 – Central Segment

The Central Segment for Alternative 3 is located in Sutter and Placer counties. It traverses three watersheds: NEMDC, Curry Creek, and Pleasant Grove Creek. The total length of this segment is approximately 38,000 feet along the centerline of the corridor. No interchanges are planned along this segment.

Amount of Impervious Area. The estimated amount of impervious area associated with this segment is 97 acres. Approximately 23, 58, and 16 acres are within the NEMDC, Curry Creek, and Pleasant Grove Creek watersheds, respectively.

The increase in impervious area would result in increased peak flows and runoff volumes. Although the amount of impervious area is relatively small compared with the total drainage area of the watersheds, BMPs would be required to attenuate peak flows to less than pre-project levels and retain the additional runoff. The PCFCWCD's Stormwater Management Manual requires that peak flows be reduced to approximately 90 percent of pre-project conditions for 2-year through 100-year storm events. The Stormwater Management Manual also requires that retention be provided for flow volumes exceeding pre-project flow volumes. Also, Sutter County's General Plan requires that new development must adequately mitigate increases in stormwater flows and volume to avoid increase in downstream flows and must conform to the appropriate county requirements and standards governing drainage.

The total width of the proposed Parkway corridor is approximately 1,000 feet in the Central Segment. Accounting for the six travel lanes and the Parkway's shoulders, this leaves approximately 888 feet of unpaved area along the length of the Parkway in this segment where BMPs such as detention basins and swales could be located either within the median or between the proposed shoulders and the corridor edge.

Stream Crossings. Four stream crossings are within this segment: one on Steelhead Creek, one on Curry Creek, and two on Pleasant Grove Creek. Culverts or a bridge could be used at the Steelhead Creek crossing. The Curry Creek and Pleasant Grove Creek crossings coincide with floodplain crossings; therefore, the road would be elevated on a bridge.

Canal Crossings. This segment does not cross any existing canals. Therefore, there would be no potential impacts to canals.

Length of Floodplain Crossed. The total length of 100-year floodplain crossed by this segment is approximately 4,800 feet.

At the western edge, the Central Segment would start in the eastern edge of the 100-year floodplain associated with the NEMDC and extend for approximately 1,000 feet.

This segment crosses the 100-year floodplain associated with Curry Creek. Depending on the alignment of the crossing within the proposed corridor, the floodplain width is on the order of 2,500 feet. Because the floodplain width exceeds the typical maximum bridge span length of 150 feet, columns would be required. The columns would be placed outside the ordinary high water elevation of the creek. The bridges and columns would be designed and constructed to minimize potential impacts to the floodplain.

In addition, the eastern portion of this segment crosses the 100-year floodplain associated with Pleasant Grove Creek. These two crossings are the same as those described for the Central Segment of Alternative 1.

Angle of Crossing of Floodplain. This segment crosses the floodplain associated with Steelhead Creek at approximately a 45-degree angle. The Curry Creek floodplain crossing is at approximately a 90-degree angle. Both of the Pleasant Grove Creek floodplain crossings are at approximately 90-degree angles.

Total Area of Designated Floodplain Crossed. As described above, this corridor crosses several floodplains. The total amount of 100-year floodplain area crossed by this segment is approximately 94 acres. In addition, this segment crosses the 500-year floodplain associated with the NEMDC; approximately 26 acres are within this 500-year floodplain.

5.4.3 Alternative 3 – Eastern Segment

The Eastern Segment of Alternative 3 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.5 ALTERNATIVE 4 – THE YELLOW ALTERNATIVE

5.5.1 Alternative 4 – Western Segment

Amount of Impervious Area. Most of the Western Segment of Alternative 4 is within the Natomas Basin. The total length of this segment is approximately 15,300 feet along the centerline of the corridor. Two interchanges would be included along this segment as shown on Figure 4-1. The estimated amount of impervious area associated with this segment is 223 acres.

The increase in impervious area would result in increased peak flows and runoff volumes. Although the amount of impervious area is relatively small (less than 1 percent) compared with the total drainage area of the Natomas watershed (53,000 acres), BMPs would be required to attenuate peak flows to less than pre-project levels and retain the additional runoff volume. Sutter County's General Plan requires that new development must adequately mitigate increases in stormwater flows and volume to avoid increase in downstream flows and must conform to the appropriate county requirements and standards governing drainage. RD 1000 also requires that projects provide detention to attenuate peak flows to pre-project levels so that the capacity of RD 1000's pumping stations are not exceeded.

In addition, this segment includes the realignment of Sankey Road. The estimated amount of impervious area for the Sankey Road realignment is approximately 46 acres; however, since the realigned roadway would be slightly longer than the existing roadway, the additional amount of impervious area would be minimal.

Stream Crossings. There are no stream crossings within this segment.

Canal Crossings. This segment would cross the Pleasant Grove Creek Canal. The canal is within the 100-year floodplain, and as such, this portion of the road would be elevated on a bridge. The columns to support the bridge would be placed outside the ordinary high water elevation of the canal. The approximate width of the canal at this crossing is on the order of 150 to 200 feet.

Length of Floodplain Crossed. Since the entire segment is essentially within the 100-year floodplain, the entire length of this corridor traverses the floodplain. The total length is approximately 15,300 feet. When the Sankey Gap is removed from the 100-year floodplain some time in the future, the length of floodplain crossed by this segment would be reduced.

Angle of Crossing of Floodplain. This segment is almost entirely within the floodplain, which is broad and shallow, therefore, the angle of crossing is not applicable to this segment.

Total Area of Designated Floodplain Crossed. As shown on Figure 4-2, essentially all of the Western Segment associated with Alternative 4 would be within the 100-year floodplain. The estimated footprint within the 100-year floodplain is 255 acres. In addition, approximately 56 acres of the proposed corridor would be within the 500-year floodplain. When the Sankey Gap is removed from the 100-year floodplain some time in the future, the amount of floodplain crossed by this segment would be reduced.

In order to minimize potential impacts to the floodplain, the road would be elevated on a bridge. The bridge would be designed such that the bottom of the bridge would be above the 100-year water surface elevation. The encroachment in the floodplain would be limited to the bridge columns. The columns would be placed to minimize potential impacts. Therefore, encroachment within the floodplain would be minimal.

5.5.2 Alternative 4 – Central Segment

The Central Segment for Alternative 4 is located in Sutter and Placer counties. It traverses two watersheds: Curry Creek and Pleasant Grove Creek. The total length of this segment is approximately 30,600 feet along the centerline of the corridor. There are no interchanges along this segment.

Amount of Impervious Area. The estimated amount of impervious area associated with this segment is 80 acres. Approximately 64 and 16 acres are within the Curry Creek and Pleasant Grove Creek watersheds, respectively.

The increase in impervious area would result in increased peak flows and runoff volumes. Although the amount of impervious area is relatively small compared with the total drainage area of the watersheds, BMPs would be required to attenuate peak flows to less than pre-project levels and retain the additional runoff. The PCFCWCD's Stormwater Management Manual requires that peak flows be reduced to approximately 90 percent of pre-project conditions for 2-year through 100-year storm events. The Stormwater Management Manual also requires that retention be provided for flow volumes exceeding pre-project flow volumes. Also, Sutter County's General Plan requires that new development must adequately mitigate increases in stormwater flows and volume to avoid increase in downstream flows and must conform to the appropriate county requirements and standards governing drainage.

The total width of the proposed Parkway corridor is approximately 1,000 feet in the Central Segment. Accounting for the six travel lanes and the Parkway's shoulders, this leaves approximately 888 feet of unpaved area along the length of the Parkway in this segment where BMPs such as detention basins and swales could be located either within the median or between the proposed shoulders and the corridor edge.

Stream Crossings. Three stream crossings are within this segment: one on Curry Creek and two on Pleasant Grove Creek. The Curry Creek and Pleasant Grove Creek crossings coincide with floodplain crossings; therefore, the road would be elevated on a bridge.

Canal Crossings. This segment does not cross any existing canals. Therefore, there would be no potential impacts to canals.

Length of Floodplain Crossed. The total length of 100-year floodplain crossed by the Central Segment is approximately 6,300 feet. This segment crosses the 100-year floodplain associated with Curry Creek, which is essentially an extension of the floodplain associated with the Western Segment of Alternative 4. Therefore, the elevated road would continue approximately 5,000 feet into the Central Segment. The elevated road would be supported by columns. The columns would be placed outside the ordinary high water elevation of the creek. The bridges and columns would be designed and constructed to minimize potential impacts to the floodplain.

In addition, the eastern portion of this segment crosses the 100-year floodplain associated with Pleasant Grove Creek. These two crossings are the same as those described for the Central Segment of Alternative 1.

Angle of Crossing of Floodplain. This segment crosses the Curry Creek floodplain at approximately a 45-degree angle. Both of the Pleasant Grove Creek floodplain crossings area at approximately 90-degree angles.

Total Area of Designated Floodplain Crossed. As described above, this corridor crosses several floodplains. The total amount of 100-year floodplain area crossed by this segment is approximately 105 acres. In addition, this segment crosses approximately 37 acres within the 500-year floodplain.

5.5.3 Alternative 4 – Eastern Segment

The Eastern Segment of Alternative 4 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.6 ALTERNATIVE 5 – THE GREEN ALTERNATIVE

5.6.1 Alternative 5 – Western Segment

The Western Segment of Alternative 5 is the same as that for Alternative 4. Therefore, the potential impacts for this segment are the same as discussed for Alternative 4.

5.6.2 Alternative 5 – Central Segment

The Central Segment for Alternative 5 is located within Sutter and Placer counties. It traverses two watersheds: Curry Creek and Pleasant Grove Creek. The total length of this segment is approximately 30,500 feet along the centerline of the corridor. There are no interchanges along this segment.

Amount of Impervious Area. The estimated amount of impervious area associated with this segment is 78 acres. Approximately 60 and 19 acres are within the Curry Creek and Pleasant Grove Creek watersheds, respectively.

The increase in impervious area would result in increased peak flows and runoff volumes. Although the amount of impervious area is relatively small compared with the total drainage area of the watersheds, BMPs would be required to attenuate peak flows to less than pre-project levels and retain the additional runoff. The PCFCWCD's Stormwater Management Manual requires that peak flows be reduced to

approximately 90 percent of pre-project conditions for 2-year through 100-year storm events. The Stormwater Management Manual also requires that retention be provided for flow volumes exceeding pre-project flow volumes. Also, Sutter County's General Plan requires that new development must adequately mitigate increases in stormwater flows and volume to avoid increase in downstream flows and must conform to the appropriate county requirements and standards governing drainage.

The total width of the proposed Parkway corridor is approximately 1,000 feet in the Central Segment. Accounting for the six travel lanes and the Parkway's shoulders, leaves approximately 888 feet of unpaved area along the length of the Parkway in this segment where BMPs such as detention basins and swales could be located either within the median or between the proposed shoulders and the corridor edge.

Stream Crossings. Three stream crossings are within this segment: one on Curry Creek and two on Pleasant Grove Creek. The Curry Creek and Pleasant Grove Creek crossings coincide with floodplain crossings; therefore, the road would be elevated on a bridge.

Canal Crossings. This segment does not cross any existing canals. Therefore, there would be no potential impacts to canals.

Length of Floodplain Crossed. The total length of 100-year floodplain crossed by this segment is approximately 6,300 feet.

Similar to the Central Segment for Alternative 5, this segment crosses the 100-year floodplain associated with Curry Creek, which is essentially an extension of the floodplain associated with the Western Segment of Alternative 4. Therefore, the elevated road would continue approximately 4,000 feet into the Central Segment. The elevated road would be supported by columns. The columns would be placed outside the ordinary high water elevation of the creek. The bridges and columns would be designed and constructed to minimize potential impacts to the floodplain.

In addition, the eastern portion of this segment crosses the 100-year floodplain associated with Pleasant Grove Creek. These two crossings are the same as those described for the Central Segment of Alternative 1.

Angle of Crossing of Floodplain. This segment crosses the Curry Creek floodplain at approximately a 45-degree angle. Both of the Pleasant Grove Creek floodplain crossings area at approximately 90-degree angles.

Total Area of Designated Floodplain Crossed. As described above, this corridor crosses through several floodplains. The total amount of 100-year floodplain area crossed by this segment is approximately 107 acres. In addition, this segment crosses approximately 28 acres within the 500-year floodplain.

5.6.3 Alternative 5 – Eastern Segment

The Eastern Segment of Alternative 5 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.7 COMPARISON OF ALTERNATIVES

The five build alternatives are summarized and ranked in Table 5-3. The No-Build Alternative is not shown in Table 5-3 because no impacts would be associated with this alternative. A ranking of 1 correlates to the lowest number of impacts in any particular input category.

Table 5-3
Summary of Alternative Ranking: Hydrology and Floodplains

Alternative	Total Length		Impervious Area		Stream Crossings		Canal Crossings		Watersheds	
	Feet	Rank	Acres	Rank	Number	Rank	Number	Rank	Number	Rank
1	85,500	5	745	5	15	4	1	0	5	2
2	81,300	3	737	3	11	3	1	0	5	2
3	82,400	4	740	4	10	2	1	0	5	2
4	75,500	2	624	2	9	1	1	0	4	1
5	75,000	1	622	1	9	1	1	0	4	1

Alternative	100-Year Floodplain Crossing		500-Year Floodplain Crossing		100-Year Floodplain Crossed		Minimum Angle of Crossing		
	Acres	Rank	Acres	Rank	Feet	Rank	Degrees	Rank	
1	269	1	189	3	6,900	1	0	2	
2	302	2	201	4	7,600	2	45	1	
3	317	3	201	4	8,900	3	45	1	
4	370	4	96	2	21,600	4	45	1	
5	372	5	87	1	21,600	4	45	1	

5.7.1 Amount of Impervious Area

With respect to the amount of impervious area, Alternative 1 would have the largest increase in impervious area because it is the longest corridor and has the greatest number of interchanges, while Alternative 5 would have the least (i.e., shorter corridor length and fewer interchanges). However, the difference between these two alternatives is only 123 acres. Approximately 66 (Alternatives 4 and 5) to 76 percent (Alternatives 1, 2, and 3) of the total impervious area associated with the project would be created by the proposed interchanges.

As summarized in Table 5-4, Alternatives 1 and 2 would create less impervious area in Curry Creek than Alternatives 3, 4, and 5 because these alternatives would have shorter roadway lengths through the Curry Creek watershed. The amount of impervious area that would be created by the project for these alternatives would range from approximately 0.4 to 0.6 percent of the total Curry Creek drainage area.

All of the alternatives would create approximately the same amount of impervious area (approximately 0.4 square mile) within the Pleasant Grove Creek watershed, because the corridor alignments for all alternatives are similar and they all would include two interchanges. This amount would be approximately 0.8 percent of the total Pleasant Grove Creek watershed area.

Alternatives 4 and 5 would create less impervious area (approximately 0.3 square mile) in the Natomas Basin than Alternatives 1, 2, and 3 (approximately 0.5 square mile). The difference is primarily because Alternatives 4 and 5 would include two interchanges and Alternatives 1, 2, and 3 would include three interchanges within the watershed. The amount of impervious area that would be created by the project would range from approximately 0.4 to 0.6 percent of the total Natomas Basin drainage area.

Alternatives 1, 2, and 3 would contribute less than 0.1 square mile of impervious area in the NEMDC watershed, which would be less than 1 percent of the total NEMDC watershed area. Alternatives 4 and 5 do not traverse the NEMDC watershed and therefore the Parkway would not contribute any impervious area in this watershed; however, the proposed Sankey Road re-alignment would create less than 5 acres of impervious area within the NEMDC watershed.

Because the proposed corridor alignment and one interchange would be the same for all alternatives, all of the alternatives would create the same amount of impervious area within the Auburn Ravine watershed, approximately 0.2 square mile. This would be about 1 percent of the total drainage area of Orchard Creek and only about 0.2 percent of the total Auburn Ravine watershed.

All of the alternatives would create the same amount of impervious area within the Pleasant Grove Creek and Auburn Ravine watersheds. Alternatives 1, 2, and 3 would create slightly more impervious area in the Natomas watershed, while Alternatives 4 and 5 would create slightly more impervious area in the Curry Creek watershed. With the exception of the small amount of impervious area associated with the Sankey Road re-alignment, Alternatives 4 and 5 would not create any new impervious area within the NEMDC watershed.

5.7.2 Stream and Canal Crossings

Alternatives 4 and 5 have the fewest stream crossings (12 crossings), while Alternative 1 has the most (18 crossings). Alternatives 4 and 5 cross Curry Creek, Pleasant Grove Creek and tributaries to Orchard Creek. Alternatives 1, 2 and 3, cross these same creeks in different locations, but also cross Steelhead Creek.

Table 5-4
Amount of Parkway Impervious Area in Watersheds

Alternative	Total Watershed Area (sq. mi.)[1]	Area in Corridor (sq. mi.)[2]	Parkway Impervious Area (sq. mi.)[3]	Parkway Impervious Area as Percentage of Watershed
Natomas Watershed				
1	83	0.6	0.5	0.6%
2	83	0.6	0.5	0.6%
3	83	0.6	0.5	0.6%
4	83	0.5	0.3	0.4%
5	83	0.5	0.3	0.4%
Steelhead Creek (NEMDC) Watershed[4]				
1	9	0.8	0.09	1%
2	9	0.6	0.07	0.8%
3	9	0.4	0.05	0.6%
4	9	0	0	0
5	9	0	0	0
Curry Creek Watershed				
1	17	0.4	0.05	0.3%
2	17	0.5	0.05	0.3%
3	17	0.7	0.08	0.5%
4	17	0.9	0.11	0.6%
5	17	0.9	0.11	0.6%
Pleasant Grove Creek Watershed				
1	47	1.0	0.4	0.8%
2	47	1.0	0.4	0.8%
3	47	1.0	0.4	0.8%
4	47	1.0	0.4	0.8%
5	47	1.0	0.4	0.8%
Auburn Ravine Watershed				
1-5	79	0.2	0.16	0.2%

Notes:

1. Total watershed areas based on information from CH2M Hill (1993).
2. Area in corridor is based on length and width of corridor, plus interchanges and Sankey Road realignment.
3. Parkway impervious area includes road surface (6 lanes at 12 feet), shoulders (4 at 10 feet), interchanges and Sankey Road realignment.
4. While the Parkway corridor and roadway would not traverse the NEMDC watershed for Alternatives 4 and 5, there would be a small amount of impervious area created by the re-alignment of Sankey Road (approximately less than 5 acres).

Alternatives 1, 2, and 3 would cross the Natomas East Main Drainage Canal and Alternatives 4 and 5 would cross the Pleasant Grove Creek Canal. Each of the proposed canal crossings would likely require the placement of fill material (either an embankment or piers) within wetlands or waters associated with the canal crossings. The wetlands and open water of the canal at the southern crossing (Alternatives 1, 2, and 3) (Natomas East Main Drainage Canal) appear to be more than 150 feet wide and would also need to span a railroad ROW. The northern crossing (Pleasant Grove Creek Canal) (Alternatives 4 and 5) appears similar (about 150 to 200 feet) but the distance between the railroad ROW and the canal is greater. Because the estimated canal widths are approximately the same or wider than a typical bridge span, it is very likely that columns or an embankment would be required at one or both locations.

5.7.3 Length of Floodplain Crossed

Alternative 1 crosses the 100-year floodplain the least (approximately 6,900 feet), while Alternatives 4 and 5 cross the most (21,600 feet). This suggests that Alternatives 4 and 5 would require more columns to be placed within the floodplains and therefore the potential for significant encroachment would be greater for these alternatives.

When the Sankey Gap is removed from the 100-year floodplain sometime in the future, the amount of floodplain crossed by Alternatives 4 and 5 would be reduced on the order of approximately 8,000 feet. Even with removal of the Sankey Gap, Alternatives 4 and 5 would still cross considerably more floodplain than Alternatives 1, 2 and 3.

5.7.4 Angle of Crossing of Floodplain

Alternative 1 crosses Steelhead Creek longitudinally for approximately 7,000 feet; this may require relocation of the creek. Alternative 1 is the only alternative with a longitudinal crossing. The minimum angle of crossing for the other alternatives is 45 degrees in the Central Segments.

5.7.5 Total Area of Designated Floodplain Crossed

Alternative 1 would cross the least amount of 100-year floodplain (269 acres) and Alternative 5 would cross the most (372 acres). This difference is primarily due to the amount of 100-year floodplain designated within the Natomas Basin. In the future, when Sankey Gap is eliminated from the 100-year floodplain, there will be very little difference in the total amount of floodplain crossed by the alternatives.

While there is not much difference between the total amounts of floodplain crossed by the various alternatives, (103 acres), there is a difference in where the alternatives cross the Curry Creek floodplain. As summarized in Table 5-5, Alternatives 1 and 2 cross the Curry Creek floodplain farther upstream within the watershed than do Alternatives 3, 4, and 5. Potential impacts would be greater for floodplain crossings that are lower in the watershed. For example, floodplains are wider and therefore crossings would be longer. Any encroachment or fill placed in the floodplain would have the potential to impact upstream areas; therefore, crossings higher in the watershed (Alternatives 1 and 2) would have fewer impacts to floodplains.

Until the Sankey Gap is addressed and removed from the 100-year floodplain, the Western Segment associated with Alternatives 3, 4, and 5 is almost entirely within the 100-year floodplain. This limits the opportunities to site BMPs within the corridor for attenuation of peak flows and retention of runoff volumes.

Table 5-5
Distribution of Curry Creek Floodplain Crossed by Alternative

Alternative	Total Floodplain Area (sq. mi.)	Floodplain Downstream of Crossing (sq. mi.)	Floodplain in Corridor (sq. mi.)	Floodplain Upstream of Crossing (sq. mi.)	Percent of Floodplain Upstream of Crossing	Floodplain Crossing Length (feet)
1	3	2.7	0.1	0.2	6	5,009
2	3	2.3	0.1	0.6	20	7,400
3	3	1.3	0.1	1.6	53	7,900
4	3	0.8	0.2	2	67	21,600
5	3	0.8	0.2	2	67	21,600

6.0 SECONDARY AND INDIRECT IMPACTS

Recent FHWA, EPA, and Caltrans guidance on growth inducement (Mare Island Accord, 2006) advises that analysis of potential impacts associated with growth should include an evaluation of the effects of growth on resources of concern. The following discussion presents a qualitative evaluation of potential secondary and indirect impacts of Anticipated Growth (see below for definition) on human and environmental resources in the study area.

The Council on Environmental Quality (CEQ) provided clarification of the terminology "indirect impacts" when it issued the National Environmental Policy Act in 1978. Secondary and indirect impacts are defined as impacts "caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable." Moreover, indirect effects ". . . may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems."

A key term used in this section is "Anticipated Growth." This is defined as the growth that is anticipated in the study area as described in the relevant General Plans and adopted regional forecasts, such as the SACOG Blueprint scenario, including additional growth that may occur as a result of major new development proposals that have not yet been formally approved. It is possible that this additional growth may accelerate the rate of buildout in the study area, but it is not ultimately expected to result in any greater levels of development than is presented in adopted regional forecasts.

The following discussion considers secondary and indirect impacts on hydrology and floodplains that may occur as a result of direct impacts associated with the Parkway, and also as a result of anticipated growth. The study area for the analysis of secondary and indirect impacts on hydrology and floodplains is shown in Figure 6-1.

6.1 GROWTH INDUCEMENT SCENARIO

NEPA and CEQA both require environmental analyses to consider the effects of a project on growth. Caltrans defines growth inducement as the relationship between a proposed project and growth. This section summarizes the relationship between the Placer Parkway Corridor Preservation project and regional growth, and discusses potential secondary and indirect effects of the project related to growth inducement.

Placer Parkway would be growth inducing, as a component of the rapidly evolving urban matrix in western Placer County. While the project study area is predominately undeveloped at this time, parts of the study area are within local General Plan designations allowing urban growth. In addition, there are numerous proposals for major new development projects in and around the study area depicted on Figure 6-2 that are currently in various stages of the approval and entitlement process. Portions of the surrounding area (especially northern Sacramento County and southwestern Placer County) have developed very rapidly over the past several decades. This has occurred as a result of many factors, including continuing net population growth statewide, strong employment growth in the Sacramento region, relative housing affordability, and location amenities.

Population and employment growth projections for California and the Sacramento Region in general, and for south Sutter County and southwestern Placer County in particular (described in detail in the Tier 1 EIS/EIR Community Impact Assessment), indicate that that development pressures in the project vicinity will remain relatively intense, irrespective of the Parkway. Between 1950 and 2000, the California population more than tripled. During the same period, population in the six-county SACOG region increased by more than 800 percent (DOF, 2006). Projections and established goals and policies from a wide range of sources, including SACOG, Placer, Sacramento and Sutter counties, and the Cities of

Roseville, Rocklin and Lincoln, confirm that relatively high rates of population and employment growth and housing and commercial development are anticipated in the six-county region by 2050. Between 2000 and 2050, California's population is expected to increase from approximately 34 million to 55 million. During the same time period, SACOG projects that the region's growth will double, from 1.9 million in 2000 to 3.95 million in 2050, with the Roseville-Rocklin-Lincoln area remaining one of the fastest growing areas in the region (Levy and Doche-Boulos, 2005; SACOG, 2006).

Placer Parkway would be growth inducing because it would help support changes in the amount of growth beyond current general plan levels, and could influence the pace and location of some development. It is likely that Placer Parkway could help to implement the various specific development proposals in the study area, since it would serve to relieve traffic congestion associated with these proposals. Furthermore, the Parkway could affect the timing of development in the vicinity of the proposed interchange locations, particularly those proposed near vacant land adjacent to rapidly developing areas or areas now proposed for urban development. However, as the Parkway would be a limited-access road located in an area that is already undergoing extensive and rapid urbanization, its potential to facilitate growth that would not have otherwise occurred is limited. It could result in different land uses, or more intensive land uses, in the vicinity of interchanges where land use plans are still being developed and have not yet been approved. Also, it could hasten the buildout of planned commercial and industrial uses, especially in the Sunset Industrial Area and proposed Placer Ranch Specific Plan area, as well as in the Sutter Pointe Specific Plan area.

In the longer term, improved access provided to lands in the Western and Eastern segments could be a factor in stimulating additional growth and development in areas west of SR 70/99 not protected by the Natomas Basin HCP, or north of the Sutter Pointe Specific Plan area, or north of Sunset Boulevard West in Placer County. Although growth is anticipated in these areas over time (as reflected in SACOG's preferred Blueprint scenario, the Sutter County General Plan, and the City of Lincoln General Plan), such development is not reflected in general plans at present and has not been formally proposed by landowners. By providing improved access to adjacent areas, Placer Parkway could be one of many factors that would encourage growth in these areas sooner than this might otherwise occur.

The factors influencing growth in the region are complex. The Parkway is one of several major urban development proposals in the region. While Placer Parkway would contribute to regional growth, including growth beyond the level identified in current general plans, it is not feasible to quantify the amount of its contribution. A single new transportation facility such as the Parkway is only one of the many factors contributing to regional growth, and it is speculative to assign a particular quantity of growth to any one factor.

Furthermore, several factors serve to limit the likely effect of the Parkway on growth, including the following:

- No interchanges are proposed for any areas that are not already approved or proposed for development;
- All approved and proposed residential development that has not already been built is projected to be built out prior to 2020, when the Parkway is proposed to open; and
- Real estate market pressures in the area have been and continue to be intense without the Parkway, and local government jurisdictions have been supportive of processing development applications in spite of anticipated regional transportation challenges.

It is unlikely that the choice of one Parkway alternative over another would substantially change expected patterns of growth and development in the project study area and the surrounding region. In the Western Segment, all corridor alignment alternatives would provide new access to an area that is currently

undeveloped farmland, but that is proposed for mixed use urban development. The three more southerly alignments (Alternatives 1, 2, and 3) would provide two interchanges in the South Sutter Pointe Specific Plan area, while the more northerly alignments (Alternatives 4 and 5) would provide only one interchange in this area, approximately one mile farther north of the more southerly alignments in the Western Segment. Since none of the alternative alignments would include any intersections in the Central Segment, there would be little difference in growth inducement effects among the alternatives in this segment. In the Eastern Segment, two interchanges are proposed within the existing Sunset Industrial Area Plan, in an area proposed for the Placer Ranch Specific Plan. While these interchanges would provide new access to a currently undeveloped area, this area is planned for growth. In the Eastern Segment all alternatives would follow an identical alignment, so there would be no differences in growth inducement effects among the alternatives.

A future interchange at Watt Avenue could be growth inducing, because it would provide major new regional access to a portion of the project study area that is currently rural and undeveloped, although both conceptual interchange locations are now surrounded by formal development proposals or land controlled by development interests. A Watt Avenue interchange is not proposed as part of the project.

6.2 SECONDARY AND INDIRECT EFFECT EVALUATION

6.2.1 No-Build Alternative

Under the No-Build Alternative, land for the Parkway would not be acquired and the Parkway would not be constructed. There would not be any secondary or indirect impacts on hydrology and floodplains under the No-Build Alternative.

6.2.2 Build Alternatives

Construction and operation of the Parkway and anticipated growth could result in secondary and indirect impacts on hydrology and floodplains.

Anticipated growth would result in the creation of additional impervious surfaces and increased run-off in the study area that would most likely not have occurred in the absence of such growth. As the amount of land that can be developed decreases, the potential for land use changes and floodplain encroachment increases. If land outside of floodplain limits becomes less available, there may be a tendency for development to encroach into the floodplain, causing further adverse impacts. These impacts would be direct impacts of other projects not associated with Placer Parkway, and would be required to be analyzed as part of independent environmental review. Although it is not feasible to perform a detailed evaluation of these projects at this stage as specific design details are not known, potential impacts are taken into account in the Placer Parkway 2040 Cumulative analysis (see Section 7.2). This analysis evaluates a 2040 cumulative scenario, which is considered to be an appropriate projection of future development. This scenario includes full-residential build-out in Placer County west of Sierra College Boulevard, including general plan areas and major developments, and employment and population growth in line with SACOG forecasts. It assumes levels of growth and development will occur at the higher end of a potential feasible range and therefore represents a reasonable maximum development scenario for which cumulative and secondary and indirect impacts have been analyzed.

Although it is not possible to predict with any certainty where new impervious surfaces may be created, it is reasonable to assume that impacts associated with reduction in pervious land cover and increased run-off, either directly associated with the construction of the Parkway or as a result of growth induced by the Parkway could adversely affect floodplains and hydrology. This could occur in a number of ways:

- Contamination of surface water and groundwater through increased run-off of pollutants;
- Increased peak flows and runoff volumes cause flooding downstream;
- Declining levels of developable land could place additional pressure for continued floodplain encroachment, with its associated adverse effect on wildlife and increased risk of flooding;
- Impacts on aquatic wildlife as a result of increased sedimentation from run-off; or
- Impacts on aquatic wildlife as a result of constriction or blockage of natural stream flow associated with stream crossings.

7.0 CUMULATIVE IMPACTS

7.1 CUMULATIVE IMPACT SCENARIO

Analysis of cumulative impacts is required under the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). Cumulative impacts result when the effects of an action are added to or interact with other effects in a particular place and within a particular time. It is the combination of these effects, and any resulting environmental degradation, that are the focus of cumulative impact analysis. The CEQ's regulations (CEQ, 1987) explicitly state that cumulative impacts must be evaluated along with the direct and indirect effects of each alternative.

CEQA defines cumulative impacts as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts" (CEQA Guidelines, §15355). Stated another way, "a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the environmental document together with other projects causing related impacts" (CEQA Guidelines, §15130). Although a project may cause an individually limited or individually minor incremental impact that, by itself, is not significant, the increment may be "cumulatively considerable" and thus significant.

FHWA has requested that cumulative conditions for the analysis of project alternatives in the Tier 1 EIS/ EIR for the Parkway be based on development levels that are 20 years beyond the projected opening of the project. For planning purposes, Placer County Transportation Planning Agency (PCTPA) has identified 2020 as the opening year of the Parkway. Cumulative impacts are therefore being evaluated for the year 2040. This 2040 scenario includes the following projects (see Figure 6-2):

- Full build-out of all residential land in Placer County west of Sierra College Boulevard, including current general plan areas and the following major development proposals in West Placer County:
  - The Creekview and Sierra Vista Specific Plan areas in Roseville's Memorandum of Understanding (MOU) Remainder Area
  - The Sphere of Influence (SOI) expansion areas of Lincoln
  - The Placer Vineyards, Regional University and Community, and Placer Ranch Specific Plans in unincorporated Placer County
  - The Curry Creek Community Plan area
- Growth in retail employment in Placer County that balances the growth in residential development by matching SACOG's countywide estimate of about 0.32 employee per dwelling unit from their 2025 forecasts.
- Growth in total employment levels in Placer County that balances the growth in residential development by matching SACOG's 1.3 employees per dwelling unit from their 2025 forecasts.
- Full build-out of the residential development in the Sutter Pointe Specific Plan area along with a non-residential development level that balances the residential development in that area.

- Estimated 2040 developments in all other portions of SACOG's six-county region based on assuming a constant rate for the development growth between 2005 levels and the 2050 Preferred Blueprint scenario for each of SACOG's traffic analysis zones (TAZs).

7.2 CUMULATIVE IMPACTS EVALUATION

7.2.1 No-Build Alternative

Under the No-Build Alternative, land would not be acquired for the Parkway and the Parkway would not be constructed. There would not be any contribution by the Parkway to cumulative impacts under the No-Build Alternative.

7.2.2 Alternatives 1 Through 5

The combined effects of floodplain encroachment associated with multiple projects could exacerbate adverse impacts associated with individual projects, through cumulative loss of pervious surfaces and corresponding increase in the volume and rate of runoff due to reduced percolation of surface water. This also could lead to increased flooding risk as land throughout the area covered under the cumulative impact scenario is converted from pervious surface to development, and overall peak flow rates and runoff volumes are increased. Cumulative impacts can also be caused by acceleration of runoff caused by improved conveyance of stormwater through streets, gutters and storm sewer facilities. The potential adverse impacts on hydrology and floodplains associated with this development could result in significant cumulative impacts.

The amount of impervious area associated with Placer Parkway would be roughly one square mile (ranging from approximately 0.98 square mile for Alternative 5 to approximately 1.2 square miles for Alternative 1). While this is a very small amount compared to the total area of the watersheds and the project's contribution to peak flows and volumes in the creeks would be expected to be small, when combined with potential upstream flow increases, the cumulative impacts could still be significant.

Mitigation strategies have been identified to reduce these impacts to less-than-significant levels. These include strategies to avoid impacts by design (i.e., strategies to limit impacts from construction activities, and site planning and design features to avoid impacts), implementation of Best Management Practices, and participation in the City of Roseville's planned regional stormwater retention facility (Reason Farms). This facility has been specifically planned to alleviate potential downstream flooding.

In addition, Sutter County and Placer County General Plan policies and programs are intended to offset the potential direct and cumulative flooding and water quality problems that may arise from development. New developments are required to detain onsite drainage such that the rate of runoff is maintained at pre-development levels. Because peak runoff rates from new development would be maintained at pre-development levels, there would be no increases in peak flows. Both Sutter and Placer counties have ordinances that limit construction in floodplains. Given the specific policy directives of the General Plans. Given this regulatory environment, the relatively minor amount of impervious surface associated with Placer Parkway in comparison to the overall cumulative development scenario, and with development of the mitigation strategies identified in this report into enforceable mitigation measures, Placer Parkway's incremental contribution to cumulative impacts related to peak flows and floodplains would not be cumulatively considerable. Therefore, Placer Parkway's cumulative impacts associated with peak flows and floodplains would be less than significant.

8.0 WATT AVENUE INTERCHANGE

As shown on Figure 2-3, there are two general locations proposed for the Watt Avenue interchange. Because the configuration of the interchanges would not likely change by location, the increase in impervious surface would be similar for all locations. The estimated amount of additional impervious area associated with the interchange is approximately 65 acres. The first location for the interchange, associated only with Alternative 1 (Option One), would be located near and potentially cross Curry Creek and its floodplain. The other Watt Avenue interchange locations, which are associated with Alternative 1 (Option Two), and Alternatives 2 through 5, would be placed outside of the Pleasant Grove Creek floodplain limits and would not cross the creek; therefore, the potential impacts to hydrology and floodplains would be less for these options.

9.0 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION STRATEGIES

Table 9-1 summarizes the mitigation strategies to be considered for the project. Local, state, and federal agencies are requiring the development of practical mitigation measures in response to the impacts of construction activities and ongoing project operations that increase flows to existing waterways and cause flooding. The measures considered for the project have been categorized as standard conditions (SCs) and project design features (PDFs). SCs include the regulatory requirements dictated by local, state and/or federal mandates. These include the required compliance with Floodplain Management Order requirements, as well as county ordinances (e.g., flood damage and prevention ordinance). PDFs include measures that can be incorporated into the design of the project to avoid, minimize, or reduce potential environmental impacts.

Table 9-1
Potential Mitigation Measures to be Considered in Tier 2
for Impacts to Surface Water Hydrology and Floodplains

Parameter	Category	Measure
Surface Water Hydrology	SC	• Meet Sutter County, PCFCWCD and RD 1000 requirements for siting and design of facilities and hydrologic modification
	PDF	• Minimize the number of stream crossings by alternative • Minimize flow modification to streams (patterns and volume) • Mimic the natural patterns as much as possible
Floodplain Encroachment	SC	• Comply with floodplain encroachment guidance and siting/design guidance to minimize potential impacts (FHWA, USCOE, CDFG)
	PDF	• Minimize the existing floodplain affected • Use least intrusive construction methods reasonably available • Design features to avoid impacts to hydraulics and flooding • Incorporate appropriate BMPs; e.g., provide appropriate detention and retention

Notes:

BMPs = best management practices
PDF = project design feature
SC = standard condition

Based on identified impacts described above, the following key strategies for mitigation have been preliminarily identified and are discussed in further detail:

- Avoidance by design (Caltrans design guidance, consider future development in design);
- Implement Caltrans/Placer County/Sutter County BMPs (see next page for description);
- Explore potential to be included in an expansion of the City of Roseville Retention Basin; and
- Identify and address, as needed, Pleasant Grove Creek/Curry Creek Watershed Management Groups' requirements.

9.1 AVOIDANCE BY DESIGN

To reduce the environmental impacts of highways and bridges on hydrology and floodplains, the following construction, site planning, and design practices will be considered and evaluated at the preliminary design stage.

Limit Impacts from Construction Activities

- Limit temporary disturbance to minimum areas necessary for construction;
- Restore disturbed areas to pre-project conditions;
- Limit construction activities in or near creeks, including limiting amount of fill placed in creeks;
- Use the least intrusive construction methods reasonably available; and
- Avoid or minimize construction activities in floodplains (e.g., locate construction staging areas outside floodplain limits).

Site Planning to Avoid Impacts

- Avoid or minimize stream crossings if possible;
- Align roadway within the corridor to decrease impervious cover by reducing the area of pavement or number of road miles if possible;
- Provide sufficient setback distances in accordance with Caltrans and county requirements between the highway right-of-way and wetlands or riparian areas, where feasible; and
- Locate the Parkway and bridges away from sensitive areas and establish buffer zones where possible.

Design Project Features to Avoid Impacts

- Design project features (e.g., culverts, drainage systems, and bridges) to avoid increasing flow velocities that may cause or contribute to downstream erosion and flooding;
- Design project features to minimize potential for debris clogging that could cause flooding;
- Disconnect and infiltrate runoff using structural runoff controls, such as vegetated swales;
- Incorporate appropriate BMPs (e.g., provided appropriate detention and use vegetation to reduce flow velocities and peak discharges);
- For roads and bridges that cross floodplains, maximize spans and minimize piers/columns;
- Maximize the angle of stream crossing (closer to 90° is better);
- Design bridges and columns such that increase in the base flood elevation is less than one foot as specified by FEMA (see Section 3-1); and
- Mimic natural patterns as much as possible, including considering Low Impact Development (LID) whenever appropriate.

9.2 IMPLEMENT BMPS

The Caltrans Statewide Storm Water Management Plan identifies permanent and temporary BMPs that have been approved for statewide application. These BMPs must be considered during the planning and design process. BMPs that are to be incorporated into the design of new facilities as appropriate are listed below.

Consideration of Downstream Effects Related to Potentially Increased Flow

- Incorporate BMPs that will provide detention and retention such that peak flows from post-development stormwater runoff are less than pre-project peak flows in accordance with PCFCWCD's, Sutter County's, and RD 1000's criteria.

Preservation of Existing Vegetation

- Preserve existing vegetation to the extent practical.

Concentrated Flow Conveyance Systems

- Incorporate features to eliminate or reduce concentration of discharge and thereby reduce erosion. Features could include ditches, berms, dikes, and swales; overside drains; flared culvert end sections; and outlet protection/velocity dissipation devices.

Slope/Surface Protection Systems

- Incorporate vegetated surfaces that reduce flow velocities and promote infiltration to reduce the amount of runoff.

9.3 PARTICIPATE IN REGIONAL RETENTION BASIN

To help mitigate increased runoff, several projects are being developed in the region. The largest currently planned is the development of a regional stormwater retention facility called Reason Farms. The City of Roseville developed the Reason Farms retention basin to alleviate potential downstream flooding that could be caused by entitled projects and future projects within the City of Roseville or within the area covered by the Memorandum of Understanding between the City of Roseville and the County of Placer (County). The Reason Farm retention basin is located on Pleasant Grove Creek within the north-central portion of the study area, just north of the Alternative 5 Central Segment. . To accommodate the estimated retention storage volume requirements for the City of Roseville plus the West Roseville Specific Plan and MOU areas, the retention basin was designed to provide 2,530 acre-feet of storage capacity. Construction of the Reason Farms facility is anticipated to begin in 2010, with a second phase of construction planned for 2017. This plan is currently undergoing revision in connection with the Reason Farms Environmental Preserve Master Plan.

To offset the increased volume of runoff created by the Parkway, the project could participate in expansion of the Reason Farms regional retention basin. Expansion of the retention facility in the future to accommodate retention storage of other entities would be physically possible, either through extension of the embankment or through excavation. Such an expansion would require City of Roseville approval and additional environmental review.

9.4 IDENTIFY AND ADDRESS, AS NEEDED, PLEASANT GROVE CREEK/CURRY CREEK WATERSHED MANAGEMENT GROUPS' REQUIREMENTS

The Pleasant Grove/Curry Creek Ecosystem Restoration Plan (ERP) (Foothill, 2005) addresses resource management and land use in the Pleasant Grove and Curry Creek watersheds and is intended to guide future planning, restoration, and land use management activities in the watersheds. Objectives from the ERP that may be relevant and should be considered during planning, design, and construction of Placer Parkway include the following:

Objective 5.2 Protect, enhance, or recreate natural riparian processes, particularly hydrology and associated high water events, to promote the natural cycle of channel movement and sediment deposition that create a mosaic of riparian vegetation types.

Objective 6.3 Integrate meaningful ecosystem protection and restoration opportunities with the development review and approval process to encourage low impact development and transportation planning.

Objective 6.6 Ensure that flood control projects benefit habitat and wildlife while also meeting the needs of the watershed's agricultural and urban populations.

9.5 IDENTIFY AND ADDRESS, AS NEEDED, NATOMAS BASIN HABITAT CONSERVATION PLAN'S REQUIREMENTS

The purpose of the Natomas Basin Habitat Conservation Plan (NBHCP) (City of Sacramento et al, 2003) is to promote biological conservation in conjunction with economic and urban development within the basin. The goal of the NBHCP is to preserve, restore, and enhance habitat values while allowing urban development to proceed according to local land use plans. The NBHCP provides requirements regarding buffers between development and specific resource areas (e.g., garter snake habitat, wetlands, etc.), grading and construction activity restrictions, management of vegetation control along ditches and canals, and application of herbicides and pesticides. Runoff from paved areas should be directed away from wetlands. Because floodwaters can destroy giant garter snake retreats, these areas should not be inundated.

10.0 ANALYSES TO BE UNDERTAKEN IN TIER 2

The technical studies and reports that will need to be completed as part of Tier 2 include the following:

- Drainage Report consistent with Caltrans Highway Design Manual 800 (Caltrans, 2001b) and Caltrans Design Directive D-6 requirements (Caltrans, 2001a) (Note: guidance provided by Caltrans Environmental Handbook, Volume 1, Chapter 9 will also be followed once it becomes available); and
- Location Hydraulic Study and Summary Floodplain Encroachment Report consistent with Caltrans Environmental Handbook, Volume 1, Chapter 17 requirements (Caltrans, 2005).

Hydrologic and hydraulic analyses should be performed in accordance with Caltrans' Highway Design Manual (Caltrans, 2001b). The results should be compiled into a drainage report (Caltrans, 2001a). A copy of the drainage report requirements is attached as Appendix A. With respect to hydrology and floodplains, the drainage report should include the following:

- Summary of hydrologic and hydraulic analyses;
- Copy of the appropriate FEMA map(s);
- Map or table summarizing elevations of flood of record, 100-year flood and Ordinary High Water;
- Summary of modeling results; and
- Floodplain summary sheet in accordance with HDM 804.7

As discussed above, floodplain encroachment associated with Placer Parkway is not expected to be significant. In accordance with Caltrans' guidance (Caltrans, 2005) a Location Hydraulic Study will need to be performed to demonstrate that the proposed design would not significantly encroach on or impact floodplains. Since the project would not be expected to significantly increase the base flood elevation in the floodplains, a Summary Floodplain Encroachment Report would be prepared.

The Location Hydraulic Study is performed to evaluate the base flood (100-year) and potential impacts from the Proposed Action on the base floodplain. The study should be based on FEMA's Flood Insurance Study data and the FIRMs. Contents of the Location Hydraulic Study (Caltrans, 2005) should include:

- The risks associated with implementation of the action;
- The impacts on natural and beneficial floodplain values;
- The support of probable incompatible floodplain development;
- The measures to minimize floodplain impacts associated with the action; and
- The measures to restore and preserve the natural and beneficial floodplain values impacted by the action.

The Summary Floodplain Encroachment Report (Caltrans, 2005) will be based on the results of the location hydraulic study. The seven key issues to be addressed comprise the following:

1. Is the Proposed Action a longitudinal encroachment of the base floodplain?

2. Are the risks associated with the implementation of the Proposed Action significant?

3. Will the Proposed Action support probable incompatible floodplain development?

4. Are there any significant impacts on natural and beneficial floodplain values?

5. Routine construction procedures are required to minimize impacts on the floodplain. Are there any special mitigation measures necessary to minimize impacts or restore and preserve natural and beneficial floodplain values?

6. Does the Proposed Action constitute a significant floodplain encroachment as defined in 23 CFR 650.105q?

7. Are location hydraulic studies that document the above answers in the file?

Appendix A
Drainage Report Outline

APPENDIX A
DRAINAGE REPORT OUTLINE

Title Page

- *Co-Route – PM/KP*
- *Project Description, EA, Date*

Responsible Registered Engineer:

- *Signature(s) and stamp(s) of Engineer(s) in responsible charge*

Table of Contents:

Summary:

- *A general discussion of the scope of the drainage work on the project, including but not limited to:*
  - *Breadth/Limitations of Report*
  - *References to Approving and Correlating documents*
  - *Any creek, stream, and river crossings and associated floodplains*
  - *Historical issues (see Hydraulic Files, local Maintenance Supervisor, and/or local residents)*
  - *Recurrence intervals used*
  - *Special circumstances affecting design (downstream facilities, fish passage, etc.)*
  - *Drainage pattern changes (if any) and mitigation measures (if any)*
  - *Methodologies employed and justification*
  - *Agencies whose facilities may be impacted by project (and the nature of the impact)*
  - *Agencies and organizations whose activities affect design (i.e., RWQCB, TRPA, Watershed groups)*
  - *Drainage system nomenclature*
  - *Storm water and erosion control strategies*
  - *Project personnel*

(Note: For less complex projects the report may be a title and summary on one page)

The following categories may or may not be applicable depending on the project situation:

Offsite:

Hydrology:

- Watershed map with contours and delineated shed boundaries
- Basin characteristics used for runoff determination (vary according to methodology)
- Assumptions
- Rainfall data (appropriate gauge and intensities)
- Points of concentration and outfalls
- Soil characteristics (if applicable, may be on separate map)
- Debris/bulking potential
- Time of concentration calculations
- Summary table by shed with A, Tc, C or CN, Q_{10}, and Q_{100}

Hydraulics:

- System number referenced to appropriate shed designation (specify by PM/KP and station)
- System controls (constrains upstream or downstream)
- Available headwater (AHW)
- HGL calculations (resulting HW compared to AHW)
- Analysis of hydraulically efficient materials (lower friction)
- Inlet/Outlet treatment
- Energy dissipation requirements (if any)

Onsite:

Roadway Drainage:

- Shed maps (with delineated boundaries and nomenclature)
- Recurrence interval selected and justification
- Points of concentration (DIs) identified by station
- Tc calculations (remember cumulative effect)
- System controls
- Grate interception/bypass calculations (on grade and in sag)
- Gutter spread and capacity calculations (table for summary)
- HGL Table or profile for networks (when applicable)
- Summary table by shed with A, Tc, C, and Design Q

Open Channels:

- *Typical section(s), design Q, WSel, longitudinal slope, and velocity calculations*
- *System controls, establishment of Manning's "n"*
- *Evaluation of need for bank stabilization and/or armoring*
- *Summary of and reference to any modeling results*

Storm Water Quality (Using Storm Water Quality Handbook, Project Planning and Design Guide):

- *Establishment of need for temporary or permanent controls*
- *BMPs selected and justification*
- *Design storm(s) and justification*
- *Storm water quality checklist (Section 3, pp. 8 and 9, May 2000 or later revision)*

Floodplain Information:

- *Copy of study prepared by Hydraulics, including:*
  - *Copy or reference to FEMA maps*
  - *Mapping or table of elevations depicting flood of record, 100-year and Ordinary High Water*
  - *Summary of and reference to any modeling results*
  - *Floodplain summary sheet per HDM 804.7 or local version.*

PLACER PARKWAY CORRIDOR PRESERVATION
TIER 1 EIS/PROGRAM EIR

1.0 INTRODUCTION

1.1 TIER 1 EIS/PROGRAM EIR

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

1.2 CORRIDOR SELECTION AND PRESERVATION

The concept for the Placer Parkway is over a decade old. Placer County's 1994 General Plan depicts a "plan line" for it. Two planning studies helped to refine the concept:

- DKS Associates, 2000, Placer Parkway Interconnect Study/Conceptual Plan
- DKS Associates, 2001, Project Study Report (Project Development Support) for Placer Parkway

Placer Parkway is cited as a high-priority regional transportation project by the Sacramento Council of Governments (SACOG) 2025 Metropolitan Transportation Plan and the 2027 Placer County Regional Transportation Plan. The project vicinity and surrounding area include some of the fastest growing communities in the Sacramento region. A number of large urban development proposals are being considered by Sutter and Placer counties. New development is expected to add a significant amount of residential, commercial, industrial, and educational uses.

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included

representatives from planning and public works departments of all affected cities and counties, environmental, business, agricultural, development, and homeowner interests (the Study Advisory Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report will analyze these five corridor alternatives along with a No-Build Alternative.

Other potential transportation modes such as bus rapid transit may be developed in the corridor in the future, although they are not proposed as part of the current project. The width of the corridor for the Placer Parkway is to vary from approximately 500 feet in the Eastern and Western segments to approximately 1,000 feet in the Central Segment. Depending upon the alternative, the corridor's length ranges from a minimum of 14.2 miles to a maximum of 16.2 miles. The selected corridor would contain the roadway, including the median, travel lanes, shoulder, associated access ramps and a no-development buffer zone.

Corridor acquisition may not be completed until after Tier 2, as funding becomes available. Portions of the selected corridor would be preserved as a no-development buffer zone. The buffer would be maintained as a zone where development is either not permitted or is severely restricted. This is intended to restrict access to the proposed interchanges, protect the rural character of agriculturally designated areas in the vicinity of the Parkway as far as possible subject to future development, and to maximize opportunities to incorporate adjacent sensitive areas. It is intended that the buffer would be owned and managed in the future to achieve these objectives. For subsequent Tier 2 (project-level) environmental reviews, the size of this buffer zone could be considered flexible for agriculturally designated land undergoing urban development. In the Tier 2 environmental review, the specific buffer size and location would be determined. This determination would be based on performance standards on a case-by-case basis, depending on the land use needs of future approved development, and taking into account the primary objective of restricting future access to the Parkway.

Project proponents are considering employment of several land management and control mechanisms in order to ensure that the buffer would be effectively maintained as an area where development would either not be permitted, and where construction of any additional access onto the Parkway would not be allowed. These mechanisms could include land use controls, land purchase/leases, general plan amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, urban growth boundaries, etc. "Layering" or using several of these methods would provide more assurance that the buffers would be permanent, or at least more difficult to undo.

1.3 TECHNICAL STUDY OBJECTIVE

This Initial Site Assessment has been prepared to support the Tier 1 Environmental Impact Statement/Program Environmental Impact Report. It presents a Tier 1/Program level assessment of potential impacts related to the presence of hazardous materials or sites for five corridor alternatives and the No-Build Alternative as described in Chapter 2.

The scope of work performed for this report is based on the Caltrans Local Assistance Procedures Manual (Caltrans, 2006), as modified for purposes of Tier 1/Program analysis by agreement of Caltrans, and the Caltrans Environmental Handbook guidance (Caltrans, 2005) on preparing an Initial Site Assessment. In addition, the evaluation considered guidance from the FHWA, Environmental Checklists for Draft and Final Environmental Documents (FHWA, 1998a; FHWA, 1998b).

The purpose of this ISA is to review past and current land uses and activities within the study area to identify the potential presence of hazardous substances, including hazardous wastes. This assessment was accomplished by, and limited to, a study area reconnaissance and review of readily available pertinent documentation regarding past and current land use to identify any "recognized environmental conditions" (RECs), regulatory enforcement actions, permit status, or investigations into hazardous materials or

wastes associated with the site. American Society for Testing and Materials (ASTM) standards on environmental site assessments (ASTM E 1527-05) define a "recognized environmental condition" as:

> The presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

This ISA includes the following:

- Review of pertinent, available documents and maps describing local geological and hydrogeological conditions;
- Review of readily available historical aerial photographs of the study area. These photographs were reviewed for evidence of previous activities and development which would suggest the potential presence of hazardous substances at the study area;
- Review and interpretation of archival U.S. Geological Survey (USGS) topographic maps for information regarding historical land use potentially involving the manufacture, generation, use, storage, and/or disposal of hazardous substances at the study area;
- A reconnaissance of readily accessible portions of the study area to assess evidence of current and/or past use or storage of toxic or hazardous materials; onsite ponds, landfills, dry wells, waste streams or other disposal units; visible soil contamination, aboveground or underground storage tanks; electrical transformers containing polychlorinated biphenyls (PCBs); and drums, barrels and other storage containers;
- A visual review of adjacent properties to identify potential sources of contaminants that could adversely impact the environment;
- Review of the database list search conducted by Environmental Data Resources, Inc. (EDR) of federal and state known or potential hazardous waste sites or landfills, and sites otherwise under investigation for environmental violations;[1]

[1] An initial EDR report was prepared for the Placer Parkway project in May 2003 and the results were summarized in the Technical Memorandum, Screening Evaluation of PSR Alternatives, Placer Parkway Corridor Preservation Tier 1 EIS/EIR dated February 23, 2004. That document concluded the following:

- 17 properties were identified as potentially representing sites of concern;
- 13 of these were deemed insignificant with respect to the screening analysis because they either had no known contamination releases, minute volumes of hazardous materials/wastes, were closed agency cases, or were likely to be easily remediated;
- The remaining four sites were mapped on Figure 5-9 of the Technical Memorandum.

A new EDR report, dated March 20, 2006, was prepared for this ISA because the original report was almost 3 years old. In the intervening years, several sites have been dropped from various lists and several name changes have occurred due to property transactions. The two EDR reports have been compared and found to be consistent. Accordingly, this ISA document supersedes the information presented in the February 2004 Technical Memorandum.

- Inquiries to the California Environmental Protection Agency, Regional Water Quality Control Board, and Department of Toxic Substances Control, the Placer County Office of Emergency Services, and the Placer County Environmental Health Department for information regarding environmental permits, environmental violations or incidents, and/or the status of enforcement actions within the study area or adjacent properties;

- Review of the California Department of Transportation (Caltrans) ISA checklist for hazardous waste to ensure that relevant information detailed on this checklist and appropriate for a Tier 1/Program level analysis is contained within this report; and

- Preparation of this report to present findings and conclusions.

This report is organized as follows:

Chapter 2 The Proposed Action
Chapter 3 Study Area Overview
Chapter 4 Site History and Regulatory Files
Chapter 5 Site Reconnaissance
Chapter 6 Summary of Findings
Chapter 7 Secondary and Indirect Impacts
Chapter 8 Cumulative Impacts
Chapter 9 Potential Watt Avenue Interchange
Chapter 10 Avoidance, Minimization, and/or Mitigation Strategies
Chapter 11 Analyses to be Undertaken in Tier 2
Chapter 12 Limitations
Chapter 13 References

This report also includes figures that show the project location, each build alternative, and pertinent technical information prepared to evaluate the build alternatives.

Throughout this document, the Placer Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

2.0 THE PROPOSED ACTION

The Proposed Action for the Placer Parkway Corridor Preservation Project is to select and preserve a 500- to 1,000-foot-wide corridor in the project study area, within which the future four- or six-lane Placer Parkway may be constructed. The ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction, and operation of the Parkway. Although the action taken at Tier 1 on the Placer Parkway Corridor Preservation Project is limited, the underlying project whose effects are studied in this document is the Placer Parkway. To the extent feasible at this early stage, the Tier 1 EIS/EIR addresses the potential effects of construction and operation of the future roadway.

2.1 THE PROJECT STUDY AREA

The project study area is an area of approximately 33,460 acres located in Placer and Sutter counties, with a small section located in Sacramento County (see Figures 1-1 and 1-2). The portion of the study area in Sacramento County is located in the extreme southwestern corner of the study area and does not include any of the proposed corridor alignment alternatives. It extends from SR 70/SR 99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego roads.

For the purposes of the analysis the study area is divided into three segments:

- Western Segment: the Western Segment extends from SR 70/99 to Pleasant Grove Road in Sutter County.
- Central Segment: the Central Segment extends from Pleasant Grove Road in Sutter County to approximately 2,300 feet north of Pleasant Grove Creek in Placer County.
- Eastern Segment: the Eastern Segment extends from approximately 2,300 feet north of Pleasant Grove Creek to SR 65 in Placer County.

2.2 CORRIDOR ALTERNATIVES

The following subsections describe the corridor alternatives, which are depicted on Figure 2-1, and are numbered according to location from south to north in the study area.

2.2.1 The No-Build Alternative

Under the No-Build Alternative, the project would not be implemented. A Placer Parkway corridor would not be selected/preserved, and the future Placer Parkway would not be constructed.

2.2.2 Alternative 1 – the Red Alternative

Alternative 1 would extend from SR 70/99 approximately ½ mile north of Riego Road, eastward approximately 1 mile north of Baseline Road to approximately Watt Avenue, proceeding north and transitioning in an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment alternative is 16.2 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.3 Alternative 2 – the Orange Alternative

Alternative 2 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed northeast, then in a northerly direction south of Pleasant Grove Creek, transitioning to an easterly direction before it reaches Sunset Boulevard West, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.4 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.4 Alternative 3 – the Blue Alternative

Alternative 3 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed north along the Sutter/Placer County Line, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.6 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.5 Alternative 4 – the Yellow Alternative

Alternative 4 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.3 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.2.6 Alternative 5 – the Green Alternative

Alternative 5 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 4,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.2 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.3 PARKWAY DESIGN ASSUMPTIONS

Although the Parkway would be designed and construction-level impacts analyzed during Tier 2, for the purpose of this report and the Tier 1 EIS/Program EIR, several assumptions have been made about potential design and configuration concepts. These assumptions would be subject to further development and refinement, and specific decisions about design of the roadway would be made during the Tier 2 process. For example, the number, location, and design of over-crossings would be determined at the time of final Parkway design, in consultation with local jurisdictions. The following sections outline assumptions for the future roadway.

Preliminary costs estimates for the Parkway range from $600 to $650 million (2005 dollars). This includes costs for right-of-way, design, construction and environmental mitigation for the four- to six-lane facility. The funding situation has spurred interest in exploring other more creative funding options.

These include a county-wide sales tax, more developer contributions, and tolling facilities. The Technical Report and Tier 1 EIS/Program EIR do not make any assumptions about funding sources.

2.3.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane facility. A preliminary conceptual cross section (see Figure 2-2) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/Program EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

2.3.2 Conceptual Roadway Elevation

As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on either side of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways, or trails.

Throughout the project study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These over-crossings would not connect to the Parkway. Parkway access would be via the interchanges described below.

2.3.3 Interchange Concepts

The analysis assumes that the location of interchanges (see Figure 2-1) is as follows.

- SR 70/99 (at ½ mile north of Riego Road or at Sankey Road)
- One or two locations to be determined in southern Sutter County
- Fiddyment Road
- Foothills Boulevard
- SR 65 at Whitney Ranch Parkway

The following discussion outlines concepts and assumptions for the six interchanges that could potentially serve Placer Parkway.

2.3.3.1 Western Segment

Within the Western Segment of the Parkway, a high-speed, freeway-to-freeway type interchange would connect the Parkway with SR 70/99 at one of following potential locations depending on the project alternative (see Section 2.2). Placer Parkway would terminate at SR 70/99.

- **Placer Parkway/SR 70/99 Interchange at North of Riego Road.** This alternative concept uses "braided" ramps to eliminate weaving.

- Problems or conflicts with the future SR 70/99 at Riego Road interchange being developed by Sutter County and Caltrans.

- **Placer Parkway/SR 70/99 Interchange at Sankey Road.** Under this alternative concept, the existing two-lane Sankey Road would be realigned to the south of Placer Parkway and the proposed freeway-to-freeway interchange, extending from approximately ¼ mile west of SR 70/99 to approximately ¼ mile east of the Union Pacific railroad tracks. There would be no direct access to SR 70/99 or Placer Parkway from the realigned Sankey Road.

Depending on the final alignment selected, one or two additional arterial interchanges would also be located in south Sutter County. Conceptual locations are identified for purposes of this Tier 1/Program analysis (see Figure 2-2). The actual location of these interchanges would be developed in the Tier 2 phase, based on Sutter County requirements.

2.3.3.2 Central Segment

Within the Central Segment of the Parkway, there would not be any access proposed as part of the Project in the 7-mile segment between Fiddyment Road and Pleasant Grove Road. Please see Section 2.4 regarding a potential connection to a future extension of Watt Avenue (Figure 2-3) which could be proposed and constructed by others in the Central Segment; such an interchange is not part of the Placer Parkway.

2.3.3.3 Eastern Segment

Within the Eastern Segment of the Parkway, a signalized high-speed freeway-to-freeway and local access interchange would connect the Parkway to SR 65 at Whitney Ranch Parkway (Figure 2-1). From SR 65 eastward Placer Parkway would terminate and become Whitney Ranch Parkway east of the SR 65 exit ramp intersection. Traffic signals would be provided at the exit ramp terminals. This interchange would

be approximately 1 mile north of a planned SR 65/Sunset Boulevard interchange and 1.2 miles south of the existing Twelve Bridges interchange.

As part of this interchange, auxiliary lanes would be required on SR 65 in both directions to enhance traffic operations on the north side of the future SR 65/Sunset Boulevard interchange. The southbound SR 65 exit-ramp at Sunset Boulevard is being designed to accommodate an additional auxiliary lane required for the future Placer Parkway/Whitney Ranch Parkway interchange to minimize the reconstruction of this ramp in the future. Within the Eastern Segment of the Parkway, from SR 65 westward, two interchanges with local roadways would be constructed, one at Foothills Boulevard and one at Fiddyment Road, as depicted on Figure 2-1.

The future interchange on Placer Parkway at Fiddyment Road would be located near the existing intersection of Fiddyment Road and Sunset Boulevard West. To provide acceptable traffic operations, additional distance needs to be provided between the Fiddyment Road/Sunset Boulevard West intersection and the Fiddyment Road/Placer Parkway westbound off-ramp intersection. Therefore, Sunset Boulevard West will need to be realigned to the north as it nears Fiddyment Road.

2.3.4 Landscaping Concept

For the purposes of this environmental analysis, preliminary landscaping concepts have been developed for Placer Parkway. These are entirely conceptual and would be subject to further refinement during the Tier 2 environmental process. It is anticipated that landscaping would be used to reflect local topography and vistas in the study area and complement the varying character of land adjacent to the Parkway corridor. Landscape design would vary within the Parkway's three segments depending on corridor width and type and density of surrounding land uses. Landscaping would be used within the median and the Parkway buffer zone to enhance the aesthetics of the Parkway, and would be used to provide screening and enhance local and long-distance views. Where appropriate, more concentrated plantings would be considered to buffer the Parkway from future adjacent land uses that may be incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Landscape design would likely include a mix of compatible native and non-native plants that may require some irrigation. Wherever possible, native plant species would be used in line with Caltrans policy. Where possible and depending on availability, feasibility and cost, recycled water would be used for irrigation.

During a future design phase, lighting elements would be designed for safety and would consider the proposed landscaping plan in order to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower-voltage lighting, and proposing lighting fixtures that conform with the visual character of the area).

2.4 POTENTIAL WATT AVENUE INTERCHANGE

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 2-3). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/Program EIR. However, the connection of Placer Parkway to a potential Watt Avenue extension could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/Program EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential

Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges with Placer Parkway.

2.5 AGENCY PERMITS AND APPROVALS

The Proposed Action would preserve a preferred corridor for a future transportation facility. In the future, permits and approvals would be obtained from appropriate agencies prior to construction of the Parkway. These permits and approvals may include specific design or mitigation requirements that would be incorporated into the project.

2.6 SUBSEQUENT TIER 2 INFORMATION

As noted earlier, the design and construction of Placer Parkway—including its interchanges and over-crossings, and ancillary features such as stream crossings, safety devices, storm water management structures, and similar improvements—would be evaluated in a subsequent Tier 2 environmental review process once a corridor has been identified. Chapter 11 provides more detailed information regarding Tier 2 studies.

3.0 STUDY AREA OVERVIEW

This section presents a general description of the study area. A reconnaissance of the study area was conducted on March 20, 2006. Observations made during the site reconnaissance are discussed in Chapter 5.

3.1 STUDY AREA LOCATION AND DESCRIPTION

The majority of the study area is in southwestern Placer County, with some areas in southeastern Sutter County and a small area in northern Sacramento County (Figures 1-1 and 2-1). The topography of the study area generally rises from west to east, with elevations ranging from 10 to 165 feet. The study area is drained by Pleasant Grove Creek in the north, Curry Creek in the south, and the Natomas East Main Drainage Canal in the west.

The study area is primarily in agricultural uses. Other development includes a mixture of commercial and light and heavy industrial uses. In general, development increases in density moving from west to east, with a concentration of new development (mainly residential) in the Eastern Segment of the study area.

3.2 GEOLOGIC AND HYDROGEOLOGIC SETTING

The study area is located on the eastern side of the Sacramento Valley, at the eastern border of the Great Valley Geomorphic Province. The Sacramento Valley extends from Redding in the north to the Sacramento-San Joaquin Delta Region in the south. At the latitude of the study area, the valley is approximately 48 miles wide. The Sacramento Valley is a large northwest trending topographic depression bounded to the east and west by the Sierra Nevada and Coast mountain ranges, respectively. Sediments derived from these ranges were shed into the basin and achieved thicknesses approaching 40,000 feet (Norris and Webb, 1976). Geologic units represented in the study area include the Mehrten Formation, the Turlock Lake Formation, and the Riverbank Formation. The Mehrten Formation consists of undifferentiated andesitic mudflows, volcanic breccias, pyroclastic deposits, lava flows, and sedimentary river channel deposits. The Turlock Lake Formation represents eroded alluvial fans which were derived primarily from granitic and metamorphic rocks of the Sierra Nevada located to the east of the subject area. The Riverbank Formation consists of weathered reddish gravel, sand, and silt. Other areas of the study area are blanketed with Holocene alluvium and undivided basin deposits (Helley and Harwood, 1985).

Groundwater level measurements are made by the California Department of Water Resources (DWR) and cooperating federal and local agencies. The DWR maintains the data on their website (www.well.water.ca.gov/map). The data indicate that the depth to groundwater in the site vicinity is generally highest during the spring season and lowest during the late fall season.

4.0 SITE HISTORY AND REGULATORY FILES

This section discusses data obtained from aerial photographs and historical topographic maps, and information obtained from federal, state, and county database files.

4.1 HISTORICAL AERIAL PHOTOGRAPHS

Historical aerial photographs of the study area for the years 1952, 1958, 1964, 1975, 1988, 1991, 1994, and 2004 were reviewed and interpreted for indications of past site land use and/or site activities which may have involved the manufacture, generation, use, storage, and/or disposal of hazardous materials. The following observations were made:

- 1952 – The study area is in use as agricultural land, with some residences and farm buildings along the roads. Railroad tracks are visible in the Eastern Segment, near SR 65;
- 1958 – The study area appears relatively unchanged with respect to the 1952 photograph. Handwritten notes on the photograph indicate that Sunset Boulevard was named Oil Derrick Road, but no evidence of oil or gas development was noted in the study area;
- 1964 – Increasing residential development is visible along the main roads, particularly in the Eastern Segment and the southern portion of the study area;
- 1975 – In the Eastern Segment of the study area, near the present location of the Western Regional Sanitary Landfill (WRSL), two ponds are visible. The aerial photograph appeared to be projected over a topographic map, and on that map these ponds were labeled "industrial waste ponds." These ponds are located to the north of any proposed corridor alternatives. The remainder of the study area appeared relatively unchanged with respect to the 1964 photograph;
- 1988 – The WRSL is visible in the Eastern Segment of the study area. The ponds are no longer visible. The remainder of the study area appears relatively unchanged with respect to the 1975 photograph, with increasing development along SR 65 and Industrial Boulevard;
- 1991 – Increasing residential and commercial development is visible in the Eastern Segment of the study area;
- 1994 – The study area appears relatively unchanged with respect to the 1991 photograph; and
- 2004 – The study area appears relatively unchanged with respect to the 1994 photograph.

4.2 HISTORICAL TOPOGRAPHIC MAPS

In order to supplement information obtained through the review of aerial photographs and discussions with agency and other contacts, archival topographic maps were reviewed and interpreted for indication of topographic and land use change that may indicate the presence or historical occurrence of site land use and/or site activities which may have involved the manufacture, generation, use, storage, and/or disposal of hazardous materials. The following observations were made from the maps that were available:

USGS Sacramento, California Quadrangle, 1892 updated 1906 (1:125,000)

At the low level of detail relative to modern standards presented on this map (USGS, 1892a), all that can be ascertained is that roads corresponding to SR 70/99, SR 65, Baseline Road, Sunset Boulevard, and Brewer Road were present. A railroad line is also present, approximately paralleling SR 65.

USGS Sacramento, California Quadrangle, 1892 updated 1929 (1:125,000)

No significant differences between this map (USGS, 1892b) and the previous topographic map were noted.

USGS Sacramento, California Quadrangle, 1961 (1:250,000)

This topographic map (USGS, 1961) shows the Natomas East Main Drainage Canal. Two additional railroad lines are noted, one paralleling the canal (denoted as "abandoned") and one slightly farther east, intersecting the canal south of Sankey Road. The Catlett Power Station is depicted near the canal on Catlett Road, but is not within the study area. No other development features are noted.

USGS Roseville, California and Pleasant Grove, California Quadrangles, 1967, Photorevised 1987 (1:24,000)

These topographic maps (USGS, 1987a, 1987b) depict several buildings along the main roads. The increasing density of the road and power line networks also indicates increasing development.

USGS Sacramento, California Quadrangle, 1994 (1:100,000)

No significant differences between this map (USGS, 1994) and the previous topographic map were noted.

4.3 REGULATORY AGENCY FILES

A review of readily available agency lists was conducted for information regarding hazardous substance releases, landfills, hazardous waste facilities, or environmental investigations at or near the site. A search of state and federal agency databases was obtained from EDR of Milford, Connecticut. The EDR Report is presented in Appendix A, which includes a figure illustrating sites identified within the study area. The EDR figure includes 23 mappable "sites." Of these, 17 are represented by a single property. The remaining 6 sites contain a total of 55 specific properties, which cannot be shown individually on the map because of its scale. Review of the EDR Report and site reconnaissance (discussed in Chapter 5) concluded that only five locations represent potential RECs for the proposed Placer Parkway project. These are shown on Figure 4-1 and are discussed in subsequent sections of this report.

4.3.1 EDR Report

EDR reviews databases compiled by federal, state, and local governmental agencies. The complete list of databases reviewed by EDR together with a description of each database and its release date is provided in the EDR Report. This information is reported as received from EDR. EDR reports information as provided by federal and state databases. The accuracy and/or completeness of information contained in these federal and state databases cannot be verified. However, the use of and reliance on this information is a professionally accepted practice in the conduct of environmental due diligence. Caltrans requires a review of county, state, and U.S. Environmental Protection Agency (U.S. EPA) lists of known hazardous substance facilities within 1 mile of the site for an ISA. The entire Parkway study area was reviewed for potential facilities. Records searched for the EDR Report are described in the EDR Report and summarized below.

Federal National Priorities List

The EPA's National Priorities List (NPL), released November 2005, contains information on uncontrolled or abandoned hazardous waste sites. To appear on the NPL, sites must have met or surpassed a predetermined hazard ranking system code, been chosen as a state's top priority site, pose a significant

health or environmental threat, or be a site where the U.S. EPA has determined that remedial action is more cost-effective than removal action. The EDR database review included the proposed NPL, delisted NPL, and NPL Liens databases. This review did not identify any NPL sites within the study area.

Federal CERCLIS

The U.S. EPA's Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) database, dated October 2005, identifies known or suspected uncontrolled or abandoned hazardous waste sites. The EDR database review included the CERCLIS database. This search did not identify any CERCLIS sites within the study area.

Federal No Further Remedial Action Planned

The No Further Remedial Action Planned (NFRAP) database contains sites where, following an initial investigation, no contamination was found, contamination was removed quickly, or the contamination was not serious enough to warrant NPL status. The U.S. EPA database release date was October 2005. The database search did not identify any NFRAP sites within the study area.

Federal RCRAInfo

The Resource Conservation and Recovery Act Information System (RCRAInfo) includes selective information on sites that generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kilograms (kg) of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate more than 1,000 kg of hazardous waste, or more than 1 kg of acutely hazardous waste per month. Treatment, Storage and Disposal Facilities (TSDFs) treat, store, or dispose of the waste. The Corrective Action Report (CORRACTS) identifies hazardous waste handlers with RCRA corrective action activity. The RCRAInfo and CORRACTS databases were released by the U.S. EPA in December 2005. The database search did not identify any CORRACTS or TSDF sites within the study area. The database search identified one LQG facility within the study area:

- *All Terrain Exploration Drilling, 6330 Brewer Road, Pleasant Grove, California.* This facility is located slightly north of the Alternative 2 corridor alignment along South Brewer Road. This facility has no reported violations of its LQG permit. Based on the absence of permit violations, the potential for this facility to represent a REC for the project is considered to be low.

The database search identified 13 SQG facilities within the study area. Of these, 12 facilities had no reported violations of their SQG permits. The one remaining facility is discussed below:

- *Tenco Tractor Inc., 7310 Pacific Avenue, Pleasant Grove, California.* This facility is located south of the Western Segment of Alternatives 4 and 5 and north of the Sankey Road realignment. This facility is also listed, either under this name or as Holt of California, on the state leaking underground storage tank (LUST), underground storage tank (UST), spills, leaks, investigations, and cleanups (SLIC), aboveground storage tank (AST), HAZNET, and waste discharge system (WDS) databases. One reported violation of the facility's SQG permit occurred in December 1989. The violation type was "Generator – Land Ban Requirements," and was reported as being back in compliance in May 1990. Other databases report that a benzene spill case at the site was closed by the RWQCB in June 2001. Historical UST databases report that six USTs have been present

at this facility, containing waste solvents, motor oil, and unleaded gasoline. According to data on the RWQCB's website, as of November 2005, groundwater at this facility was impacted with benzene, toluene, ethylbenzene, and total xylenes (BTEX), gasoline- and diesel-range organic compounds, and gasoline oxygenates including methyl tert butyl ether (MTBE). These compounds have impacted a drinking water aquifer, and remediation at this facility is ongoing. Given the contaminant concentrations, the ongoing remediation, and the proximity of this facility to one of the proposed corridors, this facility represents a potential REC for the project, with a low potential for impact.

Federal Emergency Response Notification System

The Emergency Response Notification System (ERNS) is a national database initiated in 1986, which is used to collect information on reported spills or releases of oil or hazardous substances. The database contains information from spill reports made to federal authorities including the Coast Guard, the U.S. EPA, the National Response Center, and the Department of Transportation. The agency release date for the ERNS was December 2005. The database search identified two ERNS sites within the study area:

- *South Brewer and East Catlett, Lincoln, California.* This spill occurred in 1992 at the intersection of South Brewer Road and East Catlett Road, which is located north of the study area's boundary. According to the database, one drum of an unknown material was discovered. Given this event's location outside of the study area, the potential for this spill to represent a REC for the project is considered to be low.

- *Natomas Road North of Keyes Road/Next to Canal, Pleasant Grove, California.* This spill occurred in 1987 at the intersection of Natomas Road and Keyes Road, along the Natomas East Main Drainage Canal. According to the database, two 25-gallon drums of an unknown material were discovered. Considering the length of time that has elapsed since this event, the small quantity involved, and the location of the spill outside of any of the proposed corridor alignment alternatives, the potential for this spill to represent a REC for the project is considered to be low.

State CAL-SITES

This California Department of Toxic Substances Control (DTSC) database contains information on properties in California where hazardous substances have been released, or where the potential for such a release exists. The release date for the CAL-SITES database was August 2005. The database search did not identify any CAL-SITES sites within the study area.

State Annual Work Plan

The Annual Work Plan (AWP) database is maintained by DTSC and identifies known hazardous substances sites targeted for cleanup. The AWP database was released in August 2005. The database search did not identify any AWP sites within the study area.

State Leaking Underground Storage Tank

The LUST database contains information pertaining to reported leaking underground storage tanks within the state of California. The California Regional Water Quality Control Board (RWQCB) release date for the LUST database for Region 5C was January 2006, and for Region 6L was September 2003. The database search identified three LUST sites within the study area. One of these facilities, Holt of California, is discussed in the RCRAInfo section above (as Tenco Tractor, Inc.). The other two facilities are discussed below:

- *SBC, 5495 Pleasant Grove Road, Pleasant Grove, California.* This facility is located near the western end of the northern boundary of the study area, and is not located within any of the proposed corridor alignment alternatives. According to information from the database report and from the RWQCB website, one diesel UST was removed from this facility in 2003 and was found to have leaked. Subsequent groundwater monitoring detected low levels of oxygenates and diesel-range organics. The most recent round of sampling (June 2005) did not detect any groundwater contamination. This facility is also listed in the state UST database as the Pacific Bell facility, which does not provide any further information. Given the absence of an ongoing source of contamination, the low initial contaminant concentrations, the declining concentrations over time, and the location of this facility outside of any of the proposed Parkway corridors, the potential for this facility to represent a REC for the project is considered to be low.

- *Reynolds West Coast End Plant, 3939 Cincinnati Avenue, Rocklin, California.* This facility is located near the eastern boundary of the study area, and is not located within any of the proposed corridor alignment alternatives. This facility is also listed in the state historical UST, FID, and SWEEPS databases and the Placer County MS database as Reynolds Metal Company, and as the Ball Metal Beverage Container Company in the federal RCRIS and Facility Index System (FINDS) databases and the state HAZNET and CORTESE databases. According to information from the database report and from the RWQCB website, toluene leaked from a UST and contaminated soil at the facility. The RWQCB closed the soil remediation case for this facility in July 2000. The other database listings report that the facility is a small quantity generator of hazardous wastes with no reported permit violations. HAZNET shows several shipments of hazardous wastes, including PCBs, halogenated organic compounds, and waste oil. Considering the "no further action required" case status, the impacts to soils only, the absence of hazardous waste generator permit violations, and the location of this facility outside of any of the proposed Parkway corridors, the potential for this facility to represent a REC for the project is considered to be low.

State Solid Waste Information System

The Solid Waste Information System (SWIS) is maintained by the California Integrated Waste Management Board (CIWMB) and was updated in December 2005. This database lists active, closed, and inactive landfills. The database search did not identify any SWIS facilities within the study area. Note that the Western Regional Sanitary Landfill was not included on this database. This is probably because the address of the Western Regional Sanitary Landfill (and the adjacent Materials Recycling Facility) discussed in Section 4.3.2 is Athens Road at Fiddyment Road, which is outside of the database search area.

State Underground Storage Tank

The state UST database is a comprehensive listing of facilities with active USTs and was updated in January 2006. The database search identified four UST facilities within the study area. One of these facilities, Tenco Tractor, Inc., is discussed in the RCRAInfo section above, and another facility, Pacific Bell, is discussed in the Federal ERNS section above (as SBC). The other two facilities are discussed below:

- *Hunt and Sons Cardlock, 4000 Cincinnati Avenue, Rocklin, California.* This facility is located near the eastern boundary of the study area, and is not located within any of the proposed corridor alignment alternatives. This facility is also listed in the state HAZNET

database. The size, construction and contents of the UST are not known from the database information. Given the location of this facility outside of any of the proposed Parkway corridors, the potential for it to represent a REC for the project is considered to be low.

- *Best Machinery Tractor Company, 3131 Sankey Road, Pleasant Grove, California.* This facility is located in the Western Segment of the study area, and is located directly south of Alternatives 4 and 5 west of Pleasant Grove Road. This facility is also reported on the state historical UST and WDS databases. The facility used to have one 1,000-gallon leaded gasoline UST, which was removed in 1986. The facility also reportedly has a waste discharge system on-site, most likely a septic field. Given the absence of reported impacts to soil or groundwater, the potential for this facility to represent a REC for the project is considered to be low.

State Aboveground Storage Tank

The state AST database is a comprehensive listing of registered AST facilities and petroleum AST facilities. This database is maintained by the State Water Resources Control Board (SWRCB) and was last updated in January 2006. The database search identified five AST facilities within the study area. One of these sites, Holt of California, is discussed in the RCRAInfo section above (as Tenco Tractor). The other four facilities are Pleasant Grove Ready-Mix, Hertz Equipment Rental Corporation, GAP Inc. – Online Ordering and Customer Service, and Sysco Food Services. The database only reports the total number of gallons stored at each facility. No further information is available for these facilities from this database. However, based on the absence of these sites from other databases, their potential to represent a REC to the project is considered to be low.

State REF

The REF database lists properties that have been referred by DTSC to another state or local regulatory agency. DTSC maintains this database and it was last updated in August 2005. The database search identified one REF facility within the study area; Cornelius Airstrip. However, during the site reconnaissance, it was determined that no airstrip is located at the address listed in the database. The database indicates that, wherever the airstrip is located, no problems have been identified.

State Waste Discharge System

The WDS database catalogues facilities that have been issued waste discharge requirements. SWRCB maintains this database and it was last updated in December 2005. The database search identified seven WDS facilities within the study area. One of these facilities, Best Machinery Tractor Company, is discussed in the state UST section above, and another facility, Holt of California, is discussed in the RCRAInfo section above (as Tenco Tractor). The remaining five facilities are discussed below:

- *Doorcraft-Rocklin, 3901 Cincinnati Avenue, Rocklin, California.* This facility is located near the eastern boundary of the study area, and is not located within any of the proposed corridor alignment alternatives. According to the database, this is a Category C facility, which is likely a septic field. The facility is considered a minor threat to water quality. Based on this information, the potential for it to represent a REC for the project is considered to be low.

- *Progress Rail Services, 3909 Cincinnati Avenue, Rocklin, California.* This facility is located near the eastern boundary of the study area, and is not located within any of the proposed corridor alignment alternatives. This facility is also listed on the state HAZNET database, which reports that the facility has shipped small amounts of off-

specification, aged, or surplus organics. According to the WDS database, this is a Category C facility, which is likely a septic field. The facility is considered a minor threat to water quality. Based on this information, the potential for it to represent a REC for the project is considered to be low.

- *A R Ready Mix, 3131 Sankey Road, Pleasant Grove, California (same address as Best Machinery Tractor Co.).* This facility is located in the Western Segment of the study area, and is located directly south of Alternatives 4 and 5 west of Pleasant Grove Road. According to the WDS database, this is a Category C facility, which is likely a septic field. The facility is considered to be a minor threat to water quality. Based on this information, the potential for it to represent a REC for the project is considered to be low.

- *Sysco Distribution Center WWTP, 7062 Pacific Avenue, Pleasant Grove, California.* This property is a food distribution warehouse that reportedly includes a municipal/domestic waste treatment facility that is listed as Category B (a facility having a physical, chemical, or biological waste treatment system) and is considered to represent a moderate threat to water quality. It is located south of Alternatives 4 and 5 west of Pleasant Grove Road. Given the nature of the facility, the potential for the property to represent a REC for the project is considered to be low.

- *Teichert, 7466 Pacific Avenue, Pleasant Grove, California.* This property is located south of Alternatives 4 and 5 west of Pleasant Grove Road. It is a Category C facility that is judged to represent a minor threat to water quality. Given its distance from the realignment corridor, the potential for the property to represent a REC for the project is considered to be low.

4.3.2 Orphan Facilities

Orphan facilities are those facilities that have been identified within the database report, but not mapped due to inadequate or erroneous geocode information. Fifty-nine orphan facilities were listed in the EDR report. Of these, three were located based on information provided by site names and local knowledge and were determined to be within the study area:

- *Western Placer HHWCF (Household Hazardous Waste Collection Facility), Athens Road at Fiddyment, Lincoln, California.* This facility, commonly known as the Materials Recycling Facility, is located in the Western Segment of the study area, co-located with the Western Regional Sanitary Landfill (WRSL). The facility was listed in the state HazNet database as having generated nine shipments of household waste. No further information is available. According to the CIWMB website, the WRSL is an active landfill that accepts ash, construction and demolition debris, mixed municipal waste, and sludge/biosolids. The facility was inspected by the local enforcement agency on February 23, 2006, and no violations or areas of concern were noted.

The 280-acre WRSL is in the northwestern portion of the Eastern Segment southeast of the Fiddyment Road and Athens Avenue intersection. The land is owned and operated by the Western Placer Waste Management Authority, a joint powers organization consisting of Placer County and the cities of Lincoln, Roseville, and Rocklin.

A groundwater monitoring well network was installed between 1995 and 2000 (with occasional replacement wells installed subsequently), and regular monitoring has been conducted at the WRSL since 1995. The network consists of 25 wells (6 for corrective action monitoring, 18 for detection monitoring, and 1 for water level only).

A monitoring well located immediately west of one of the original unlined modules first showed evidence of groundwater degradation in the fourth quarter 1995. Several volatile organic compounds (VOCs) were identified as having exceeded their respective Tolerance Limits, defined in WDR Order No. R5-2002-0218 as either:

- The background value established in the Monitoring and Reporting Program (MRP) for that constituent; or

- The constituent's background value, based on data for each reporting period collected only from the background monitoring points.

The presence of VOCs in the monitoring well was attributed to contamination via the migration of landfill gas (LFG).

A Corrective Action Program and addendum were submitted to the RWQCB and were approved. The initial corrective actions identified were the installation of final cover and the extraction of LFG. Quarterly monitoring of groundwater quality in the six corrective action wells supplemented by trend analysis of results is used to evaluate the effectiveness of the actions.

At the present time, the WRSL is not considered to represent a potential REC to the project, given the lack of violations and regulatory sanctions. The possibility of the WRSL representing a potential REC will be evaluated further near the time of construction.

- *Rio Bravo Power Plant, 3100 Sparta Court, Lincoln, California,* is listed on the SWEEPS and UST lists. This facility is a biomass plant to generate electrical power. A fluidized bed boiler is used to provide steam. The location and size of the onsite UST is not known. In the event that the UST is located within the proposed Placer Parkway alignment, it would represent a REC for the project.

- *Formica Corporation, 3500 Cincinnati Avenue, Sunset Whitney Ranch, California.* Formica Corporation was included in the following lists: FINDS; LUST; CHMIRS; Cortese; RCRA-LQG; RCRA-TSDF; CORRACT; CERC-NFRAP; HIST UST; and EMI. The site is located approximately 1,400 feet to the east and hydrologically upgradient of the study area with respect to groundwater. Formica is reported to have had one violation in records reviewed. The site was the location of a hazardous material release to soil associated with a 50,000-gallon underground fuel oil tank and an 180-gallon diesel tank, both of which were removed in 1992. Remediation consisted of soil over excavation until acceptable levels of total petroleum hydrocarbons (TPHs) remained. The case was closed by the Environmental Health Division (EHD) in 1996 (ESA, 1997). The Formica property is not considered to be an REC for the project.

4.3.3 Other Sites

Other potential hazardous waste/materials sites not listed in the EDR Report because they are immediately outside of the study area are discussed below.

- *Placer Propane (Enterprise Propane), 1545 Nichols Street, California.* Placer Propane (also called Enterprise Propane) is located approximately 1,000 feet southeast of the study area west of Industrial Boulevard. This facility stores and transfers propane to tanks on trucks and rail cars. A tank farm is located at this site containing close to 1,000,000 gallons of propane. Placer Propane is considered an extremely/acutely hazardous materials facility, and therefore, is required to prepare and submit a Risk

Management Plan to EHD. Placer Propane (under the name Enterprise Propane) recently submitted this plan to the EHD, and it is still under review by the County. Once reviewed, it will enter a 45-day public comment period (Reid, 2006).

The Risk Management Plan evaluates alternative and worst-case scenarios and includes an evaluation of sensitive receptors in the area. Placer Propane will need to prepare a revision to their plan that addresses new land use in the area. Upon revision, part of the plan may include giving copies of the plan to nearby sensitive land uses, including educational facilities or sensitive institutions (i.e., hospitals and nursing homes) (Reid, 2006). This facility is judged not to be a concern for the project.

4.3.4 Sutter County Environmental Health Division

According to the Sutter County Environmental Health Division, there are no known contaminated sites in the Sutter County portion of the Placer Parkway study area (Wilson, 2006).

4.3.5 Sutter County Agricultural Commission

This agency issues AST/UST permits within Sutter County. There are no known leaking ASTs or USTs in the Sutter County portion of the Placer Parkway study area (Schoenwald, 2006).

4.3.6 Placer County Office of Emergency Services

The Placer County Office of Emergency Services (which includes the Placer County Fire Department) was contacted with respect to hazardous materials files on facilities in the study area. The Office confirmed that emergency response plans in event of a fire at the Western Regional Landfill had been prepared. The Office did not consider any other facilities within the study area to be of concern.

4.3.7 Placer County Environmental Health Department

The Placer County Environmental Health Department (PCEHD) maintains a database of sites of potential environmental concern; however, the data available in the EDR report regarding sites in this database is insufficient to assess their potential to affect the study area. The PCEHD was contacted with respect to hazardous materials files on sites and/or facilities within or near the study area. According to Mr. John Miners, the PCEHD is not aware of any sites and/or facilities within or near the study area that could represent a REC to the project (Miners, 2006).

4.3.8 Regional Water Quality Control Board

The Regional Water Quality Control Board Central Valley Region maintains a web site (www.waterboards.ca.gov) with comprehensive LUST and SLIC databases. The Western Regional Sanitary Landfill is owned and operated by the Western Placer Waste Management Authority (WPWMA). It operates under Waste Discharge Requirements issued by the RWQCB. A release of hazardous constituents was detected in 1995 and corrective actions were implemented, as discussed in Section 5.3.2 of this report. A series of five monitoring wells is located along the south property line of the WRSL adjacent to the proposed Placer Parkway corridor. Regular monitoring of landfill gas, leachate, and groundwater indicates that regulatory criteria are not exceeded in this area. The presence of the WRSL does not at present constitute a REC for the proposed project.

4.3.9 Department of Toxic Substances Control

The DTSC was contacted regarding information about hazardous materials releases within the study area. DTSC information did not indicate any hazardous materials releases had occurred in the study area.

5.0 SITE RECONNAISSANCE

A reconnaissance of the site and neighboring properties was conducted on March 20, 2006. The visit consisted of a driving tour of the study area. Given the size of the study area (approximately 110 square miles), the site reconnaissance was performed to field-verify sites of concern identified in the regulatory file review, and to identify any other sites of concern. Selected photographs of the site taken during the site reconnaissance are presented in Appendix B. No specific studies were conducted with respect to historical railway sites within the study area because no historical railway sites appeared in any government list. Similarly, the Historical Resources Evaluation Report (JRP, 2006) states that two historic railway segments in the study area were previously found to be ineligible for inclusion in the National Register of Historic Places and, accordingly, were not evaluated further for this project.

5.1 PAST USES OF THE PROPERTY

According to a review of historical documents, the study area has been used primarily as agricultural land. Increasing development has occurred in the last few decades, especially in the eastern portion of the study area and along existing roads.

5.2 SITE OBSERVATIONS

5.2.1 Hazardous Materials

Underground/Aboveground Storage Tanks

No USTs or ASTs were noted during the site reconnaissance. Several USTs and ASTs that were reported at various facilities within the study area are discussed in the database report sections above.

Drums and Containers

During the site reconnaissance, drums were noted in three areas (Figure 4-1):

Site 1: The first site was a property containing numerous abandoned automobiles and pieces of agricultural equipment. Several drums were also noted among the debris. This property is located on the northwestern corner of the intersection of Riego Road and Pleasant Grove Road, extending approximately 1,200 feet north of Riego Road. Estimating from the most recent aerial photographs, the dumping appeared to impact an area of approximately 300 feet by 1,200 feet (360,000 square feet). Because this area is located in the vicinity of the proposed alignment corridors for Alternatives 1, 2, and 3, it represents a potential REC for these alternatives.

Site 2: The second site was a private property located on Sankey Road between Pleasant Grove Road and the Natomas East Main Drainage Canal. Approximately 100 drums were noted on this property. From the public right-of-way, it was not clear whether the drums were full or empty. Some of the drums were irregularly placed in animal pastures while others were stacked near a farm outbuilding. Based on estimates from the most recent aerial photographs, the dumping appears to affect an area of approximately 600 square feet. Because this area is located along the proposed realignment of Sankey Road associated with Alternatives 4 and 5, this area represents a potential REC for these alternatives.

Site 3: The third site appeared to be an uncontrolled dumping site on Philip Road (estimated coordinates of 38.8027°N, 121.4048°W). Refuse visible from the public right-of-way included household waste, tires, agricultural equipment, and two 55-gallon drums. Estimating from the most recent aerial photographs, the dumping appeared to impact an area of approximately 500 square feet. Because this site

is located in the proposed corridor alignment for all Alternatives, it represents a potential REC for the proposed project.

5.2.2 Hazardous Waste

No direct evidence of hazardous waste was observed in the study area during the site reconnaissance; however, the three sites mentioned in Section 5.2.1 possibly contain hazardous wastes.

5.2.3 PCB-Containing Equipment

Pole-mounted and pad-mounted transformers were observed throughout the study area. Also, a new gas-fired power plant was under construction in the Eastern Segment of the study area. The new plant is known as the Roseville Energy Park. Because this plant is still under construction, PCBs should not be an issue at this facility. The same reasoning applies to the Rio Bravo Power Plant, a relatively new facility (1990).

5.2.4 Solid Waste

Solid waste dumpsters and trashcans were observed at properties throughout the study area. As noted in Section 4.3.2, the WRSL is located in the Eastern Segment of the study area. This facility is not considered to represent a REC for the project.

5.2.5 Drains and Sumps

The scope of this site reconnaissance did not permit investigation of the entire study area for drains and sumps.

5.2.6 Wells

The scope of the site reconnaissance did not permit investigation of the entire study area for the presence of wells. Due to the agricultural land uses present in the area and the absence of potable surface water pipelines in the majority of the study area, many numerous active, inactive, and abandoned water wells are present.

5.2.7 Pits, Ponds, and Lagoons

Several catchment basins are located in developed areas in the Eastern Segment of the study area. Also, several agricultural ponds were noted on properties in the Central and Western segments of the study area. No pits were noted during the site reconnaissance; however, the scope of this site reconnaissance did not permit investigation of the entire study area.

5.3 NEIGHBORING PROPERTIES

The properties surrounding the study area are similar in character to the study area. Properties to the east across SR 65 are a mixture of commercial and residential development. The properties immediately north, south, and west of the study area are primarily agricultural. The potential for the properties surrounding the study area to represent a REC for the project is considered to be low.

The nearby Placer Propane facility is discussed in Section 4.3.3.

6.0 DIRECT IMPACTS

Environmental impacts associated with the potential presence of hazardous materials fall into two distinct categories. The first relates to the existence of hazardous materials (sources, sites or facilities) in an area in which a project is proposed to be located. Such materials may pose a risk to human health and the environment during the construction or operation of the project, and must be appropriately remediated prior to the onset of any construction activities. A summary of the potential presence of hazardous materials is presented in Sections 6.2 through 6.6.

Several avoidance, minimization, and/or mitigation strategies are proposed as part of the project, as described in Chapter 10. Four of these mitigation strategies are intended to address potential impacts, as follows:

- Impacts associated with the presence of lead-based paint (LBP) and/or asbestos-containing material (ACM) due to the demolition of structures along the preferred alignment;
- Impacts associated with the presence of aerially deposited lead (ADL) along the edges of existing roadways where future construction will occur;
- Impacts associated with soil contamination in potential REC areas, e.g., Tenco Tractor and three uncontrolled dump sites; and,
- Impacts associated with agricultural soils where pesticides have been historically applied.

The second category of potential environmental impacts associated with hazardous materials relates to the potential of the proposed project to use, generate, store, or release hazardous waste. Placer Parkway would not generate any hazardous waste during operation but may involve the use and storage of potentially hazardous materials during construction.

6.1 NO-BUILD ALTERNATIVE

Under the No-Build Alternative, land would not be acquired for the Parkway and the Parkway would not be constructed. There would not be any increased use and/or storage of hazardous materials in the study area associated with the No-Build Alternative, and no investigations would be required with respect to the potential presence of hazardous materials within the study area.

6.2 ALTERNATIVE 1

6.2.1 Western Segment

One dump site, discussed in Section 5.2.1, was identified in the Western Segment of Alternative 1 during the site reconnaissance. Site 1 is located near the Alternative 1 corridor. It contains numerous abandoned automobiles and pieces of agricultural equipment. Several drums were also noted amongst the debris. This property is located at the northwestern corner of the intersection of Riego Road and Pleasant Grove Road. Based on estimates from the most recent aerial photographs, the dumping appeared to affect an area of approximately 300 feet by 1,200 feet (360,000 square feet). This site represents a potential REC for Alternative 1.

6.2.2 Central Segment

The site reconnaissance identified an uncontrolled dumping site (Figure 4-1, Site 3) on Phillip Road (estimated coordinates of 38.8027°N, 121.4048°W). Refuse visible from the public right-of-way included household waste, tires, agricultural equipment, and two 55-gallon drums. Based on estimates from the most recent aerial photographs, the dumping appeared to affect an area of approximately 500 square feet. This site represents a potential REC for Alternative 1.

6.2.3 Eastern Segment

The Rio Bravo site, which reportedly contains a UST, currently represents a potential REC for Alternative 1. The WRSL is located in this segment but, as discussed in Section 4.3.2, it does not at present represent a potential REC for the project. A future interchange at Fiddyment Road could potentially encroach upon the area immediately west of the existing sanitary landfill that is owned by the Western Placer Waste Management Authority and which is identified as a future landfill expansion area. Encroachment, if any would affect approximately 5 to 6 acres of the southeastern corner of this property.

6.3 ALTERNATIVE 2

6.3.1 Western Segment

The Western Segment of Alternative 2 is the same as that of Alternative 1. Therefore the potential impacts for this segment are the same as discussed for Alternative 1.

6.3.2 Central Segment

The Central Segment of Alternative 2 differs in alignment from Alternative 1, but the single REC identified for Alternative 1 is the same REC that is identified for Alternative 2. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

6.3.3 Eastern Segment

The Eastern Segment of Alternative 2 is the same as for Alternative 1. Therefore the potential impacts for this segment are the same as discussed for Alternative 1.

The WRSL is located in this segment but, as discussed in Section 4.3.2, it does not at present represent a potential REC for the project.

6.4 ALTERNATIVE 3

6.4.1 Western Segment

The Western Segment of Alternative 3 is the same as that of Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

6.4.2 Central Segment

The Central Segment of Alternative 3 differs in alignment from Alternative 1, but the single REC identified for Alternative 1 is the same REC that is identified for Alternative 3. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

6.4.3 Eastern Segment

The Eastern Segment of Alternative 3 is the same as for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

The WRSL is located in this segment but, as discussed in Section 4.3.2, it does not at present represent a potential REC for the project.

6.5 ALTERNATIVE 4

6.5.1 Western Segment

One dump site (Figure 4-1, Site 2), discussed in Section 5.2.1, was identified in the Western Segment of Alternative 4 during the site reconnaissance. Approximately 100 drums were noted on the property, which, based on site reconnaissance and air photo review, appears to be about 600 square feet in size. Tenco Tractor, discussed in Section 4.3.1 under Federal RCRAInfo, also represents a potential REC for the project, with a low potential for impact.

6.5.2 Central Segment

The Central Segment of Alternative 4 differs in alignment from Alternative 1, but the single REC identified for Alternative 1 is the same REC that is identified for Alternative 4. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

6.5.3 Eastern Segment

The Eastern Segment of Alternative 4 is the same as Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

The WRSL is located in this segment but, as discussed in Section 4.3.2, it does not at present represent a potential REC for the project.

6.6 ALTERNATIVE 5

6.6.1 Western Segment

The Western Segment of Alternative 5 is the same as for Alternative 4. Therefore, the potential impacts for this segment are the same as discussed for Alternative 4.

6.6.2 Central Segment

The Central Segment of Alternative 5 differs in alignment from Alternative 1, but the single REC identified for Alternative 1 is the same REC that is identified for Alternative 5. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

6.6.3 Eastern Segment

The Eastern Segment of Alternative 5 is the same as Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

The WRSL is located in this segment but, as discussed in Section 4.3.2, it does not at present represent a potential REC for the project.

6.7 COMPARISON OF ALTERNATIVES

All five build alternatives could be potentially affected by the presence of RECs within the alternative alignments. All alignments of alternatives may contain three RECs and two, Alternatives 4 and 5, may contain four RECs. This is not anticipated to result in any substantial difference between alternatives, as the presence of occurrences of potential RECs is not significantly different in terms of need for further investigation and potential remediation requirements.

The potential RECs are:

- An uncontrolled dump site in the Western Segment (Alternatives 1, 2, and 3);
- A second uncontrolled dump site in the Western Segment (Alternatives 4 and 5);
- The Tenco Tractor site (Alternatives 4 and 5);
- A third uncontrolled dump site in the Central Segment (all alternatives); and
- The Rio Bravo site in the Eastern Segment (all alternatives).

Further information on the Tenco Tractor site, the location of the UST on the Rio Bravo site, and the uncontrolled dump sites would be obtained during Tier 2 (see Section 11 for further details).

The use and storage of potentially hazardous materials during construction of the Parkway, and the associated risk of accidental release into the environment, or of human exposure, would be the same for all build alternatives.

Potentially hazardous materials used during construction would predominantly be petroleum hydrocarbons, e.g., diesel, gasoline, and motor oil. Accidental releases could be attributable to normal construction activities, such as overfilling of vehicles or fuel storage tanks, as well as normal leakage. Soil and/or surface waters would be the media most likely affected, with exposure to humans and ecological receptors by means of direct contact.

7.0 SECONDARY AND INDIRECT IMPACTS

Recent FHWA, U.S. EPA, and Caltrans guidance on growth inducement (Mare Island Accord, 2006) advises that analysis of potential impacts associated with growth should include an evaluation of the effects of growth on resources of concern. The following discussion presents a qualitative evaluation of potential secondary and indirect impacts of Anticipated Growth (see below for definition) on human and environmental resources in the study area.

The Council on Environmental Quality (CEQ) provided clarification of the terminology "indirect impacts" when it issued the National Environmental Policy Act (NEPA) in 1978. Secondary and Indirect impacts are defined as impacts "caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable." Moreover, indirect effects ". . . may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems."

A key term used in this section is "Anticipated Growth." This is defined as the growth that is anticipated in the study area as described in the relevant General Plans and adopted regional forecasts, such as the SACOG Blueprint scenario (as detailed in the Community Impact Assessment), including additional growth that may occur as a result of major new development proposals that have not yet been formally approved. It is possible that this additional growth may accelerate the rate of buildout in the study area, but it is not ultimately expected to result in any greater levels of development than is presented in adopted regional forecasts.

The following discussion considers secondary and indirect impacts associated with the presence of hazardous materials or sites in the study area that may occur as a result of direct impacts associated with the Parkway, and also as a result of anticipated growth. The study area for the analysis of secondary and indirect impacts is shown in Figure 7-1.

7.1 GROWTH INDUCEMENT SCENARIO

NEPA and CEQA both require environmental analyses to consider the effects of a project on growth. Caltrans defines growth inducement as the relationship between a proposed project and growth. This section summarizes the relationship between the project and regional growth, and discusses potential secondary and indirect effects of the project related to growth inducement.

Placer Parkway would be growth inducing, as a component of the rapidly evolving urban matrix in western Placer County. While the project study area is predominately undeveloped at this time, parts of the study area are within local General Plan designations allowing urban growth. In addition, there are numerous proposals for major new development projects in and around the study area depicted on Figure 7-2 that are currently in various stages of the approval and entitlement process. Portions of the surrounding area (especially northern Sacramento County and southwestern Placer County) have developed very rapidly over the past several decades. This has occurred as a result of many factors, including continuing net population growth statewide, strong employment growth in the Sacramento region, relative housing affordability, and location amenities.

Population and employment growth projections for California and the Sacramento Region in general, and for southwestern Placer County and south Sutter County in particular (described in detail in the Tier 1 EIS/EIR Community Impact Assessment), indicate that that development pressures in the project vicinity will remain relatively intense, irrespective of the Placer Parkway project. Between 1950 and 2000, the California population more than tripled. During the same period, population in the six-county SACOG region increased by more than 800 percent (DOF, 2006). Projections and established goals and policies

from a wide range of sources, including SACOG, Placer, Sacramento and Sutter counties, and the Cities of Roseville, Rocklin and Lincoln, confirm that relatively high rates of population and employment growth and housing and commercial development are anticipated in the six-county region by 2050. Between 2000 and 2050, California's population is expected to increase from approximately 34 million to 55 million. During the same time period, SACOG projects that the region's growth will double, from 1.9 million in 2000 to 3.95 million in 2050, with the Roseville-Rocklin-Lincoln area remaining one of the fastest growing areas in the region (Levy and Doche-Boulos, 2005; SACOG, 2006).

Placer Parkway would be growth inducing because it would help support changes in the amount of growth beyond current general plan levels, and could influence the pace and location of some development. It is likely that Placer Parkway could help to implement the various specific development proposals in the study area, since it would serve to relieve traffic congestion associated with these proposals. Furthermore, the Parkway could affect the timing of development in the vicinity of the proposed interchange locations, particularly those proposed near vacant land adjacent to rapidly developing areas or areas now proposed for urban development. However, as the Parkway would be a limited-access road located in an area that is already undergoing extensive and rapid urbanization, its potential to facilitate growth that would not have otherwise occurred is limited. It could result in different land uses, or more intensive land uses, in the vicinity of interchanges where land use plans are still being developed and have not yet been approved. Also, it could hasten the buildout of planned commercial and industrial uses, especially in the Sunset Industrial Area and proposed Placer Ranch Specific Plan area, as well as in the proposed Sutter Pointe Specific Plan area.

In the longer term, improved access provided to lands in the Western and Eastern segments could be a factor in stimulating additional growth and development in areas west of SR 70/99 not protected by the Natomas Basin HCP, or north of the Sutter Pointe Specific Plan area, or north of Sunset Boulevard West in Placer County. Although growth is anticipated in these areas over time (as reflected in SACOG's preferred Blueprint scenario, the Sutter County General Plan, and the City of Lincoln General Plan), such development is not reflected in general plans at present and has not been formally proposed by landowners. By providing improved access to adjacent areas, Placer Parkway could be one of many factors that would encourage growth in these areas sooner than this might otherwise occur.

The factors influencing growth in the region are complex. Placer Parkway is one of several major urban development proposals in the region. While Placer Parkway would contribute to regional growth, including growth beyond the level identified in current general plans, it is not feasible to quantify the amount of its contribution. A single new transportation facility such as the Parkway is only one of the many factors contributing to regional growth, and it is speculative to assign a particular quantity of growth to any one factor.

Furthermore, several factors serve to limit the likely effect of the Parkway on growth, including the following:

- No interchanges are proposed for any areas that are not already approved or proposed for development;
- All approved and proposed residential development that has not already been built is projected to be built out prior to 2020, when the Parkway is proposed to open; and,
- Real estate market pressures in the area have been and continue to be intense without the Parkway, and local government jurisdictions have been supportive of processing development applications in spite of anticipated regional transportation challenges.

It is unlikely that the choice of one Placer Parkway alternative over another would substantially change expected patterns of growth and development in the project study area and the surrounding region. In the

Western Segment, all corridor alignment alternatives would provide new access to an area that is currently undeveloped farmland, but that is proposed for mixed use urban development. The three more southerly alignments (Alternatives 1, 2, and 3) would provide two interchanges in the Sutter Pointe Specific Plan area, while the more northerly alignments (Alternatives 4 and 5) would provide only one interchange in this area, approximately one mile farther north of the more southerly alignments in the Western Segment. Since none of the alternative alignments would include any intersections in the Central Segment, there would be little difference in growth inducement effects among the alternatives in this segment. In the Eastern Segment, two interchanges are proposed within the existing Sunset Industrial Area Plan, in an area proposed for the Placer Ranch Specific Plan. While these interchanges would provide new access to a currently undeveloped area, this area is planned for growth. In the Eastern Segment all alternatives would follow an identical alignment, so there would be no differences in growth inducement effects among the alternatives.

A future interchange at Watt Avenue could be growth inducing, because it would provide major new regional access to a portion of the project study area that is currently rural and undeveloped, although both conceptual interchange locations are now surrounded by formal development proposals or land controlled by development interests. A Watt Avenue interchange is not proposed as part of the project.

7.2 SECONDARY AND INDIRECT EFFECT EVALUATION

7.2.1 No-Build Alternative

Under the No-Build Alternative, land would not be acquired for the Parkway and the Parkway would not be constructed. There would not be any secondary or indirect impacts associated with hazardous materials and sites present in the study area under the No-Build Alternative.

7.2.2 Build Alternatives 1 Through 5

There would not be expected to be any secondary and indirect impacts with respect to hazardous materials or sites as a result of the Parkway. Although any disturbance of potentially hazardous sites presents a risk of secondary effects on human health and impacts to soil and groundwater and surface water as a result of accidental release or spillage, such release or spillage is not considered likely during the construction of the Parkway. The potential RECs in the study area would be subject to further investigation during Tier 2 and would be expected to be properly remediated prior to any construction activities.

The anticipated growth that would be expected to occur as a result of Placer Parkway could result in secondary and indirect impacts related to the potential presence of hazardous materials in the study area.

Anticipated growth could result in the potential disturbance of as yet unknown hazardous sites and potential RECs that may occur in and around the study area. If not properly investigated and remediated, such disturbance could result in accidental spillage or releases, which could adversely affect human health, soil, air quality and groundwater or surface water. Such effects would be direct impacts of other projects not associated with Placer Parkway, and would be required to be analyzed as part of independent environmental review. Although it is not feasible to perform a detailed evaluation of these projects at this stage as specific design details are not known, potential impacts are taken into account in the Placer Parkway 2040 Cumulative analysis (see Section 8.2). This analysis evaluates a 2040 cumulative scenario (Figure 7-2), which is considered to be an appropriate projection of future development. This scenario includes full-residential build out in Placer County west of Sierra College Boulevard, including general plan areas and major developments, and employment and population growth in line with SACOG forecasts. It assumes levels of growth and development will occur at the higher end of a potential feasible range and therefore represents a reasonable maximum development scenario for which cumulative and secondary and indirect impacts have been analyzed.

8.0 CUMULATIVE IMPACTS

8.1 CUMULATIVE IMPACT SCENARIO

Analysis of cumulative impacts is required under the National Environmental Policy Act and the California Environmental Quality Act (CEQA). Cumulative impacts result when the effects of an action are added to or interact with other effects in a particular place and within a particular time. It is the combination of these effects, and any resulting environmental degradation, that are the focus of cumulative impact analysis. The CEQ's regulations (CEQ, 1987) explicitly state that cumulative impacts must be evaluated along with the direct and indirect effects of each alternative.

CEQA defines cumulative impacts as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts" (CEQA Guidelines, §15355). Stated another way, "a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the environmental document together with other projects causing related impacts" (CEQA Guidelines, §15130). Although a project may cause an individually limited or individually minor incremental impact that, by itself, is not significant, the increment may be "cumulatively considerable" and thus significant.

FHWA has requested that cumulative conditions for the analysis of project alternatives in the Tier 1 EIS/EIR for Placer Parkway be based on development levels that are 20 years beyond the projected opening of the Parkway. For planning purposes, Placer County Transportation Planning Agency (PCTPA) has identified 2020 as the opening year of the Parkway. Cumulative impacts are therefore being evaluated for the year 2040. This 2040 scenario includes the following projects (see Figure 7-2):

- Full build-out of all residential land in Placer County west of Sierra College Boulevard, including current general plan areas and the following major development proposals in West Placer County:
  - The Creekview and Sierra Vista Specific Plan areas in Roseville's Memorandum of Understanding (MOU) Remainder Area
  - The Sphere of Influence (SOI) expansion areas of Lincoln
  - The Placer Vineyards, Regional University and Community, and Placer Ranch Specific Plans in unincorporated Placer County
  - The Curry Creek Community Plan area
- Growth in retail employment in Placer County that balances the growth in residential development by matching SACOG's countywide estimate of about 0.32 employee per dwelling unit from their 2025 forecasts.
- Growth in total employment levels in Placer County that balances the growth in residential development by matching SACOG's 1.3 employees per dwelling unit from their 2025 forecasts.
- Full build-out of the residential development in the proposed Sutter Pointe Specific Plan area along with a non-residential development level that balances the residential development in that area.

- Estimated 2040 developments in all other portions of SACOG's six-county region based on assuming a constant rate for the development growth between 2005 levels and the 2050 Preferred Blueprint scenario for each of SACOG's traffic analysis zones (TAZs).

8.2 CUMULATIVE IMPACTS EVALUATION

8.2.1 No-Build Alternative

Under the No-Build Alternative, land would not be acquired for the Parkway and the Parkway would not be constructed. There would not be any cumulative impacts under the No-Build Alternative.

8.2.2 Build Alternatives 1 Through 5

Placer Parkway and other development considered in the cumulative impact scenario would all involve the disturbance, storage, use, disposal and transport of hazardous materials to varying degrees during construction and operation. Increased urbanization and development directly increases the use, storage and generation of hazardous materials and the risk of accidental release into the environment. The adverse effects on groundwater or surface water, habitat, species, air quality, and associated effects on human health, can be exacerbated as a result of hazardous materials use and release from multiple projects in the same geographic area.

Impacts related to these activities are considered less than significant because the storage, use, disposal and transport of hazardous materials are extensively regulated by various federal, state, and local agencies, and it is assumed that those involved with the project would implement and comply with these existing hazardous materials regulations. In addition, each of these related projects would undergo its own CEQA review and include mitigation based on these regulations. Therefore significant hazards to the public would not occur, and no cumulatively significant impacts related to hazardous wastes or materials are expected.

The Parkway could potentially experience impacts associated with the presence of LBP and/or ACM due to the demolition of structures along the preferred alignment, the presence of ADL along the edges of existing roadways where future construction will occur, soil contamination in potential REC areas, e.g., Tenco Tractor, Rio Bravo Power Plant, and three uncontrolled dump sites, and agricultural soils where pesticides have been historically applied. The potential presence of these three RECs within the alignments of Alternatives 1, 2, and 3, and the presence of four potential RECs within the alignment of Alternatives 4 and 5 is not considered to present a risk of contribution to cumulative impacts. It is likely that impacts associated with these RECs can be fully avoided, either through design of the Parkway to avoid these site locations or implementation of appropriate preventative and mitigation measures during construction to prevent accidental release of contaminants to soil or groundwater.

Mitigation strategies have been identified to reduce these impacts to less-than-significant levels. With development of the mitigation strategies into enforceable mitigation measures, Placer Parkway's incremental contribution to less-than-significant cumulative impacts related to hazardous materials would not result in a cumulatively significant impact. Since cumulative impacts from the proposed project and related projects are not significant, the proposed project, by itself, cannot cause a cumulatively considerable incremental impact. Placer Parkway's cumulative impacts related to hazardous materials are therefore not significant.

9.0 POTENTIAL WATT AVENUE INTERCHANGE

No hazardous materials sites, sources, or facilities were identified in the vicinity of the location of a potential interchange between a potential new Watt Avenue interchange with any of the Parkway build alternatives.

10.0 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION STRATEGIES

A number of potential avoidance, minimization, and/or mitigation strategies may be implemented to prevent or reduce potential environmental impacts associated with hazardous waste sources and sites in the study area, and from the use and storage of hazardous materials during construction:

- During Tier 2, it is anticipated that the selected alternative could be located such that the five potential RECs would not be disturbed, particularly in view of their location primarily on the outer edges or just outside the proposed corridor alternative alignments.

- All buildings and other structures proposed for demolition should be surveyed for the presence of LBP and ACM. Any such LBP and/or ACM should be appropriately abated by a certified contractor prior to demolition and disposed of in accordance with federal, state, and local regulations;

- An ADL investigation should be conducted along unpaved shoulders adjacent to highways and roads in high traffic areas that will be disturbed during construction activities. The only locations where traffic is heavy enough to warrant an ADL investigation (when peak monthly Average Daily Traffic exceeded 10,000 vehicles in 1985; 1985 was the last year when leaded gasoline was sold in the United States) would be the intersections of the proposed Parkway and SR 65 in the east and SR 70/99 in the west; Caltrans will likely have completed an ADL site investigation at the above intersections a few years before this project goes to construction (Chadha, 2006).

- Potentially impacted soils proposed for excavation associated with potential RECs, e.g., Tenco Tractor, Rio Bravo Power Plant, and three uncontrolled dump sites, should be tested for appropriate analytes and handled in accordance with regulatory standards;

- Current agricultural soils and former undisturbed agricultural soils that are proposed for excavation during construction should be tested for pesticides and other contaminants and disposed of in accordance with federal, state, and local regulations; and

- A Health and Safety Plan should be prepared by the contractor prior to construction. This plan should describe appropriate procedures to follow in the event that any contaminated soil or groundwater is encountered during construction activities. Any unknown substances should be tested, handled, and disposed of in accordance with appropriate federal, state, and local regulations.

11.0 ANALYSES TO BE UNDERTAKEN IN TIER 2

All of the alternative alignments may potentially affect identified RECs within the study area. Further investigation of these RECs is recommended to determine what risk, if any, is posed to human and environmental health. These investigations would include the following:

- Interviews with regulators and owners/occupants of potential contaminated properties;
- An investigation of building/structure records and surveys of building and structural materials for any facilities that will be fully or partly demolished during the construction of Placer Parkway;
- Identification of location and condition and condition of UST within Rio Bravo; and
- Development of detailed hydrogeology information, including geology and groundwater depth and gradient, for the chosen alignment.
- Further investigation of Tenco Tractor site. It is assumed that continued investigation and monitoring of the Tenco Tractor site would be the responsibility of the landowner and the only costs accruing to the Placer Parkway project would be associated with a review of available records and data. A budget estimate for these services is $10,000 (in 2006 dollars).

For the remaining four RECs, three uncontrolled dump sites, and a possible UST at the Rio Bravo property, it is assumed that costs (in 2006 dollars) associated with site investigations would be on the order of $20,000 per location for Sites 2 and 3, as well as Rio Bravo. Site 1 is significantly larger; an investigation of this property is assumed to cost on the order of $50,000.

Due to the great variation in scale between the results of the EDR report and Figure 4-1, which illustrates potential RECs relative to the alternative alignments, it is difficult to say which, if any, of the RECs actually lies within a proposed alignment corridor. Figure 4-1 suggests the following:

- Drums and containers (Site 1) is very close to the Western Segment of Alternatives 1, 2, and 3;
- Drums and containers (Site 2) is very close to the realignment of Sankey Road associated with Alternatives 4 and 5;
- The location of the potential UST within the Rio Bravo site is unknown. Further clarification would be required during Tier 2; and
- The remaining two RECs seem to be several hundred feet from the proposed alternatives.

As environmental conditions in the study area may change between 2006 and the expected initial construction year of Placer Parkway (between 2015 and 2020), it is recommended that an update of this Initial Site Assessment be performed during the Tier 2 environmental process, and within six months of the start of each phase of construction. The update should include an updated database search, regulatory agency file review, and site reconnaissance for the selected corridor. If, during the update, the potential for any businesses adjacent to the project to create a REC cannot be clarified, recommendations should be developed for appropriate soil sampling within the adjacent project area.

12.0 LIMITATIONS

The conclusions presented in this report are professional opinions based upon visual observations of the study area, and interpretation of the available historical information and documents reviewed. The conclusions are intended exclusively for the purpose outlined in this report, and at the location and project indicated. This report is intended for the sole use of FHWA, Caltrans, and SPRTA. The scope of services performed in execution of this investigation may not be appropriate to satisfy the needs of other users, and any use or reuse of this document or the findings, conclusions, or recommendations presented herein is at the sole risk of said user.

It should be recognized that this study is not intended to be a definitive investigation of potential environmental impacts in the study area. Given that the scope of services for this investigation was limited, it is possible that currently unrecognized contamination might exist in the study area.

Opinions presented herein apply to the existing and reasonably foreseeable site conditions at the time of the assessment. They cannot necessarily apply to site changes of which this office is unaware and has not had the opportunity to evaluate. Changes in the conditions of this property may occur with time due to natural processes or human activities in the study area. Changes in applicable standards may also occur as a result of legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated, wholly or in part, by changes beyond the control of the authors.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL RECORDS

RCRAInfo: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System(RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month Large quantity generators generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/15/2005 has revealed that there is 1 RCRA-LQG site within the searched area.

Not reported Date Completed: 13-AUG-88	RIEGO RD., .25 MILE E/O	22	78

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency

A review of the HAZNET list, as provided by EDR, and dated 12/31/2003 has revealed that there are 29 HAZNET sites within the searched area.

Facility Type: Not reported
Facility Status: Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
Agency Type: Not reported
Waste Type: Not reported
Threat to Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.
Reclamation: Not reported

Design Flow:	Not reported	Baseline Flow:	Not reported

Facility Type: Industrial - Facility that treats and/or disposes of liquid or semisolid wastes from any servicing, producing, manufacturing or processing operation of whatever nature, including mining, gravel washing, geothermal operations, air conditioning, ship building and repairing, oil production, storage and disposal operations, water pumping.

Facility Status: Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.

Agency Type: Private

Waste Type: Not reported

Threat to Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.

Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Agency Contact:	Ray Griffin	Agency Phone:	(925) 754-2717
Design Flow:	Not reported	Baseline Flow:	Not reported

Facility Type: Industrial - Facility that treats and/or disposes of liquid or semisolid wastes from any servicing, producing, manufacturing or processing operation of whatever nature, including mining, gravel washing, geothermal operations, air conditioning, ship building and repairing, oil production, storage and disposal operations, water pumping.
Facility Status: Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
Agency Type: Private
Waste Type: Not reported
Threat to Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.
Reclamation: Not reported
POTW: Not reported
NPDES Number: CAS000001 The 1st 2 characters designate the state. The remaining 7 are assigned by the Regional Board

Design Flow:	Not reported	Baseline Flow:	Not reported
Facility Type:	Industrial - Facility that treats and/or disposes of liquid or semisolid wastes from any servicing, producing, manufacturing or processing operation of whatever nature, including mining, gravel washing, geothermal operations, air conditioning, ship building and repairing, oil production, storage and disposal operations, water pumping.		
Facility Status:	Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.		
Agency Type:	Private		
Waste Type:	Not reported		
Threat to Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.		
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.		
Reclamation:	Not reported

Facility Type: Industrial - Facility that treats and/or disposes of liquid or semisolid wastes from any servicing, producing, manufacturing or processing operation of whatever nature, including mining, gravel washing, geothermal operations, air conditioning, ship building and repairing, oil production, storage and disposal operations, water pumping.
Facility Status: Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
Agency Type: Private
Waste Type: Not reported
Threat to Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded

TEICHERT (Continued) **1005441170**

at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.
Reclamation: Not reported
POTW: Not reported

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 11/29/05

Next Scheduled EDR Contact: 05/01/06
Data Release Frequency: Quarterly

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Data Release Frequency: No Update Planned

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 10/24/05
Date Data Arrived at EDR: 12/21/05
Date Made Active in Reports: 01/30/06
Number of Days to Update: 40

Next Scheduled EDR Contact: 03/20/06
Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

RCRA: Resource Conservation and Recovery Act Information

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

SSTS: Section 7 Tracking Systems

Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

Data Release Frequency: Quarterly

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

DEED: Deed Restriction Listing
Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

EDR PROPRIETARY RECORDS

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services

ISA Checklist

Caltrans Metric

Initial Site Assessment (ISA) Checklist

Project Information

District 3 County Placer, Sutter, and Sacramento Route Between SR 65 to the east and SR 70/99 to the west

Kilometer Post (Post Mile) N/A EA N/A

Description The project is a Tier 1 EIS/Program EIR for the preservation of a corridor for the future construction of Placer Parkway – a new east-west roadway linking SR 65 and SR 70/99. The study area is approximately 110 square miles in size.

Is the project on the HW Study Minimal-Risk Projects List (HW1)? No

Project Manager phone #

Project Engineer phone #

Project Screening

Attach the project location map to this checklist to show location of all know and/or potential HW sites identified. See attached maps from the Draft Initial Site Assessment dated August 21, 2006.

1 Project Features: New R/W? Yes Excavation? Minimal Railroad Involvement? Minimal

Structure demolition/modification? Minimal Subsurface utility relocation? Minimal

2. Project Setting Primarily agricultural, underdeveloped land between Highway 65 in the east and Highways 70/99 in the west

Rural or Urban Rural

Current land uses Mainly agricultural with scattered commercial/light industrial in east and west

Adjacent land uses Same as above with residential primarily to south
(industrial, light industry, commercial, agricultural, residential, etc.)

3 Check federal, State, and local environmental and health regulatory agency records as necessary, to see if any known hazardous waste site is in or near the project area. If a known site is identified, show its location on the attached map and attach additional sheets, as needed, to provide pertinent information for the proposed project.

4 Conduct Field Inspection. Date March 20, 2006 Use the attached map to locate potential or known HW sites.

STORAGE STRUCTURES / PIPELINES: Refer to the Draft Initial Site Assessment dated August 21, 2006, for details and illustration of known and potential hazardous waste sites in the study area.

Underground tanks _____ Surface tanks _____
Sumps _____ Ponds _____
Drums _____ Basins _____
Transformers _____ Landfill _____
Other _____

Initial Site Assessment (ISA) Checklist

(continued)

CONTAMINATION: (spills, leaks, illegal dumping, etc.) Refer to the Draft Initial Site Assessment dated August 21, 2006, for details and illustration of known and potential hazardous waste sites in the study area.

Surface staining _____ Oil sheen _____

Odors _____ Vegetation damage _____

Other _____

HAZARDOUS MATERIALS: (asbestos, lead, etc.) Refer to the Draft Initial Site Assessment dated August 21, 2006, for details and illustration of known and potential hazardous waste sites in the study area.

Buildings _____ Spray-on fireproofing _____

Pipe wrap _____ Friable tile _____

Acoustical plaster _____ Serpentine _____

Paint _____ Other _____

5 Additional record search, as necessary, of subsequent land uses that could have resulted in a hazardous waste site. Use the attached map to show the location of potential hazardous waste sites.

6 Other comments and/or observations: Areal extent and concentrations of possible contamination to be evaluated during subsequent Tier 2 studies upon selection of preferred alternative alignment.

ISA Determination

Does the project have potential hazardous waste involvement? Yes If there is known or potential hazardous waste involvement, is additional ISA work needed before task orders can be prepared for the Investigation? Yes If "YES," explain; then give an estimate of additional time required:

The possible lateral extent and nature of contamination for relevant recognized environmental conditions (RECs) should be evaluated in order to provide a basis for scoping of subsequent Tier 2 studies. Estimated time: 2 months.

A brief memo should be prepared to transmit the ISA conclusions to the Project Manager and Project Engineer.

ISA Conducted by Angela Ledgerwood **Date** 12/1/06*

By Raymond H. Rice

1.0 INTRODUCTION

1.1 Tier 1 EIS/Program EIR

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

1.2 Corridor Selection and Preservation

The concept for the Placer Parkway is over a decade old. Placer County's 1994 General Plan depicts a "plan line" for it. Two planning studies (DKS Associates, 2000 and 2001) helped to refine the concept:

- DKS Associates, 2000, Placer Parkway Interconnect Study/Conceptual Plan
- DKS Associates, 2001, Project Study Report (Project Development Support) for Placer Parkway

Placer Parkway is cited as a high-priority regional transportation project by the Sacramento Area Council of Governments (SACOG) 2025 Metropolitan Transportation Plan and the 2027 Placer County Regional Transportation Plan. The project vicinity and surrounding area include some of the fastest growing communities in the Sacramento region. A number of large urban development proposals are being considered by Placer and Sutter counties. New development is expected to add a significant amount of residential, commercial, industrial, and educational uses.

June 2007

6/13/07 ..\K\T\Placer Parkway 2007\Tech Studies June07\MEPLAN\Fig_1_Project_Location.pdf

URS Corporation L:\Projects\PlacerParkway2006_28066593\MXD\Current Working Documents\Archaeological_Survey_Report\Fig_1_Project_Location.mxd Date: 6/29/2006 4:11:03 PM Name: akkeele0

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included representatives from planning and public works departments of all affected cities and counties, environmental, business, agricultural, development, and homeowner interests (the Study Advisory Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report (Tier 1 EIS/EIR) will analyze these five corridor alternatives along with a No-Build Alternative (Figure 2).

Other potential transportation modes such as bus rapid transit may be developed in the corridor in the future, although they are not proposed as part of the current project. The width of the corridor for the Placer Parkway is to vary from approximately 500 feet in the Eastern and Western segments to approximately 1,000 feet in the Central Segment. Depending upon the alternative, the corridor's length ranges from a minimum of 14.2 miles to a maximum of 16.2 miles. The selected corridor would contain the roadway, including the median, travel lanes, shoulder, associated access ramps and a no-development buffer zone.

Corridor acquisition may not be completed until after Tier 2, as funding becomes available. Portions of the selected corridor would be preserved as a no-development buffer zone. The buffer would be maintained as a zone where development is either not permitted or is severely restricted. This is intended to restrict access to the proposed interchanges, protect the rural character of agriculturally designated areas in the vicinity of the Parkway as far as possible subject to future development, and to maximize opportunities to incorporate adjacent sensitive areas. It is intended that the buffer would be owned and managed in the future to achieve these objectives. For subsequent Tier 2 (project-level) environmental reviews, the size of this buffer zone could be considered flexible for agriculturally designated land undergoing urban development. In the Tier 2 environmental review, the specific buffer size and location would be determined. This determination would be based on performance standards on a case-by-case basis, depending on the land use needs of future approved development, and taking into account the primary objective of restricting future access to the Parkway.

Project proponents are considering employment of several land management and control mechanisms to ensure that the buffer would be effectively maintained as an area where development would not be permitted, and where construction of any additional access onto the Parkway would not be allowed. These mechanisms could include land use controls, land purchase/leases, general plan amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, urban growth boundaries, etc. "Layering" or using several of these methods would provide more assurance that the buffers would be permanent, or at least more difficult to undo.

1.3 Technical Study Objective

Placer Parkway would be designed to improve regional accessibility for businesses and jobs in the project vicinity including access to SR 70/99 and the I-5 corridor in northern Sacramento County. With its controlled access, an objective of the proposed transportation facility would be to strike a balance among advancing planned job growth along the SR 65 and SR 70/99 corridors, avoiding urban growth inducement in areas not designated for development, and helping to preserve the rural character of southwestern Placer County and south Sutter County.

During the modified National Environmental Policy Act (NEPA)/404 process[1], the importance of identifying secondary/indirect impacts, particularly growth-inducement, was a key process issue. In addition to traditional methods used to evaluate growth-inducement impacts, the Placer Parkway Project Team identified the MEPLAN model, which was used in the SACOG Blueprint process, as an additional analysis tool to quantify such impacts in the Tier 1 EIS/EIR. FHWA, Caltrans, the U.S. Army Corps of Engineers (USACE) and the U.S. Environmental Protection Agency (U.S. EPA) supported the additional analysis.

The Project Team has applied the MEPLAN model to assess the potential for growth inducement among Parkway alternatives, consistent with a Tier 1/Program level assessment. This MEPLAN Technical Report presents an assessment of the potential impact on the location of development through 2040 due to implementing the corridor alignment alternatives and the No-Build Alternative as described in Chapter 2.

The MEPLAN analysis also includes an evaluation of development levels with and without a Placer Parkway interchange at a potential future extension of Watt Avenue. The potential extension of Watt Avenue and an interchange with Placer Parkway are not part of the project. This potential work would be a distinct project or projects with a separate environmental review. The direction to analyze each build alternative with and without a Watt Avenue interchange is based on input from the Policy Advisory Committee during the preparation of the Concept Plan and Project Study Report (PSR) (DKS Associates, 2001) for Placer Parkway.

This report is organized as follows:

Chapter 2	The Proposed Action
Chapter 3	Description of the Sacramento MEPLAN Model
Chapter 4	Use of MEPLAN for Placer Parkway Corridor Preservation Tier 1 EIS/EIR
Chapter 5	Results of MEPLAN Analysis
Chapter 6	References

This report also includes figures and tables, which show the project location, each action alternative, and pertinent technical information prepared to evaluate the action alternatives.

Throughout this document, the Placer Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

[1] As part of the planning process for the Tier 1 EIS/EIR, FHWA, Caltrans, and PCTPA (acting on the behalf of SPRTA (South Placer Regional Transportation Authority) agreed to participate with the U.S. Army Corps of Engineers (USACE) and the U.S. Environmental Protection Agency (U.S. EPA) in the modified NEPA/404 process. The goal of this modified NEPA/404 process for the Tier 1 EIS/EIR is to ensure that Tier 1 decisions reflect careful consideration of the 404 Guidelines that implement the U.S. Clean Water Act. These guidelines are to be addressed as early as possible in the Tier 1 NEPA evaluation to eliminate the need to revisit decisions in Tier 2 that might otherwise conflict with 404 permit requirements.

2.0 THE PROPOSED ACTION

The Proposed Action for the Placer Parkway Corridor Preservation Project is to select and preserve a 500- to 1,000-foot-wide corridor in the project study area, within which the future four- or six-lane Placer Parkway may be constructed. The ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction, and operation of the Parkway. Although the action taken at Tier 1 on the Placer Parkway Corridor Preservation Project is limited, the underlying project whose effects are studied in this document is the Placer Parkway. To the extent feasible at this early stage, the Tier 1 EIS/EIR addresses the potential effects of construction and operation of the future roadway.

2.1 The Study Area

The study area is an area of approximately 33,460 acres located in Sutter and Placer counties, with a small section located in Sacramento County (Figures 1 and 2). The portion of the study area that is located in Sacramento County is in the extreme southwestern corner of the study area and does not include any of the proposed corridor alignment alternatives. It extends from SR 70/SR 99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego Roads. The study area as defined for transportation analysis includes the study area and is described in Section 3.1.

The study area is divided into three segments:

- Western Segment: the Western Segment extends from SR 70/99 to Pleasant Grove Road in Sutter County.
- Central Segment: the Central Segment extends from Pleasant Grove Road in Sutter County to approximately 2,300 feet north of Pleasant Grove Creek in Placer County.
- Eastern Segment: the Eastern Segment extends from approximately 2,300 feet north of Pleasant Grove Creek to SR 65 in Placer County.

2.2 Corridor Alternatives

The following subsections describe the corridor alignment alternatives, which are depicted on Figure 2, and are numbered according to location from south to north in the study area.

2.2.1 The No-Build Alternative

Under the No-Build Alternative, the project would not be implemented. A Placer Parkway corridor would not be selected/preserved, and the future Placer Parkway would not be constructed.

2.2.2 Alternative 1 – the Red Alternative

Alternative 1 would extend from SR 70/99 approximately ½ mile north of Riego Road, eastward approximately 1 mile north of Baseline Road to approximately Watt Avenue, proceeding north and transitioning in an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment alternative is 16.2 miles long. This alternative includes six interchanges, as described in Section 2.3.3.

2.2.3 Alternative 2 – the Orange Alternative

Alternative 2 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed northeast, then in a northerly direction south of Pleasant Grove Creek, transitioning to an easterly direction before it reaches Sunset Boulevard West, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.4 miles long. This alternative would include six interchanges, as described in Section 2.3.3 below.

2.2.4 Alternative 3 – the Blue Alternative

Alternative 3 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed north along the Sutter/Placer County Line, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.6 miles long. This alternative would include six interchanges, as described in Section 2.3.3 below.

2.2.5 Alternative 4 – the Yellow Alternative

Alternative 4 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.3 miles long. This alternative would include five interchanges, as described in Section 2.3.3 below.

2.2.6 Alternative 5 – the Green Alternative

Alternative 5 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 4,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.2 miles long. This alternative would include five interchanges, as described in Section 2.3.3 below.

2.3 Parkway Design Assumptions

Although the Parkway would be designed and construction-level impacts analyzed during Tier 2, for the purpose of this report and the Tier 1 EIS/EIR, several assumptions have been made about potential design and configuration concepts. These assumptions would be subject to further development and refinement, and specific decisions about design of the roadway would be made during the Tier 2 process. For example, the number, location, and design of over-crossings would be determined at the time of final Parkway design, in consultation with local jurisdictions. The following sections outline assumptions for the future roadway.

Preliminary costs estimates for the Parkway range from $600 to $650 million (2005 dollars). This includes costs for right-of-way, design, construction and environmental mitigation for the four- to six-lane facility. The funding situation has spurred interest in exploring other more creative funding options.

These include a county-wide sales tax, more developer contributions, and tolling facilities. The Technical Report and Tier 1 EIS/EIR do not make any assumptions about funding sources.

2.3.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane facility. A preliminary conceptual cross section (see Figure 3) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

2.3.2 Conceptual Roadway Elevation

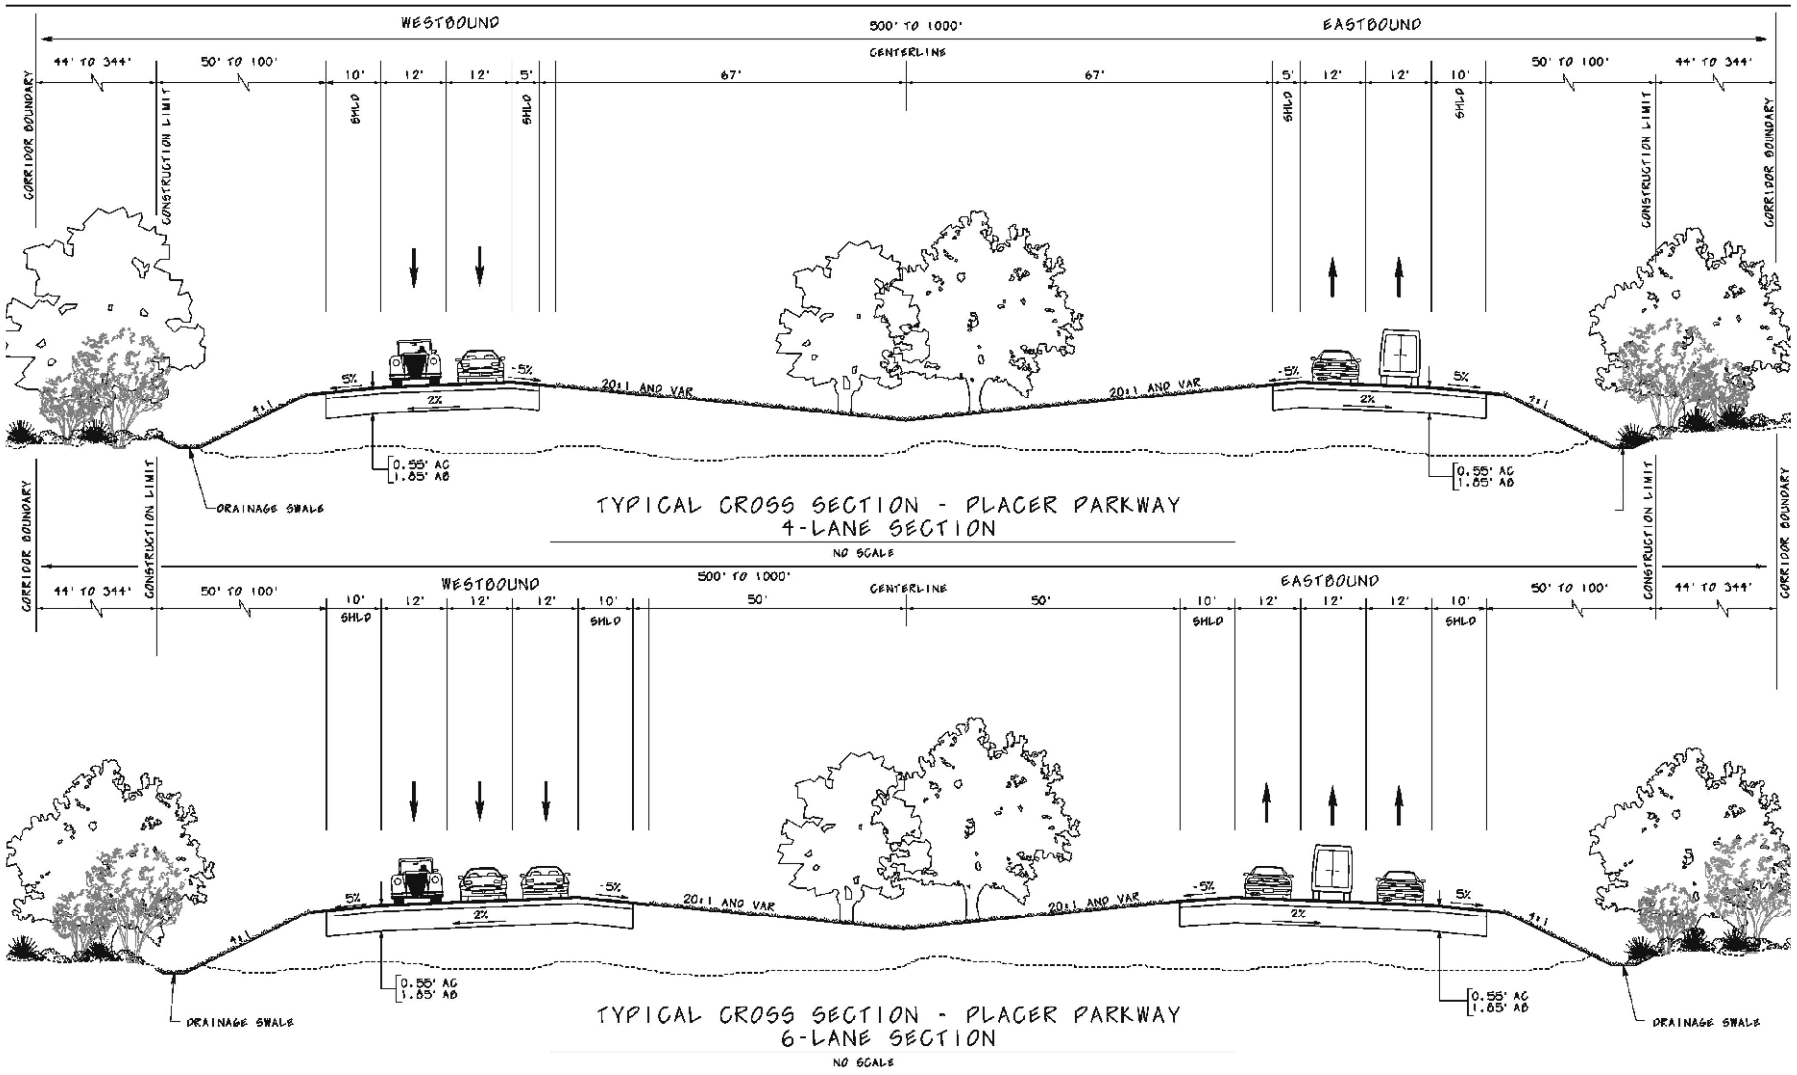
As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on either side of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways or trails.

Throughout the study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These over-crossings would not connect to the Parkway. Parkway access would be via the interchanges described below.



PLACER PARKWAY	Tier 1 EIS/EIR MEPLAN Technical Report	Typical Cross Section (Conceptual)	***Figure 3*** ***June 2007***

2.3.3 Interchange Concepts

The analysis assumes that the location of interchanges (see Figure 2) is as follows.

- SR 70/99 (at ½ mile north of Riego Road or at Sankey Road)
- One or two locations to be determined in southern Sutter County
- Fiddyment Road
- Foothills Boulevard
- SR 65 at Whitney Ranch Parkway

The following discussion outlines concepts and assumptions for the interchanges that could potentially serve Placer Parkway.

2.3.3.1 Western Segment

Within the Western Segment of the Parkway, a high-speed, freeway-to-freeway type interchange would connect the Parkway with SR 70/99 at one of following potential locations depending on the project alternative (see Section 2.2). Placer Parkway would terminate at SR 70/99.

- **Placer Parkway/SR 70/99 Interchange at North of Riego Road.** This alternative concept uses "braided" ramps to eliminate weaving problems or conflicts with the future SR 70/99 at Riego Road interchange being developed by Sutter County and Caltrans.

- **Placer Parkway/SR 70/99 Interchange at Sankey Road.** Under this alternative concept, the existing two-lane Sankey Road would be realigned to the south of Placer Parkway and the proposed freeway-to-freeway interchange, extending from approximately ¼ mile west of SR 70/99 to approximately ¼ mile east of the Union Pacific railroad tracks. There would be no direct access to SR 70/99 or Placer Parkway from the realigned Sankey Road.

Depending on the final alignment selected, one or two additional arterial interchanges would also be located in south Sutter County. Conceptual locations are identified for purposes of this Tier 1/Program analysis (see Figure 2). The actual location of these interchanges would be developed in the Tier 2 phase, based on Sutter County requirements.

2.3.3.2 Central Segment

Within the Central Segment of the Parkway, there would not be any access proposed as part of the Project in the 7-mile segment between Fiddyment Road and Pleasant Grove Road. Please see Section 2.4 regarding a potential connection to a future extension of Watt Avenue (Figure 4) which could be proposed and constructed by others in the Central Segment; such an interchange is not part of the Placer Parkway.

2.3.3.3 Eastern Segment

Within the Eastern Segment of the Parkway, a signalized high-speed freeway-to-freeway and local access interchange would connect the Parkway to SR 65 at Whitney Ranch Parkway (Figure 2). From SR 65 eastward Placer Parkway would terminate and become Whitney Ranch Parkway east of the SR 65 exit ramp intersection. Traffic signals would be provided at the exit ramp terminals. This interchange would be approximately 1 mile north of a planned SR 65/Sunset Boulevard interchange and 1.2 miles south of the existing Twelve Bridges interchange.

As part of this interchange, auxiliary lanes would be required on SR 65 in both directions to enhance traffic operations on the north side of the future SR 65/Sunset Boulevard interchange. The southbound SR 65 exit-ramp at Sunset Boulevard is being designed to accommodate an additional auxiliary lane required for the future Placer Parkway/Whitney Ranch Parkway interchange to minimize the reconstruction of this ramp in the future. Within the Eastern Segment of the Parkway, from SR 65 westward, two interchanges with local roadways would be constructed, one at Foothills Boulevard and one at Fiddyment Road, as depicted on Figure 2.

The future interchange on Placer Parkway at Fiddyment Road would be located near the existing intersection of Fiddyment Road and Sunset Boulevard West. To provide acceptable traffic operations additional distance needs to be provided between the Fiddyment Road/Sunset Boulevard West intersection and the Fiddyment Road/Placer Parkway westbound off-ramp intersection. Therefore, Sunset Boulevard West will need to be realigned to the north as it nears Fiddyment Road.

2.3.4 Landscaping Concept

For the purposes of this environmental analysis, preliminary landscaping concepts have been developed for Placer Parkway. These are entirely conceptual and would be subject to further refinement during the Tier 2 environmental process. It is anticipated that landscaping would be used to reflect local topography and vistas in the study area and complement the varying character of land adjacent to the Parkway corridor. Landscape design would vary within the Parkway's three segments depending on corridor width and type and density of surrounding land uses. Landscaping would be used within the median and the Parkway buffer zone to enhance the aesthetics of the Parkway, and would be used to provide screening and enhance local and long-distance views. Where appropriate, more concentrated plantings would be considered to buffer the Parkway from future adjacent land uses that may be incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Landscape design would likely include a mix of compatible native and non-native plants that may require some irrigation. Wherever possible, native plant species would be used in line with Caltrans policy. Where possible and depending on availability, feasibility and cost, recycled water would be used for irrigation.

During a future design phase, lighting elements would be designed for safety and would consider the proposed landscaping plan in order to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower-voltage lighting, and proposing lighting fixtures that conform with the visual character of the area).

2.4 Potential Watt Avenue Interchange

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 4). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/EIR. However, the connection of Placer Parkway to a potential Watt Avenue extension could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges with Placer Parkway.

MEPLAN
Technical Report

Potential Watt Avenue Interchange

Figure 4

June 2007

2.5 Agency Permits and Approvals

The Proposed Action would preserve a preferred corridor for a future transportation facility. In the future, permits and approvals would be obtained from appropriate agencies prior to construction of the Parkway. These permits and approvals may include specific design or mitigation requirements that would be incorporated into the project.

2.6 Subsequent Tier 2 Information

As noted earlier, the design and construction of Placer Parkway—including its interchanges and over-crossings, and ancillary features such as stream crossings, safety devices, stormwater management structures, and similar improvements—would be evaluated in a subsequent Tier 2 environmental review process once a corridor has been identified.

3.0 DESCRIPTION OF THE SACRAMENTO MEPLAN MODEL

The Sacramento region has been a leader in developing urban models. In the fall of 2002 SACOG became one of the first Metropolitan Planning Organizations (MPO) in the United States to use a fully integrated land use and transportation model for policy purposes. The adoption of this policy was preceded by extensive model-demonstration exercises aimed at showing the usefulness of these models for urban and regional policy analysis. Researchers at the University of California, Davis, together with the consulting firms HBA Specto and Modelistica, implemented the first set of models with the cooperation of SACOG. These exercises were largely academic in nature (see Johnston and de la Barra, 2000; Rodier et al., 2002; and Abraham and Hunt, 1999 for examples of this work).

The Sacramento Model Test Bed study was a side-by-side comparison of the SACOG travel model, a land use model that was used in conjunction with the SACOG travel model, and two fully integrated land use and travel demand models of which MEPLAN was one. The purpose of the study was to test and compare each model's policy analysis ability (Hunt et al., 2001). Each model was given identical data from the Sacramento region for model calibration. A trend scenario was run as well as three policy scenarios. While this study did not explicitly recommend one model over another, the findings of this study, together with the previous model demonstration studies, led to MEPLAN being adopted by SACOG for regional policy analysis. SACOG implemented and funded the third incarnation of the Sacramento MEPLAN model, the model used in this technical study for the Placer Parkway Corridor Preservation Tier 1 EIS/EIR.

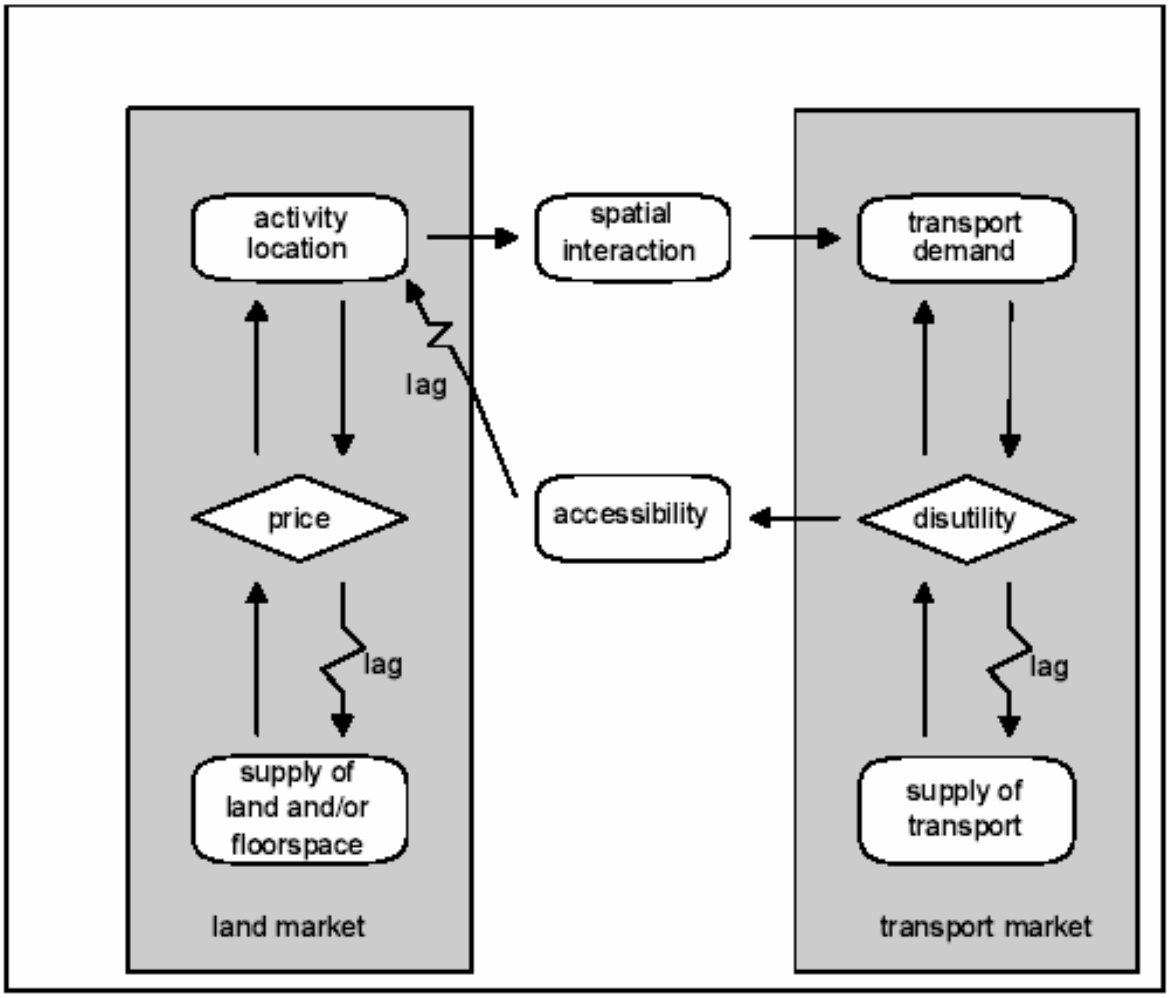
A growing body of work has been produced that has analyzed the MEPLAN model's response to uncertain conditions, including uncertain model inputs, parameters, and spatial allocations (Clay and Johnston, 2005; Clay and Johnston, 2006; Clay and Johnston, 2006; and Rodier and Johnston, 2001). Across all of these studies and the other scenario/policy testing research cited below, MEPLAN has not been shown to err in the ranking of policies or scenarios for the indicators analyzed in this present study.

3.1 Overview of MEPLAN

The MEPLAN modeling framework is described by Hunt and Simmonds (1993). The basis of the framework is the interaction between two parallel markets, a land market and a transportation market. This interaction is illustrated in Figure 5. Behavior in these two markets is a response to price, and price-like signals that arise from market mechanisms. In the land markets, price and generalized cost (disutility) affect production, consumption, and location decisions by activities. In the transportation markets, money and time costs of travel affect both mode and route selection decisions.

The cornerstone of the land market model is a spatially disaggregated social accounting matrix (SAM) (Pyatt and Thorbecke, 1967) or input-output table (Leontieff, 1951) that is expanded to include variable technical coefficients and uses different categories of space (e.g., different types of building and/or land). Logit models of location choice are used to allocate volumes of activities in the different sectors of the SAM to geographic zones. The attractiveness or utility of zones is based on the cost of inputs (which include transportation costs) to the producing activity, location-specific disutilities, and the costs of transporting the resulting production to consumption activities. The resulting patterns of economic interactions among activities in different zones are used to generate origin-destination matrices of different types of trips. These matrices are loaded to a multi-modal network representation that includes nested logit forms for the mode choice models and stochastic user equilibrium for the traffic assignment model (with capacity constraints). The resulting network times and costs affect transportation costs, which then affect the attractiveness of zones and the location of activities, and thus the feedback from transportation to land use is accomplished.

Figure 5: System of Two Types of Markets
Markets in land and in transportation and the interactions between them form the basis of the MEPLAN framework.



Reproduced with permission from Abraham (2000)

The framework is moved through time in steps from one time period to the next, making it "quasi-dynamic." In a given time period, the land market model is run first, followed by the transportation market model, and then an incremental model simulates changes in the next time period (see Figure 6). The transportation costs arising in one period are fed into the land market model in the next time period, thereby introducing lags in the location response to transport conditions. See the paper by Hunt and Simmonds (1993) for descriptions of the mathematical forms used in MEPLAN and a study by Johnston et al. (2001) for a more complete explanation of the model structure.

Figure 6: MEPLAN Submodels and Their Interactions
Temporal dynamics are simulated by ordering the sequence of interactions among the program modules at adjacent points in time.

3.2 Development MEPLAN Model for Sacramento Region

The specific structure of the Sacramento MEPLAN model is shown in the diagram in Figure 7, and Table 1 defines the categories in the diagram. The large matrix in the middle of the diagram lists the factors in the land use submodel and describes the nature of the interaction between factors. A given row in this matrix describes the consumption needed to produce one unit of the factor, indicating which factors are consumed and whether the rate of consumption is fixed (f) or price elastic (e).

The Sacramento MEPLAN model uses eleven industry and service factors that are based on the SAM and aggregated to match employment and location data. Households are divided into three income categories (high, medium, and low) based on the SAM and residential location data. The consumption of households by businesses represents the purchase and supply of labor. This MEPLAN model does not include the number of workers by education level in the households, which would result in a more accurate matching of workers with jobs. This disaggregation may be done at a later stage if funding is available.

The consumption of business activities by households represents the purchase of goods and services by consumers. Industry and households consume space at different rates and have different price elasticities, and thus seven land use factors are used in the model. Constraints are placed on the amount of manufacturing land use to represent zoning regulations that restrict the location of heavy industry. Developed land other than land used for agriculture is represented in the molded by the factor URBAN

Figure 7: The MEPLAN Matrices

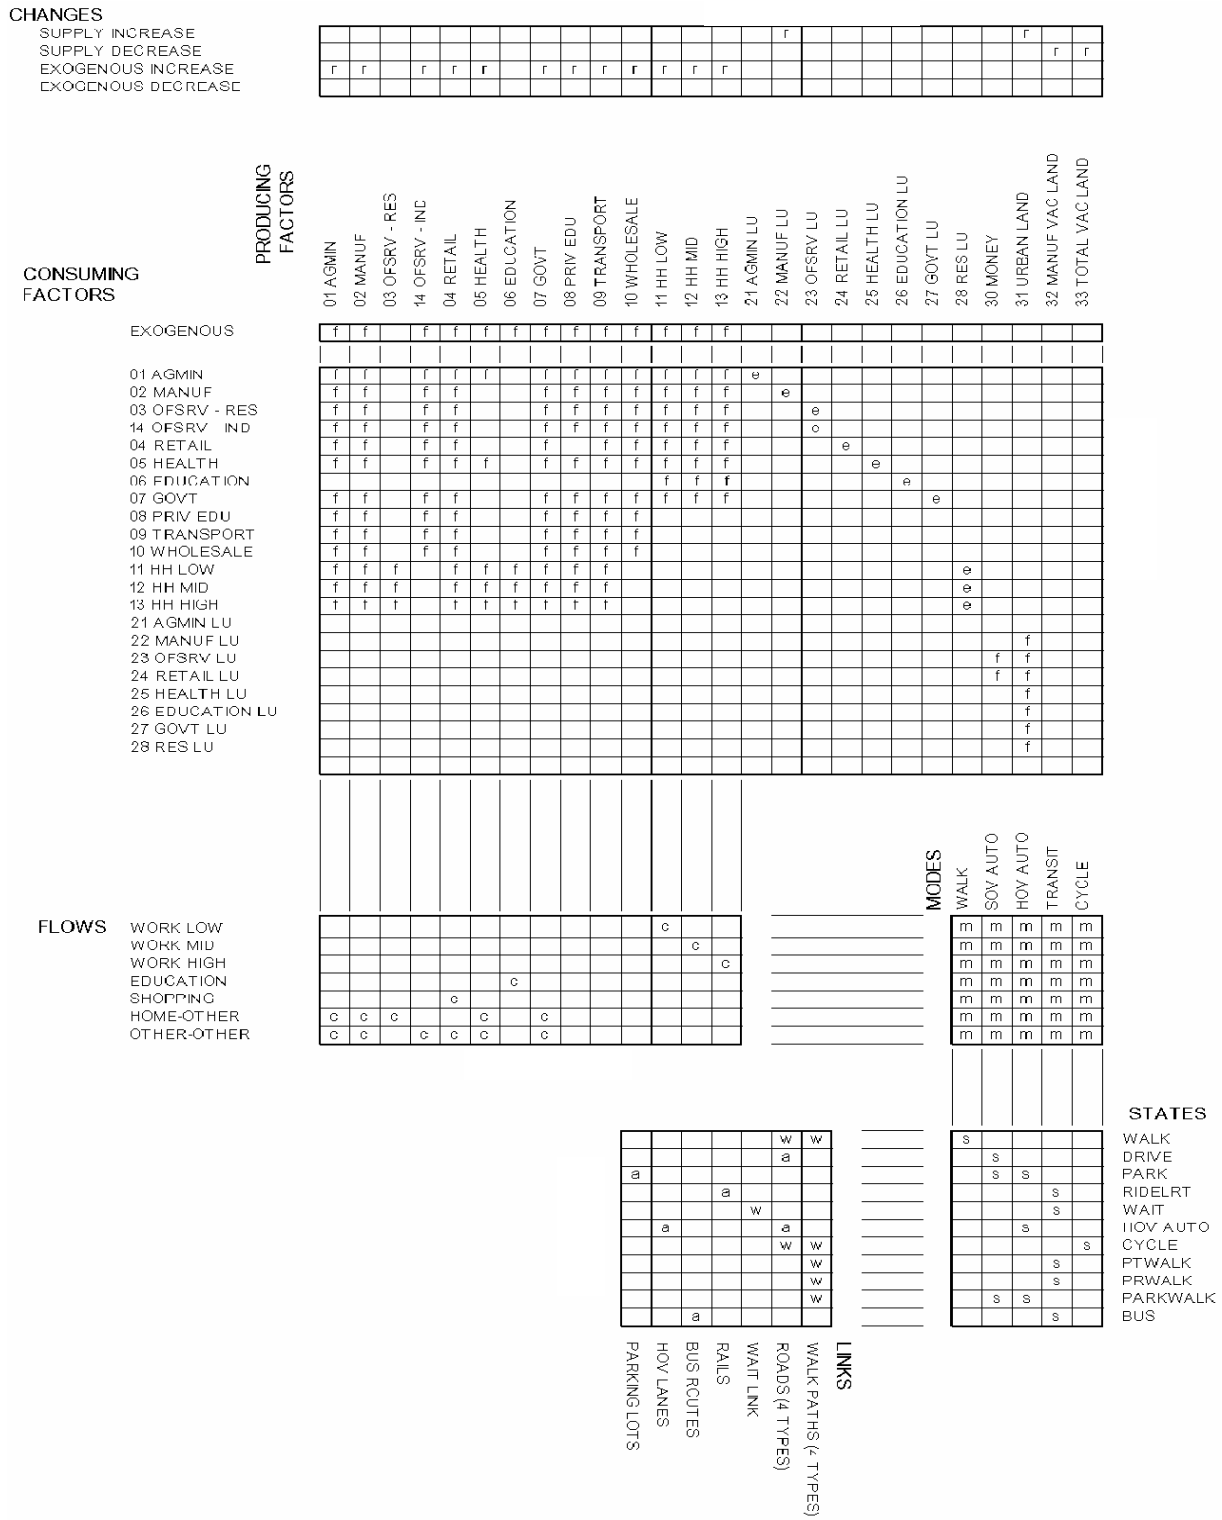

Table 1:
Description of MEPLAN Categories in Figure 7

Type of Category	Category Name	Category Description
Industry and Service	AGMIN	Agriculture and mining
	MANUF	Manufacturing
	OFSRV-RES	Services and office employment consumed by households
	OFSRV-IND	Services and office employment consumed by other industry
	RETAIL	Retail
	HEALTH	Health
	EDUCATION	Primary and secondary education
	GOVT	Government
	PRIV EDU	Private education
	TRANSPORT	Commercial transportation
	WHOLESALE	Wholesale
Households	HH LOW	Households with annual income less than $20,000
	HHMID	Households with annual income between $20,000 and $50,000
	HH HIGH	Households with annual income greater than $50,000
Land Use	AGMIN LU	Land used for agriculture
	MANUF LU	Land used for manufacturing
	OFSRV LU	Land used for services and office employment
	RETAIL LU	Land used for retail
	HEALTH LU	Land used for health
	EDUCATION LU	Land used for education
	GOVT LU	Land used for government
	RES LU	Land used by residences

LAND. Two factors are used to keep track of the amount of vacant land available for different purposes in future time periods (MANUF VAC LAND and TOTAL VAC LAND), and the development process converts these two factors to URBAN LAND. The MONEY factor is a calibration parameter that allows differential rents to be paid by different users of the same category of land, meaning that a firm would pay a higher rent for the same category of land in the downtown zone than it would in a more rural zone.

The single-row matrix just above the large matrix in Figure 7 shows activity that is demanded exogenously, which includes exporting industry, retired households, and unemployed households. This corresponds to the "basic" economy in a Lowry model (Lowry, 1964).

The matrix directly above at the top of the diagram shows the structure of the incremental model that operates between time periods. The r's for the industry and household factors indicate the economic growth in the region, and the r's for the land use factors show how vacant land is converted to urban land.

The matrix on the left below the large matrix indicates the structure of the interface between the land use and transportation submodels. Each row represents one of the matrices of transportation demand and indicates the producing factors (in the corresponding columns in the matrix above) whose matrices of trades are related to that flow.

The remaining three matrices at the bottom show the structure of the transportation model. Five modes are available, and each mode can consist of several different types of activity on different types of links. The matrix directly to the right shows that all modes are available to all flows (m). The matrix below this, on the right, indicates the travel states (s) that make up each mode. The matrix on the left shows which travel states are allowed on each transportation network link and whether capacity restraint is in effect (a) or not (w). The design of the mode choice and assignment models is based on the Sacramento Regional Travel Demand model. A more detailed description of the Sacramento MEPLAN model design can be found in Abraham's dissertation (2000).

3.3 Applications of Sacramento Regional MEPLAN Model

3.3.1 Blueprint

In 2005/2006 SACOG engaged in a long-range visioning process that involved citizens, planners, and elected officials from the various counties and municipalities that make up the SACOG study area. This effort was in part a response to substantial growth forecasts for this region that estimated an increase of 1.7 million new people in the region by 2050. The MEPLAN model was used in this "Sacramento Region Blueprint Project," to forecast what the increase in population would look like in terms of land development, congestion, travel times, and air quality. A "Future Base Case" was established that allocated the forecast growth, in both population and employment, to land and the increased travel to the road and transit networks. This forecast was then presented as a starting point for the regional planning process.

SACOG's regional travel demand model, SACMET, was converted to a MEPLAN format for the Blueprint analysis. MEPLAN uses "regional analysis districts" (RADs), which are groupings of "traffic analysis zones" (TAZs). The full SACMET roadway and transit networks are used in MEPLAN with the RAD "centroids" connected to the detailed transportation networks through multiple "centroid connectors." The resulting traffic assignments are less accurate than SACMET on the local roadway system but similar to SACMET on the regional roadway system and provide an adequate input to a model that allocates development at a RAD level. The model was calibrated to a year 2000 base year, and ran in 2.5-year time steps out to 2050. According to SACOG, the travel model performance gives an adequate response over time on a regional level (congestion response over time).

The Future Base Case land use scenario contained 800,000 vacant acres zoned for development, of which only roughly 250,000 were assumed to be consumed by 2050. This scenario was intended to represent a market-oriented outcome in which developers could build and households and employment could be located where they received the highest benefit without land use or zoning restrictions. This scenario produced a fairly low density sprawling region with large increases in travel times due to network congestion. The travel outputs were input into the region's air quality model to produce forecasts of air pollution for the analysis year. These forecasts demonstrated that an uncontrolled urban future would lead to increased air pollution and a failure to meet U.S. EPA air quality standards (i.e., SACOG would become a non-attainment region).

This Future Base Case was used as a starting point in the numerous citizen meetings held throughout the region. Citizens were asked to evaluate smaller geographies, typically in the vicinity of where the meeting was being held. As the meetings progress from the local level to the county level the geographies being considered increased until they reached the regional level. The PLACE^{3}S (**PLA**nning for **C**ommunity **E**nergy, **E**conomics, and **E**nvironmental **S**ustainability) planning tool was used at these meetings to give real-time feedback to citizens as they manipulated the physical layout of the region to better suit their "vision" of Sacramento's future. MEPLAN was also employed at the conclusion of this process to obtain regionwide impacts for the preferred land use scenario. Throughout this process the

ability of MEPLAN to represent both the land use response and the traffic response to the alternatives considered added value as well as an economic reality check on the feasibility of the scenarios for SACOG's planning staff.

3.3.2 Long-Range Transportation and Land Use Scenarios (Mineta Foundation)

In the Sacramento Region Blueprint Project, citizens were only able to manipulate two characteristics of the region, the density and the use of land. The region's travel networks—which represented the region's transportation improvement program (TIP) and long-range development plan (LRDP)—were maintained in the MEPLAN analysis regardless of the land use scenario being tested. This was for a variety of reasons, not the least of which was simplification of an already complex process.

At the same time the Blueprint Project was being conducted the Mineta Transportation Institute (MTI) funded a project that also used the Sacramento MEPLAN model to analyze citizen-generated scenarios (Johnston et al., 2005). That work differed from the Blueprint Project in several important ways. The outreach for the MTI project was not as comprehensive. Only two citizens groups, who focus on environmental and equity issues, were selected for that project rather than the public at-large. The selected citizens groups were given full access to the model (street networks, bus and light rail transit systems, land use, densities, and growth boundaries). Also, rather than start at the neighborhood level and move successively up in scale, the citizen groups were only allowed to generate alternative scenarios at the regional level (all six counties in the SACOG study area). The intermediate step of using PLACE^{3}S was omitted and scenarios were input directly into MEPLAN for analysis.

The citizens groups chose to remove all road expansion (including HOV lane additions or expansions) and interchange improvements from 2005 on in the region and redirect the infrastructure money into a set of ambitious transit investments, including an expanded light rail transit (LRT) system and the development of a bus rapid transit (BRT) system. The citizens also employed an aggressive urban growth boundary and a per trip road pricing policy. These were modeled in the following combinations: Scenario 1—transit improvement scenario, Scenario 2—urban growth boundary, Scenario 3—transit improvements with urban growth boundary, Scenario 4—transit improvements with trip-based pricing, and Scenario 5—transit improvements with urban growth boundary and trip based pricing. Several of the combinations were shown to reduce region wide VMT (and by consequence, vehicle emissions) by significant amounts over the modeled period. In addition, traveler welfare measures were used to analyze the degree to which travelers were hurt or benefited from the citizen's scenarios. All of the scenarios produced a net benefit to lower income households. Scenarios 1 and 4 caused middle and upper income households to be worse off than the market-oriented Future Base Case. These scenarios also produced a net loss to the region as a whole. Scenarios 2 and 3 benefited all income levels and the region as a whole. Scenario 5 benefited the lower and middle income households but hurt the higher income households. It did, however, benefit the region overall.

The results and conclusions of the MTI study are interesting and readers are encouraged to reference the full text of the report. However, for the purposes of this technical study for the Tier 1 EIS/EIR, it is most import to note that the MEPLAN model has been demonstrated in the MTI study and others (see Rodier et al., 2002, and Hunt et al., 2001 for examples) to be able to effectively rank a broad range of land and transport scenarios across a number of relevant indicators. In the MTI study the results were shown to SACOG planning and modeling staff before publication. The authors concluded, ". . . a model such as MEPLAN can produce broadly reasonable rankings for a variety of policy scenarios 50 years into the future" (p. 43).

4.0 USE OF MEPLAN FOR PLACER PARKWAY TIER 1 EIS/EIR

The Project Team for Placer Parkway explained to SACOG its desire to explore the potential use of MEPLAN in the Parkway planning process, specifically to:

- Identify the potential for growth with and without the project, and
- Differentiate the potential for growth inducement among alternatives.

SACOG agreed that the model would be a useful tool for this purpose. They recommended that the model's assumptions about future land supply by RAD be modified to reflect recent local government input to SACOG for implementing the Blueprint through the ongoing 2035 MTP update. SACOG subsequently provided the revised land supply information for each RAD.

To help distinguish between Parkway alternatives it was desirable to split some MEPLAN zones. Table 2 describes the locations where three MEPLAN zones where the split into two or three zones each. The MEPLAN zone system used for the Parkway analysis is shown in Figure 8.

Table 2:
MEPLAN Zone Splits used in Analysis of Placer Parkway Alternatives

MEPLAN Zones [1]	Split Zones[2]	Geographic Area[3]
30 (South Sutter County)	30	North of Sankey Road
	60	South of Sankey Road
73 (West Placer County)	61	South of a line about 2 miles north of Baseline Road
	62	From 2 miles north of Baseline Road to Sunset Boulevard West
	73	North of Sunset Boulevard West
71 (Rocklin)	63	West of SR 65
	71	East of SR 65

See Figure 8 for MEPLAN zone boundaries

5.0 RESULTS OF MEPLAN ANALYSIS

Tables 3 through 6 show the estimated change in 2040 development levels in each MEPLAN zone between the No-Build Alternative and the selected build alternatives based on the MEPLAN model. The percentage change in development due to the build alternatives is shown graphically in Figures 9 through 16. Tables 7 and 8 focus on the change in households and jobs in the "local project vicinity," a geographic area, shown on Figures 9 through 16, in the vicinity of the proposed project where land use information is available at the RAD level. This combination of RADs does not constitute a formal project "study area" for the project as defined in the Tier 1 EIS/EIR.

A review of these tables and figures indicates the following:

- The MEPLAN model maintains the same amount of 2040 development (households and jobs) in the six-county region[2] but it allocates 2040 development somewhat differently with the build alternatives than with the No-Build Alternative due to the change in accessibility provided by Placer Parkway.

- Compared to the No-Build Alternative, the MEPLAN model estimates that about 1,000 to 1,200 additional households would develop by 2040 in the local project vicinity with the build alternatives (see Table 7). The amount of residential development in the remainder of the region would decrease by about the same amount.

- The 1,000 to 1,200 additional households represent an increase of about 0.4 percent in the total number of households in the local project vicinity by 2040.

- Although Figures 9 through 16 show that in some rural portions of Yuba, Sutter, and Yolo counties the build alternatives would have changes in households compared to the No-Build Alternative, the increase or decrease of 0.5 to 2 percent in these rural areas is a small number of households (less than 50 in any MEPLAN zone)

- The MEPLAN model estimates that Alternative 1 would have about the same number of households in the local project vicinity as Alternative 5 (see Table 7). The addition of a Watt Avenue interchange on Placer Parkway would increase the number of households in the local project vicinity by about 180 for Alternative 1 and by about 70 for Alternative 5.

- Compared to the No-Build Alternative, the MEPLAN model estimates that about 1,800 to 2,100 additional jobs would exist by 2040 in the local project vicinity (see Table 8) with the build alternatives. The amount of jobs in the remainder of the region would decrease by about the same amount.

- The 1,800 to 2,100 additional jobs represent an increase of about 0.6 percent to 0.7 percent in the total number of jobs in the local project vicinity by 2040.

- The MEPLAN model estimates that Alternative 1 would have about 100 more jobs in the local project vicinity than Alternative 5 (see Table 8). The addition of a Watt Avenue interchange on Placer Parkway would increase the number of jobs in the local project vicinity by about 200 for Alternative 1 and by about 260 for Alternative 5.

[2] Regional totals between alternatives differ by no more than 0.02 percent.

- The location of the increase in households is somewhat influenced by the corridor alignment. A comparison between Figures 10 and 14 indicates that a small number of additional households would locate farther north under Alternative 5 than under Alternative 1. A similar comparison on the increase in jobs between Figures 9 and 13 shows less of a difference between Alternatives 1 and 5.

NATURAL ENVIRONMENT STUDY
PLACER PARKWAY CORRIDOR PRESERVATION TIER 1 EIS/ PROGRAM EIR

1.0 INTRODUCTION

1.1 TIER 1 EIS/PROGRAM EIR

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

Since the inception of the environmental planning process in 2003, the Placer County Transportation Planning Agency (PCTPA) has been committed to developing Placer Parkway following an ecosystem approach, as described in recent guidance from the U.S. Department of Transportation, called *Eco-Logical: An Ecosystem Approach to Developing Infrastructure Projects* (Brown, 2006).

Eco-Logical presents a guideline for mitigating infrastructure projects with the goal of preserving ecosystems, as opposed to individual resources, while facilitating the public projects that encourage economic growth and stabilize communities through interagency cooperation. The document was approved by many federal agencies including, but not limited to, U.S. Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), U.S. Department of Transportation (USDOT), and the U.S. Environmental Protection Agency (U.S. EPA). The guidelines for ecosystem mitigation proposed in the document stress the importance of conserving large-scale, multi-resource areas, reducing habitat fragmentation, following through with negotiated mitigation measures and increasing public and stakeholder involvement at key stages throughout projects. Examples of the ecosystem approach are highlighted in the following sections: increased transparency in communication with stakeholder groups and agencies (Section 3.3); protection of larger scale, multi-resource ecosystem and reduction of habitat fragmentation (Section 5.5);

and predictability, including the knowledge that commitment made by all agencies will be honored (Section 6.1).

1.2 CORRIDOR SELECTION AND PRESERVATION

The concept for the Placer Parkway is over a decade old. Placer County's 1994 General Plan depicts a "plan line" for it. Two planning studies helped to refine the concept:

- DKS Associates, 2000, Placer Parkway Interconnect Study/Conceptual Plan
- DKS Associates, 2001, Project Study Report (Project Development Support) for Placer Parkway

Placer Parkway is cited as a high priority regional transportation project by the Sacramento Area Council of Governments (SACOG) 2025 Metropolitan Transportation Plan and the 2027 Placer County Regional Transportation Plan. The project vicinity and surrounding area include some of the fastest growing communities in the Sacramento region. A number of large urban development proposals are being considered by Placer and Sutter counties. New development is expected to add a significant amount of residential, commercial, industrial, and educational uses.

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included representatives from planning and public works departments of all affected cities and counties, environmental, business, agricultural, development, and homeowner interests (the Study Advisory Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report will analyze these five corridor alternatives along with a No-Build Alternative.

Other potential transportation modes such as bus rapid transit may be developed in the corridor in the future, although they are not proposed as part of the current project. The corridor for the Placer Parkway is to vary from approximately 500 feet wide in the Eastern and Western segments to approximately 1,000 feet wide in the Central Segment. Depending upon the alternative, the corridor's length ranges from a minimum of 14.2 miles to a maximum of 16.2 miles. The selected corridor would contain the roadway, including the median, travel lanes, shoulder, associated access ramps and a no-development buffer zone.

Corridor acquisition may not be completed until after Tier 2, as funding becomes available. Portions of the selected corridor will be preserved as a no-development buffer zone. The buffer would be maintained as a zone where development is either not permitted or is severely restricted. This is intended to restrict access to the proposed interchanges, protect the rural character of agriculturally designated areas in the vicinity of the Parkway as far as possible subject to future development, and to maximize opportunities to incorporate adjacent sensitive areas. It is intended that the buffer would be owned and managed in the future to achieve these objectives. For subsequent Tier 2 (project-level) environmental reviews, the size of this buffer zone could be considered flexible for agriculturally designated land undergoing urban development. In the Tier 2 environmental review, the specific buffer size and location would be determined. This determination would be based on performance standards on a case-by-case basis, depending on the land use needs of future approved development, and taking into account the primary objective of restricting future access to the Parkway.

Project proponents are considering employment of several land management and control mechanisms in order to ensure that the buffer would be effectively maintained as an area where development would either not be permitted, and where construction of any additional access onto the Parkway would not be allowed. These mechanisms could include land use controls, land purchase/leases, general plan

amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, urban growth boundaries, etc. "Layering" or using several of these methods would provide more assurance the buffers would be permanent, or at least more difficult to undo.

1.3 TECHNICAL STUDY OBJECTIVE

This Natural Environment Study has been prepared to support the Tier 1 Environmental Impact Statement/Program Environmental Impact Report. It presents a Tier 1/Program level assessment of potential impacts related to natural resources for five corridor alternatives and the No-Build Alternative as described in Chapter 2.

The scope of work performed for this report is based on the Caltrans Natural Environment Study Template (Caltrans, 2005a), as modified for purposes of Tier 1/Program analysis by agreement of the California Department of Transportation (Caltrans), the Caltrans Highway Design Manual (HDM) (Caltrans, 2001b), and the Caltrans Environmental Handbook (Caltrans, 2005b) on preparing a Natural Environment Study. In addition, the evaluation considered guidance from the Federal Highway Administration (FHWA), Environmental Checklists for Draft and Final Environmental Documents (FHWA, 1998a; FHWA, 1998b).

This report is organized as follows:

Chapter 2: The Proposed Action
Chapter 3: Study Methods
Chapter 4: Environmental Setting
Chapter 5: Biological Resources, Discussion of Impacts and Mitigation
Chapter 6: Regulatory Requirements and Additional Analyses
Chapter 7: References

This report also includes figures and tables, which show the project location, each build alternative, and pertinent technical information prepared to evaluate the build alternatives.

Throughout this document, the Placer Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

2.0 THE PROPOSED ACTION

The Proposed Action for the Placer Parkway Corridor Preservation Project is to select and preserve a 500- to 1,000-foot-wide corridor in the project study area, within which the future four- or six-lane Placer Parkway may be constructed. The ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction, and operation of the Parkway. Although the action taken at Tier 1 on the Placer Parkway Corridor Preservation Project is limited, the underlying project whose effects are studied in this document is the Placer Parkway. To the extent feasible at this early stage, the Tier 1 EIS/EIR addresses the potential effects of construction and operation of the future roadway.

2.1 THE PROJECT STUDY AREA

The project study area is an area of approximately 33,460 acres located in Placer and Sutter Counties, with a small section located in Sacramento County (see Figures 1-1 and 2-1). It extends from SR 70/99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego roads. The portion of the study area in Sacramento County is located in the extreme southwest corner of the study area and does not include any of the proposed corridor alignment alternatives.

For the purposes of the analysis the study area is divided into three segments:

- Western Segment: the Western Segment extends from SR 70/99 to Pleasant Grove Road in Sutter County.
- Central Segment: the Central Segment extends from Pleasant Grove Road in Sutter County to approximately 2,300 feet north of Pleasant Grove Creek in Placer County.
- Eastern Segment: the Eastern Segment extends from approximately 2,300 feet north of Pleasant Grove Creek to SR 65 in Placer County.

2.2 CORRIDOR ALTERNATIVES

The following subsections describe the corridor alternatives, which are depicted on Figure 2-1, and are numbered according to location from south to north in the study area.

2.2.1 The No-Build Alternative

In this alternative, the project would not be implemented. A Placer Parkway corridor would not be selected/preserved, and the future Placer Parkway would not be constructed.

2.2.2 Alternative 1 – the Red Alternative

Alternative 1 would extend from SR 70/99 approximately ½ mile north of Riego Road, eastward approximately 1 mile north of Baseline Road to approximately Watt Avenue, proceeding north and transitioning in an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment alternative is 16.2 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.3 Alternative 2 – the Orange Alternative

Alternative 2 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed northeast, then in a northerly direction south of Pleasant Grove Creek, transitioning to an easterly direction before it reaches Sunset Boulevard West, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.4 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.4 Alternative 3 – the Blue Alternative

Alternative 3 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed north along the Sutter/Placer County Line, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.6 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.5 Alternative 4 – the Yellow Alternative

Alternative 4 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.3 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.2.6 Alternative 5 – the Green Alternative

Alternative 5 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 4,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.2 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.3 PARKWAY DESIGN ASSUMPTIONS

Although the Parkway would be designed and construction-level impacts analyzed during Tier 2, for the purpose of this report and the Tier 1 EIS/Program EIR, several assumptions have been made about potential design and configuration concepts. These assumptions would be subject to further development and refinement, and specific decisions about design of the roadway would be made during the Tier 2 process. For example, the number, location, and design of over-crossings would be determined at the time of final Parkway design, in consultation with local jurisdictions. The following sections outline assumptions for the future roadway.

Preliminary costs estimates for the Parkway range from $600 to $650 million (2005 dollars). This includes costs for right-of-way, design, construction, and environmental mitigation for the four- to six-lane facility. The funding situation has spurred interest in exploring other more creative funding options.

These include a county-wide sales tax, more developer contributions, and tolling facilities. The Technical Report and Tier 1 EIS/EIR do not make any assumptions about funding sources.

2.3.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane facility. A preliminary conceptual cross section (see Figure 2-2) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/Program EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

2.3.2 Conceptual Roadway Elevation

As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to would span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on either side of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways, or trails.

Throughout the project study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These

over-crossings would not connect to the Parkway. Parkway access would be via the interchanges described below.

2.3.3 Interchange Concepts

The analysis assumes that the location of interchanges (see Figure 2-1) is as follows.

- SR 70/99 (at ½ mile north of Riego Road or at Sankey Road)
- One or two locations to be determined in southern Sutter County
- Fiddyment Road
- Foothills Boulevard
- SR 65 at Whitney Ranch Parkway

The following discussion outlines concepts and assumptions for the six interchanges that could potentially serve Placer Parkway.

2.3.3.1 Western Segment

Within the Western Segment of the Parkway, a high-speed, freeway-to-freeway type interchange would connect the Parkway with SR 70/99 at one of following potential locations depending on the project alternative (see Section 2.2). Placer Parkway would terminate at SR 70/99.

- **Placer Parkway/SR 70/99 Interchange at North of Riego Road.** This alternative concept uses "braided" ramps to eliminate weaving problems or conflicts with the future SR 70/99 at Riego Road interchange being developed by Sutter County and Caltrans.

- **Placer Parkway/SR 70/99 Interchange at Sankey Road.** Under this alternative concept, the existing two-lane Sankey Road would be realigned to the south of Placer Parkway and the proposed freeway-to-freeway interchange, extending from approximately ¼ mile west of SR 70/99 to approximately ¼ mile east of the Union Pacific railroad tracks. There would be no direct access to SR 70/99 or Placer Parkway from the realigned Sankey Road.

Depending on the final alignment selected, one or two additional interchanges would also be located in south Sutter County. Conceptual locations are identified for purposes of this Tier 1/Program analysis (see Figure 2-1). The actual location of these interchanges would be developed in the Tier 2 phase, based on Sutter County requirements.

2.3.3.2 Central Segment

Within the Central Segment of the Parkway, there would not be any access proposed as part of the project in the 7-mile segment between Fiddyment Road and Pleasant Grove Road. Please see Section 2.4 regarding a potential connection to a future extension of Watt Avenue (Figure 2-3) which could be proposed and constructed by others in the Central Segment; such an interchange is not part of the Placer Parkway.

2.3.3.3 Eastern Segment

Within the Eastern Segment of the Parkway, a signalized high-speed freeway-to-freeway and local access interchange would connect the Parkway to SR 65 at Whitney Ranch Parkway (Figure 2-1). From SR 65 eastward Placer Parkway would terminate and become Whitney Ranch Parkway east of the SR 65 exit ramp intersection. Traffic signals would be provided at the exit ramp terminals. This interchange would

be approximately 1 mile north of a planned SR 65/Sunset Boulevard interchange and 1.2 miles south of the existing Twelve Bridges interchange.

As part of this interchange, auxiliary lanes would be required on SR 65 in both directions to enhance traffic operations on the north side of the future SR 65/Sunset Boulevard interchange. The southbound SR 65 exit-ramp at Sunset Boulevard is being designed to accommodate an additional auxiliary lane required for the future Placer Parkway/Whitney Ranch Parkway interchange to minimize the reconstruction of this ramp in the future. Within the Eastern Segment of the Parkway, from SR 65 westward, two interchanges with local roadways would be constructed, one at Foothills Boulevard and one at Fiddyment Road, as depicted on Figure 2-1.

The future interchange on Placer Parkway at Fiddyment Road would be located near the existing intersection of Fiddyment Road and Sunset Boulevard West. To provide acceptable traffic operations, additional distance needs to be provided between the Fiddyment Road/Sunset Boulevard West intersection and the Fiddyment Road/Placer Parkway westbound off-ramp intersection. Therefore, Sunset Boulevard West will need to be realigned to the north as it nears Fiddyment Road.

2.3.4 Landscaping Concept

For the purposes of this environmental analysis, preliminary landscaping concepts have been developed for Placer Parkway. These are entirely conceptual and would be subject to further refinement during the Tier 2 environmental process. It is anticipated that landscaping would be used to reflect local topography and vistas in the study area and complement the varying character of land adjacent to the Parkway corridor. Landscape design would vary within the Parkway's three segments depending on corridor width and type and density of surrounding land uses. Landscaping would be used within the median and the Parkway buffer zone to enhance the aesthetics of the Parkway, and would be used to provide screening and enhance local and long distance views. Where appropriate, more concentrated plantings would be considered to buffer the Parkway from future adjacent land uses that may be incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Landscape design would likely include a mix of compatible native and non-native plants that may require some irrigation. Wherever possible, native plant species would be used in line with Caltrans policy. Where possible and depending on availability, feasibility and cost, recycled water would be used for irrigation.

During a future design phase, lighting elements would be designed for safety and would consider the proposed landscaping plan in order to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower-voltage lighting, and proposing lighting fixtures that conform with the visual character of the area).

2.4 POTENTIAL WATT AVENUE INTERCHANGE

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 2-3). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/Program EIR. However, the connection of Placer Parkway to a potential Watt Avenue extension could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/Program EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential

Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges to Placer Parkway.

2.5 AGENCY PERMITS AND APPROVALS

The Proposed Action would preserve a preferred corridor for a future transportation facility. In the future, permits and approvals would be obtained from appropriate agencies prior to construction of the Parkway. These permits and approvals may include specific design or mitigation requirements that would be incorporated into the project.

2.6 SUBSEQUENT TIER 2 INFORMATION

As noted earlier, the design and construction of Placer Parkway—including its interchanges and over-crossings, and ancillary features such as stream crossings, safety devices, stormwater management structures, and similar improvements—would be evaluated in a subsequent Tier 2 environmental review process once a corridor has been identified. Chapter 6 provides more detailed information regarding Tier 2 studies.

3.0 STUDY METHODS

3.1 REGULATORY SETTING

Both NEPA and CEQA require consideration of impacts to biological resources. A general discussion of NEPA and CEQA requirements is provided in Chapter 1 of this Tier 1 EIS/EIR. In addition, other types of legislation address biological resources. Relevant laws and guidelines are described below.

Pre-project coordination among agencies and stakeholders has been extensive and is modeled after the *Eco-Logical* approach described by Brown (2006).

3.1.1 Federal Regulations

Federal regulations that apply to biological resources include the federal Endangered Species Act (ESA), Sections 404 and 401 of the federal Clean Water Act, and the Migratory Bird Treaty Act.

3.1.1.1 Federal Endangered Species Act

The federal ESA prohibits take of endangered or threatened species. Take is defined to include harassing, harming (including substantially modifying or degrading habitat), pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species or any attempt to engage in such conduct (16 USC 1532, 50 CFR 17.3). Actions that result in take can result in civil or criminal penalties. If a proposed project would result in a take of a federally listed species, the Applicant is required to acquire a take permit under Section 10 or a biological opinion under Section 7 of the Act. A Section 7 consultation and biological opinion is typically pursued through the nexus of the USCOE as the lead federal permitting agency (see below).

3.1.1.2 Sections 404 and 401 of the Federal Clean Water Act

The USCOE and the U.S. EPA regulate the discharge of dredged and fill material into "waters of the United States" (waters) under Section 404 of the Clean Water Act. USCOE jurisdiction over nontidal waters encompasses navigable waters and their tributaries, and wetlands adjacent to these waters that will either be directly or indirectly affected by a proposed project.

Section 401 of the Clean Water Act requires any Applicant receiving a Section 404 permit from the USCOE to obtain a Section 401 water quality certification from the state. The Central Valley Regional Water Quality Control Board (CVRWQCB) is the state agency responsible for issuance of water quality certifications in West Placer County. A water quality certification is issued when an Applicant can demonstrate that a project will comply with state water quality standards and other aquatic resource protection requirements. Conditions of the 401 Certification become conditions of the federal permit.

3.1.1.3 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (16 USC § 703 712) prohibits the take of any migratory bird. Under this act, it is unlawful to take, possess, import, export, transport, sell, offer for sale, purchase, or barter any migratory bird, or any part, nest, or eggs of any such bird except under the terms of a valid permit. Under this act, take is defined as the action of or attempt to pursue, hunt, shoot, collect, or kill.

3.1.2 State Regulations

3.1.2.1 California Endangered Species Act

The California ESA is similar to the federal ESA but pertains only to state threatened and endangered species. The California ESA requires state agencies to consult with the California Department of Fish and Game (CDFG) when preparing documents under CEQA to ensure that the actions of the state lead agency do not jeopardize the continued existence of listed species. The California ESA prohibits take of state-listed plant and animal species. CDFG may authorize take if there is an approved habitat management plan or management agreement that avoids or compensates for impacts on listed species. The California ESA requires agencies to consult with the CDFG on projects or actions that could affect listed species, directs the CDFG to determine whether jeopardy to listed species would occur, and allows the CDFG to identify "reasonable and prudent alternatives" to the project consistent with conserving the species. Agencies can approve a project that affects a listed species if the agency determines that there are overriding considerations; however, the agencies are prohibited from approving projects that would cause the extinction of a listed species.

Mitigating impacts to state-listed species involves avoidance, minimization, and compensation. Unavoidable impacts on state-listed species are typically addressed in a detailed mitigation plan prepared in accordance with CDFG guidelines. The CDFG exercises authority over mitigation projects involving state-listed species, including those resulting from CEQA mitigation requirements.

3.1.2.2 Fish and Game Code Section 1600: Streambed Alteration Agreements

Under Chapter 6 of the CDFG Code, CDFG is responsible for the protection and conservation of the state's fish and wildlife resources. Section 1600 et seq. of the Code defines the responsibilities of CDFG and the requirements for public and private project proponents to obtain an agreement to "divert, obstruct, or change the natural flow or bed, channel or bank of any river, stream, or lake designated by the department in which there is at any time an existing fish or wildlife resources or from which those resources derive benefit, or will use material from the streambeds designated by the department." Public agencies file 1602 applications, and private parties file 1603 applications for streambed alteration agreements.

The regional office of the CDFG typically has responsibility for issuing streambed alteration agreements in coordination with the local warden and the unit biologist. These agreements usually include specific requirements related to construction techniques and remedial and compensatory measures to mitigate for adverse impacts. CDFG may also require long-term monitoring as part of an agreement to assess the effectiveness of the proposed mitigation.

3.1.2.3 Native Plant Protection Act

The Native Plant Protection Act of 1977 designates rare and endangered plants and provides specific protection measures for identified populations.

3.1.2.4 Porter-Cologne Act

The Porter-Cologne Water Quality Control Act (Porter-Cologne Act) of 1970 grants the State Water Resources Control Board (SWRCB) and its regional offices power to protect water quality and is the primary vehicle for implementation of California's responsibilities under Section 401 of the federal Clean Water Act. The Porter-Cologne Act grants the SWRCB authority and responsibility to adopt plans and policies, regulate discharges to surface and groundwater, regulate waste disposal sites, and require cleanup of discharges of hazardous materials and other pollutants.

3.1.3 General Plans and Policies

3.1.3.1 Sutter County General Plan

The Sutter County General Plan, which was adopted in 1996, contains policies to preserve open space, agricultural and natural resources, the most relevant of which are listed below.

Goal 4.B To protect wetland and riparian areas throughout Sutter County.

Goal 4.C To protect and enhance habitats that support fish and wildlife species.

Goal 4.D To preserve and protect the vegetation resources of Sutter County.

Goal 4.E To conserve, protect and enhance open space lands and natural resources in Sutter County.

Specific policies and implementation objectives related to the achievement of each of these goals are included in the General Plan.

3.1.3.2 Placer County General Plan and Legacy Open Space and Agricultural Conservation Program

The Placer County General Plan, adopted in 1994, contains policies to preserve open space, agricultural and natural resources, the most relevant of which are listed in this section. In December 1997, the Placer County Board of Supervisors directed the Planning Director to initiate a program to provide for long-term preservation of open space in Placer County. In April 1998, the Board of Supervisors formed a citizen advisory committee and initiated an open space implementation program in accordance with specified goals, elements, and measures of success. This program became the Placer Legacy Program. The specific objectives of the Placer Legacy Program are to:

- Maintain a viable agricultural segment of the economy;
- Conserve natural features and necessary access to a variety of outdoor recreation opportunities;
- Retain important and historic areas;
- Preserve the diversity of plant and animal communities;
- Protect Endangered and other special-status plant and animal species;
- Separate urban areas into distinct communities; and
- Ensure public safety.

Based on input and analysis from the Scientific Working Group, the Citizens Advisory Committee and the public, the County identified guidelines for preparation of a joint Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP). These guidelines have been incorporated into the Placer Legacy Program's implementation documents, the Placer Legacy Program Summary Report (June 2000), and the Placer Legacy Program Implementation Report (June 2000).

The parties listed above and other public agencies have entered into the "Framework Agreement regarding the Planning, Development and Implementation of the Placer Legacy Program," which established a framework for cooperation and collaboration among state and federal agencies and local governments in the development and implementation of the Placer Legacy Program. It describes opportunities for partnership and collaboration among the County, cities in the County, the Placer County Water Agency, and the state and federal regulatory and land management agencies in the development of the Placer Legacy Program. At present, the Placer Legacy Program is not complete or active.

3.1.4 Placer County Conservation Plan

The PCCP is a proposed strategy and regulatory framework designed to guide and streamline permitting for large-scale development in western Placer County over the next 50 years while establishing a network of conservation areas to protect and conserve sensitive species and natural communities. The PCCP covers approximately 221,000 acres in western Placer County, including important natural communities such as stream environments, vernal pool grasslands, grasslands, blue oak and valley oak woodlands, and agricultural lands such as rice. Many stream and wetland resources found in the western part of Placer County are regulated under the federal Endangered Species Act (ESA) and the Clean Water Act (CWA) because they provide aquatic habitat for threatened and endangered species. The goal of combining these regulatory frameworks is a streamlined permitting process and greater environmental benefits. SPRTA has indicated its intention to become a participating agency with the Parkway as a covered activity.

3.1.4.1 The Natomas Basin Habitat Conservation Plan

A large portion of the Western Segment of the study area falls within Sutter County and northern Sacramento County. These areas are part of a geographic region called the Natomas Basin. The Natomas Basin Habitat Conservation Plan (NBHCP) was established in 1997 as a multi-species conservation program to mitigate the expected loss of habitat values and incidental take of protected species that would result from urban development, operation of irrigation and drainage systems, and rice farming. The Natomas Basin Conservancy (NBC) manages the implementation of the NBHCP.

3.1.4.2 Placer County Tree Ordinance

The Placer County Tree Ordinance applies to any project with the potential to affect protected trees. Protected trees are defined as any native tree species with a diameter at breast height (DBH) of 6 inches or greater. The Placer County Tree Ordinance acknowledges the County's value for native trees and their preservation. This ordinance prohibits the removal of landmark trees, including stands or groves of native trees, native tree corridors, and other important native tree habitats. In addition, trees that are designated for preservation and avoidance are not to be damaged, and damage penalties of up to $50,000 per scar can be assessed by the County.

3.2 STUDIES REQUIRED

The study area was evaluated from existing field studies and reports, aerial photography and geographic information systems (GIS) data. Limited field visits were conducted to verify aerial photography and GIS data. The aerial photography of the study area was flown in 2004 (AirPhoto USA, 2004). GIS data were compiled from a variety of sources, primarily Placer County and the California Department of Fish and Game. GIS coverage includes special-status species from the California Natural Diversity Data Base (CDFG, 2006) and Natomas Basin Conservancy (CH2M Hill, 2003), vernal pools (CDFG, 1998a; Placer County, 2003a), wetlands (CDFG, 1997), and riparian areas (CDFG, 1997; Placer County, 2003a). Existing environmental studies for large portions of the study area were reviewed for pertinent information on biological resources as follows:

- City of Roseville Retention Basin Project Draft Environmental Impact Report (URS and PWA, 2002a)
- Roseville Energy Facility Application for Certification (URS, 2001)
- West Roseville Specific Plan Draft Environmental Impact Report (EIP Associates, 2003)
- Placer Legacy Open Space and Agricultural Conservation Program (Placer County, 2000, 2003c; 2004; PRBO, 2006)

- Natomas Basin Conservancy (Estep, 2002, 2003; Wylie and Martin, 2002; Wylie et al., 2004)
- Sierra Vista Specific Plan Preliminary Constraints Map (City of Roseville, 2005a)
- Creekview Specific Plan Preliminary Constraints Map (City of Roseville, 2005b)
- Placer Ranch wetland delineation (ECORP, 2005)
- Placer Vineyards DEIR (Placer County, 2006)
- Pleasant Grove and Curry Creek Ecosystem Restoration Plan (Foothill Associates, 2005)

3.3 PERSONNEL AND SURVEY DATES

A field verification survey was carried out on March 8, 2006, with the objective of verifying the approximate geographic limit of wetlands, stream crossings and sensitive habitats in the study area and characterizing these resources. Field surveys were limited to areas with public access or visible from public roadways. Field surveys were also used to verify that existing aerial photography (Airphoto USA, 2004) and GIS data are current and accurate.

3.4 AGENCY COORDINATION AND PROFESSIONAL CONTACTS

Additional details about public participation activities conducted for the Placer Parkway Tier 1 EIS/EIR are provided in the Placer Parkway Public Participation Methodology Report, available on the PCTPA website.

In addition, FHWA, Caltrans, and PCTPA agreed in spring 2004 to participate with the U.S. Army Corps of Engineers (USCOE) and the U.S. EPA in a modified National Environmental Policy Act (NEPA)/404 process.

3.5 LIMITATION THAT MAY INFLUENCE RESULTS

The majority of the land in the study area is privately owned. A complete ground reconnaissance of the biological resources within the study area was not feasible, nor is one appropriate at the Tier 1 level of environmental analysis. However, this NES includes evaluation of extensive GIS mapping of resources in the area that has been developed over a number of years in conjunction with several other projects, such as the proposed Placer County Conservation Plan (PCCP) and Natomas Basin Habitat Conservation Plan efforts, and various Specific Plans in the eastern area of the study area. In addition, recent (2004) high-quality aerial photographs were reviewed for the entire study area.

4.0 ENVIRONMENTAL SETTING

This chapter describes the physical and biological characteristics of the study area and the vicinity.

4.1 DESCRIPTION OF THE EXISTING BIOLOGICAL AND PHYSICAL CONDITIONS

4.1.1 Physical Conditions

The study area is located in a transitional zone between the Sierra Nevada foothills and the lowlands of the Central Valley (Placer County, 2000). Undeveloped areas support a mix of cultivated rice fields, grasslands, agricultural fields, intermittent streams, riparian woodland, freshwater marsh, vernal pools and other seasonal wetlands. Developed areas are located intermittently throughout the study area (Figure 2-1). Large commercial developments are generally found in the southwestern and northeastern corners of the study area, and rural residential development is scattered throughout. The Western Segment of the study area is partly located within the former floodplain of the Sacramento River. The low, floodplain areas are predominately in rice cultivation. Rice fields are typically inundated by irrigation water during the growing season and by rainwater during the winter as well as from upstream runoff from urban development.

4.1.2 Habitats and Natural Communities

Rice fields and irrigation channels are used by flocks of wintering and migratory waterfowl. The eastern side of the Western Segment and the entire Central Segment of the study area are comprised of a patchwork of seasonally flooded habitat and drier annual grasslands/agricultural areas, which are either dry-farmed, irrigated for crops, or used for livestock grazing. As the study area transitions to the foothills of the Sierra-Nevada in the Eastern Segment of the study area, habitat is almost entirely comprised of grassland/cultivated types that favor foraging raptors and other grassland birds and terrestrial wildlife. The patchwork of these two predominant habitat types within the study area is depicted in Figure 4-1. Other important habitat types, such as freshwater marsh wetlands and vernal pool complexes, are spread throughout the entire study area. Descriptions of each habitat type are provided below.

Cultivated Rice Fields and Other Seasonally Flooded Habitat. Rice fields in the study area are leveled and terraced to facilitate seasonal inundation. Fields are typically inundated during the growing season from late May to early August. Some fields may be flooded again during the winter months to attract waterfowl. Vegetation along the margins of rice fields is typically dominated by ruderal[1], non-native species. Many species of migratory waterfowl use rice fields during the winter, depending on flooding cycles and management practices. Typical species include snow goose *(Chen caerulescens)*, greater white-fronted goose (*Anser albifrons*), northern shoveler (*Anas clypeata*), bufflehead (*Bucephala albeola*), and ruddy duck (*Oxyura jamaicensis*) (Placer County, 2003c).

Other Agricultural Habitats. Non-irrigated pasture and/or irrigated croplands comprise the majority of other agricultural habitats in the study area. These may include a mix of perennial grasses and legumes which may be used for grazing of livestock or seed producing grasses such as barley, rye and wheat which are planted in the fall and harvested in the spring. Many species of birds and rodents have adapted to use these habitats, and as a result larger birds of prey (hawks, falcons) also use them as foraging grounds.

Annual Grassland. Annual grassland is comprised of upland areas that have not been previously cultivated. This habitat type is made up of non-native and native species including ryegrass (*Lolium* sp.), barley (*Hordeum* sp.), ripgut brome (*Bromus diandrus*), and filaree (*Erodium* sp.). Annual grassland provides habitat for wildlife species such as western meadowlark (*Sturnella neglecta*), red-tailed hawk (*Buteo jamaicensis*), killdeer (*Charadrius vociferous*), western fence lizard (*Sceloporus occidentalis*),

[1] ruderal; def. a plant that grows in disturbed areas, poor land, or waste

voles (*Microtus* sp.), deer mice (*Peromyscus maniculatus*), coyote (*Canis latrans*), and other species. Annual grasslands in the study area are often associated with vernal pool wetlands.

Vernal Pools and Other Seasonal Wetlands. Vernal pools and other seasonal wetlands are typically located within a larger matrix of annual grasslands that are collectively referred to in this document as a "vernal pool complex." Figure 4-2 depicts the known vernal pools complexes, as well as wetlands and other waters of the United States, and riparian zones within the study area. The density and size of the vernal pools varies depending upon the location but the area of uplands is typically more than five times greater than the area of wetlands in a vernal pool-grassland complex. Vernal pools are shallow, seasonally inundated depressions that are underlain with a subsurface layer that limits water infiltration. The seasonal ponding and drying associated with vernal pools supports a unique community of plants and animals. Vernal pool vegetation in the study area is dominated by species such as coyote thistle (*Eryngium vaseyi*), popcorn flower (*Plagiobothrys stipitatus*), downingia (*Downingia* spp.), goldfields (*Lasthenia* spp.), quaking grass (*Briza minor*) and buttercup (*Ranunculus bonariensis*). Invertebrates, including listed vernal pool fairy shrimp (*Branchinecta lynchi*) and vernal pool tadpole shrimp (*Lepidurus packardi*) may occupy vernal pools and other seasonal wetlands in the study area.

Two types of vernal pools occur in Placer County: northern volcanic mudflow vernal pools (Brussard, 1999) and northern hardpan vernal pools. Northern volcanic mudflow types have an average pool size that is typically small (<100 m^2); the pools are irregularly spaced and do not form large pool complexes. Northern mudflow vernal pools have characteristically shallow soils, less than 30 cm deep, and are underlain by impervious mudflow welded tuff. They have a "flashy hydrology," which means they undergo filling and refilling many times over the wet season. Northern hardpan pools are typically found in complexes in areas of hummocky ground on old river terraces above the recent river floodplains and below the foothills. These pools are often larger than mudflow pools, and may be over 1 acre in size. The hydrology of hardpan vernal pools is less flashy and the pools remain filled longer than mudflow vernal pools (CDFG, 1998b).

Two primary sources were used to identify vernal pool complexes in the study area: mapping developed for the PCCP was used for portions of the study area in Placer County and the more general vernal pool habitat mapping available from the CDFG website (CDFG, 1998a) was used for the portions of the study area within Sutter and Sacramento counties that are not covered by PCCP data. Both of these data sources identify complexes (or groups) of vernal pools, not individual pools. The upland areas surrounding these pools are integral to the ecological community and are treated equally within the vernal pool complex. The CDFG vernal pool complex data for Sutter and Sacramento counties was augmented based on a review of 2002 aerial photographs (Airphoto USA, 2002).

Seasonal and Perennial[2] Streams. The study area is located within the Sacramento River Basin, which is bounded by the Sierra Nevada to the east, the Coast Ranges to the west, the Cascade Range and Trinity Mountains to the north, and the Delta-Central Sierra area to the south. The majority of the study area is east of the Natomas Basin and is within the watersheds of Pleasant Grove Creek, Curry Creek, and the Natomas East Main Drainage Canal (a.k.a., Steelhead Creek). A small portion of the study area in the northeastern corner is within the Auburn Ravine watershed (Figure 4-3).

Pleasant Grove Creek and Curry Creek drain into the Pleasant Grove Creek Drainage Canal that in turn drains to the Sacramento River via the Cross Canal in southern Sutter County. Steelhead Creek south of Curry Creek drains into the Natomas East Main Drainage Canal that also drains to the Sacramento River near the confluence with the American River. Some stretches of these streams have been channelized and the hydrology has been modified by the addition of urban and agricultural irrigation runoff during the dry season. All of the major creeks have deep indentations or have stretches that have deep indentations (Foothill Associates, 2005). These conditions are generally worse in the lower reaches of these watersheds.

[2] A seasonal stream is one that carries water only in certain times of the year (i.e., will have water in the winter and spring and will be dry in the summer and fall). A perennial stream is one that carries water throughout the year.

Prior to development within the watershed, Pleasant Grove Creek and its tributaries were seasonal streams; however, summer flows are now maintained by irrigation runoff from urban areas and cultivated fields (URS and PWA, 2002b). Pleasant Grove Creek has the largest drainage network within the study area. It originates in the far Eastern Segment of the study area and flows westward where it terminates in the Pleasant Grove Creek Drainage Canal (see more information about this canal below). Sections of Pleasant Grove Creek in the Central Segment support a mature riparian forest, as described in the riparian woodland section, below. Fish species likely to occur in Pleasant Grove Creek include California roach (*Lavinia symmetricus*), Sacramento sucker (*Catostomus occidentalis*), smallmouth bass (*Micropterus dolomieui*), and spotted bass (*Micropterus punctulatus*) (URS, 2002a).

Curry Creek has several tributaries that originate in the southeastern corner of the study area near Fiddyment Road and flow to the west. Curry Creek drains into the Pleasant Grove Creek Drainage Canal in the Western Segment of the study area, which in turn drains into the Sacramento River via the Cross Canal. Some segments of Curry Creek and its tributaries have been channelized and the bed of the stream is largely composed of fine sediment (URS, 2002b). Close to the boundary between Sutter and Placer counties, Curry Creek is approximately 25 feet wide with sparse woody riparian vegetation.

The Natomas East Main Drainage Canal Watershed south of Curry Creek originates near the southern edge of the study area near Baseline Road and drains into the Natomas East Main Drainage Canal, north of the confluence with Dry Creek. This creek drains into the Sacramento River via the Natomas East Main Drainage Canal and a pumping station that discharges the water near the confluence of the Sacramento and American rivers.

The Natomas East Main Drainage Canal is a constructed flood control facility that intersects the southwestern portion of the study area. This canal is accessible to migrating anadramous fish species, although it is considered unlikely that anadromous fish would successfully spawn or reside in any of the tributaries north of Dry Creek (GANDA, 2006). It flows from north to south in the Western Segment of the study area and drains into the Sacramento River just north of the City of Sacramento. The Pleasant Grove Creek Canal runs south to north in the Western Segment of the study area, north of Sankey Road, and flows into the Cross Canal.

Riparian Woodland. Riparian woodland borders most of the central reaches of Pleasant Grove Creek. Less developed riparian areas (with fewer large trees) occur adjacent to tributaries of Pleasant Grove Creek and limited areas of Curry Creek (Figure 4-2). Typical woody species include Goodding's willow (*Salix gooddingii*), Fremont cottonwood (*Populus fremontii*), and Valley oak (*Quercus lobata*). Large trees in or adjacent to riparian areas are considered habitat for state-listed Swainson's hawk. Understory riparian vegetation containing elderberry bushes (*Sambucus* sp.) is considered habitat for federally threatened Valley elderberry longhorn beetles (*Desmocerus californicus dimorphus*). This established riparian woodland supports a high diversity of resident and migratory bird species, such as scrub jay (*Aphelocoma coerulescens*), black-crowned night heron (*Nycticorax nycticorax*), ruby-crowned kinglet (*Regulus calendula*), Wilson's warbler (*Wilsonia pusilla*), Lincoln's sparrow (*Melospiza lincolnii*), great horned owl (*Bubo virginianus*), and Bullock's oriole (*Icterus bullockii*). The extent of riparian areas in the study area was identified based upon GIS databases provided by the CDFG (1997) and Placer County (2003b).

Freshwater Marsh Wetlands and Other Waters of the U.S. (Excluding Stream Channels). The most common wetland type in the study area after vernal pools and other seasonal wetlands is freshwater marsh. Freshwater marsh habitats are characterized by saturated or periodically flooded soils that support some combination of rushes (*Juncus* spp.), sedges (*Cyperus* spp.), cattail (*Typha* spp.), and bulrush (*Scirpus* spp.). Bird species such as mallard (*Anas platyrhynchos*), American widgeon (*Anas americana*) and red-winged blackbirds (*Agelaius phoeniceus*) can be found in freshwater marsh habitat throughout the project site. Wetlands were identified with GIS data provided by CDFG (1997), USFWS (2003), ECORP

(2003a), CH2M Hill (2003), and URS (2003) and are identified in Figure 4-2. Vernal pools are a particular subset of seasonal wetlands, and have been described separately previously in this section due to their unique nature and tendency to be used as habitat by numerous special-status species.

Conservation Areas. Three privately owned conservation areas have been identified in the study area, where they comprise approximately 522 acres (see Figure 4-2). These areas are lands that have been preserved or set aside in some manner to protect wetlands or special-status species and their habitat. These areas include differing forms of land use or management restrictions. Two of these conservation areas have been established as mitigation banks for the giant garter snake as part of the Natomas Basin Habitat Conservation Plan (NBHCP). Both occur in the Western Segment of the study area. The northernmost of these areas is being considered for transfer to private ownership (Roberts, 2006) although this transaction is pending at this time. The third conservation area is located in the Central Segment of the study area and is under private management.

4.2 REGIONAL SPECIES AND HABITATS OF CONCERN

The following species are included in this NES because suitable habitat for the species is present in the study area, there is a nearby record of the species, or the species has been previously recorded in the study area. Species that are listed as threatened or endangered under the federal or California endangered species act, California Fully Protected species, or a candidate for listing are described below. Other special-status species are described separately in a subsequent section.

Regional species and habitats of concern were identified based upon a review of occurrence records from the California Natural Diversity Data Base (CDFG, 2006), the U.S. Fish and Wildlife Service list of endangered, threatened, species of concern or candidate species that may occur in Sacramento, Sutter, or Placer County (Appendix A), and a review of the California Native Plant Society's Electronic Inventory (CNPS, 2006). Table 4-1 and Table 4-3 summarize the regional species that are evaluated in this Natural Environment Study report. Table 4-2 lists the species that were eliminated from consideration based on the absence of suitable habitat in the study area. A list of regional species of concern is provided in Appendix B. The table in Appendix B presents the status, and preferred habitat for the special-status species addressed in this report. Figure 4-4 shows CNDDB records within the study area.

Table 4-1
Listed and Proposed Threatened/Endangered Species Potentially Occurring or Known to Occur in the Study Area

Scientific Name	Common Name
Branchinecta lynchi	vernal pool fairy shrimp
Lepidurus packardi	vernal pool tadpole shrimp
Desmocerus californicus dimorphus	Valley elderberry longhorn beetle
Buteo swainsoni	Swainson's hawk
Elanus leucurus	white-tailed kite
Grus canadensis tabida	greater sandhill crane
Haliaeetus leucocephalus	Bald eagle
Riparia riparia	Bank swallow
Thamnophis gigas	giant garter snake
Gratiola heterosepala	Boggs Lake hedge hyssop

Table 4-2
Listed and Proposed Threatened/Endangered Species with Low Potential to Occur in the Study Area

Scientific Name	Common Name
Aquila chrysaetos	golden eagle
Coccyzus americanus occidentalis	Western yellow-billed cuckoo
Laterallus jamaicensis coturniculus	California black rail
Hypomesus transpacificus	Delta smelt
Oncorhynchus mykiss	Central valley steelhead
Oncorhynchus tshawytscha	Central valley spring-run chinook
Oncorhynchus tshawytscha	Central valley winter-run chinook
Ambystoma californiense	California tiger salamander, central population
Rana aurora draytonii	California red-legged frog

Each of the species listed in Table 4-1 is described briefly below.

4.2.1.1 Listed, Proposed, and Fully Protected Species

Vernal Pool Branchiopods. Two federally listed branchiopods are known to occur in the study area and the vicinity. Vernal pool fairy shrimp (*Branchinecta lynchi*) and vernal pool tadpole shrimp (*Lepidurus packardi*) are known to occur in seasonally ponded depressions in the study area. These species hatch from resting eggs when the pools become inundated by runoff from fall and winter rains. The resting eggs, called cysts, remain in the bottom of the dry pool through the summer. Branchiopods can complete their life cycle in as few as 10 to 12 days to take advantage of short-lived vernal pools, swales, or puddles (Eriksen and Belk, 1999). These species use artificial depressions, tire tracks, and other sites that pond water only during the winter.

The vernal pool fairy shrimp is a federally listed threatened species. This species is widely distributed through the grasslands of California, from Shasta County south to Riverside County. Populations of vernal pool fairy shrimp are often small, and this species tends to be outnumbered by other co-occurring species. Vernal pool fairy shrimp occur in a wide variety of pool types, but are most commonly found in small swales, or vernal pools in unplowed grasslands (Eriksen and Belk, 1999).

The vernal pool tadpole shrimp is a federally listed endangered species. This species is found mainly in the northern and eastern portions of the Central Valley, in vernal pools and swales containing highly turbid water, often in unplowed grasslands. Suitable habitat for both species exists within the study area, as shown in Figure 4-2. There is no critical habitat for vernal pool branchiopods in the study area.

Valley Elderberry Longhorn Beetle. The Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) is a federally threatened species that occurs exclusively in elderberry shrubs (*Sambucus mexicanus*). The beetle's range extends throughout California's Central Valley, and elderberry shrubs occur most often in riparian areas. The riparian areas in the study area may be suitable for the beetle, if elderberry shrubs are present. Figure 4-5 shows the distribution of riparian habitat that is potentially suitable for elderberry shrubs. This habitat includes substantial portions of the main branch of Pleasant Grove Creek and small areas along its tributaries. Some areas along Curry Creek appear to support vegetation that could contain elderberry plants. Elderberry shrubs could also occupy other upland habitats. However, no elderberry shrubs have been documented in the study area.

Swainson's Hawk. Swainson's hawk (*Buteo swainsoni*) is listed as threatened under the California Endangered Species Act (ESA). In California, Swainson's hawks nest in the Central Valley of California and in the juniper woodlands of Modoc County. Nests are typically found in scattered trees or along riparian corridors adjacent to annual grasslands, pastures, alfalfa, and other crops that provide foraging habitat (CDFG, 1994). Areas of known nesting and foraging habitat are shown on Figure 4-6. Swainson's hawks also nest in urban areas, although the reproductive success of pairs in urban areas has been shown to be lower than that of birds that nest in rural areas (England et al., 1995). The current population of nesting Swainson's hawks in California is believed to be 10 percent of historic numbers due to loss of breeding habitat in the state and wintering habitats in Mexico, Central, and South America. Elimination of breeding habitat is the result of several land conversion activities, including loss of small farms with shelterbelts and tree plantings to larger agribusiness, increasing development of woody perennial crops (i.e., orchards and vineyards), and urban development (England et al., 1997).

Swainson's hawks forage primarily on small rodents and reptiles during the breeding season and on insects during the non-breeding period (England et al., 1997). Agricultural areas are most often used by Swainson's hawks for foraging following harvest or irrigation activities that reduce vegetation cover and make prey populations more visible (Smallwood, 1995). Potential foraging habitat for Swainson's hawk in the study area is shown in Figure 4-6.

Swainson's hawks have been recorded nesting in solitary trees adjacent to riparian areas within the study area Central Segment (CDFG, 2006) (Figure 4-4). Swainson's hawks have also been recorded nesting in the study area, along Pleasant Grove Creek nearby the site of the existing Roseville Waste Water Treatment Facility (ESA, 1996) and in the near vicinity (URS, 2001). They have also been recorded nesting just outside of the western boundary of the study area, in the Natomas Basin (Estep, 2002, 2003). A large nesting population exists along the banks of the Sacramento River approximately 3 miles west of the study area.

White-Tailed Kite. The white-tailed kite (*Elanus leucurus*) is designated as a fully protected species under the California Fish and Game Code. White-tailed kites are year-round residents of the Central Valley and typically forage in agricultural areas, feeding on small mammals, birds, and reptiles (CPIF, 2000). They nest in tall trees near grassland or agricultural areas where this species forages. In the study area, white-tailed kites may use agricultural habitat and grassland for foraging. Large trees, including those around riparian areas, may be suitable nesting habitat.

Greater Sandhill Crane. The greater sandhill crane (*Grus canadensis tabida*) is listed as threatened under the California ESA and is a fully protected species under the California Fish and Game Code. Sandhill cranes breed in the northeast counties of California and winter in the Sacramento and San Joaquin valleys where they forage in open grassland habitats, wetlands, and grain fields (corn, rice, and wheat). They typically occur in very localized areas, foraging in flooded fields in the study area during the winter. This species has potential to occur in the winter foraging in inundated rice fields and in riparian/wetland habitat.

Bald Eagle. The bald eagle (*Haliaeetus leucocephalus*) is a federally threatened species and a state endangered species. In the winter bald eagles are typically found throughout California at lakes, reservoirs, rivers, and some rangelands and coastal wetlands. They generally breed in northern California in areas with mountains, foothill forests, and woodlands near sources of water such as reservoirs, lakes, and rivers. Their nests can be found in the upper reaches of tall trees throughout their breeding habitat (CDFG, 2006). Bald eagles eat small animals, fish, waterfowl, and the carrion of deer and cattle.

Bank Swallow. The bank swallow (*Riparia riparia*) is a California threatened species. It is a colonial nester, which nests primarily in riparian and other lowland habitats. It requires vertical banks/cliffs with fine textured/sandy soils near streams, rivers, lakes, or ocean to dig nesting holes for nesting. This species has been recorded in CNDDB (CDFG, 2006) in the vicinity of the study area. Such habitat is not present in the study area, and the species is unlikely to be present.

Giant Garter Snake. The giant garter snake (*Thamnophis gigas*) is listed as threatened under federal and state endangered species acts. This mostly aquatic snake is the largest of the garter snake genus, *Thamnophis*, and is endemic to the valley floors of the Sacramento and San Joaquin valleys (USFWS, 1993). Giant garter snakes can be found in rice fields, canals, and irrigation ditches where their preferred habitat, freshwater marsh and low-gradient streams, has been depleted. They prey on small fish, tadpoles, and frogs throughout the year. Giant garter snakes hibernate in underground burrows in upland areas adjacent to aquatic habitats during the winter from October through March. During this period they are susceptible to harm from earth-moving activities.

Habitat for the giant garter snake occurs primarily in the Western Segment of the study area. They are known to occur within drainage ditches in low-lying areas in Sutter County with a high occurrence of seasonally flooded habitat. Giant garter snakes have not been documented from Placer County (CDFG, 2006). This fully aquatic garter snake was probably not historically present east of the Natomas East Main Drainage Canal and the Pleasant Grove Drainage Canal because these areas would have lacked the continuous marsh and open-water aquatic habitats associated with this species. However, it is possible that the expansion of rice cultivation and the construction of the drainage canals may provide dispersal corridors and habitats that would support the giant garter snake. Figure 4-7 identifies specific sightings of giant garter snake from the CNDDB (CDFG, 2006) and Natomas Basin Conservancy (CH2M Hill, 2003).

Boggs Lake Hedge-Hyssop. Boggs Lake hedge-hyssop (*Gratiola heterosepala*) is a state listed endangered species. It is also a CNPS 1B species. This annual herb is endemic to vernal pool habitats with clay soils, and has been recorded in 13 Central Valley counties. Boggs Lake hedge-hyssop blooms from April to June. There are no recorded sightings of this species in the study area; however, vernal pool complexes identified in Figure 4-2 would be considered suitable habitat.

4.2.1.2 Other Special-Status Species

Table 4-3 summarizes species that are considered species of concern but are not formally listed under the federal or California endangered species acts or fully protected under the California Fish and Game Code.

Table 4-3
Other Special-Status Species with Potential to Occur in the Study Area

Scientific Name	Common Name
Invertebrates	
Linderiella occidentalis	California linderiella
Birds	
Agelaius tricolor	tricolor blackbird
Ammodramus savannarum	grasshopper sparrow
Asio flammeus	short-eared owl
Athene cunicularia hypugea	western burrowing owl
Baeolophus inornatus	oak titmouse
Buteo regalis	ferruginous hawk
Carduelis lawrencei	Lawrence's goldfinch
Charadrius montanus	mountain plover
Circus cyaneus	northern harrier
Dendroica petechia	yellow warbler

Table 4-3 (Continued)
Other Special-Status Species with Potential to Occur in the Study Area

Scientific Name	Common Name
Eremophila alpestris actia	horned lark
Falco columbarius	Merlin
Icteria virens	yellow-breasted chat
Lanius ludovicianus	loggerhead shrike
Melanerpes lewis	Lewis' woodpecker
Melospiza melodia mailliardi	Modesto song sparrow
Numenius americanus	long-billed curlew
Picoides nuttallii	Nuttall's woodpecker
Plegadis chihi	white-faced ibis
Progne subis	purple martin
Sphyrapicus ruber	red-breasted sapsucker
Toxostoma redivivum	California thrasher
Reptiles	
Emys marmorata[*]	northwestern pond turtle
Phrynosoma coronatum frontale	California horned lizard
Amphibians	
Scaphiopus hammondii	western spadefoot
Mammals	
Myotis ciliolabrum	small-footed myotis bat
Myotis yumanensis	Yuma myotis bat
Corynorhinus townsendii townsendii	Pacific western big-eared bat
Eumops perotis californicus	greater western mastiff bat
Fish	
Oncorhynchus tshawytscha	Fall-Run Chinook Salmon
Pogonichthys macrolepidotus	Sacramento splittail
Plants	
Downingia pusilla	dwarf downingia
Legenere limosa	Legenere
Balsamorhiza macrolepis var. *macrolepis*	big scale balsamroot
Cordylanthus mollis ssp. *hispidus*	Hispid bird's-beak
Juncus leiospermus var. *ahartii*	Ahart's dwarf rush
Sagittaria sanfordii	Sanford's arrowhead
Juncus leiospermus var. *leiospermus*	Red Bluff dwarf rush

[*]Formerly *Clemmys marmorata marmorata*, also called *Actinemys marmorata marmorata*.

Each of the species listed in Table 4-3 is briefly described in the following subsections.

California Linderiella. California linderiella (*Linderiella occidentalis*) is a federal species of concern and is typically associated with seasonal pools found in unplowed grasslands. The life history of this species is similar to the listed branchiopods discussed above in the Threatened and Endangered Species section. This species is known from many sites within Placer County (CDFG, 2006). Suitable habitat for California linderiella in the study area includes vernal pools (Figure 4-2).

Tricolor Blackbird. Tricolor blackbird (*Agelaius tricolor*) is a state and federal species of concern. This species is a colonial nester that occurs throughout the Central Valley in emergent wetlands large enough to support 50 or more breeding pairs. During the winter, large flocks disperse from breeding grounds and forage in pastures and other agricultural fields. Populations of tricolor blackbirds have decreased due to loss of large wetlands. There are no known breeding records of tricolor blackbirds in the study area, although there are a few wetland areas that may be large enough to support a breeding population (Figure 4-2). This species could occur sporadically throughout the study area during the winter in agricultural habitats.

Grasshopper Sparrow. The grasshopper sparrow (*Ammodramus savannarum*) has the potential to occur in California in the summer months. This species can be found in savannahs, prairies, and grassy fields. Grasshopper sparrows make their nests on the ground in small depressions hidden by surrounding grasses. This species may occur in agricultural fields throughout the study area.

Short-Eared Owl. The short-eared owl (*Asio flammeus*) is a federal and state species of concern. This species is a winter resident of the Central Valley, especially in the western Sierra Nevada foothills, and locally in the southern desert region (CDFG, 2006). It forages for small mammals over grassland, irrigated croplands, and occasionally marshes. This species has the potential to occur on the study area in winter, and use cultivated rice fields, grasslands and marshes as foraging habitat.

Western Burrowing Owl. The western burrowing owl (*Athene cunicularia hypugea*) is a federal and state species of concern. Burrowing owls prefer annual and perennial grasslands, typically with sparse or nonexistent tree or shrub canopies. In California, they are found in close association with California ground squirrel burrows (*Spermophilus beecheyi*), which provide them with year-round shelter and seasonal nesting habitat. Burrowing owls also use human-made structures such as culverts, debris piles, or openings beneath pavement as shelter and nesting habitat (CDFG, 1995). Burrowing owl populations are declining due to diminishing habitat and burrowing mammal control (including extermination of small mammals and closure of burrows). Burrowing owls exhibit a high degree of nest site fidelity. Burrowing owl nests are known from two locations within the study area, including the West Roseville Specific Plan area and the Natomas Basin (CDFG, 2006) (Figure 4-4).

Oak Titmouse. The oak titmouse (*Baeolophus inornatus*) is a federal species of concern. This species is a year-round resident of oak woodlands. The oak titmouse requires secondary cavities in mature trees for breeding. In the study area, oak titmouse has the potential to occur in established riparian habitat with oak trees, and in area of oak woodland where streams are not present.

Ferruginous Hawk. The ferruginous hawk (*Buteo regalis*) is a state and federal species of concern. This species is a wide ranging winter migrant in the Central Valley of California. It forages individually over grassland and some agricultural habitats where small mammals, birds and reptiles are commonly caught as prey items. Trees, utility poles and fenceposts are used as perches for roosting and hunting. This species is not known to breed in the study area. It has the potential to occur during the winter in the study area.

Lawrence's Goldfinch. Lawrence's goldfinch (*Carduelis lawrencei*) is a federal species of concern. It has a highly variable distribution, and within California is found in the foothills surrounding Central Valley from spring through fall. Lawrence's goldfinch breeds in open oak or other arid woodland and chaparral, near water (CDFG, 2006). This species forages for seeds and to a lesser extent, invertebrates in grassland or other herbaceous habitat. There is low potential for this species to occur in the study area.

Mountain Plover. The mountain plover (*Charadrius montanus*) is a federal and state species of concern. The mountain plover is a winter resident of California that is locally common in the Central Valley from Sutter and Yuba counties southward, and in the foothill valleys west of the San Joaquin Valley. Mountain plovers prefer heavily grazed native rangelands and recently cultivated croplands (Knopf and Rupert, 1995) for foraging for invertebrates (Knopf, 1998). Alkali flats, now virtually nonexistent, were historically a common foraging habitat for mountain plovers. Upland grass habitats in the study area have the potential to provide foraging habitat for wintering mountain plover, in areas that are not inundated with water.

Northern Harrier. The northern harrier (*Circus cyaneus*) is a state species of concern. It nests in scattered locations throughout California, in grasslands, marshes, fallow agricultural fields, and open rangelands (CDFG, 2006). Nests are often in emergent wetlands along rivers or lakes, but it may also nest in grassland or grain fields several miles from water. This species may occur in the study area, either nesting in emergent wetlands or foraging in cultivated rice fields and grassland habitats.

Yellow Warbler. The yellow warbler (*Dendroica petechia*) is a state species of concern. They typically use moist areas including riparian areas with willows, cottonwoods, and sycamores in which to make their nests (CDFG, 2006). The yellow warbler may also be found in agricultural and suburban areas in the proximity of preferred habitat. This species has potential to occur within the study area.

Horned Lark. The horned lark (*Eremophila alpestris actia*) is a state species of concern. This species prefers open areas lacking dense vegetation such as grasslands and meadows. Horned larks are found in coastal regions from Sonoma to San Diego, in the San Joaquin Valley, and east to the foothills (CDFG, 2006). Nests are found on the ground hidden by grasses and are shaped like an open cup. This species has the potential to occur in the agricultural fields within the study area.

Merlin. Merlins (*Falco columbarius*) are migratory birds that are found in California during the winter in open woodlands, savannahs, on the edges of grasslands, deserts, and farms. Although this species is a state species of concern, it is not known to breed in California (CDFG, 2006). The merlin has the potential to occur near farmland, agriculture, and grassland areas in the study area where there is light tree cover.

Yellow-Breasted Chat. The yellow-breasted chat (*Icteria virens*) is a state species of concern. This species will nest during the summer months in riparian areas characterized by willows and other brushy tangles near sources of water. It will nest low to the ground where it will also forage (CDFG, 2006). This species has the potential to occur within the riparian areas in the study area.

Modesto Song Sparrow. The Modesto song sparrow (*Melospiza melodia mailliardi*) was listed as a state species of concern in 2001 but has since lost that status. Several of its close relatives retain a status of special concern by the state such as the Suisun song sparrow (*Melospiza melodia maxillaries*) (CDFG, 2006). This species prefers riparian areas and may be found within the study area.

Purple Martin. The purple martin (*Progne subis*) is a state species of concern. It can be found nesting in woodlands and low elevation coniferous forests where it will generally nest in cavities created by woodpeckers. They will also inhabit human made nesting structures (CDFG, 2006). This species may be found within woodlands in the study area.

Loggerhead Shrike. The loggerhead shrike (*Lanius ludovicianus*) is a federal and state species of concern. It is a year-round resident of the Central Valley lowland and foothills, occurring most frequently in open habitats (CDFG, 2006). This species prefers areas with perches such as shrubs, trees, fences, or utility lines. Loggerhead shrikes build nests in shrubs or trees, and forage primarily for insects from a stationary perch. This species has the potential to occur in the study area.

Lewis' Woodpecker. Lewis' woodpecker (*Melanerpes lewis*) is a federal species of concern. It is an uncommon local winter resident of the Central Valley that uses open oak savannas, deciduous woodland, and coniferous forest habitats (CDFG, 2006). There is moderate potential for this species to occur on the study area in the riparian woodlands adjacent to creek areas.

Long-Billed Curlew. The long-billed curlew (*Numenius americanus*) is a federal and state species of concern. It is locally common during winter in the Central Valley and it breeds in northeast California. Large numbers of non-breeding individuals have occurred in the Central Valley during the summer in some years (Cogswell, 1977). This species forages for invertebrates in grasslands and croplands, and could use grassland areas of the study area for winter foraging.

Nuttall's Woodpecker. The Nuttall's woodpecker (*Picoides nuttallii*) is a federal species of concern. This species is a year-round resident of oak woodlands. The Nuttall's woodpecker nests in cavities that the male of the species excavates. In the study area, this species has the potential to occur in established riparian habitat with oak trees, and in area of oak woodland where streams are not present.

White-Faced Ibis. The white-faced ibis (*Plegadis chihi*) is a state and federal species of concern. This species prefers shallow, grassy marshes for breeding. Its breeding range has drastically decreased in California and does not include the study area. The white-faced ibis roosts among dense stands of freshwater emergent vegetation, near shallow water or muddy fields for foraging. It has the potential to occur sporadically throughout the study area during the winter, particularly in flooded rice fields.

Red-Breasted Sapsucker. The red-breasted sapsucker (*Sphyrapicus ruber*) is a federal species of concern. This species most commonly occurs in coniferous forests, but can also be found in mixed riparian woodlands. In California, it is a winter migrant, occurring in sporadic locations. In the study area, this species has the potential to occur in established riparian corridors with mature trees.

California Thrasher. The California thrasher (*Toxostoma redivivum*) is a federal species of concern. This species is a year-round resident of oak woodlands. The California thrasher requires dense underbrush for breeding. In the study area, California thrasher has the potential to occur in well riparian habitat, and also in area of oak woodland where streams are not present.

Northwestern Pond Turtle. The northwestern pond turtle (*Clemmys marmorata*) is a state and federal species of concern. In California, this subspecies of western pond turtle occurs throughout the mountains and valleys of northern California. The pond turtle is found in ponds and streams within grasslands, meadows, wetlands, woodlands, forests, and brushlands. It lays its eggs in upland areas. This species has declined due to loss and alteration of aquatic and wetland habitats, loss of breeding areas near aquatic habitats, and habitat fragmentation. This species has the potential to occur throughout the study area in permanent sources of water such as slow moving sections of creeks and emergent wetlands.

California Horned Lizard. The California horned lizard (*Phrynosoma coronatum frontale*) is a federal and state species of concern, and is protected under the California Fish and Game Code. This lizard typically inhabits foothill woodland and riparian habitat with scattered grassland. In Placer County, it is known from more mountainous regions in the central portion of the county (CDFG, 2006). There is small potential for the California horned lizard to occur in riparian habitat within the study area (Figure 4-2).

Western Spadefoot. The western spadefoot (*Scaphiopus hammondii*) is a federal and state species of concern. This amphibian occurs in the central and southern Coast Ranges, the Central Valley, and the foothills of the Sierra Nevada (Stebbins, 1985). Western spadefoot has lost substantial portions of its breeding habitat to urban and agricultural development. The western spadefoot primarily inhabits washes, floodplains of rivers, alluvial fans, playas, and alkali flats in the foothills and mountain valleys up to 3,000 feet. It prefers areas of open vegetation and short grasses where the soil is sandy or gravelly (Stebbins, 1985). Breeding habitat consists of seasonally inundated pools or occasionally low-gradient, seasonal streams (Jennings and Hayes, 1994). Spadefoots are strictly nocturnal. For most of the year during the day and during long dry periods they hide in deep, almost vertical burrows which can be up to 36 inches deep (Stebbins, 1972). Western spadefoot has been documented from a seasonal stream immediately east of the City of Roseville Wastewater Treatment Plant on Phillip Road and two additional locations immediately southeast (CDFG, 2006) (Figure 4-4). Vernal pools and other seasonal wetlands in the study area may provide suitable habitat for this species.

Bats. The following special-status bat species are known to occur in California and could occur in the vicinity of the study area:

- Yuma myotis bat (*Myotis yumanensis*), a federal species of concern;
- Small-footed myotis (*Myotis ciliolabrum*), a federal species of concern
- Pacific western big-eared bat (*Corynorhinus townsendii townsendii*); and
- Greater western mastiff bat (*Eumops perotis californicus*), a state and federal species of concern.

These bat species are generally widespread throughout many regions of California. Bats are commonly found in association with open forests and woodlands where they forage over water bodies. Suitable roosting and nesting areas include caves, mines, tree snags, buildings, and other human-made structures. In California, these species generally mate during the late fall and give birth to their young between early May and the end of July (Jameson and Peeters, 1988).

The bat species listed above could use parts of the study area for foraging, particularly wet areas such as rice fields, vernal pools, and seasonal drainages. Potential roosting sites may also be present within developed land in rural areas, such as houses and barns. Dead trees or snags within riparian areas may also provide potential roosting site for special-status bats.

Central Valley Fall-Run Chinook Salmon. Chinook salmon (*Oncorhynchus tshawytscha*) is a federal candidate for listing and historically ranged from the Ventura River in California to Point Hope, Alaska (Federal Register, 2000). The general life history of the anadromous Chinook salmon includes both freshwater and oceanic phases of development. Incubation, hatching, and emergence occur in freshwater, followed by migration to the ocean, at which time smoltification (adaptation from freshwater to saltwater life cycle) occurs. Maturation is initiated and completed upon return to freshwater habitats. Once maturation is complete, spawning occurs in natal streams.

See Appendix C for a Special-Status Fish Assessment report. The Central Valley Fall Run Evolutionary Significant Unit of Chinook has the potential to occur in the study area. The Fall Run ESU uses the Natomas East Main Drainage Canal as migratory habitat in order to reach spawning habitat in Dry Creek (GANDA, 2006, Appendix C). This ESU does not spawn in the study area (NMFS, 2006). The Natomas East Main Drainage Canal is not considered critical habitat for the Fall Run ESU (Calfish, 2006).

Sacramento Splittail. This species (*Pogonichthys* macrolepidotus) was removed from listing as a federal threatened species in 2003; however splittail is still a California species of concern. Sacramento splittail occurs in the lower delta of the Sacramento and San Joaquin rivers where it spawns over shoreline

vegetation or over gravel in creek tributaries of large rivers during spring high water levels. There is one record of this species from the vicinity of the study area in the CNDDB (CDFG, 2006). The lack of suitable habitat makes it very unlikely that this species occurs in the study area.

Dwarf Downingia. Dwarf downingia (*Downingia pusilla*) has no federal or state status, but this species is included on the California Native Plant Society (CNPS) List 2. This small herb is generally found on clay soils in mesic valley and foothill grasslands, and vernal pools. It has been recorded from Merced, Mariposa, Napa, Placer, Sacramento, Shasta, San Joaquin, Solano, Sonoma, Stanislaus, Tehama, and Yolo counties. This species typically occurs in vernal pools with low overall vegetative cover. It is known to occur in Placer County (CDFG, 2006) and known records are shown in Figure 4-4.

Legenere. Legenere (*Legenere limosa*) is a USFWS Species of Concern and is included on CNPS List 1B. Generally found in pristine vernal pool habitat, this species' range has been greatly reduced over the past several decades. Legenere is documented in eleven counties, from Tehama County in the north to San Mateo County in the south. This species is known to occur in Placer County (CDFG, 2006), but not in the study area. Vernal pools in the study area may provide suitable habitat for this species (Figure 4-2).

Big Scale Balsamroot. Big scale balsamroot (*Balsamorhiza macrolepis* var. *macrolepis*) has no federal or state status, but is included on the CNPS List 1B. Typically found in valley and foothill grasslands, including serpentine grassland, this species is known from Tehama County in the north to Santa Clara County in the south. There are three known occurrences in Placer County in the project vicinity (CDFG, 2006). However, this species has a low potential to occur in the study area due to the absence of undisturbed grasslands. Some higher quality or undisturbed grasslands in the vicinity of the study area may provide habitat for this species.

Hispid Bird's-Beak. Hispid bird's-beak (*Cordylanthus mollis* ssp. *hispidus*) has no federal or state status, but is included on the CNPS List 1B. Typically found in grasslands and a wet meadow associated with alkaline soils, this species' distribution is limited to five counties, including Placer. Hispid bird's beak has been recorded in the CNDDB in the vicinity of the study area (CDFG, 2006). Due to the degraded conditions of most wetlands in the study area, this species is unlikely to be present although it could occur in higher quality or undisturbed wetlands.

Ahart's Dwarf Rush and Red Bluff Dwarf Rush. Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*) and Red Bluff dwarf rush (*Juncus leiospermus* var. *leiospermus*) have no federal or state status, but these two subspecies are both included on the CNPS List 1B. Both rush species are herbs typically found along the edges of vernal pools and have limited distributions. Ahart's dwarf rush occurs in only five counties in California: Butte, Calaveras, Placer, Sacramento and Yuba (CDFG, 2006). There is one occurrence of Ahart's dwarf rush in Placer County near the Town of Lincoln, which is approximately 8 miles north of the study area (CDFG, 2006). Red Bluff dwarf rush is only known from four California counties: Butte, Shasta, Tehama, and Placer. Only one occurrence of Red Bluff dwarf rush is known from Placer County. Both species are typically observed in high-quality vernal pools and have some potential to occur in the study area.

Sanford's Arrowhead. Sanford's arrowhead (*Sagittaria sanfordii*) has no federal or state status, but is included on the CNPS List 1B. A large herb, this species is generally found in shallow water associated with freshwater marsh habitat and occasionally drainage ditches. Found from Del Norte County in the north to Orange County in the south, it is not know from Placer County, but has been documented in adjoining Sacramento County near the Placer County line (CDFG, 2006). Due to the disturbed nature of most wetlands in the study area it has a low potential to occur there.

5.0 BIOLOGICAL RESOURCES, DISCUSSION OF IMPACTS AND MITIGATION

This chapter evaluates potential direct, indirect and cumulative effects of the Parkway on sensitive biological resources. Direct and indirect effects are described below. Cumulative effects are described in Section 5.3.1.

Direct and indirect effects are defined as follows:

- **Direct Effect:** The National Environmental Policy Act (NEPA) Regulations define direct effects as those "which are caused by the action and occur at the same time and place." Resources lost under the footprint of the action are obvious direct effects, such as filling a wetland to build a highway. Less obvious direct effects might be where a natural process has been blocked, such as blocking a migration corridor or disrupting a breeding cycle.

- **Indirect Effect**: As defined in the NEPA regulations indirect effects are those "which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems."

The analysis of potential impacts on sensitive biological resources in this Tier 1 document is based on a relative comparison of the sensitive biological resources within each corridor alignment alternative. Analysis of impacts is based on existing data sources, with a limited amount of ground level reconnaissance efforts. Due to the generalized nature of existing data and consistent with the ecosystem approach described in *Eco-Logical* by Brown (2006), sensitive biological resources have been grouped into six categories — three general habitat types (vernal pool, riparian, and other wetlands) and three species-specific habitat types (giant garter snake, Swainson's hawk, and Valley elderberry longhorn beetle). The general habitat types were selected because they are under the regulatory jurisdiction of one or more natural resource agencies and/or they are the preferred habitat for multiple special-status species. The three species-specific habitat types were selected because these species are currently state or federally listed and have a high likelihood of occurring in the study area. Impacts on sensitive biological resources are discussed in Section 5.1.3; resource categories are described as follows:

- **Wetlands resources** potentially regulated under the federal Clean Water Act or the Porter-Cologne Act.

- **Riparian habitat** is a habitat closely associated with streams or rivers. It usually includes trees and other vegetation that helps to stabilize banks and often provides shade to part or all of the adjacent water body.

- **Vernal pool complexes.** This habitat category is used by multiple special-status species, including vernal pool fairy shrimp, vernal pool tadpole shrimp, Boggs lake hedge-hyssop, dwarf downingia, and legenere. Vernal pool complexes also include an upland environment favored for many other species such as white-tailed kite, burrowing owl, and other raptors.

- **Potential giant garter snake habitat** includes rice fields, canals, irrigation ditches, freshwater marshes and low-gradient streams primarily associated with the areas west of the Union Pacific Railroad ROW. Giant garter snake habitat represents seasonally

flooded areas that are suitable for many other types of wildlife, such as wintering waterfowl.

- **Potential Swainson's hawk nesting habitat.** This habitat includes all riparian areas with established woodland that includes mature trees. It also includes groups of large trees within one mile of a riparian area. Swainson's hawks require mature trees for nesting.

- **Valley elderberry longhorn beetle habitat.** This habitat category corresponds to riparian areas that have an understory shrub component.

Potential direct and indirect impacts are described and evaluated in the following sections.

5.1 DIRECT EFFECTS

Analysis of direct effects for the Parkway is based on tabulation of resources within the proposed corridors, because the actual limits of direct disturbance that would result from the transportation facility are not known. This is a conservative approach and actual direct effects are expected to be less than stated as the Parkway footprint would be approximately 350 feet in width, while the analysis considers a proposed corridor width ranging from 500 to 1,000 feet. A road design would be developed as part of the Tier 2 analysis process that would facilitate a detailed assessment of direct effects in the Tier 2 level.

5.1.1 Natural Communities and Special-Status Species Habitats

This section provides information on the acreage of sensitive natural communities within each corridor alignment. This information is intended to provide a comparison of the types and extent of habitat in each alternative corridor alignment alternative. The precise area and location of ground-disturbing activities will not be analyzed as part of this document; however, a general comparison between the resources found within each corridor will provide a general basis for an evaluation of potential impacts at the Tier 1 level.

The project build alternatives will in some way cause the loss, fragmentation, and/or degradation of some habitat. This is unavoidable. Each of the build alternatives presented in the following sections was developed to minimize the adverse effects of the project. In the Tier 2 phase more specific design measures will be developed that will address such concerns as the obstruction of free movement of wildlife, and the fragmentation of habitat.

Direct effects of each build alternative are discussed below, by segment and by resource. Locations of wetlands resources and riparian habitat are shown on Figure 4-2. Vernal pool complexes are shown on Figure 4-2. Potential habitat for Valley elderberry longhorn beetle, Swainson's hawk, and giant garter snake are shown on Figures 4-5, 4-6, and 4-7, respectively. Potential stream crossings are shown on Figure 5-1.

5.1.2 No-Build Alternative

Under the No-Build Alternative, land for the future construction of Placer Parkway would not be acquired and the Placer Parkway would not be constructed. No impacts to natural communities of special concern, or to threatened, endangered, candidate, or fully protected species would occur as a result of the No-Build Alternative.

5.1.3 Alternative 1 – the Red Alternative

5.1.3.1 Alternative 1 – Western Segment

Natural Communities of Special Concern

Wetland Resources: In the Western Segment, wetlands (excluding vernal pool complexes) are primarily associated with areas around the Pleasant Grove Creek Canal and the Natomas East Main Drainage Canal. Alternative 1 in the Western Segment has 0.3 acre of wetland resources within the corridor alignment. Impacts to wetland resources would include direct loss of habitat due to fill associated with the construction of the Parkway.

Riparian Resources: No riparian habitat is located within the Western Segment of Alternative 1.

Vernal Pool Complexes: Alternative 1 bisects a large vernal pool complex in the Western Segment. The corridor's alignment through this complex is comprised of 23.1 acres of this sensitive habitat. Impacts to vernal pool complexes would include direct loss of habitat due to fill associated with the construction of the Parkway.

Threatened, Endangered, Candidate, and Fully Protected Species

Potential Giant Garter Snake Habitat: Much of the Western Segment is comprised of potential giant garter snake habitat, due to its location in the low-lying Natomas Basin. Alternative 1 has 340.8 acres of potential giant garter snake habitat within the corridor alignment. Impacts to giant garter snake habitat would include loss of potential breeding, foraging, and migratory habitat, which would be removed as a result of construction of the Parkway.

Potential Swainson's Hawk Nesting and Foraging Habitat: No Swainson's hawk nesting habitat is located within the Western Segment of Alternative 1. Alternative 1 would impact 85 acres Swanson's hawk foraging habitat in the Western Segment.

Potential Valley Elderberry Longhorn Beetle Habitat: No Valley elderberry longhorn beetle habitat was identified during reconnaissance surveys within the Western Segment of Alternative 1. Focused surveys should be conducted during Tier 2 to specifically identify potential impacts to the Valley elderberry longhorn beetle.

Potential Stream Crossings: Although this segment would not cross any streams, it would cross the Natomas East Main Drainage Canal. The width of this canal at this crossing and its associated wetlands is estimated to be greater than a standard bridge span of 150 feet and the bridge would therefore need to be supported by columns. In addition, a railroad ROW is located very close to the canal; this railroad ROW would also need to be spanned. The columns would be placed outside the ordinary high water elevation of the canal, to the extent practical. The bridges would be designed and constructed to minimize potential impacts to the canal. There are no stream crossings along this segment.

Impacts to biological resources as a result of the bridge crossing at the Natomas East Main Drainage Canal would include loss of stream bottom and/or riparian habitat where columns are placed. A 150-foot-wide section of the canal would be shaded where the bridge crossing is placed.

Conservation Lands

There are no conservation areas present within the Western Segment of Alternative 1.

5.1.3.2 Alternative 1 – Central Segment

Natural Communities of Special Concern

Wetlands: Alternative 1 has 15.5 acres of wetlands in the Central Segment. Impacts to wetland resources would include direct loss of habitat due to fill associated with the construction of the Parkway.

Riparian Resources: Alternative 1 has 5.9 acres of riparian habitat in the Central Segment. Impacts to riparian resources would include loss of riparian trees, shrubs, and other vegetation due to fill from the roadway and its associated facilities. Where the roadway would cross stream or canal crossings, shading from the bridge may change the composition of the remaining vegetation.

Vernal Pool Complexes: The Central Segment of Alternative 1 has 5.5 acres of vernal pool complexes. Impacts to vernal pool complexes would include direct loss of habitat due to fill associated with the construction of the Parkway.

Threatened, Endangered, Candidate, and Fully Protected Species

Potential Giant Garter Snake Habitat: Garter snakes have historically been absent from this segment of the project area and there are no documented occurrences of the giant garter snake east of the Natomas East Main Drainage Canal or the Pleasant Grove Creek Canal (CDFG, 2006). However, the wetland and riparian areas within this segment may provide habitat for the giant garter snake. Focused habitat assessments should be conducted during Tier 2 to evaluate potential impacts to the giant garter snake.

Potential Swainson's Hawk Nesting and Foraging Habitat: The central alignment of Alternative 1 passes through several patches of potential Swainson's hawk nesting habitat, associated with Steelhead Creek and the main Branch of Pleasant Grove Creek. The total amount of habitat is 6.0 acres. Impacts to this habitat include loss of trees used for nesting that would be removed due to construction of the Parkway. This alternative would also impact 387 acres of Swanson's hawk foraging habitat in the Central Segment.

Potential Valley Elderberry Longhorn Beetle Habitat: Potential Valley elderberry longhorn beetle habitat comprises 1.9 acres of the Central Segment of Alternative 1. Impacts to beetle habitat would include direct loss of the host plant of this species, elderberry shrubs, which would be removed as a result of the construction of the Parkway.

Potential Stream Crossings: There are nine stream crossings within this segment: four on Steelhead Creek, three on Curry Creek, and two on Pleasant Grove Creek. This segment crosses approximately 7,000 feet of Steelhead Creek longitudinally. Depending on the alignment of the road within the corridor, realignment of this section of Steelhead Creek may be required. Culverts may be used at smaller creek crossings. Where creek crossings coincide with floodplain crossings, the road would be elevated on a bridge.

Any hard-bottomed structure such as a culvert would have the potential to create a drop in elevation (particularly at the downstream end) that may become a barrier to fish migration and may also significantly alter the morphology and fluvial dynamics of the channel (Garcia and Associates, 2006; Appendix C). Under higher flow conditions, such stream crossing may cause water to back up behind the crossing, trapping sediment and debris at the upstream end, thereby exacerbating flooding and possibly further destabilizing stream banks (Foothill Associates, 2005). Such small-scale or localized changes in stream morphology can affect fluvial dynamics to produce significant impacts on fish habitat (Garcia and

Associates, 2006; Appendix C). Bridge crossings could result in stream channel loss and/or loss of riparian habitat.

This segment does not cross any existing canals; therefore, there would be no potential impacts to canals.

Conservation Lands

No conservation areas are present within the Central Segment of Alternative 1.

5.1.3.3 Alternative 1 – Eastern Segment

Natural Communities of Special Concern

Wetlands: Within the Eastern Segment, 20.0 acres of wetlands are located within the corridor alignment. Impacts to wetland resources would include direct loss of habitat due to fill from the construction of the Parkway.

Riparian Resources: No riparian habitat is located within the Eastern Segment of Alternative 1.

Vernal Pool Complexes: Within the Eastern Segment, 94.1 acres of vernal pool complexes are located within the corridor alignment. Impacts to vernal pool complexes would include direct loss of habitat due to fill from the construction of the Parkway.

Threatened, Endangered, Candidate, and Fully Protected Species

Potential Giant Garter Snake Habitat: No potential giant garter snake habitat is located within the Eastern Segment of Alternative 1.

Potential Swainson's Hawk Nesting and Foraging Habitat: Within the Eastern Segment, 0.4 acre of potential Swainson's hawk nesting habitat is located within the corridor alternative. Impacts to this habitat include loss of nesting trees that would be removed due to construction of the roadway and associated facilities. This alternative would impact 552 acres of Swainson's hawk foraging habitat in the Eastern Segment.

Potential Valley Elderberry Longhorn Beetle Habitat: No Valley elderberry longhorn beetle habitat was identified during reconnaissance surveys within the Eastern Segment of Alternative 1. Focused surveys should be conducted during Tier 2 to specifically identify potential impacts to the Valley elderberry longhorn beetle.

Potential Stream Crossings: Six new stream crossings are within this segment: four on tributaries of Pleasant Grove Creek and two on tributaries of Orchard Creek. All of these crossings are in the headwaters of the creeks; therefore, culverts would be used at these crossings. In addition, this segment includes three existing stream crossings along SR 65. These crossings would require modifications, such as extension of existing culverts, as part of adding auxiliary lanes to the Parkway.

Any hard-bottomed structure such as a culvert would have the potential to create a drop in elevation (particularly at the downstream end) that may become a barrier to fish migration and may also significantly alter the morphology and fluvial dynamics of the channel (Garcia and Associates, 2006; Appendix C). Under higher flow conditions, such stream crossing may cause water to back up behind the crossing, trapping sediment and debris at the upstream end, thereby exacerbating flooding and possibly further destabilizing stream banks (Foothill Associates, 2005). Such small-scale or localized changes in

stream morphology can affect fluvial dynamics to produce significant impacts on fish habitat (Garcia and Associates, 2006; Appendix C).

This segment does not cross any existing canals; therefore, there would be no potential impacts to canals.

Conservation Lands

No conservation areas are located within the Eastern Segment of Alternative 1.

5.1.4 Alternative 2 – the Orange Alternative

5.1.4.1 Alternative 2 – Western Segment

The Western Segment of Alternative 2 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.1.4.2 Alternative 2 – Central Segment

Natural Communities of Special Concern

Wetlands: Alternative 2 has 10.6 acres of wetland habitat in the Central Segment. Impacts to wetland habitat would include direct loss of habitat due to fill from the construction of the Parkway.

Riparian Resources: Alternative 2 has 12.3 acres of riparian habitat in the Central Segment. Impacts to riparian resources would include loss of riparian trees, shrubs, and other vegetation due to fill from the roadway and its associated facilities. Where the roadway would cross stream or canal crossings, shading from the bridge may change the composition of the remaining vegetation.

Vernal Pool Complexes: Alternative 2 has 6.9 acres of vernal pool complexes in the Central Segment. Impacts to vernal pool complexes would include direct loss of habitat due to fill from the construction of the Parkway.

Threatened, Endangered, Candidate, and Fully Protected Species

Potential Giant Habitat: Garter snakes have historically been absent from this segment of the project area and there are no documented occurrences of the giant garter snake east of the Natomas East Main Drainage Canal or the Pleasant Grove Creek Canal (CDFG, 2006). However, the wetland and riparian areas within this segment could provide habitat for the giant garter snake. Focused habitat assessments should be conducted during Tier 2 to identify potential impacts to the giant garter snake.

Potential Swainson's Hawk Nesting and Foraging Habitat: The Central Segment of Alternative 2 has 7.5 acres of potential Swainson's hawk nesting habitat. Impacts to this habitat include loss of nesting trees that would be removed due to construction of the Parkway. This alternative would impact 315.3 acres of Swanson's hawk foraging habitat in the Central Segment.

Potential Valley Elderberry Longhorn Beetle Habitat: Potential Valley elderberry longhorn beetle habitat comprises 1.3 acres of the Central Segment of Alternative 2. Impacts to beetle habitat would include direct loss of the host plant of this species, elderberry shrubs, which would be removed due to the construction of the Parkway.

Potential Stream Crossings: Five stream crossings are within this segment: two on Steelhead Creek, two on Curry Creek, and one on Pleasant Grove Creek. Culverts may be used at smaller creek crossings. Where creek crossings coincide with floodplain crossings, the road would be elevated on a bridge.

Any hard-bottomed structure such as a culvert would have the potential to create a drop in elevation (particularly at the downstream end) that may become a barrier to fish migration and may also significantly alter the morphology and fluvial dynamics of the channel (Garcia and Associates, 2006; Appendix C). Under higher flow conditions, such stream crossing may cause water to back up behind the crossing, trapping sediment and debris at the upstream end, thereby exacerbating flooding and possibly further destabilizing stream banks (Foothill Associates, 2005). Such small-scale or localized changes in stream morphology can affect fluvial dynamics to produce significant impacts on fish habitat (Garcia and Associates, 2006; Appendix C). Bridge crossings could result in stream channel loss and/or loss of riparian habitat.

This segment does not cross any existing canals; therefore, there would be no potential impacts to canals.

Conservation Lands

No conservation areas are present within the Central Segment of Alternative 2.

5.1.4.3 Alternative 2 – Eastern Segment

The Eastern Segment of Alternative 2 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.1.5 Alternative 3 – the Blue Alternative

5.1.5.1 Alternative 3 – Western Segment

The Western Segment of Alternative 3 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.1.5.2 Alternative 3 – Central Segment

Natural Communities of Special Concern

Wetland Resources: Alternative 3 has 11.7 acres of wetlands in the Central Segment. Impacts to wetlands would include direct loss of habitat due to fill from the construction of the Parkway.

Riparian Resources: Alternative 3 has 4.8 acres of riparian habitat in the Central Segment. Impacts to riparian habitat would include loss of riparian trees, shrubs, and other vegetation due to fill from the construction of the Parkway. Where the roadway would bridge stream or canal crossings, shading from the bridge may change the composition of the remaining vegetation.

Vernal Pool Complexes: Alternative 3 has 10.4 acres of vernal pool complexes in the Central Segment. Impacts to vernal pool complexes would include direct loss of habitat due to fill from the construction of the Parkway.

Threatened, Endangered, Candidate, and Fully Protected Species

Potential Giant Garter Snake Habitat: Garter snakes have historically been absent from this segment of the project area. There are no documented occurrences of the giant garter snake east of the Natomas

East Main Drainage Canal or the Pleasant Grove Creek Canal (CDFG, 2006). However, the wetland and riparian areas within this segment may provide habitat for the giant garter snake. Focused habitat assessments should be conducted during Tier 2 to identify potential impacts to the giant garter snake.

Potential Swainson's Hawk Nesting and Foraging Habitat: The Central Segment of Alternative 3 has 4.2 acres of potential Swainson's hawk nesting habitat. Impacts to this habitat include loss of nesting trees that would be removed due to the construction of the Parkway. This alternative would impact 352 acres of Swainson's hawk foraging habitat in the Central Segment.

Potential Valley Elderberry Longhorn Beetle Habitat: Potential Valley elderberry longhorn beetle habitat comprises 1.2 acres of the Central Segment of Alternative 3. Impacts to beetle habitat would include direct loss of their host plant, elderberry shrubs, which would be removed for the construction of the Parkway.

Potential Stream Crossings: Four stream crossings are within this segment: one on Steelhead Creek, one on Curry Creek, and two on Pleasant Grove Creek. Culverts or a bridge could be used at the Steelhead Creek crossing. The Curry Creek and Pleasant Grove Creek crossings coincide with floodplain crossings; therefore, the road would be elevated on a bridge. Any hard-bottomed structure such as a culvert would have the potential to create a drop in elevation (particularly at the downstream end) that may become a barrier to fish migration and may also significantly alter the morphology and fluvial dynamics of the channel (Garcia and Associates, 2006; Appendix C). Under higher flow conditions, such stream crossing may cause water to back up behind the crossing, trapping sediment and debris at the upstream end, thereby exacerbating flooding and possibly further destabilizing stream banks (Foothill Associates, 2005). Such small-scale or localized changes in stream morphology can affect fluvial dynamics to produce significant impacts on fish habitat (Garcia and Associates, 2006; Appendix C). Bridge crossings could result in stream channel loss and/or loss of riparian habitat.

This segment does not cross any existing canals; therefore, there would be no potential impacts to canals.

Conservation Lands

No conservation areas are present within the Central Segment of Alternative 3.

5.1.5.3 Alternative 3 – Eastern Segment

The Eastern Segment of Alternative 3 is the same as that of Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.1.6 Alternative 4 – the Yellow Alternative

5.1.6.1 Alternative 4 – Western Segment

Natural Communities of Special Concern

Wetlands: Alternative 4 has 0.3 acre of wetlands in the Western Segment. Impacts to wetland resources would include direct loss of habitat due to fill from the construction of the Parkway.

Riparian Resources: There is no riparian habitat in the Western Segment of Alternative 4.

Vernal Pool Complexes: Alternative 4 has 8.9 acres of vernal pool complexes in the Western Segment. Impacts to vernal pool complexes would include direct loss of habitat due to fill from the construction of the Parkway.

Threatened, Endangered, Candidate, and Fully Protected Species

Potential Giant Garter Snake Habitat: Alternative 4 has 268.2 acres of potential giant garter snake habitat in the Western Segment. Impacts to giant garter snake habitat would include loss of potential breeding, foraging, and migratory habitat.

Potential Swainson's Hawk Nesting and Foraging Habitat. There is no potential Swainson's hawk nesting habitat in the Western Segment of Alternative 4. This alternative would impact 60.7 acres of Swanson's hawk foraging habitat in the Western Segment.

Potential Valley Elderberry Longhorn Beetle Habitat. No Valley elderberry longhorn beetle habitat was identified during reconnaissance surveys within the Western Segment of Alternative 4. Focused surveys should be conducted during Tier 2 to specifically identify potential impacts to the Valley elderberry longhorn beetle.

Potential Stream Crossings: There are no stream crossings within this segment.

This segment would cross the Pleasant Grove Creek Canal. The canal is within the 100-year floodplain, and as such, this portion of the road would be elevated on a bridge. The columns to support the bridge would be placed outside the ordinary high water elevation of the canal. The approximate width of the canal at this crossing is on the order of 150 to 200 feet.

Impacts to biological resources as a result of the bridge crossing at the Pleasant Grove Creek Canal would include loss of stream bottom and/or riparian habitat where columns are placed. A 150- to 200-foot-wide section of the canal would be shaded where the bridge crossing is placed.

Conservation Lands

A small portion of conservation area previously owned and managed by the Natomas Basin Conservancy is located in the Western Segment of Alternative 4. This property was traded for land west of SR 70/99 in the fall of 2006 and is no longer a conservation area.

5.1.6.2 Alternative 4 – Central Segment

Natural Communities of Special Concern

Wetlands: Alternative 4 has 8.0 acres of wetland habitat in the Central Segment. Impacts to wetland resources would include direct loss of habitat due to fill from the construction of the Parkway.

Riparian Resources: Alternative 4 has 4.8 acres of riparian habitat in the Central Segment. Impacts to riparian resources would include loss of riparian trees, shrubs and other vegetation due to fill from the construction of the Parkway. Where the roadway would bridge stream or canal crossings, shading from the bridge may change the composition of the remaining vegetation.

Vernal Pool Complexes: Alternative 4 has 3.7 acres of vernal pool complexes in the Central Segment. Impacts to vernal pool complexes would include direct loss of habitat due to fill from the construction of the Parkway.

Threatened, Endangered, Candidate, and Fully Protected Species

Potential Giant Garter Snake Habitat: Garter snakes have historically been absent from this segment of the project area. There are no documented occurrences of the giant garter snake east of the Natomas

East Main Drainage Canal or the Pleasant Grove Creek Canal (CDFG, 2006). However, the wetland and riparian areas within this segment could provide habitat for the giant garter snake. Focused habitat assessments should be conducted during Tier 2 to identify potential impacts to the giant garter snake.

Potential Swainson's Hawk Nesting and Foraging Habitat: The Central Segment of Alternative 4 has 2.9 acres of potential Swainson's hawk nesting habitat. Impacts to this habitat include loss of trees used for nesting that would be removed due to construction of the Parkway. This alternative would impact 250.8 acres of Swanson's hawk foraging habitat in the Central Segment.

Potential Valley Elderberry Longhorn Beetle Habitat: Potential Valley elderberry longhorn beetle habitat comprises 1.2 acres of the Central Segment of Alternative 4. Impacts to beetle habitat would include direct loss of their host plant, elderberry shrubs, as a result of vegetation removal for the construction of the Parkway.

Potential Stream Crossings: Three stream crossings are within this segment: one on Curry Creek and two on Pleasant Grove Creek. The Curry Creek and Pleasant Grove Creek crossings coincide with floodplain crossings; therefore, the road would be elevated on a bridge. Any hard-bottomed structure such as a culvert would have the potential to create a drop in elevation (particularly at the downstream end) that may become a barrier to fish migration and may also significantly alter the morphology and fluvial dynamics of the channel (Garcia and Associates, 2006; Appendix C). Under higher flow conditions, such stream crossing may cause water to back up behind the crossing, trapping sediment and debris at the upstream end, thereby exacerbating flooding and possibly further destabilizing stream banks (Foothill Associates, 2005). Such small-scale or localized changes in stream morphology can affect fluvial dynamics to produce significant impacts on fish habitat (Garcia and Associates, 2006; Appendix C). Bridge crossings could result in stream channel loss and/or loss of riparian habitat.

This segment does not cross any existing canals; therefore, there would be no potential impacts to canals.

Conservation Lands

No conservation areas are present within the Central Segment of Alternative 4.

5.1.6.3 Alternative 4 – Eastern Segment

The Eastern Segment of Alternative 4 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.1.7 Alternative 5 – the Green Alternative

5.1.7.1 Alternative 5 – Western Segment

The Western Segment of Alternative 5 is the same as that for Alternative 4. Therefore, the potential impacts for this segment are the same as discussed for Alternative 4.

5.1.7.2 Alternative 5 – Central Segment

Natural Communities of Special Concern

Wetland Resources: Alternative 5 has 7.7 acres of wetland habitat in the Central Segment. Impacts to wetland resources would include direct loss of habitat due to fill from the construction of the Parkway.

Riparian Resources: Alternative 5 has 4.9 acres of riparian habitat in the Central Segment. Impacts to riparian resources would include loss of riparian trees, shrubs, and other vegetation due to fill from the construction of the Parkway. Where the roadway would bridge stream or canal crossings, shading from the bridge may change the composition of the remaining vegetation.

Vernal Pool Complexes: Alternative 5 has 21.0 acres of vernal pool complexes in the Central Segment. Impacts to vernal pool complexes would include direct loss of habitat due to fill from the construction of the Parkway.

Threatened, Endangered, Candidate, and Fully Protected Species

Potential Giant Garter Snake Habitat: Garter snakes have historically been absent from this segment of the project area. There are no documented occurrences of the giant garter snake east of the Natomas East Main Drainage Canal or the Pleasant Grove Creek Canal (CDFG, 2006). However, the wetland and riparian areas within this segment could provide habitat for the giant garter snake. Focused habitat assessments should be conducted during Tier 2 to identify potential impacts to the giant garter snake.

Potential Swainson's Hawk Nesting and Foraging Habitat: The Central Segment of Alternative 5 has 3.2 acres of potential Swainson's hawk nesting habitat. Impacts to this habitat include loss of trees used for nesting that would be removed due to construction of the Parkway. This alternative would impact 146.7 acres of Swainson's hawk foraging habitat in the Central Segment.

Potential Valley Elderberry Longhorn Beetle Habitat: Potential Valley elderberry longhorn beetle habitat comprises 1.2 acres of the Central Segment of Alternative 5. Impacts to beetle habitat would include direct loss of their host plant, elderberry shrubs, which would be removed as a result of construction of the Parkway.

Potential Stream Crossings: Three stream crossings are within this segment: two on Curry Creek and one on Pleasant Grove Creek. The Curry Creek and Pleasant Grove Creek crossings coincide with floodplain crossings; therefore, the road would be elevated on a bridge. Any hard-bottomed structure such as a culvert would have the potential to create a drop in elevation (particularly at the downstream end) that may become a barrier to fish migration and may also significantly alter the morphology and fluvial dynamics of the channel (Garcia and Associates, 2006; Appendix C). Under higher flow conditions, such stream crossing may cause water to back up behind the crossing, trapping sediment and debris at the upstream end, thereby exacerbating flooding and possibly further destabilizing stream banks (Foothill Associates, 2005). Such small-scale or localized changes in stream morphology can affect fluvial dynamics to produce significant impacts on fish habitat (Garcia and Associates, 2006; Appendix C). Bridge crossings could result in stream channel loss and/or loss of riparian habitat.

This segment does not cross any existing canals. Therefore, there would be no potential impacts to canals.

Conservation Lands

No conservation areas are present within the Central Segment of Alternative 5.

5.1.7.3 Alternative 5 – Eastern Segment

The Eastern Segment of Alternative 5 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.1.8 Description of Impacts to Special-Status Species

Impacts to threatened, endangered, candidate, and fully protected species are evaluated here in relation to the amount of habitat available to each species within the alignment alternatives. Based on the preliminary analysis of such impacts in this NES, additional evaluation of impacts would occur during Tier 2 of the project reflecting specific project design details and results of more extensive habitat and species surveys. Preliminary evaluations of potential direct effects to threatened, endangered, candidate, and fully protected species are discussed below.

White-Tailed Kite and Swainson's Hawk. Construction of the Parkway would potentially remove habitat used by the white-tailed kite and Swainson's hawk (see Figure 4-6 for potential Swainson's hawk habitat). The affected habitat would include large trees that are potential nest sites for the white-tailed kite and the Swainson's hawk, agricultural, and grassland habitats where these two raptor species forage, and disturbance of nests during construction activities. The proposed study corridors for Alternatives 4 and 5 have the least amount of habitat potentially suitable for nesting and foraging Swainson's hawks and white-tailed kites (Table 5-1). The study corridors for Alternatives 1 and 3 have the largest area of these habitat types. Most of the nesting habitat is located within the Central Segment of the study area but most of the potential foraging habitat, approximately 550 acres, is located within the Eastern Segment.

Table 5-1
Sensitive Resources Potentially Impacted by Each Build Alternative
(acres)

Resource Category	Alternative				
	1	2	3	4	5
Wetlands	35.8	30.9	32.0	28.3	28.0
Riparian Habitat	5.9	12.3	4.8	4.8	4.9
Vernal Pool Complex	122.7	124.1	127.6	106.7	124.0
Potential Giant Garter Snake Habitat	340.8	340.8	340.8	268.2	268.2
Potential Swainson's Hawk/White-Tailed Kite Nesting Habitat	6.4	7.9	4.6	3.3	3.6
Potential Swainson's Hawk Foraging Habitat	1,024.0	952.3	989.0	863.5	759.4
Potential Valley Elderberry Longhorn Beetle Habitat	1.9	1.3	1.2	1.2	1.2

Greater Sandhill Crane. Construction of the Parkway would result in the loss of seasonally flooded habitats that are potentially used by the migrating and wintering greater sandhill cranes. The loss of this habitat would also affect other non-listed species of waterfowl and wading birds that occur in the study area. However, seasonally flooded habitat is extensive in the vicinity of the proposed Placer Parkway corridors compared to the amount of habitat that would be potentially affected. Approximately 660 to 760 acres of seasonally flooded habitat is present within each of the corridor alternatives.

Giant Garter Snake. The extensive rice fields and drainage channels within the Western Segment of the study area are considered potentially suitable habitat for giant garter snake (see Figure 4-7). This habitat includes seasonally flooded areas such as rice fields, drainage channels and adjacent upland areas. It is

likely that a much smaller portion of that area would actually support a population of the giant garter snakes. Because giant garter snakes have limited dispersal capacity, focused habitat assessments would be conducted as part of the Tier 2 process to determine how much habitat would be directly impacted.

Alternatives 4 and 5 have the smallest amount of potential giant garter snake habitat within the proposed study corridors, approximately 268.2 acres, as compared to Alternatives 1, 2, and 3, which have a approximately 340.8 acres of this habitat category (Table 5-1). All of the giant garter snake habitat is located within the Western Segment of the proposed corridor alternatives so the proposed corridor is reduced to two alignments with generally similar areas of this habitat type, although the area within the northern alignment (Alternatives 4 and 5) is 8 percent larger than the southern alignment area.

Fall-Run Chinook Salmon and Central Valley ESU Steelhead. Listed salmonids such as the Central Valley ESU steelhead trout and fall-run Chinook salmon (candidate species) are known to occur seasonally in both the Auburn Ravine/Coon Creek watershed immediately to the north of the Parkway study area and the Dry Creek watershed immediately to the south, including the Natomas East Main Drainage Canal (Placer County, 1999; ECORP, 2003b; GANDA, 2001, 2005). See Appendix C for a Special-Status Fish Assessment report. However, fall-run Chinook salmon and steelhead are unlikely to use the streams in the study area due to the absence of instream habitat features required to support sustainable populations of these species (GANDA, 2006). Steelhead and salmon require gravel and cobble riffle areas for spawning, and cool-water rearing habitats for successful recruitment. Juvenile salmon leave freshwater and enter the ocean by spring; however, juvenile steelhead may remain resident in natal streams for several years before going to sea. Resident steelhead require perennially cool water for summer rearing. The major streams in the Placer Parkway study area, Pleasant Grove Creek, Curry Creek and Steelhead Creek lack the cool-water rearing habitats and the riffle areas required for spawning steelhead and salmon.

Construction of the Parkway is unlikely to adversely affect steelhead or fall-run Chinook salmon as these species are not likely to be present in the study area except for occasional transient occurrences via the two drainage canals. Crossings of major streams and drainage canals would be accomplished via bridges that would be constructed to avoid impedance of fish passage. Best management practices to control erosion and minimize degradation of water quality would be implemented during construction of a future road facility at the water crossings to protect aquatic habitats in the streams.

Vernal Pool Species. Vernal pool complexes occupy large parts of the study area. These complexes contain a mosaic of upland/grassland habitat and vernal pool wetlands. Vernal pool wetlands are potential habitat for several special-status species, including:

- Vernal pool fairy shrimp;
- Vernal pool tadpole shrimp;
- Boggs Lake hedge hyssop;
- Legenere;
- Western spadefoot; and
- Dwarf downingia.

Vernal pool complexes would be directly impacted as a result of construction of the Parkway, which could adversely impact populations of these special-status species.

Alternative 3 has the largest area of vernal pool complex habitat within the study area and Alternative 4 has the smallest area of this habitat category (Table 5-1). However, approximately 70 to 90 percent of the total vernal pool complex habitat within each of the corridor alignment alternatives is located within the Eastern Segment (approximately 94 acres) and therefore does not vary by alternative.

Valley Elderberry Longhorn Beetle. The host plant of the Valley elderberry longhorn beetle, blue elderberry shrubs (*Sambucus mexicana*), is uncommon in the study area. Elderberry shrubs are typically associated with the understory of riparian habitats. Construction of the Parkway would potentially remove or disturb riparian habitats and associated elderberry shrubs. Areas of riparian habitat have been identified for this NES, and additional field surveys would need to be completed during the Tier 2 process in order to precisely locate elderberry shrubs.

All of the potential Valley elderberry longhorn beetle habitat within each of the alternative corridors is located within the Central Segment, but the total area does not vary significantly between alternatives (see Figure 4-5). Alternative 1 has the largest area of potential Valley elderberry longhorn beetle habitat within the study area but this area is only about 0.6 acre larger than the area within the corridor for Alternative 2, and 0.7 acre larger than the area within the corridors for Alternatives 3 through 5, which contain the smallest area of this habitat (Table 5-1).

5.1.9 Comparison of Alternatives

A comparison of the Parkway build alternatives indicates differences between alternatives with respect to biological resources. The wetlands acreage is slightly larger for Alternatives 1, 2, and 3 due to the presence of a greater number of wetlands in the Western Segment. The greatest difference is between Alternative 1, which has 35.8 acres, and Alternative 5, which has 28 acres. Alternative 2 has more than double the amount of riparian habitat than other build alternatives due to the presence of an area of riparian habitat along Curry Creek in the Central Segment. Stream crossings are highest for Alternative 1, because it bisects several reaches of Steelhead Creek in the Central Segment (Table 5-2).

Table 5-1 summarizes the amount of sensitive habitat within each alternative corridor alignment. Alternatives 4 and 5 could impact approximately 72.6 acres less potential giant garter snake habitat than Alternatives 1, 2, and 3. The area of mature riparian trees available to Swainson's hawk for nesting in Alternatives 1 and 2 is greater than any of the other alternatives. The area of vernal pool complex potentially affected is highest for Alternative 3 and lowest for Alternative 4 in comparison to the other build alternatives. The amount of potential Valley elderberry longhorn beetle habitat is similar for all build alternatives, and is less than 2 acres in all instances.

Table 5-2 summarizes the number of new waterway crossings of each alternative. Figure 5-1 shows the location of each stream crossing by alternative.

Table 5-2
Number of New Waterway Crossings Potentially Impacted by Each Build Alternative

Alternative	No. of Stream Crossings	Canal Crossings
1	15	1
2	11	1
3	10	1
4	9	1
5	9	1

5.2 SECONDARY AND INDIRECT IMPACTS

Recent FHWA, U.S. EPA, and Caltrans guidance on growth inducement (Mare Island Accord, 2006) advises that analysis of potential impacts associated with growth should include an evaluation of the effects of growth on resources of concern. The following discussion presents a qualitative evaluation of

potential secondary and indirect impacts of Anticipated Growth (see below for definition) on human and environmental resources in the study area.

The Council on Environmental Quality (CEQ) provided clarification of the terminology "indirect impacts" when it issued the National Environmental Policy Act in 1978. Secondary and indirect impacts are defined as impacts "caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable." Moreover, indirect effects ". . . may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems."

A key term used in this section is "Anticipated Growth." This is defined as the growth that is anticipated in the study area as described in the relevant General Plans and adopted regional forecasts, such as the SACOG Blueprint scenario (as detailed in the Community Impact Assessment [Mara Feeney & Associates and DKS Associates, 2007]), including additional growth that may occur as a result of major new development proposals that have not yet been formally approved. It is possible that this additional growth may accelerate the rate of buildout in the study area, but it is not ultimately expected to result in any greater levels of development than is presented in adopted regional forecasts.

The following discussion considers secondary and indirect impacts on biological resources that may occur as a result of direct impacts associated with the Parkway, and as a result of anticipated growth.

5.2.1 Growth Inducement Scenario

The study area for the analysis of secondary and indirect impacts is shown in Figure 5-2. NEPA and CEQA both require environmental analyses to consider the effects of a project on growth. Caltrans defines growth inducement as the relationship between a proposed project and the resulting direct and indirect effects on growth (State CEQA Guidelines Section 15126[d]). This section summarizes the relationship between the Placer Parkway Corridor Preservation project and regional growth, and discusses potential secondary and indirect effects of the project related to growth inducement.

Placer Parkway would be growth inducing, as a component of the rapidly evolving urban matrix in western Placer County. While the project study area is predominately undeveloped at this time, parts of the study area are within local General Plan designations allowing urban growth. In addition, numerous proposals for major new development projects in and around the study area depicted on Figure 5-2 are currently in various stages of the approval and entitlement process. Portions of the surrounding area (especially northern Sacramento County and southwestern Placer County) have developed very rapidly over the past several decades. This has occurred as a result of many factors, including continuing net population growth statewide, strong employment growth in the Sacramento region, relative housing affordability, and location amenities.

Population and employment growth projections for California and the Sacramento Region in general, and for south Sutter County and southwestern Placer County in particular (described in detail in the Tier 1 EIS/EIR Community Impact Assessment), indicate that development pressures in the project vicinity will remain relatively intense, irrespective of the Parkway. Between 1950 and 2000, the California population more than tripled. During the same period, population in the six-county SACOG region increased by more than 800 percent (DOF, 2006). Projections and established goals and policies from a wide range of sources, including SACOG, Placer, Sacramento, and Sutter counties, and the Cities of Roseville, Rocklin and Lincoln, confirm that relatively high rates of population and employment growth and housing and commercial development are anticipated in the six-county region by 2050. Between 2000 and 2050, California's population is expected to increase from approximately 34 million to 55 million. During the same time period, SACOG projects that the region's growth will double, from 1.9 million in 2000 to 3.95 million in 2050, with the Roseville-Rocklin-Lincoln area remaining one of the fastest growing areas in the region (Levy and Doche-Boulos, 2005; SACOG, 2006).

Placer Parkway would be growth inducing because it would help support changes in the amount of growth beyond current general plan levels, and could influence the pace and location of some development. It is likely that Placer Parkway could help to implement the various specific development proposals in the study area, since it would serve to relieve traffic congestion associated with these proposals. Furthermore, the Parkway could affect the timing of development in the vicinity of the proposed interchange locations, particularly those proposed near vacant land adjacent to rapidly developing areas or areas now proposed for urban development. However, as the Parkway would be a limited-access road located in an area that is already undergoing extensive and rapid urbanization, its potential to facilitate growth that would not have otherwise occurred is limited. It could result in different land uses, or more intensive land uses, in the vicinity of interchanges where land use plans are still being developed and have not yet been approved. Also, it could hasten the buildout of planned commercial and industrial uses, especially in the Sunset Industrial Area and proposed Placer Ranch Specific Plan area, as well as in the proposed Sutter Pointe Specific Plan area.

In the longer term, improved access provided to lands in the Western and Eastern segments could be a factor in stimulating additional growth and development in areas west of SR 70/99 not protected by the NBHCP, or north of the Sutter Pointe Specific Plan area, or north of Sunset Boulevard West in Placer County. Although growth is anticipated in these areas over time (as reflected in SACOG's preferred Blueprint scenario, the Sutter County General Plan, and the City of Lincoln General Plan), such development is not reflected in general plans at present and has not been formally proposed by landowners. By providing improved access to adjacent areas, Placer Parkway could be one of many factors that would encourage growth in these areas sooner than this might otherwise occur.

The factors influencing growth in the region are complex. The Parkway is one of several major urban development proposals in the region. While Placer Parkway would contribute to regional growth, including growth beyond the level identified in current general plans, it is not feasible to quantify the amount of its contribution. A single new transportation facility such as the Parkway is only one of the many factors contributing to regional growth, and it is speculative to assign a particular quantity of growth to any one factor.

Furthermore, several factors serve to limit the likely effect of the Parkway on growth, including the following:

- No interchanges are proposed for any areas that are not already approved or proposed for development;
- All approved and proposed residential development that has not already been built is projected to be built out prior to 2020, when the Parkway is proposed to open; and
- Real estate market pressures in the area have been and continue to be intense without the Parkway, and local government jurisdictions have been supportive of processing development applications in spite of anticipated regional transportation challenges.

It is unlikely that the choice of one Placer Parkway build alternative over another would substantially change expected patterns of growth and development in the project study area and the surrounding region. In the Western Segment, all corridor alignment alternatives would provide new access to an area that is currently undeveloped farmland, but that is proposed for mixed use urban development. The three more southerly alignments (Alternatives 1, 2, and 3) would provide two interchanges in the Sutter Pointe Specific Plan area, while the more northerly alignments (Alternatives 4 and 5) would provide only one interchange in this area, approximately one mile farther north of the more southerly alignments in the Western Segment. Since none of the alternative alignments would include any intersections in the Central Segment, there would be little difference in growth inducement effects among the alternatives in this segment. In the Eastern Segment, two interchanges are proposed within the existing Sunset Industrial Area Plan, in an area proposed for the Placer

Ranch Specific Plan. While these interchanges would provide new access to a currently undeveloped area, this area is planned for growth. In the Eastern Segment all alternatives would follow an identical alignment, so there would be no differences in growth inducement effects among the alternatives.

A future interchange at Watt Avenue could be growth inducing, because it would provide major new regional access to a portion of the project study area that is currently rural and undeveloped, although both conceptual interchange locations are now surrounded by formal development proposals or land controlled by development interests. A Watt Avenue interchange is not proposed as part of the project.

5.2.2 Secondary and Indirect Effect Evaluation

5.2.3 No-Build Alternative

Under the No-Build Alternative land for Placer Parkway would not be acquired and the Parkway would not be constructed. There would not be any secondary or indirect impacts on biological resources under the No-Build Alternative.

5.2.4 Build Alternatives

Construction and operation of the Parkway and anticipated growth could result in secondary and indirect impacts on biological resources.

Anticipated growth would be expected to result in different land management and uses in the study area that would most likely not have occurred in the absence of such growth. Increased areas of impervious surface, habitat fragmentation, and hydrological changes could adversely affect biological resources. These impacts would be direct impacts of other projects not associated with Placer Parkway, and would be required to be analyzed as part of independent environmental review.

It is not feasible to perform a detailed evaluation of these projects at this stage because specific design details are not known. However, potential impacts of these projects are addressed in the Placer Parkway 2040 Cumulative analysis (see Section 5.3). This analysis evaluates a 2040 cumulative scenario, which is considered to be an appropriate projection of future development. This scenario includes full residential build-out in Placer County west of Sierra College Boulevard, including general plan areas and major developments, and employment and population growth in line with SACOG forecasts. It assumes levels of growth and development will occur at the higher end of a potential feasible range, and therefore represents a reasonable maximum development scenario for which cumulative and secondary and indirect impacts have been analyzed.

Although it is not possible to predict with any certainty where such impacts might occur, it is reasonable to assume that they would occur within the secondary and indirect impact analysis study area (Figure 5-2). The general nature of such impacts is discussed below.

Preservation of a future transportation corridor has the potential to indirectly affect biological resources if management of the land within the corridor is modified. Such impacts could also occur within the secondary and indirect impact analysis study area as a result of anticipated growth. However, initially there should be little change to land use as the land is expected to be leased back to its previous owners. However, land use in the corridor is likely to change if adjacent areas are converted to urban development and current agricultural land uses become less feasible. Effects that may be expected when the land use of the transportation corridor changes might include the fallowing of existing rice fields that are currently flood irrigated during the growing season or vernal pool complexes that are currently grazed. Potential effects might include the loss or degradation of habitat for species that benefit from the current land management practices. Examples of affected habitats might include agricultural areas used by foraging Swainson's hawks, greater sandhill cranes, wintering waterfowl, giant garter snakes, and burrowing owls,

as well as grazed vernal pool areas occupied by rare plants. A decrease in land management activities might also benefit nesting Swainson's hawks and white-tailed kites, the Valley elderberry longhorn beetle, and riparian habitats that are adversely affected by intensive land management activities.

Indirect impacts would primarily occur during Tier 2. The Tier 2 activities associated with all of the build alternatives would result in approximately the same type and degree of indirect impacts, as discussed below. These impacts are discussed collectively. Where a distinguishing factor can be identified for a given alternative, it is discussed separately.

The existence of a new roadway would adversely affect the surrounding natural communities and special-status species in a variety of ways. In particular, the remaining habitat immediately adjacent to the roadway would likely be considered of lower value and function for wildlife. The increased noise and lights associated with the roadway would likely decrease the value of that habitat for nesting and foraging causing disturbance and potentially affecting natural breeding cycles and behavior. The increased light and noise may also attract wildlife to the roadway, causing higher rates of mortality from vehicle strikes.

Construction of the Parkway and anticipated growth would both result in various indirect effects associated with habitat fragmentation. All of the project build alternatives are major linear features that cross three watersheds (Pleasant Grove Creek, Curry Creek, and Steelhead Creek [Figure 4-3]). Riparian areas associated with creeks are particularly valuable in providing foraging, nesting, and migratory habitat for wildlife species. In comparison to surrounding grasslands or agricultural areas, riparian corridors can provide water, shade, and a multi-level canopy of vegetation in which to forage and rest. In addition, species can use these corridors to travel between other suitable but geographically isolated patches of habitat. A 350-foot-wide roadway across a riparian corridor would potentially be a significant barrier to wildlife dispersal. All of the alternatives cross at least two of the watersheds mentioned above. In addition, all alternatives cross several tributary reaches of Pleasant Grove Creek in the Eastern Segment, where all alternatives follow the exact same alignment. Alternative 1 also crosses three additional reaches of the unnamed creek and three additional reaches of Curry Creek in the Central Segment. Alternative 2 crosses two additional reaches of Curry Creek in the Central Segment.

Vernal pool complexes would also be susceptible to the effects of fragmentation caused by a new roadway and also as a result of anticipated growth. Development can have effects on the hydrology of vernal pools that are not directly impacted. The coverage of land surfaces with concrete and/or deep ripping of the hardpan layer can affect the amount and quality of water available to the perched water tables characteristic of vernal pool areas. Changes to the perched water table can lead to alterations in the rate, extent, and duration of inundation (water regime) of remaining habitat (USFWS, 1996). Survival of vernal pool branchipods is directly linked to the water regime of their habitat. Roads in or near vernal pool habitat areas can lead to additional impacts through the introduction of chemically laden runoff (i.e., petroleum products). Development may also produce conditions that are favorable for exotic predators such as bullfrogs, and mosquito fish (USFWS, 1996). The U.S. Fish and Wildlife Service typically considers any ground-disturbing activities within 250 feet of a vernal pool to comprise an indirect impact. All alternatives would have indirect impacts on vernal pools to some extent. In the Eastern Segment, the study area narrows significantly and direct and indirect impacts to vernal pools would not be avoidable for any of the alternatives. In the Western Segment, Alternatives 1, 2, and 3 pass directly through the middle of a fairly large vernal pool complex west of the Union Pacific Railroad. Indirect impacts due to changes in hydrology and fragmentation would likely be the most significant for those alternatives. Alternatives 4 and 5 also intersect the edges of several smaller vernal pool complexes in the Western and Central segments. There would be potential to minimize the level of indirect impacts to vernal pools for Alternatives 4 and 5 during the siting of the roadway within the corridor (Tier 2).

Landscaping would be installed within the Parkway's no-development buffer zone, i.e., the portions of the 500- and 1,000-foot-wide corridors not used as part of the roadway cross section, as well as within the median. The landscaping would provide some degree of buffer between the roadway and adjacent vegetation; however, there is also the potential for the spread of non-native landscaping materials. If the appropriate species were used, the potential for the spread of non-native landscaping materials would be reduced. Native vegetation currently within the buffer area would be especially vulnerable to the introduction and spread of weedy or aggressively spreading species that are not dependent on supplemental irrigation.

5.3 CUMULATIVE IMPACTS

5.3.1 Cumulative Impacts Scenario

Analysis of cumulative impacts is required under NEPA and the California Environmental Quality Act (CEQA). Cumulative impacts result when the effects of an action are added to or interact with other effects in a particular place and within a particular time. It is the combination of these effects, and any resulting environmental degradation, that are the focus of cumulative impact analysis. The Council on Environmental Quality's (CEQ's) regulations (CEQ, 1987) explicitly state that cumulative impacts must be evaluated along with the direct and indirect effects of each alternative.

CEQA defines cumulative impacts as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts" (CEQA Guidelines, §15355). Stated another way, "a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the environmental document together with other projects causing related impacts" (CEQA Guidelines, §15130). Although a project may cause an individually limited or individually minor incremental impact that, by itself, is not significant, the increment may be "cumulatively considerable" and thus significant. The federal Endangered Species Act defines cumulative impacts as those effects of "future State or private activities, not including Federal activities, that are reasonably certain to occur within the action area of the Federal action subject to consultation" (USFWS and NMFS, 1998).

FHWA has requested that cumulative conditions for the analysis of project alternatives in the EIS/EIR for Placer Parkway be based on development levels that are 20 years beyond the projected opening of the Parkway. For planning purposes, PCTPA has identified 2020 as the opening year of the Parkway. Cumulative impacts are therefore being evaluated for the year 2040. The 2040 scenario includes the following projects (see Figure 5-2):

- Full build-out of all residential land in Placer County west of Sierra College Boulevard, including current general plan areas and the following major development proposals in West Placer County:
  - The Creekview and Sierra Vista Specific Plan areas in Roseville's Memorandum of Understanding (MOU) Remainder Area
  - The Sphere of Influence (SOI) expansion areas of Lincoln
  - The Placer Vineyards, Regional University and Community, and Placer Ranch Specific Plans in unincorporated Placer County
  - The Curry Creek Community Plan area
- Growth in retail employment in Placer County that balances the growth in residential development by matching SACOG's countywide estimate of about 0.32 employee per dwelling unit from their 2025 forecasts.

- Growth in total employment levels in Placer County that balances the growth in residential development by matching SACOG's 1.3 employees per dwelling unit from their 2025 forecasts.

- Full build-out of the residential development in the proposed Sutter Pointe Specific Plan area along with a non-residential development level that balances the residential development in that area.

- Estimated 2040 developments in all other portions of SACOG's six-county region based on assuming a constant rate for the development growth between 2005 levels and the 2050 Preferred Blueprint scenario for each of SACOG's traffic analysis zones (TAZs).

Past and present projects that are considered in the cumulative impact scenario include existing regional transportation facilities such as SR 70/99, SR 65, and the Union Pacific Railroad (UPRR). Past and present projects also include the relatively dense residential development to the east and south of the project study area boundary.

5.3.2 Cumulative Impacts Evaluation

Placer Parkway would incrementally contribute to the projected loss of natural vegetation and sensitive natural communities within western Placer County. However, the majority of potentially impacted areas from the alternatives overlap areas that are already planned or proposed for development or other land uses prior to 2040. The combined effects of the conversion of native vegetation and farmland to suburban residential, commercial/industrial, and regional roadways associated with past, present, and future projects could exacerbate adverse impacts associated with Placer Parkway through habitat fragmentation and cumulative loss of habitats used by special-status species and sensitive natural communities. Indirect effects may also be increased as a result of decreased quality of the remaining areas of habitat as a result of habitat fragmentation and adverse effects of increased proximity to urban land uses, such as stormwater run-off, noise, and disturbance.

Past development within western Placer County has substantially increased the area of developed land in the county. Approximately 2,600 acres were urbanized during the two-year period from 1996 to 1998. Between 1998 and 2000, the California Department of Conservation estimated that 3,800 acres of western Placer County were urbanized. In 2004, the West Roseville Specific Plan authorized the development of approximately 3,162 acres of vernal pool and upland habitats in the vicinity of the Placer Parkway alternatives, which is now under construction. It is anticipated that substantial additional development is likely to occur in the vicinity of the project. Examples of this anticipated future development, either proposed or anticipated (and based on input from jurisdictions), is listed in Table 5-3. Approximately 50,000 acres of development is currently planned or anticipated in the vicinity of Placer Parkway. The Parkway would occupy approximately 500 to 600 acres[3] depending upon the alternative that is selected, approximately 1 percent of the total area that is anticipated for development in this portion of western Placer County. A substantial portion of the Parkway corridor would include areas already proposed for developments (Table 5-3).

3 The developed area of the Placer Parkway corridor is estimated based upon an average developed highway corridor width of 312 feet and does not include the undeveloped areas within the corridor at the outer margins of the proposed corridor.

Table 5-3
Estimated Area of Proposed Development in the Vicinity of Placer Parkway

Proposed Development	Acres
3D North	46
3D South	65
Aiken Property	156
Brookfield Property	681
City of Lincoln Sphere of Influence (overlaps other proposed developments)	19,773
City of Roseville Retention Basin	1,741
Creekview Specific Plan Area	587
Curry Creek Community Plan	1,463
Curry Creek Community Plan	312

The additional development that is anticipated by 2040 would substantially reduce and fragment remaining habitats within western Placer County and south Sutter County. The combination of the Parkway and other planned and proposed development would decrease habitat availability for sensitive species and decrease the area of sensitive habitats such as wetlands, vernal pool complexes, and riparian areas. Habitat fragmentation would increase, with areas in the south and east of the study area being particularly affected. Development in the south and east of the study area would result in an almost continuous stretch of urbanization from I-80 in the south to the alignment of Alternative 5 (Figure 5-2) in the north.

The Parkway would primarily be located within areas already proposed for future urban uses. Therefore, the potential for the Parkway to cause a cumulative increase in habitat fragmentation and isolation would be limited to those few areas where development would not be likely to occur except for the proposed Parkway. These areas are associated with proposed crossings of major streams that currently provide important habitat linkages. For example, all of the alternatives would cross Pleasant Grove Creek immediately upstream of the City of Roseville's proposed Reason Farms Retention Basin. Proposed development east of the Parkway will fragment and isolate other portions of the wildlife corridors along Pleasant Grove Creek and its tributaries. The construction of this new crossing of Pleasant Grove Creek would result in additional fragmentation of the linkage between proposed open space within the West Roseville Specific Plan area and the open space areas within the Reason Farms Retention Basin site.

Although the percentage of contribution of impacts from the Placer Parkway alternatives would be small compared to the overall impacts of the projects anticipated in western Placer County by 2040, the impacts on waters of the U.S. and associated vernal pool and riparian habitats may be important in the context of the amount of disturbance that has occurred historically in the area. For example, the U.S. Fish and Wildlife Service recovery plan for vernal pool species specifies the preservation of at least 85 percent of the remaining vernal pool habitat within western Placer County as the recovery goal (USFWS, 2005). As such, the cumulative contribution of the Placer Parkway to further reduction of these sensitive habitats is considered substantial.

The earlier development of regional transportation facilities such as SR 70/99 and SR 65 have resulted in habitat fragmentation with barriers to wildlife movement in an east/west direction. Placer Parkway would result in an additional barrier to wildlife movement, but in a north/south direction. However, the east-west orientation of the Parkway minimizes potential cumulative effects on wildlife movement as existing stream and riparian corridors are also generally located in an east-west orientation within western Placer County, which minimizes the crossings by the proposed road corridor.

Areas of contiguous open space comprising agricultural land and pasture and undeveloped land would only remain within the north and west side of the study area following the development of the Parkway and other planned and proposed development in the study area. The remaining open space within the developed areas would be highly fragmented and therefore of significantly lower quality than what currently exists. There would likely be declines in the diversity of animal, plant and wildlife populations due to adverse effects of habitat fragmentation and isolation of remaining populations. Remaining habitat would be of less value than similar contiguous habitat.

As a result, the potential adverse impacts on sensitive biological resources associated with Placer Parkway are considered cumulatively considerable. Mitigation for impacts to sensitive biological habitat would be provided by a combination of fees paid to the Natomas Basin Habitat Conservation Plan, and either fees paid to the PCCP or a combination of avoidance, minimization, and compensation. Mitigation strategies for direct impacts are discussed further in Section 5.5.

5.4 POTENTIAL WATT AVENUE INTERCHANGE

The potential future interchange with Watt Avenue would be an interchange located at the far eastern edge of the Central Segment. Figure 2-3 shows each conceptual interchange location. Alternative 1 has two options for interchange location, one to the north (Option Two) and one to the south (Option One). Option Two would also be the location of the interchange for Alternative 2. Alternatives 3 and 4 share the same interchange location. It is estimated any interchanges could result in approximately 65 acres of potential direct habitat impacts. The type and amount of sensitive biological resources that would be impacted would be evaluated as part of the Tier 2 process. Direct impacts would include loss of general wildlife habitat but there would not likely be any impacts to potential giant garter snake habitat, potential

Swainson's hawk nesting habitat, or potential Valley elderberry longhorn beetle habitat as a result of a potential Watt Avenue interchange.

The proposed interchange locations for Alternative 1 (Option One) would impact approximately 9 acres of wetlands beyond the alignment corridor. The interchange for Alternative 1 (Option Two) and Alternative 2 would affect less than 1 acre of wetlands. However, both these alternatives could affect approximately 11 acres that have been mapped as vernal pool complex for the Placer Legacy planning effort. The proposed interchange location for Alternatives 3 and 4 would impact approximately 6 acres of additional wetland habitats beyond the study corridors for these alternatives. The interchange option for Alternatives 3 and 4 would also potentially affect 3 acres of vernal pools. The interchange for Alternative 5 would impact approximately 1 acre of wetlands but would not affect any vernal pool complexes. No additional stream crossings would occur as a result of the potential Watt Avenue interchange.

5.5 AVOIDANCE, MINIMIZATION AND MITIGATION

Under the Modified NEPA/404 MOU (discussed below in Section 6.1) Concurrence Point #5 states that the mitigation framework for Tier 1 will describe in general terms the processes that PCTPA will use to maximize opportunities for successful mitigation, including long-term mitigation and management of resources. The MOU states that the mitigation framework should identify the following:

- Mitigation options available for creation, restoration, enhancement and preservation of aquatic resources (e.g., land dedication, acquisition of conservation easements, in lieu of fees for acquisition, mitigation banks), and potential mitigation sites;
- Wildlife/environmental friendly design including but not limited to, low impact development standards, maintaining or creating environmental corridors, and construction of bridges over stream crossings;
- Opportunities to build upon existing or planned conservation efforts of other agencies and non-governmental organizations for the purposes of protecting and restoring large, intact landscapes; and
- Institutions and instruments for long-term management of mitigation sites.

A screening level evaluation of the conceptual corridor alignments identified in the Project Study Report (PSR) (DKS Associates, 2001) along with a number of other potential alternatives was conducted from 2003 to 2005. The purpose of the screening level evaluation was to:

- Develop preliminary engineering, transportation, and screening criteria,
- Identify "fatal flaws" or issues of substantial impact associated with these corridor alignments, and
- Identify opportunities for adjusting them to minimize or eliminate fatal flaws, and reduce impacts to biological resources.

The results of the screening level evaluation were published in a Technical Memorandum in 2004 (URS, 2004). The results of the environmental screening of PSR alternatives identified areas where slight modifications to the alignments would significantly reduce potential impacts to biological resources. Those modifications were implemented. For instance, a large wetland and conservation area along the main branch of Curry Creek was avoided by changing Alternative 3 to curve north. Also, vernal pool

complexes in the eastern part of the Central Segment, and in the western part of the Eastern Segment were modified to be avoided by all Tier 1 corridor alignments.

Future (Tier 2) efforts to site the alignment within the selected corridor will also place a high priority on avoiding impacts to sensitive biological resources. Activity-specific avoidance and minimization measures would be developed during the Tier 2 process to protect sensitive biological resources during construction and operation of the Parkway. Examples of potential avoidance and minimization measures that might be implemented to protect special-status fish species are provided in Appendix C.

The following sections describe the proposed mitigation strategies for Sutter County and Placer County. The proposed mitigation would be implemented during the Tier 2 phase of the project when specific impacts have been identified. Where HCP options exist, the biological resource impacts identified during the Tier 2 phase would be mitigated according to the requirements of the specific plan. In areas where an HCP option is not available, the Tier 2 mitigation would be implemented according to the strategies outlined below.

5.5.1 Mitigation Strategy for Sutter County

5.5.1.1 Mitigation Strategy under the Natomas Basin Habitat Conservation Plan

A large portion of the Western Segment of the study area falls within Sutter County and northern Sacramento County. These areas are part of a geographic region called the Natomas Basin. The NBHCP was established in 1997 as a multi-species conservation program to mitigate the expected loss of habitat values and incidental take of protected species that would result from urban development, operation of irrigation and drainage systems, and rice farming. The Natomas Basin Conservancy (NBC) manages the implementation of the NBHCP. To meet the mitigation goals of the NBHCP, a mitigation fee is paid to the NBC by developers of projects when they apply for building permits. The NBC then uses the mitigation fees to acquire, restore, and manage mitigation lands to provide habitat for protected species and maintain agriculture in the basin (NBC, 2006). The required fees would be paid to the NBC to mitigate for Parkway impacts to special status species in the NBHCP service area.

5.5.1.2 Mitigation Strategy for Impacts Not Within the Natomas Basin Habitat Conservation Plan

The mitigation strategy that would be pursued for impacts to areas within Sutter County but not in the Natomas Basin would include a combination of avoidance, minimization, and compensation. Measures to avoid and minimize potential impacts would include scheduling construction activities to minimize disturbance during sensitive life cycle phases of wildlife species; monitoring construction activities to limit disturbance, vegetation removal, and habitat damage; and implementing an environmental awareness training program for all construction personnel. In keeping with the strategy presented in *Eco-Logical* (Brown, 2006), compensation would include some combination of habitat preservation, restoration, and creation developed in coordination with federal, state, and local agencies with the goal of protecting larger, connected habitat rather than protecting fragmented areas of a single resource.

The framework for conservation efforts established by the NBHCP would be implemented to the extent feasible to mitigate for impacts resulting from Placer Parkway.

Efforts to conserve, restore, or create compensatory habitat would be focused within the Pleasant Grove Creek watershed, or areas to the north. Areas to the south are less preferred because of existing and proposed future development. Preservation of large blocks of habitat or linkages between existing conservation areas would be preferred to the acquisition of smaller habitat areas.

Mitigation for impacts to vernal pool species would be consistent with the Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon. The Plan presents an ecosystem-level strategy for recovery and conservation because all covered species occur in the same natural ecosystem. The five key elements of the recovery strategy are as follows: habitat protection; adaptive habitat management, restoration and monitoring; status surveys; research; and participation and outreach. The Placer Parkway project may contribute to the recovery effort primarily through habitat protection through the establishment of conservation areas and reserves that will maintain or enhance species habitat values.

Existing USFWS and CDFG mitigation guidelines for giant garter snake, Valley elderberry longhorn beetle, and Swainson's hawks would be used.

5.5.2 Mitigation Strategy for Placer County

The proposed Placer County Conservation Plan (PCCP) is a Placer County program consisting of a Natural Community Conservation Plan (NCCP) and a Habitat Conservation Plan (HCP) that seeks to protect Placer's diverse open-space and agricultural resources. It also seeks to promote viable economic opportunities within the County. The PCCP is being developed under the Placer Legacy. An HCP is a plan that permits the removal of habitat for federally listed species in designated areas and specifies measures for conserving and enhancing habitat for these species in open space preserves. An NCCP identifies and provides for the regional or area-wide protection of plants, animals, and their habitats, while allowing compatible and appropriate economic activity.

The PCCP is currently under development and the timing of its completion is uncertain. It may or may not be adopted by the time that mitigation is implemented for Placer Parkway. Because a goal of the mitigation framework is to use regional opportunities to build on existing or planned conservation efforts, the conceptual mitigation for Placer Parkway must include the goals of the PCCP, and use (if available) its established mechanisms for conservation. At the same time, conceptual mitigation for Placer Parkway must provide for suitable alternatives should the PCCP not be functional in time to serve this project's mitigation needs.

Under either scenario, the avoidance and minimization of impacts is the preferred strategy for Placer Parkway, as identified in *Eco-Logical* guidance from the U.S. Department of Transportation (Brown, 2006). Consistent with the *Eco-Logical* strategy, required mitigation will be implemented so that it would complement and expand existing conservation and open space areas in the project vicinity. A number of opportunities for restoration and conservation are identified in the draft Ecosystem Restoration Plan for the Pleasant Grove Creek and Curry Creek watersheds (Foothill Associates, 2005). Although variation exists in the amount of direct impacts of the roadway, each alternative would have approximately the same order of magnitude except the No-Build Alternative, which would have no direct impacts. However, during the Tier 2 process, the exact location of the roadway will be identified within the corridor preserved during Tier 1. During this siting process, a more detailed, ground based evaluation of sensitive biological resources will be completed, including a jurisdictional wetland delineation and sensitive species surveys. Results of ground surveys will be used to avoid, to the extent feasible, the placement of the roadway alignment directly within areas of sensitive resources.

The following sections describe a conceptual mitigation framework for areas within western Placer County both with and without the PCCP.

5.5.2.1 Mitigation Strategy Under the Placer County Conservation Plan

The PCCP is a proposed strategy and regulatory framework designed to guide and streamline permitting for large-scale development in western Placer County over the next 50 years while establishing a network of conservation areas to protect and conserve sensitive species and natural communities. The PCCP

covers approximately 221,000 acres in western Placer County, including important natural communities such as stream environments, vernal pool grasslands, grasslands, blue oak and valley oak woodlands, and agricultural lands such as rice. Many stream and wetland resources found in the western part of Placer County are regulated under the federal Endangered Species Act (ESA) and the Clean Water Act (CWA) because they provide aquatic habitat for threatened and endangered species. The goal of combining these regulatory frameworks is a streamlined permitting process and greater environmental benefits.

SPRTA has coordinated with Placer County since 2003 on becoming a Participating Agency with the Placer Parkway as a "covered" activity. A draft Planning Agreement is being finalized for consideration by SPRTA, Placer County, and resource agencies. If the PCCP is approved it would likely require mitigation based on acres of undeveloped lands that are developed rather than on a habitat-specific basis. Two options compensating for project impacts are under consideration:

- In-lieu fee payment, or
- Acquisition of conservation lands by the project developer.

Both of these options would provide conservation of larger, consolidated areas of land that are consistent with the *Eco-Logical* approach advocated by Brown (2006). The in-lieu fee payment option would rely on a set payment per acre of undeveloped land converted to development. No value for the in-lieu payment has been assigned at this time pending the adoption of a conservation area strategy. However, the small area of vernal pool habitat remaining in western Placer County has complicated this effort. Proposed strategies would provide a minimum of 3:1 compensation for vernal pool habitat that would consist of 2:1 preservation and 1:1 creation. The U.S. Fish and Wildlife Service has suggested a much higher ratio in order to achieve 85 percent preservation of the remaining habitat as proposed under the recovery plan for vernal pool species (2005).

Another part of the County's planning effort is the development of the County Aquatic Resources Plan (CARP), which will protect sensitive aquatic resources and is intended ultimately to allow the County to authorize projects under CWA Section 404. However, unlike the PCCP, which has no upper limit on the size of project that the County can authorize, under CARP the County would only be able to authorize projects that have impacts of up to 3 acres of waters of the United States.

The U.S. Environmental Protection Agency and U.S. Army Corps of Engineers (USCOE) have proposed a streamlined process for obtaining CWA Section 404 authorizations for western county projects with 3 acres or more of impacts. These projects would be able to tier from the NEPA and CWA analyses that will be performed for the PCCP and CARP, provided that they otherwise meet the conditions established in the PCCP and CARP. This should eliminate the need for additional off-site alternatives analysis at the project level, provide project proponents with greater flexibility with regard to on-site avoidance, and generally result in expedited processing of individual permit applications for such projects.

5.5.2.2 Mitigation Strategy Without the Placer County Conservation Plan

The mitigation strategy that would be pursued if the PCCP were unavailable by the time the Placer Parkway project is implemented would be based upon the mitigation guidelines presented in *Eco-Logical* (Brown, 2006). This strategy would include a combination of avoidance, minimization, and compensation. Compensation would include some combination of habitat preservation, restoration, and creation developed in coordination with federal, state, and local agencies. Compensation areas would be selected that meet the following criteria:

1. Contiguous with existing open space or high value habitat;

2. Compatible with existing watershed and regional plans such as the Pleasant Grove/Curry Creek Ecosystem Restoration Plan (Foothill Associates, 2005) and the USFWS Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon (USFWS, 2005); and

3. Acceptable to the federal, state, and local agencies with regulatory jurisdiction over the affected resources.

A recent USFWS memorandum to Placer County stated that preservation of existing high-quality vernal pool habitat is preferable to creation; however, if creation is required to satisfy other regulatory requirements, the USFWS prefers creation in areas that are not currently vernal pool habitat (Sanchez, 2006).

Compensatory habitat mitigation in the absence of the PCCP would be implemented according to the strategies outlined for Sutter County in Section 5.5.1.2. The Recovery Plan for Vernal Pool Ecosystems of California and Southern Oregon set a goal of preserving at least 85 percent of the remaining vernal pool critical habitat in western Placer County (USFWS, 2005). The Plan presents an ecosystem-level strategy for recovery and conservation because all of the covered species occur in the same natural ecosystem. The five key elements of the recovery strategy are as follows: habitat protection, adaptive habitat management, restoration and monitoring, status surveys, research, and participation and outreach. The project may contribute to the recovery effort through habitat protection and the establishment of conservation areas and reserves that will maintain or enhance species habitat values.

Under the Recovery Plan, western Placer County contains designated "core areas" of vernal pool habitat, some of which falls within the Placer Parkway study area. Core areas are designated as zone 1, 2, or 3. The zone designation will be used to determine the order of their overall priority for recovery. It is anticipated in the Recovery Plan that a number of the covered species can be recovered primarily through the protection of areas designated as zone 1. All of the core areas in western Placer County are zone 2, which are areas where the most widely distributed species occur (Figure 4-2). Protection of zone 2 core areas will significantly contribute to recovery of these species, and if sufficient, might offset the need to protect some lands within zone 1 core areas (USFWS, 2005). In general, the USFWS considers recovery recommendations in zones 2 and 3 core areas to be more flexible than zone 1, and recovery criteria specific to those zones may be modified on a case-by-case basis based on future information (USFWS, 2005).

6.0 REGULATORY REQUIREMENTS AND ADDITIONAL ANALYSES

6.1 REGULATORY REQUIREMENTS FOR TIER 1

FHWA, Caltrans, and PCTPA have participated with the USCOE and the U.S. EPA in a modified NEPA/404 process. A formal process is usually initiated by the submittal of an application for a Section 404 permit under the Clean Water Act to the USCOE. It focuses on identification of a Least Environmentally Damaging Practicable Alternative (LEDPA). This process ensures federal agency agreement that the preferred alternative is the LEDPA necessary to obtain permits prior to project construction.

The Tier I EIS/EIR process for the project does not require a Section 404 permit or any permits from any federal agencies. Therefore, a LEDPA determination is not necessary in the current process. However, all parties have participated in a modified NEPA/404 process that has provided increased certainty that the corridor alignment identified as the preferred alternative in the Final EIS/Program EIR will meet the criteria of Section 404 of the Clean Water Act. This will help to address significant LEDPA issues during the Tier 2 process, and is intended to result in an ultimate project that will receive a Section 404 permit. The establishment of the modified MOU has increased the level of predictability for long-term project planning and has increased the likelihood that commitments by agencies will be honored, as discussed in *Eco-Logical* (Brown, 2006).

No additional biological resource studies or analyses are proposed for the Tier 1 process. Detailed design information required for further studies will be not be available until the Tier 2 stage of the project.

6.2 ANALYSIS TO BE UNDERTAKEN IN TIER 2

Additional studies will be required for the Tier 2 EIS/EIR and permitting process. Detailed habitat mapping would be conducted using a combination of GIS data, aerial photography, and field reconnaissance. Focused surveys for special-status species may also occur within the chosen corridor alternative. This would include vernal pool branchipods, giant garter snake, Valley elderberry longhorn beetle, listed plants, and any other species that become listed prior to the Tier 2 document. Results of focused surveys and habitat mapping would be included (if applicable) in a Biological Assessment in support of Section 7 consultation with the USFWS, NOAA Fisheries, and/or California State Endangered Species Consultation. Focus surveys and mapping would also be used to site the roadway within the chosen corridor alternative in a manner that least affects special-status species and sensitive habitat.

A formal wetland delineation would be conducted for the U.S. Army Corps of Engineers and California Regional Water Quality Control Board permitting requirements under Section 404/401 of the Clean Water Act.

Pre-construction surveys would likely also be completed after the Tier 2 EIS/EIR document but prior to construction for species such as Swainson's hawk, white-tailed kite, and other nesting birds.

Oakland, CA 94612

Subject: Species List for Placer Parkway Corridor Preservation

Dear: Dr. Pretare

We are sending this official species list in response to your June 16, 2006 request for information about endangered and threatened species. The list covers the California counties and/or U.S. Geological Survey 7½ minute quad or quads you requested.

Our database was developed primarily to assist Federal agencies that are consulting with us. Therefore, our lists include all of the sensitive species that have been found in a certain area *and also ones that may be affected by projects in the area*. For example, a fish may be on the list for a quad if it lives somewhere downstream from that quad. Birds are included even if they only migrate through an area. In other words, we include all of the species we want people to consider when they do something that affects the environment.

Please read Important Information About Your Species List (below). It explains how we made the list and describes your responsibilities under the Endangered Species Act.

Our database is constantly updated as species are proposed, listed and delisted. If you address proposed and candidate species in your planning, this should not be a problem. However, we recommend that you get an updated list every 90 days. That would be September 14, 2006.

Please contact us if your project may affect endangered or threatened species or if you have any questions about the attached list or your responsibilities under the Endangered Species Act. A list of Endangered Species Program contacts can be found at www.fws.gov/sacramento/es/branches.htm.

Endangered Species Division

Federal Endangered and Threatened Species that Occur in or may be Affected by Projects in the Counties and/or U.S.G.S. 7 1/2 Minute Quads you requested

Document Number: 060616035203
Database Last Updated: May 5, 2006

Species of Concern - The Sacramento Fish & Wildlife Office no longer maintains a list of species of concern. However, various other agencies and organizations maintain lists of at-risk species. These lists provide essential information for land management planning and conservation efforts. See www.fws.gov/sacramento/es/spp_concern.htm for more information and links to these sensitive species lists.

Red-Legged Frog Critical Habitat - The Service has designated final critical habitat for the California red-legged frog. The designation becomes final on May 15, 2006. See our map index.

Species

Listed Species

Invertebrates

Branchinecta lynchi
vernal pool fairy shrimp (T)

Desmocerus californicus dimorphus
valley elderberry longhorn beetle (T)

Lepidurus packardi
vernal pool tadpole shrimp (E)

Fish

Hypomesus transpacificus
delta smelt (T)

Oncorhynchus mykiss
Central Valley steelhead (T) (NMFS)
Critical habitat, Central Valley steelhead (X) (NMFS)

Oncorhynchus tshawytscha
Central Valley spring-run chinook salmon (T) (NMFS)
Critical Habitat, Central Valley spring-run chinook (X) (NMFS)
Critical habitat, winter-run chinook salmon (X) (NMFS)
winter-run chinook salmon, Sacramento River (E) (NMFS)

Amphibians

Ambystoma californiense
California tiger salamander, central pppulation (T)

Rana aurora draytonii
California red-legged frog (T)

Reptiles

Thamnophis gigas

giant garter snake (T)

Birds

Haliaeetus leucocephalus

bald eagle (T)

Candidate Species

Fish

Oncorhynchus tshawytscha

Central Valley fall/late fall-run chinook salmon (C) (NMFS)
Critical habitat, Central Valley fall/late fall-run chinook (C) (NMFS)

Birds

Coccyzus americanus occidentalis

Western yellow-billed cuckoo (C)

Selected Quads

RIO LINDA (512B) TAYLOR MONUMENT (513A) PLEASANT GROVE (528C) ROSEVILLE (528D) VERONA (529D)

County Lists

No county species lists requested.

Key:

(E) *Endangered* - Listed as being in danger of extinction.
(T) *Threatened* - Listed as likely to become endangered within the foreseeable future.
(P) *Proposed* - Officially proposed in the Federal Register for listing as endangered or threatened.
(NMFS) Species under the Jurisdiction of the National Oceanic & Atmospheric Administration Fisheries Service. Consult with them directly about these species.
Critical Habitat - Area essential to the conservation of a species.
(PX) *Proposed Critical Habitat* - The species is already listed. Critical habitat is being proposed for it.
(C) *Candidate* - Candidate to become a proposed species.
(V) Vacated by a court order. Not currently in effect. Being reviewed by the Service.
(X) *Critical Habitat* designated for this species

Important Information About Your Species List

How We Make Species Lists

We store information about endangered and threatened species lists by U.S. Geological Survey 7½ minute quads. The United States is divided into these quads, which are about the size of San Francisco.

The animals on your species list are ones that occur within, **or may be affected by** projects within, the quads covered by the list.

- Fish and other aquatic species appear on your list if they are in the same watershed as your quad or if water use in your quad might affect them.
- Amphibians will be on the list for a quad or county if pesticides applied in that area may be carried to their habitat by air currents.
- Birds are shown regardless of whether they are resident or migratory. Relevant birds on the county list should be considered regardless of whether they appear on a quad list.

Plants

Any plants on your list are ones that have actually been observed in the area covered by the list. Plants may exist in an area without ever having been detected there. You can find out what's in the nine surrounding quads through the California Native Plant Society's online Inventory of Rare and Endangered Plants.

Surveying

Some of the species on your list may not be affected by your project. A trained biologist or botanist, familiar with the habitat requirements of the species on your list, should determine whether they or habitats suitable for them may be affected by your project. We recommend that your surveys include any proposed and candidate species on your list.

For plant surveys, we recommend using the Guidelines for Conducting and Reporting Botanical Inventories. The results of your surveys should be published in any environmental documents prepared for your project.

Your Responsibilities Under the Endangered Species Act

All animals identified as listed above are fully protected under the Endangered Species Act of 1973, as amended. Section 9 of the Act and its implementing regulations prohibit the take of a federally listed wildlife species. Take is defined by the Act as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect" any such animal.

> Take may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or shelter (50 CFR §17.3).

Take incidental to an otherwise lawful activity may be authorized by one of two procedures:

- If a Federal agency is involved with the permitting, funding, or carrying out of a project that may result in take, then that agency must engage in a formal consultation with the Service.

  During formal consultation, the Federal agency, the applicant and the Service work together to avoid or minimize the impact on listed species and their habitat. Such consultation would result in a biological opinion by the Service addressing the anticipated effect of the project on listed and proposed species. The opinion may authorize a limited level of incidental take.

- If no Federal agency is involved with the project, and federally listed species may be taken as part of the project, then you, the applicant, should apply for an incidental take permit. The Service may issue such a permit if you submit a satisfactory conservation plan for the species that would be affected by your project.

  Should your survey determine that federally listed or proposed species occur in the area and are likely to be affected by the project, we recommend that you work with this office and the California Department of Fish and Game to develop a plan that minimizes the project's direct and indirect impacts to listed species and compensates for project-related loss of habitat. You should include the plan in any environmental documents you file.

Critical Habitat

When a species is listed as endangered or threatened, areas of habitat considered essential to its conservation may be designated as critical habitat. These areas may require special management considerations or protection. They provide needed space for growth and normal behavior; food, water, air, light, other nutritional or physiological requirements; cover or shelter; and sites for breeding, reproduction, rearing of offspring, germination or seed dispersal.

Although critical habitat may be designated on private or State lands, activities on these lands are not restricted unless there is Federal involvement in the activities or direct harm to listed wildlife.

If any species has proposed or designated critical habitat within a quad, there will be a separate line for this on the species list. Boundary descriptions of the critical habitat may be found in the Federal Register. The information is also reprinted in the Code of Federal Regulations (50 CFR 17.95). See our critical habitat page for maps.

Candidate Species

We recommend that you address impacts to candidate species. We put plants and animals on our candidate list when we have enough scientific information to eventually propose them for listing as threatened or endangered. By considering these species early in your planning process you may be able to avoid the problems that could develop if one of these candidates was listed before the end of your project.

Wetlands

If your project will impact wetlands, riparian habitat, or other jurisdictional waters as defined by section 404 of the Clean Water Act and/or section 10 of the Rivers and Harbors Act, you will need to obtain a permit from the U.S. Army Corps of Engineers. Impacts to wetland habitats require site specific mitigation and monitoring. For questions regarding wetlands, please contact Mark Littlefield of this office at (916) 414-6580.

Updates

Our database is constantly updated as species are proposed, listed and delisted. If you address proposed and candidate species in your planning, this should not be a problem. However, we recommend that you get an updated list every 90 days. That would be September 14, 2006.

Appendix B

Listed, Proposed Species, Species of Concern, and Candidate Species That May Occur in the Vicinity of the Placer Parkway Corridor Preservation Project Study Area

Table B-1
Listed, Proposed, Species of Concern and Candidates for Listing That May Occur in the Vicinity of the Placer Parkway Corridor Preservation Study Area

Scientific Name COMMON NAME	Federal/ State Listing[1]	CNPS/ R-E-D[2]	Preferred Habitat	Likelihood That Species May Occur in Study area
LISTED, PROPOSED, AND CANDIDATE SPECIES				
Elanus leucurus (nesting) white-tailed kite	None/ FP	–	Low rolling foothills, valley margins with scattered oaks and river bottomlands or marshes adjacent to deciduous woodland; dense-topped trees for nesting and perching	Observed in the study area; has nested in the vicinity
Buteo swainsoni (nesting) Swainson's hawk	None/ T	–	Breeds in stands with few trees in juniper-sage flats, riparian areas, oak savannahs, with adjacent suitable forage areas such as grasslands, or alfalfa or grain fields supporting rodent populations	Known to occur; mature trees suitable for nesting in the study area
Grus canadensis tabida (nesting and wintering) greater sandhill crane	None/ T, FP	–	Winters in the Central Valley; prefers wide open habitats, including mesic grasslands, mesic croplands, and large freshwater marshes	May occur in the study area during winter. Not in breeding range
Thamnophis gigas giant garter snake	T/ T, P	–	Prefers freshwater marsh and low gradient streams, has adapted to drainage canals and irrigation ditches	Known to occur in the study area
Oncorhynchus tshawytscha Central Valley fall-run chinook salmon	C/ None	–	Pacific Ocean, spawn in large, permanent coastal streams and rivers, over gravel beds	Uses Natomas East Main Drainage Canal for migration; does not breed in study area
Branchinecta lynchi vernal pool fairy shrimp	T/ None	–	Vernal pools, inhabit small, clear-water sandstone depression pools and grassed swale, earth slump, or basalt-flow depression pools	May occur in the study area
Lepidurus packardi vernal pool tadpole shrimp	E/ None	–	Seasonal pools in unplowed grassland with old alluvial soils underlain by hardpan or in sandstone depressions, water in the pools has very low alkalinity and conductivity	May occur in the study area
Desmocerus californicus dimorphus Valley elderberry longhorn beetle	T/ None	–	Occurs only in the Central Valley, in association with blue elderberry shrubs, prefers to lay eggs in elderberries 2 to 8 inches in diameter, some preference for "stressed" elderberries	May occur in the study area
Gratiola heterosepala Boggs Lake hedge-hyssop	None/ E	1B/ 1-2-2	Marshes and swamps (freshwater), vernal pools; clay soils; usually in vernal pools, sometimes on lake margins; 10 to -2,375 meters	May occur in the study area

Table B-1
Listed, Proposed, Species of Concern and Candidates for Listing That May Occur in the Vicinity of the Placer Parkway Corridor Preservation Study Area

Scientific Name COMMON NAME	Federal/ State Listing[1]	CNPS/ R-E-D[2]	Preferred Habitat	Likelihood That Species May Occur in Study area
SPECIES OF CONCERN				
Myotis yumanensis Yuma myotis bat	SC/ None	–	Forests and woodlands with sources of water over which to feed, roosts in buildings, mines, caves, crevices, occasionally under bridges	May occur in the study area
Myotis ciliolabrum small-footed myotis bat	SC/ None	–	Arid woody or brushy uplands, near water, west and east sides of Sierra Nevada; 0 to 2,700 meters	May occur in the study area
Corynorhinus townsendii townsendii Pacific western big-eared bat	SC/ SC	–	Prefers mesic areas; roosts in caves or similar structures	May occur in the study area
Eumops perotis californicus greater western mastiff bat	SC/ None	–	Open, arid grassland and sparse woodland, often using cliffs for breeding and roosting	May occur in the study area
Agelaius tricolor (nesting colony) tricolored blackbird	SC/ SC	–	Open water, protected nesting substrate such as blackberry brambles or emergent vegetation sufficient to accommodate at least fifty nesting pairs	May occur in the study area
Athene cunicularia hypugea Western burrowing owl	SC/ SC	–	Grassland, sparse shrubland use abandoned burrows of ground squirrel, and other burrowing mammals, for shelter and nesting	May occur in the study area
Buteo regalis (wintering) ferruginous hawk	SC/ SC	–	Grasslands or desert with elevated structure for nest; uncommon winter resident and migrant in Central Valley	May occur in the study area
Baeolophus inornatus Oak titmouse	SC/ None	–	Oak woodlands and riparian areas	May occur in the study area
Charadrius montanus mountain plover	SC/ SC	–	Central Valley (winter resident) prefers grassland for foraging	May occur in the study area
Plegadis chihi white-faced ibis	SC/ SC	–	Roosts among dense stands of freshwater emergent vegetation, near shallow water or muddy fields for foraging, currently known to the Central Valley as a rare summer visitor	May occur in the study area
Asio flammeus short-eared owl	SC/ SC	–	Nests in marsh habitats; during winter uses grasslands, marshes, and agricultural habitats	May occur in the study area

Legenere limosa legenere	SC/ None	1B/ 2-3-3	Vernal pools; in beds of vernal pools; many historic occurrences are extirpated	May occur in the study area
Downingia pusilla dwarf downingia	None/ None	2/ 1-2-1	Valley and foothill grassland (mesic), vernal pools; 1 to 445 meters	Observed in the study area

[1] Federal and State Listing Codes:
- E = Endangered
- T = Threatened
- C = Candidate
- D = Delisted
- PT = Proposed Threatened
- P = Protected
- FP = Fully Protected
- SC = Species of Concern

[2] Source: CNPS, 2001. California Native Plant Society's Inventory of Rare and Endangered Plants of California, 6th Edition. David P. Tibor, Editor. Sacramento, California.

CNPS List:
- 1B. Rare or Endangered in California and elsewhere
- 2. Rare or Endangered in California, more common elsewhere

CNPS Rarity – Endangerment – Distribution key:

R – Rarity
- 1 Rare in California but found in sufficient numbers and distributed widely enough that the potential for extinction is low at this time.
- 2 Distributed in a limited number of occurrences in California, occasionally more if each occurrence is small.
- 3 Distributed in California in one to several highly restricted occurrences, or present in such small numbers that it is seldom reported.

E – Endangerment
- 1 Not very endangered in California
- 2 Fairly endangered in California
- 3 Seriously endangered in California

D – Distribution
- 1 More or less widespread outside California
- 2 Rare outside California
- 3 Endemic to California

1.0 Introduction

This report describes the likely historic and current distribution of special-status fish species in the vicinity of the proposed Placer Parkway Project (Project). This information is being provided in support of a Tier 1 EIS/EIR for the Project consistent with California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA) requirements. Available information pertaining to fisheries resources in the vicinity of the Project was reviewed, including the draft ecosystem restoration plan (ERP) for Pleasant Grove and Curry creeks (Foothill Associates 2005), the Draft Environmental Impact report (EIR) for the adjacent Placer Vineyards Project (Quad Knopf 2006), the coordinated resource management plan (CRMP) for the Dry Creek Watershed (ECORP 2003), and Garcia and Associates' (GANDA) reports and project files for multi-year fisheries, water temperature monitoring, and flow measurement work conducted in Cirby, Linda, Pleasant Grove, and Kaseberg creeks (GANDA 2001, 2005). Also reviewed were the California Department of Fish and Game (CDFG) California Natural Diversity Data Base (CNDDB 2006) and the U.S. Fish and Wildlife Service (USFWS) special-status species list (USFWS 2006) for 7.5-minute series quadrangles that encompass and surround the Project area (PA). Some limited site reconnaissance was also performed as part of this assessment (i.e., a one-day field visit by a GANDA biologist, 12 May 2006); however, no sampling of fish populations in the PA was performed as part of this assessment.

2.0 Watershed Hydrology of the Project Area

The Placer Parkway Project is located in the southeastern Sacramento Valley near the boundary of western Placer, eastern Sutter, and northern Sacramento counties (Figure 1). Elevation ranges from a high of approximately 150 feet above sea level in the eastern segment of the PA to a low of approximately 30 feet above sea level in the western segment. The majority of the PA is within the lower Pleasant Grove Creek/Curry Creek watershed, which is bordered to the north by the Auburn Ravine/Coon Creek watershed and to the south by the Dry Creek watershed. In the western segment of the PA, Pleasant Grove Creek and Curry Creek empty into the Pleasant Grove Canal that flows north and drains into the Sacramento River via the Cross Canal. The southwestern corner of the PA encompasses the area drained by the upper portion of the Natomas East Main Drainage Canal (NEMDC), also known as "Steelhead Creek." South of the PA, the NEMDC also empties into the Sacramento River, downstream of Dry Creek's confluence with the NEMDC.

Pleasant Grove Creek and Curry Creek

Pleasant Grove and Curry creeks were historically dry or very nearly dry in the summer months, but are now more perennial due to excess surface water contributed by urban runoff and rice farming (Foothill Associates 2005). Pleasant Grove Creek originates east of the PA at an elevation approximately 400 feet just north of the city

of Rocklin. Along with Kaseberg Creek (its major tributary), Pleasant Grove Creek drains the western portions of the cities of Rocklin and Roseville (east of the PA). Smaller Curry Creek originates near the southeast corner of the PA at a lower elevation (approximately 130 feet) and drains an area about one-third the size of the Pleasant Grove Creek watershed. Curry Creek has little riparian habitat compared to Pleasant Grove Creek and a smaller duration of annual flow.

Within the PA, both Pleasant Grove and Curry creeks are low-gradient channelized streams flowing through agricultural lands with minimal riparian vegetation. Channel incision resulting from urban and agricultural development in the watershed is evident. Pleasant Grove and Curry creeks tend to have higher water temperatures and lower dissolved oxygen (DO) concentrations than neighboring systems; this is primarily due to lower channel gradient and a consequent lack of oxygenating riffle habitats, little-to-no groundwater contributions, and a loss of riparian shade caused by urbanization and agricultural practices that contributes to solar warming of the stream (Foothill Associates 2005). Bed substrates in both streams are almost entirely mud and sand throughout the PA. Earthen streambanks are actively eroding in some locations, particularly where excessive down-cutting of the streambed has occurred as a result of channel confinement.

During our site visit on 12 May 2006, many locations in the eastern and central segments of the PA had visible surface flow, while the more channelized agricultural portions of these streams (e.g., in the western segment of the PA) had more stagnant surface water. Average wetted channel widths (on 12 May 2006) were 1-5 meters in Pleasant Grove Creek and 1-2 meters in Curry Creek within the PA; however, some locations near the headwaters of Curry Creek had surface water present only at road crossings (i.e., under bridges and at culvert mouths).

In the western segment of the PA, both streams empty into the Pleasant Grove Canal. This canal is approximately 20-30 meters wide from levee to levee. At the time of our site visit, the canal was wetted across portions of this width, although no flow was apparent. The Pleasant Grove Canal empties into the Cross Canal to the north which drains into the Sacramento River.

The Upper NEMDC

The upper NEMDC drains the north Natomas area including the southwest portion of the PA. Runoff in the upper NEDMC (from the Sankey Road levee south to the confluence with Dry Creek) is controlled by Sacramento County Pump Station No. D15 located immediately upstream of the Canal's confluence with Dry Creek (Resources Agency 2003). South of the PA (and below the Dry Creek confluence), the NEDMC empties into the Sacramento River near its confluence with the American River.

The upper NEMDC in the PA is very similar in size and character to the Pleasant Grove Canal. At the time of our site visit, the upper NEMDC was also wet in isolated sections across the majority of its width. The unnamed tributary in the PA that crosses the proposed Alternative 1 alignment at Locust Road and at Brewer Road (see Figure 1) also drains to the upper NEMDC. At the time of our field visit, the wetted channel width in this tributary was 1-2 meters at the Locust Road crossing; however, both the north and south forks of this tributary were dry just upstream at the Brewer Road crossing.

3.0 Fish Resources in the Project Area

Field sampling of fish populations was not performed as part of this assessment. Therefore, the following list of fish species that may occur in the PA was compiled based on environmental documentation prepared for other projects in the vicinity of the PA (e.g., Placer County 1999, ECORP 2003, Foothill Associates 2005, Quad Knopf 2006), results of the CNDDB and USFWS special-status-species queries, as well as regional knowledge and previous fish sampling experience in adjacent watersheds (GANDA 2001, 2005).

Generally, the fish fauna observed in a given region is determined by the numerous zoogeographic, physiological, ecological, and behavioral factors that structure fish assemblages. Moyle (2002) recognizes four fish assemblages that typically occur in streams of the Central Valley. From higher elevation/cooler water streams to lower elevation/warmer water streams, these fish assemblages include: (1) the rainbow trout assemblage, (2) the California roach assemblage, (3) the pikeminnow-hardhead-sucker assemblage, and (4) the deep-bodied fishes assemblage. Moyle (2002) also notes that overlap among "zones" or regions with these distinct fish assemblages can be fairly broad in tributaries of the Sacramento River.

The Placer Parkway PA is mainly within the deep-bodied fishes zone, but may also include a portion of the pikeminnow-hardhead-sucker assemblage (*sensu* Moyle 2002). Habitat and flow conditions for fishes of these assemblages have been heavily altered by urbanization and agriculture. In many low-elevation Central Valley streams, fish are largely confined to channelized ditches and sloughs. In the PA, specifically, low-to-intermittent flow conditions, high summer temperatures, low DO concentrations, channelization and sedimentation of streams, and a lack of access to productive floodplain habitats has tended to favor introduced warm-water fishes such as bass, sunfishes, catfishes, and carp over the native minnows and suckers of the deep-bodied fishes assemblage.

Warm-water fishes that potentially occur in the PA include introduced species such as western mosquitofish (*Gambusia affinis*), bluegill and green sunfishes (*Lepomis* spp.), brown and black bullhead catfish (*Ameiurus* spp.), golden shiner (*Notemigonus*

crysoleucas), spotted and largemouth bass (*Micropterus* spp.), and common carp (*Cyprinus carpio*).

Cool-water fishes that potentially occur in the PA include native species such as Sacramento sucker (*Catostomus occidentalis*), Sacramento pikeminnow (*Ptychocheilus grandis*), and hitch (*Lavinia exilicauda*). It is also possible that several special-status native species may occur in the PA (see below).

Special-Status Fishes in the Project Area

Special-status fishes discussed below include: those species and races listed under the federal Endangered Species Act (federal ESA) as "endangered," "threatened," or as candidates for federal listing (i.e., federal Species of Concern): those species and races listed under the California Endangered Species Act (state ESA) as "endangered" or "threatened;" and CDFG Species of Special Concern, recently delisted species, and other unlisted species of special interest (e.g., anadromous lampreys). Considering geographic range alone, special-status fish species that could potentially occur in the PA would include steelhead trout (*Oncorhynchus mykiss*), Chinook salmon (*Oncorhynchus tshawytscha*), Pacific lamprey (*Lampetra tridentata*), Delta smelt (*Hypomesus transpacificus*), Sacramento splittail (*Pogonichthys macrolepidotus*), and hardhead minnow (*Mylopharodon conocephalus*).

However, existing habitat conditions in the PA effectively limit or preclude the occurrence of several of these species. For example, Delta smelt, which is listed as "threatened" under the state and federal ESAs, typically occurs in estuaries and mainstem rivers as opposed to tributary streams. Hardhead minnow, which is listed as a CDFG Species of Special Concern, is generally confined to cooler waters with deep, rock-bottomed pools which are not available in the PA. Therefore, neither Delta smelt nor hardhead would be expected to occur in the PA. The potential occurrence of steelhead trout, Chinook salmon, Pacific lamprey, and Sacramento splittail in the PA is discussed below.

The USFWS special-status species list for the quadrangles encompassing the PA (Verona, Pleasant Grove, Roseville, Taylor Monument, and Rio Linda) and the quadrangles surrounding the PA (Sutter Causeway, Nicolaus, Sheridan, Lincoln, Gold Hill, Rocklin, Knights Landing, Grays Bend, Citrus Heights, Folsom, Davis, Sacramento West, and Sacramento East) included three fish species: steelhead trout, Chinook salmon, and Delta smelt. Three distinct salmonid races were specified: the Central Valley Evolutionarily Significant Unit (ESU) steelhead trout (listed as "threatened" under the federal ESA), Central Valley ESU spring-run Chinook salmon (listed as "threatened" under the state and federal ESAs), and Central Valley ESU winter-run Chinook salmon (listed as "endangered" under the state and federal ESAs). The CNDDB query resulted in no listed fish species for the quadrangles encompassing or surrounding the PA; however, the CNDDB is typically an incomplete source of information regarding the occurrence of listed fish species.

Among the special-status salmonids listed above, only the Central Valley ESU steelhead trout (federally threatened) has some potential to occur in the PA (on a seasonal basis). Fall/late-fall-run Chinook salmon (considered a candidate for federal listing and a CDFG Species of Special Concern) also has some potential to occur in the PA (on a seasonal basis).

Generally, the PA and associated upper watershed do not provide adequate habitat to support or sustain salmonid populations of any kind. Indeed, it is unlikely that Pleasant Grove or Curry creeks supported salmonids even historically due to intermittent flow conditions, high water temperatures, and a general lack of suitable spawning and rearing habitat. Steelhead and salmon require gravel and cobble riffle areas for spawning, and cool-water rearing habitats for successful recruitment, both of which are lacking in the PA. Juvenile salmon leave freshwater and enter the ocean by spring; however, juvenile steelhead may remain resident in natal streams for several years before going to sea. As such, resident steelhead require perennially cool water (i.e., for summer rearing) which is not available in the PA or even in the upstream portions of the Pleasant Grove Creek watershed. Therefore, recruitment of steelhead from the Pleasant Grove and Curry creeks is not possible, and any occurrence of steelhead in the PA would be limited only to the occasional stray adult fish attempting to spawn in surrounding watersheds.

Steelhead and fall/late-fall-run Chinook salmon are known to occur seasonally in both the Auburn Ravine/Coon Creek watershed immediately to the north of the PA, and the Dry Creek watershed immediately to the south of the PA, including the NEMDC, a.k.a. "Steelhead Creek" (Placer County 1999; ECORP 2003; GANDA, 2001, 2005). The PA encompasses the upper portion of the NEMDC, which is connected to Dry Creek. Therefore, it may be possible for the occasional stray steelhead or salmon from Dry Creek to occur in the upper NEMDC. However, the confluence of Dry Creek with the NEMDC is well downstream (i.e., approximately 7 miles south) of the PA, and access to the upper NEMDC from downstream of this confluence may be impeded by the presence of Sacramento County Pump Station No. D15 (which is located in the Canal immediately upstream of the confluence; see Figure 1). Furthermore, the upper NEMDC itself does not offer suitable spawning or rearing habitat for steelhead or salmon, and predators of juvenile salmonids such as bullfrogs and introduced warm-water fishes are abundant. Thus, the occurrence of migratory steelhead or salmon in the PA is likely limited to fish that stray temporarily into the upper portion of the NEMDC.

It remains unclear whether or not any stray steelhead or salmon could accidentally make their way into the Pleasant Grove Canal and eventually reach the upper portions of Pleasant Grove or Kaseberg creeks (i.e., upstream of the PA). Spawning habitat is still very limited in the relatively low-elevation headwater portions of these streams, thus it unlikely that spawning efforts would be successful in these areas even if fish could reach them. In addition, predation by bullfrogs and other exotic

predators would greatly limit the survival of any juvenile salmonids. During our site visit (12 May 2006), bullfrogs were observed in nearly all waters of the PA that were visited.

However, fall/late-fall-run Chinook salmon found in adjacent watersheds often do stray from natal streams and, in some instances, use seasonal streams for spawning. Spawning salmon have consistently been observed in low numbers in Cirby Creek, a low-elevation tributary of Dry Creek with sandy substrates and similar habitat characteristics to Pleasant Grove Creek (GANDA 2005). However, Pleasant Grove Creek originates at the base of the Sierra foothills near the valley floor, whereas the headwaters of Dry Creek are higher in elevation where more adequate spawning and rearing habitat is available. Thus, salmon are not likely to be as attracted to Pleasant Grove Creek as they are to Dry Creek and its higher-elevation tributaries.

Because juvenile Chinook salmon remain resident in natal streams for only between one and seven months (Moyle 2002), they are not limited by high water temperatures and low flow conditions during summer months. Thus, salmon would be better able to utilize seasonally adequate habitats in the PA and upper watershed than steelhead (although note that this scenario remains unlikely still). As discussed above, spawning and seasonal rearing habitats for salmon in the PA and upper Pleasant Grove Creek watershed are poor to marginal (at best). Therefore, the occurrence of Chinook salmon in this portion of the PA is unlikely.

Pacific lamprey is the other anadromous species that could potentially occur in the PA. This species is not federally listed, but has received increased attention by fisheries scientists and federal and state agencies due to dwindling populations throughout the Central Valley. Like salmonids, lampreys spawn in riffle areas with swift currents, which are notably lacking in the low-gradient streams within the PA and the relatively low-elevation headwater areas in the Pleasant Grove/Curry Creek watershed. Thus, spawning conditions in the PA and upper watershed are suboptimal for lamprey as well. Pacific lampreys are normally absent from highly polluted and altered streams (Moyle 2002), but they have persisted in some streams that have been highly altered (e.g., Putah Creek and the Santa Clara River). Ammocoetes (the larval/juvenile life stage for lampreys) prefer areas of mud and sand for rearing (which are abundant in the PA) and may remain in freshwater streams for up to seven years before maturing to adulthood and going to sea (i.e., this species may potentially be present year-round). However, because there is probably no spawning of Pacific lampreys in the upper watershed, ammocoetes are not likely to utilize waters of the PA that may be suitable for juvenile life stages. Pacific lampreys are known to occur in Dry Creek (ECORP 2003) and may therefore occur in the upper NEMDC; however, their presence in the PA and in the upstream portions of Pleasant Grove Creek is currently unknown.

As stated above, the CNDDB query resulted in no *listed* fish species for the quadrangles encompassing or surrounding the PA. However, a secondary CNDDB

query for *all* fish species resulted in a single occurrence of Sacramento splittail, which was delisted in 2003 as "threatened" under the federal ESA, but is still considered a CDFG Species of Special Concern. Sacramento splittail are known to inhabit tidal sloughs and slow-moving waters of the Sacramento-San Joaquin estuary and the lower Sacramento River and its tributaries. During winter/spring spawning, splittail prefer shallow-water, low-salinity habitats; therefore they may occasionally be present in the NEMDC (ECORP 2003) and/or the Pleasant Grove Canal. Splittail move upstream during high flow periods in the spring to spawn on flooded vegetation (Moyle 2002). For example, the Yolo Bypass area approximately 15 miles southwest of the PA, is considered to be an important spawning and rearing area for splittail. Thus, while their occurrence in the PA is currently unknown, splittail could be present in the NEMDC or the Pleasant Grove Canal during high-flow periods in the spring.

4.0 Proposed Measures to Minimize Potential Impacts to Fish

Phase I (the current phase) of the Placer Parkway Project consists of route identification and right-of-way acquisition for the proposed project alignments. Therefore, the specific actions and associated designs of individual stream crossings within these alternatives have yet to be determined. In years to come, these actions will be proposed and evaluated as part of Phase II of the Project. Thus, while future impacts to fish cannot be discussed specifically, several key measures to minimize potential impacts to fish can be identified.

Construction of the Project will likely result in various impacts to local watershed hydrology and stream morphology in the PA. Such impacts will result from the construction of bridges, roads, associated utilities, and the conversion of vegetated land cover in the PA to impermeable road surfaces. Direct impacts such as stream crossings and channel realignments are most likely. Thus, in order to minimize potential impacts to fish, all perennial watercourses should be crossed by spans or bridges as opposed to culverts or other hard-bottomed structures. Any such hard-bottomed structure will have the potential to create a drop (particularly at the downstream end) that may become a barrier to fish migration and may also significantly alter the morphology and fluvial dynamics of the channel. Under higher flow conditions, an improperly designed stream crossing may cause water to back up behind the crossing, trapping sediment and debris at the upstream end, thereby exacerbating flooding and possibly further destabilizing stream banks (Foothill Associates 2005).

In terms of channel realignment, every effort should be made to avoid channel confinement. Even small-scale or localized changes in stream morphology can affect fluvial dynamics to produce significant impacts on fish habitat. Thus, to the greatest extent possible, channelizing and straightening of stream courses should be avoided in favor of realignments that emphasize channel stability as well as proper geomorphic

function. Associated loss of shading or degradation of riparian vegetation should be also avoided where possible and mitigated where such impacts are unavoidable. In this sense, channel realignments associated with implementation of the Project may be viewed as an opportunity for stream restoration in the PA, and should be coordinated with future restoration plans (see below).

In the Pleasant Grove/Curry Creek watershed, direct impacts on streams are most likely to occur on the smaller creeks and drainages. Setbacks are required for development adjacent to ephemeral and perennial streams; however, many of the smaller drainages that exist in the PA may not be classified as ephemeral creeks. Therefore, cumulative impacts to these minor drainages could result in significant effects on overall hydrology (Foothill Associates 2005).

Standard mitigation measures including the development of erosion control and pollution control plans will be also required. These should include the use of Best Management Practices (BMPs) for erosion control such as the use of straw bales, silt fences, revegetation measures, control of spillage, and storage of potentially toxic substances. Monitoring of turbidity and inspections by an environmental monitor should eventually be considered.

Additionally, some "ground truthing" of the fish resources in the PA (as described herein) should be performed in the form of quantitative or qualitative fish population sampling. Even limited sampling efforts could provide valuable information regarding actual fish species composition, distribution, and relative abundance, which in turn would provide guidance for avoiding or minimizing potential impacts to fish as a result of implementing the Project.

Conclusions Regarding Potential Impacts to Special Status Fishes

No significant impacts to special-status fishes are anticipated if the avoidance and minimization measures described above are implemented. Generally, the PA and associated upper watershed do not provide adequate habitat to support or sustain populations of special-status fish species as described above. It is therefore likely that these species would only be present if they stray into the PA (i.e., in very small numbers on a mostly seasonal basis). However, in the future, better documentation of existing fish communities in the PA and upper watershed (i.e., field surveys) would be useful for determining whether proposed avoidance and minimization measures are adequate. As planning for the next phase of project development proceeds, further consultation with USFWS, NOAA and CDFG should be implemented. A Biological Assessment should be developed prior to the final phase of project design and development that would formally address potential effects on federally-listed fish species.

5.0 Future Restoration Efforts

Finally, planning and construction of the Project should be coordinated to the greatest extent possible with future restoration efforts planned for the Pleasant Grove/Curry Creek watershed. This coordination will include ensuring that likely future conditions at build-out of the Project are aligned with the greater vision, goals, and objectives outlined in the Pleasant Grove/Curry Creek ERP (Foothill Associates 2005). The ERP's vision statement reads:

> *"The Pleasant Grove/Curry Creek Watershed sustains a variety of healthy native upland and riparian habitats situated within an economically sustainable matrix of carefully planned and implemented mixed use communities and agricultural lands." (p. 24)*

The goals and objectives that further articulate this vision statement could serve as guidelines for avoiding potential impacts during implementation of the Placer Parkway Project. However, because this ERP does not address fish species *per se*, some attention must be paid to the extending the vision, goals, and specific objectives to cover fish resources and the potential occurrence of special-status fishes in the Placer Parkway PA. As mentioned above, the various actions and mitigations that will be associated with the Project may present excellent opportunities for integration with future restoration efforts, particularly in terms of planning concerted efforts to rehabilitate stream channels and provide bank stabilization in the PA. Indeed, protection of sensitive species and the restoration of degraded habitats are identified as specific goals of the ERP.

PUBLIC PARTICIPATION METHODOLOGY REPORT
PLACER PARKWAY CORRIDOR PRESERVATION
TIER 1 EIS/PROGRAM EIR

1.0 INTRODUCTION

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included representatives from planning and public works departments of all affected cities and counties, environmental, business, agricultural, development, and homeowner interests (the Study Advisory Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report will analyze these five corridor alternatives along with a No-Build Alternative. Throughout this document, the Placer Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

2.0 PUBLIC PARTICIPATION PROGRAM

The Public Participation Methodology Report was prepared to document the project's public outreach program undertaken as part of the Placer Parkway Tier 1 EIS/EIR. The intent of the Public Participation Program is to ensure that community stakeholders, including community interest groups and the public, are aware of the project, and are involved and engaged in the planning process.

The Public Participation Program for the Placer Parkway Tier 1 EIS/EIR was designed to actively involve project stakeholders in the planning process. Its goal was to obtain input to develop a range of corridor

alternatives to be considered in the Tier 1 EIS/EIR and to select a corridor for the future construction of Placer Parkway. Program objectives included:

- Addressing public and community interest group issues and concerns;
- Continuing ongoing stakeholder coordination; and
- Involving federal, state, regional, and local agencies.

3.0 PARTICIPANT GROUPS

The following participant groups were targeted in the public participation program.

3.1 PROPERTY OWNERS

The project team ensured that the property owners in the study area were informed about and involved in the planning and environmental review process. Placer County Transportation Planning Agency (PCTPA) developed a mailing list of property owners in the project study area from the Assessor's Offices of Placer, Sacramento, and Sutter counties. This list and subsequent updates were used for distributing meeting notices and newsletters, in addition to other methods for outreach, described below, to keep the property owners engaged and informed. Property owners in the study area (based on the assessor information and individual requests) were informed about public meetings and received project-related information at key project milestones.

3.2 KEY STAKEHOLDERS

The Placer Parkway Corridor Preservation Project is of interest to a wide range of key stakeholders, including business and industry, environmental, agricultural, neighborhoods, community, and special interest groups, public agencies, and local jurisdictions. A variety of methods were developed to engage these groups through interviews, meetings, and other outreach activities described in Chapter 4.

3.3 LOCAL, STATE, AND FEDERAL AGENCIES

Coordination for the Placer Parkway Corridor Preservation Project is being carried out with a number of public agencies and organizations, including:

- Federal Highway Administration (FHWA)
- California Department of Transportation (Caltrans)
- U.S. Army Corps of Engineers – Sacramento District
- U.S. Environmental Protection Agency – Region IX
- U.S. Fish and Wildlife Service
- California Department of Fish and Game
- Sacramento Area Council of Governments (SACOG)
- Natomas Basin Conservancy

3.4 LOCAL JURISDICTIONS

The following local jurisdictions were directly involved in the planning process:

- Placer County
- Sacramento County
- Sutter County
- City of Lincoln
- Town of Loomis

- City of Rocklin
- City of Roseville
- City of Sacramento

4.0 PUBLIC PARTICIPATION PROGRAM METHODS

4.1 COMMUNITY STAKEHOLDER INTERVIEWS

The project team conducted interviews with 30 community stakeholders between May and July 2003 to identify issues, concerns, and potential benefits regarding the proposed project. Interviewees included representatives from public agencies, businesses, the agricultural sector, environmental groups, and local government. Interviews were conducted in person or by telephone.

The identities of the interviewees are confidential. Copies of the questionnaires (without interviewee identification) are available for review at PCTPA, 299 Nevada Street, Auburn, California, 95603 (Telephone: 530.823.4030; email: pctpa@pctpa.org). A September 2003 summary report is posted on PCTPA's website.

The results of these interviews were organized into the following categories:

- Project purpose and goals
- Perceived benefits of the project
- General issues and concerns about the project
- Planning process

The interview results helped to focus subsequent public presentations and meetings with local jurisdictions and agencies. They were considered part of the public scoping process. In addition to the interviews, written and verbal scoping comments were received from the general public (at public meetings and through newsletters), from meetings with jurisdictions and agencies, from responses to the Notice of Intent/Notice of Preparation, and from the Technical Advisory, Study Advisory, and Policy Advisory Committees established for the project as discussed below.

4.2 ADVISORY COMMITTEES

Building on the public outreach programs for the Placer Parkway Interconnect Study Conceptual Plan and the 2001 Project Study Report for Placer Parkway (both prepared by DKS Associates), the project re-established the advisory committees program. In May 2003, the SPRTA Board approved the membership structure for the project's Study Advisory Committee and the Policy Advisory Committee. The membership for the Technical Advisory Committee included staff representatives from local jurisdictions and regional, state, and federal agencies. The purpose and role of each advisory committee are described below.

4.2.1 Technical Advisory Committee

A Technical Advisory Committee (TAC) was established to advise and assist PCTPA and its consultants with the technical aspects of the project. Membership of the TAC consisted of staff representatives from local jurisdictions and regional, state, and federal agencies. TAC representatives provided knowledge of environmental resources, planning, and transportation.

The role of the TAC was to provide non-binding recommendations to PCTPA and consultants on the following areas:

- Identifying local jurisdiction's or agency's concerns, issues, and preferences;

- Identifying and analyzing alternatives;
- Characterizing existing and future conditions with and without the project;
- Assessing the environmental impact of the proposed project;
- Complying with FHWA and Caltrans requirements for a Tier EIS/EIR; and
- Additional technical matters that arose during the planning process.

The TAC met eight times from May 2003 to August 2005. Meeting agendas and minutes are available via PCTPA.

4.2.2 Study Advisory Committee

A Study Advisory Committee (SAC) was established to assist in the identification of project issues and solutions. Representatives from the following key community interest groups were invited to be members of the SAC:

- Staff representatives from all local jurisdictions in the study area, including Placer County, Sacramento County, Sutter County, and the cities of Lincoln, Loomis, Rocklin, and Roseville.

- Staff representatives from regional, state, and federal agencies such as Sacramento Area Council of Governments (SACOG), Placer County Air Pollution Control District, the California Department of Transportation (Caltrans), California Department of Fish and Game, Federal Highway Administration, U.S. Fish and Wildlife Service, and the U.S. Environmental Protection Agency.

- Representatives from environmental and neighborhood groups such as the Roseville Coalition of Neighborhood Associations, the Sun City Roseville Homeowners Association, the Lincoln Municipal Advisory Council, the West Placer Metropolitan Advisory Council (MAC), the Sierra Club, the Friends of Placer County Communities, the Environmental Council of Sacramento, and the Agricultural Commissions from Placer and Sutter counties.

- Representatives from business and industry groups including the Building Industry Association, area developers (such as West Roseville Specific Plan, Placer Ranch Specific Plan, KT Development) and several Chambers of Commerce.

The SAC provided a high level of communication between PCTPA and community, environmental, agricultural, development, and other interest groups, in addition to public agencies and local jurisdictions. Each stakeholder organization or group designated a representative to the SAC. As specific issues were raised, interested individuals and those with special interests in the project were invited to attend SAC meetings. A SAC goal was to be as inclusive as possible, while keeping a balance of interests so that no one group dominated the process.

The role of the SAC was to:

- Represent the concerns, issues, and preferences of community interest groups and public agencies.
- Provide nonbinding recommendations to PCTPA's staff and consultants on project issues and concerns.
- Accurately convey project information to their constituencies.

The SAC met six times from June 2003 to August 2005. For meeting agendas and minutes from SAC meetings, see Appendix A.

4.2.3 Policy Advisory Committee

A Policy Advisory Committee (PAC) was established to provide advice and assistance in identifying project issues and solutions. Membership of the PAC consisted of:

- Placer County (2 elected officials)
- Sacramento County (1 elected official)
- Sutter County (2 elected officials)
- City of Lincoln (1 elected official)
- City of Rocklin (1 elected official)
- City of Roseville (1 elected official)
- Placer County Executive Officer (ex officio)
- Sutter County Chief Administrative Officer (ex officio)
- Caltrans District 3 District Director (ex officio)

The role of the PAC was to provide two-way communications with elected officials from jurisdictions directly affected by the proposed project. The PAC's primary role was to provide the technical staff with policy recommendations related to the needs of various jurisdictions in the project study area. The PAC provided policy guidance and recommendations in the following areas:

- Issues of concern to the public, political jurisdictions, and government agencies,
- Project alternatives,
- Characterizing existing and future conditions with and without the project,
- Assessing of environmental impacts from the Parkway, and
- Complying with FHWA and Caltrans requirements for a Tier 1 EIS/EIR.

PAC members received meeting notice and information via email and regular mail. Meeting notices were emailed to any member of the public who requested the notice. The meeting notices were included in status reports to PCTPA/SPRTA Boards and on the website. Notices were faxed to the following:

- Placer County: Placer County Clerk of the Board, Placer County Library – Auburn, Roseville Library, and City/Town Halls of Lincoln, Loomis, Rocklin, and Roseville
- Sacramento County: Sacramento County Clerk of the Board and Sacramento County Library – Sacramento – Main
- Sutter County: Sutter County Clerk of the Board and Sutter County Library – Yuba City – Main

The PAC met four times from September 2003 to August 2005. For meeting agendas and minutes from PAC meetings, see Appendix B.

4.3 PROJECT DEVELOPMENT TEAM

A Project Development Team (PDT) functioned as the steering group to provide input on the course of project studies, monitor project progress, and to solve problems. The PDT was initially made up of representatives of the National Environmental Policy Act (NEPA) lead agency (FHWA), Caltrans, the California Environmental Quality Act (CEQA) lead agency, SPRTA as represented by PCTPA, Sutter County, and the consultant team preparing the Tier 1 EIS/EIR (URS Corporation, DKS Associates, Mara Feeney & Associates, others as required).

By November 2005, most regular TAC meetings were completed, and a representative from each of the local jurisdictions was invited to attend the PDT meetings for continued involvement and input as the project progressed through completion of technical studies and Tier 1 EIS/EIR coordination.

The PDT met 16 times from September 23, 2003 through September 21, 2006, and will continue to meet throughout the duration of the project.

The PDT addressed several major project issues such as:

- NEPA and CEQA requirements and review process
- Goal and policy clarifications
- Modified NEPA/404 process
- Indirect/cumulative impact assessment including growth inducement

For a summary of agenda topics and key decisions, see Appendix C. PDT meeting minutes are on file at PCTPA's offices in Auburn, California.

4.4 MODIFIED NEPA/404 PROCESS

The goal of the modified NEPA/404 process undertaken for the Placer Parkway Tier 1 EIS/EIR process was to ensure that Tier 1 decisions reflect careful consideration of the 404(b)(1) Guidelines (40 CFR 230), which are binding, substantive regulations implementing the Clean Water Act. Federal Highway Administration, Caltrans, PCTPA, the U.S. Army Corps of Engineers, and the U.S. Environmental Protection Agency agreed to engage in a modified NEPA/404A federal coordination process, based on the NEPA/404 process set forth in the 1993 Memorandum of Understanding between federal agencies[1], modified for Tier 1 to reflect decisions made at Tier 1, and to anticipate the permit application requirements at Tier 2.

The modified process for Tier 1 commits the agencies to seek concurrence on five points:

1. Purpose and Need
2. Criteria for Selecting the Range of Alternatives
3. Range of Alternatives
4. Alternative(s) Most Likely to Contain the Least Environmentally Damaging Practicable Alternative (LEDPA)
5. Mitigation Framework

Three years of working through this process has resulted in concurrence on the Purpose and Need, the Criteria for Selecting the Range of Alternatives, and the Range of Alternatives evaluated in this Draft Tier 1 EIS/EIR. Formal requests for concurrence were made by the Federal Highway Administration (acting on its own behalf, Caltrans, and PCTPA acting on behalf of SPRTA), and concurrence letters were received from the U.S. Army Corps of Engineers and the U.S. Environmental Protection Agency.

Sixteen meetings have been held to date.

For a summary of agenda topics and key decisions, see Appendix D.

1. Signed by Federal Highway Administration, Federal Transit Administration, U.S. Environmental Protection Agency, U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, National Marine Fisheries Service, California Department of Transportation, Arizona Department of Transportation, Nevada Department of Transportation (1993).

5.0 PUBLIC NOTICE TO PREPARE A TIER 1 EIS/PROGRAM EIR AND PUBLIC SCOPING MEETINGS

On September 18, 2003, Notice of Intent was published in the Federal Register and a Notice of Preparation was submitted to the State Clearinghouse. These documents described the proposed project and solicited agency and public comment on the scope and content of the EIS/EIR. Copies of these documents were mailed to 58 federal, state, and local agencies. Twenty comment letters were received and are included in the Draft EIS/EIR. The lead agencies considered these comments when determining the appropriate information to include in the Draft EIS/EIR.

In October 2003, the Placer County Transportation Planning Agency held two scoping meetings (one in Placer County and one in Sutter County) as part of its comprehensive public participation program. The purpose of the meetings was to provide an opportunity for community members, community interest groups, and public agencies to provide input on the overall scope and content of the Tier 1 EIS/EIR. These meetings were the first in a series of three rounds of public meetings planned throughout the project. An October 2003 Scoping Meetings and Scoping Process Summary Report is available at PCTPA. A copy is posted on PCTPA's website.

5.1 NOTICES

Informational notices (Appendix E) for both meetings were mailed to community members in the project study area, including businesses, community leaders, agency staff, environmental groups, project advisory committee members, local elected officials, property owners, and the general public. More than 1,300 notices were mailed.

5.2 NEWSPAPER DISPLAY ADVERTISEMENTS

Print advertisements (Appendix F) were placed in the following newspapers to provide additional information and publicity for the meetings:

- Appeal Democrat (Sutter County)
- Lincoln News Messenger, Placer Herald and Roseville Press-Tribune (Placer County)
- Sacramento Bee (Sacramento County)

5.3 PRESS RELEASES

A press release (Appendix G) was distributed to local media outlets (radio, television, and newspapers) in Placer, Sutter, and Sacramento counties, providing an overview of the project and information on the scoping meetings. Media outlets contacted are listed below:

Print Outlets

- Auburn Journal
- Lincoln News Messenger
- Colfax Record
- Loomis News
- Placer Herald
- Roseville Press Tribune
- Sierra Heritage
- Tahoe Bonanza
- Tahoe World
- Sacramento Bee

News and Business Journals

- Sacramento Business Journal
- Sacramento News and Review

Radio and Television Outlets

- KAHI Radio
- KCRA-TV
- KOVR-Channel 13
- KXTV-TV

6.0 SCOPING MEETINGS

The public scoping meetings were held on Monday, October 6, 2003, at the Maidu Community Center in Roseville, from 4:00 to 8:00 p.m., and Thursday, October 9, 2003, at the Pleasant Grove School, from 4:00 to 8:00 p.m. Approximately 25 people attended the Roseville meeting and approximately 100 people attended the Pleasant Grove meeting.

Meeting handouts included an information guide, comment sheet, project newsletters (Appendix H), corridor maps, fact sheet (Appendix I), basic project information, and project schedule. Both meetings had an open house format with a series of stations where participants could obtain information about the project and provide feedback. Project team members staffed the stations to answer questions and provide additional information to meeting participants. Three times during the open house, the project team made a brief presentation on the project, using the same information for each presentation.

The presentations provided information on project background, purpose, need, schedule and environmental process. A stenographer was present at both meetings to record comments from the participants.

Information and display boards were organized in the following categories:

- *Planning Approach* – provided information on the environmental review process.
- *Work Program and Project Schedule* – included information on the project scope and timeline.
- *Natural Environment* – included maps of the study area and natural resource elements.
- *Human Environment* – included maps of the study area and human and social elements.
- *Corridor Alternatives* – included the three concept alignments (north, central, and south) identified in the Project Study Report (PSR) and a blank map of the study area: "Other Corridor Alternatives." Participants were provided a copy of this map to identify additional potential alignments.
- *Do You Live or Work in the Study Area* – included a map of existing parcels, farms, businesses, and residences in the project study area. Participants were provided a handout of this map to allow them to identify where they lived or worked in the project study area and to list potential impacts.

- *How to Stay Involved* – provided information on how to stay involved and informed about the project.

- *For the Record* – staffed by a certified stenographer to record verbal comments.

Scoping meeting comments were organized in the following categories:

- Corridor Alignments
- Community Impacts
- Environmental Impacts
- Land Use Impacts
- Agricultural Impacts
- Funding
- Traffic Analysis

The project team followed up on a number of issues that were raised at the public scoping meetings, including:

- *Meeting format*. For subsequent public meetings, changed the "open house" format to a more traditional presentation and question/answer session.

- *Farmland map*. No resource maps identified "working" farm operations. A map was developed with advice from the Placer and Sutter County Agricultural Commissioners to identify farming operations in the study area.

- *Power lines map*. No resource maps identified existing or proposed power lines in the project area. A map was developed to identify these existing and proposed facilities.

- *Policy review*. Several concerns were shared on existing project policies related to Central Segment access and the corridor's no-development buffer. These policy issues were reviewed with each advisory committee. Each re-affirmed the need for these policies.

- *Project area expansion*. Based on scoping input, the project area was expanded from an area north of Baseline/Riego Road to the south of the roadway.

- *Notice list*. The notice area was enlarged to include abutting areas outside of the project area, including Amoruso Acres.

In addition to comments received at these meetings, letters in response to the Notice of Intent and Notice of Preparation were received from agencies, jurisdictions, and members of the public. These letters were considered in the lead agency's determination of the appropriate scope and content of the Draft Tier 1 EIS/EIR, and will be included in that document's appendices.

7.0 PUBLIC MEETINGS

In August 2004, PCTPA held two public meetings (one in Placer County and one in Sutter County) as part of its comprehensive community outreach program. The purpose of the meetings was to obtain feedback from area residents and other community members on four potential corridor alignment alternatives being considered for evaluation in the Tier 1 EIS/EIR. These meetings were the second in a series of three rounds of public meetings planned throughout the project. An August 2004 Public

Meetings Summary Report (Moore Iacofano Goltsman [MIG], 2004)is available at PCTPA. A copy is posted on PCTPA's website.

7.1 PUBLICITY AND NOTICING

7.1.1 Newsletter

The July 2004 newsletter, which included a meeting notice, was mailed in early August 2004 to property owners (within and just outside the study area), interested community organizations, public agencies, and individuals to inform them about the public meeting. More than 1,700 newsletters were mailed.

Newsletters were mailed to the following local governments and agencies:

- Lincoln City, Loomis Town, Rocklin City, Roseville City, and Sacramento City Council
- Placer, Sacramento, and Placer County Board of Supervisors
- SACOG Board of Directors

Newsletters were sent to the following agencies:

- City of Lincoln and Rocklin Community Development Departments
- City of Roseville Planning and Redevelopment
- County of Placer Planning Department
- County of Sacramento Planning and Community Development Department
- County of Sutter Community Services Department

Newsletters were delivered to the following organizations/businesses:

- Pleasant Grove School (300 copies)
- Riego Market (300 copies)
- Sun City Community Center, Roseville (500 copies)

7.1.2 Newspaper Display Advertisements

Print ads were placed in the following newspapers to provide additional publicity for the meetings:

- Wednesday, August 11, 2004:
  - Lincoln News Messenger
  - Placer Herald
  - Roseville Tribune

- Sunday, August 15, 2004:
  - Appeal-Democrat
  - Auburn Journal
  - Sacramento Bee

The public meetings were held on Monday, August 23, 2004, at the Roseville Corporation Yard, from 6:00 to 8:00 p.m., and Thursday, August 26, 2004, at the Pleasant Grove School, from 6:00 to 8:00 p.m. Approximately 35 people attended the Roseville meeting and 120 people attended the Pleasant Grove meeting.

Meeting materials included an agenda, list of Advisory Committee members, speaker card, comment sheet, and a map with alignment alternatives for the Placer Parkway.

Both meetings began with an open house period where participants reviewed information displayed on boards and asked questions. The project team made a presentation on the work program, project schedule, technical analysis, outreach, the corridor alignment alternatives, and status of the project (see Appendix J).

The presentation was followed by a discussion of issues and concerns. The meeting then returned to an open house format, which provided an additional opportunity for participants to interact with project team members. Comments from these meetings were summarized in the following categories:

- Planning Process
- Corridor Alignment
- Community Impacts
- Environmental Impacts
- Agricultural Impacts
- Funding
- Traffic and Access
- Property Acquisition

The meetings are summarized in PCTPA's August 2004 Public Meetings Summary Report (MIG, 2004), which contains meeting comments for both meetings. Followup work by the project team included distributing CDs with resource mapping, right-of-way acquisition process, and subsequent meetings with concerned property owners.

7.1.3 Board Action and Review

As part of publicly noticed meetings, the various boards considered the following project issues:

PCTPA Board

- October 23, 2002 — Re-Affirmed PSR's Concept Corridor Alignment Alternatives
- December 4, 2002 — Authorized Staff to Negotiate and Award the Consultant Contract

SPRTA Board

- February 26, 2003 — Memorandum of Understanding with PCTPA on Funding and Lead Agency
- May 28, 2003 — Study and Policy Advisory Committee Membership and Direction
- February 28, 2004 — Project Update Presentation
- March 1, 2005 — Range of Reasonable Alternatives
- April 6, 2005 — Funding for New Alignments Screening
- May 25, 2005 — Toll Road Concept Feasibility Study Contract
- September 28, 2005 — Corridor Alignment Alternatives Selection

- December 7, 2005 Placer County Conservation Plan – Planning Agreement and Allocation

Sutter County Board of Supervisors

- November 30, 2004 Study Session – Potential Corridor Alignment Alternatives

Project status reports have also been provided to the PCTPA and SPRTA Boards on an almost monthly basis since 2003. These are included in board meeting agenda packets, which are posted on PCTPA's website.

The status reports have also been mailed to the Sutter County Board of Supervisors. They have been mailed to the city managers of Lincoln, Rocklin, and Roseville, as well as to the county administrators of Placer and Sacramento counties.

8.0 PROJECT WEBSITE

A website (www.pctpa.org/placerparkway/index.htm) provided relevant information on project background, the project description, corridor alignment alternatives, the environmental review process, funding, key milestones of the planning process, a project library with posted project documents, and public meeting dates and materials. The website was linked to PCTPA's existing website. The project website will remain active through the duration of the planning process. Members of the public were able to access information on the website and learn how to stay involved.

The project website expanded outreach and provided an alternative means for dissemination of project related information (see Appendix K for selected pages from the website).

9.0 OUTREACH MATERIALS

In 2003, the project team developed a fact sheet with key project information for distribution to members of the public. The team also developed three newsletters to keep vicinity property owners as well as interested agencies, organizations, and individuals informed about the project and to solicit comments/questions.

The first two newsletters were developed to coincide with the 2003 scoping and the 2004 public meetings. A third newsletter, in August 2005, provided information on two additional corridor alignment alternatives being considered. The SPRTA Board directed that these two be screened for potential inclusion in the range of reasonable alternatives. The newsletter also provided notice of the September 28, 2005 SPRTA Board meeting to determine the alternatives to be evaluated in the Tier 1 EIS/Program EIR. The newsletters and fact sheet and are included in Appendices H and I.

A newsletter mailing list was developed based on the county assessor's property owner information described above. This mailing list was updated based on new assessors' information as well as requests to be added based on public response to newspaper articles, public notices/meetings, website inquiries, etc.

10.0 PUBLIC HEARINGS

PCTPA will hold public hearings in spring 2007 to obtain public comments on the Draft Tier 1 Environmental Impact Statement/Program Environmental Impact Report. The public meetings will be held at two locations, one each in Placer and Sutter counties. The project website will post updates on

meeting dates and locations. Notices for these hearings will be distributed in a variety of ways, including newspapers, Federal Register, news release, newsletter, and website.

11.0 PROJECT STATUS REPORTS

Regular Project Status Reports were prepared and submitted to the PCTPA and SPRTA Boards of Directors, with copies to the Sutter County Board of Supervisors. These documents provided information on progress of the project, issues, and major decisions.

12.0 OTHER MEETINGS WITH INDIVIDUALS, AGENCIES AND COMMUNITY MEMBERS

In addition to Advisory Committee meetings, Project Team Development (PDT) meetings, and modified NEPA/404 meetings conducted with federal resource agencies, PCTPA staff and consultants also met with individuals, agencies and community members for project updates, coordination, and input. A list of such meetings is attached in Appendix L.

Minutes

I. INTRODUCTION

The first Study Advisory Committee (SAC) meeting was held on June 27th, 2003 at the City of Roseville Corporation Yard. The purpose of this meeting was to initiate the SAC for the Tier 1 EIS/EIR for the Placer Parkway Corridor Preservation Project.

Celia McAdam, PCTPA's Executive Director, welcomed the SAC members and provided an overview of the meeting's purpose. This overview included the need for the SAC – to provide information and feedback to PCTPA's staff and consultant team and to represent their organization's views on the project. Each SAC member was asked to introduce themselves and their affiliation. The PCTPA and URS consultant team introduced themselves and their roles. Meeting facilitator Daniel Iacofano (MIG – URS sub-consultant in charge of public outreach) provided an overview of the planning process, meeting purpose and agenda for the meeting. The following handouts were distributed to the SAC at the sign-in table:

- Fact Sheet
- Tier 1 EIS/EIR Project Milestone Schedule

- Study Advisory Committee Charter
- Concept Alignments from the 2001 Project Study Report (PSR) -map
- Conceptual Plan

Stan Tidman, Project Manager for PCTPA, Denise Heick, Project Manager for URS Corporation (URS), and D. Iacofano presented information on the following topics, followed by a facilitated discussion:

- Project Background
- SAC Membership and Role
- Study Goals
- Work Plan Approach
- Opportunities for Input

II. PROJECT BACKGROUND

S. Tidman familiarized the SAC with the project need, purpose, history, and potential issues/impacts.

Overview

Placer Parkway is a multi-modal, high priority regional transportation project that will connect rapidly growing western Placer County with Sutter County industrial development and the airport to the west. It will link State Route 65 with State Route 70/99, with interchanges at either end. There are three (3) segments of the project: western (SR 70/99 to county line), central (county line to Fiddyment Road), and eastern (Fiddyment Road to SR 65) segments. The project is estimated, based on preliminary planning studies, to cost approximately $200-300 million. Funding is not anticipated until 2015 or later. At this point, the project is to locate, preserve, and acquire a corridor for the future Parkway.

Need

The project is needed because of growth -- this area is one of the fastest growing areas in the state. SACOG's 2000 population and employment projections for 2025 suggest a near doubling of numbers. In addition, there are a number of pending or anticipated urban developments proposed in or around the project area, which if approved would increase traffic and lead to greater congestion. These trends are likely to have potential environmental and economic impacts on the region.

Purpose

The purpose of this project is to be a connector. It would improve access to jobs and accommodate growth, maximize mobility, avoid inducing urban growth, minimize environmental impacts, and reduce impacts on local streets.

History

There have been two preliminary planning efforts:

1) A Conceptual Plan completed in 2000 - It established a public participation program (PAC/TAC/SAC) and defined the scope, preliminary policy, guidelines, and funding possibilities for the Placer Parkway project.

2) A Project Study Report (PSR) completed in 2001 - It identified preliminary engineering and environmental issues, clarified policy direction, and identified and evaluated alignment alternatives. Several policies were outlined, including the concept of a controlled access facility, preservation of the study area's rural character, identification of no- development buffers, and no access to the Parkway from Pleasant Grove Road to Fiddyment Road. The PSR was a key document for programming purposes and for environmental funding.

The Conceptual Study and the PSR were both adopted by PCTPA and SACOG boards.

Issues
Several key issues were identified that the study must address along with potential solutions. Key issues include concerns that the Parkway and pending development proposals for the area are on different completion timelines. The Placer Parkway Tier 1 EIS/EIR will likely be on a much slower timeline than this pending development. It is unclear how the two will relate. The consultant team has worked with local agency staff and encouraged them to show at least one feasible Parkway corridor in each development proposal.

Alan Green of the Sierra Club expressed concern that a recommended alignment was shown in the Placer County General Plan. It was clarified that a recommended alignment was shown in the PSR for programming purposes only. The central segment alignment is depicted as a general planning line in Placer County's General Plan. It was emphasized that no corridor alignment has been or can be selected until this environmental review is completed.

Both S. Tidman and D. Heick clarified that the Tier 1 process is a broad-brush environmental review process to identify a corridor that can be acquired to preserve future right-of-way. The purpose of a Tier 1 analysis is not at a project- or construction-level of detail.

A. Green also referred to identification of Parkway buffers in the PSR. He asked whether the potential Watt Ave. extension would be required to have the same buffer criteria. Ken Hough of SACOG reminded the group that the Policy Advisory Committee (PAC) had decided it should have the same characteristics – but concluded it would be a future consideration. C. McAdam and S. Tidman acknowledged that Watt Avenue is a complex issue. As part of the Placer Parkway corridor preservation environmental review, impacts would be evaluated 'with' and 'without' a Watt Ave. connection. C. McAdam indicated that no decision on the extension had been made yet. Steve Propst, Caltrans, said that during the PSR process, the potential for a Watt Ave. extension was separated from the Parkway project. The decision about whether or not to extend Watt Avenue is not a part of the Placer Parkway project.

A. Green said that some of the potential urban development projects were moving ahead. This project needed to be aware of them.

III. SAC MEMBERSHIP AND ROLE

D. Iacofano provided an overview of the SAC membership, duties, responsibilities, and meeting procedures. Membership includes representation from local jurisdictions, regional/state/federal agencies, environmental and neighborhood groups, and business and industry groups.

Duties encompass identifying concerns, issues and preferences, providing non-binding recommendation and advice to PCTPA, and accurately representing the project and its activities to respective constituents. Responsibilities include attendance at SAC meetings, active participation, responsiveness, and advocacy of the interests of respective agencies or jurisdictions at the meetings. He encouraged questions and input anytime during the meeting.

IV. STUDY GOALS

D. Heick identified the project's three goals:

1) Identify corridor alternatives that would meet the project's purpose and need as well as being mindful of the need for a future LEDPA determination (Least Environmental Damaging Practicable Alternative) for federal permits prior to construction.
2) Identify a preferred corridor via a Tier 1 EIS/EIR.
3) Complete a Record of Decision (ROD) and certify the EIR, which will allow for corridor preservation and/or acquisition.

Subsequently, Tier 2 environmental review will be undertaken when funding becomes available for design and construction. The Tier 2 process will evaluate a range of alternative alignments and features within the selected corridor.

Loren Clark, representing Placer County Planning Department and the Placer Legacy HCP/NCCP, inquired whether the project would consider entitlements or land dedications. He also asked if land acquisition would happen before the certification process is complete. D. Heick acknowledged the project would try to take advantage of entitlements. But, the lead agencies would not have authority to acquire land prior to completion of the certification process.

V. WORK PLAN APPROACH

D. Heick said the consultant team and PCTPA are working with FHWA and Caltrans to continue to identify appropriate guidelines to complete the work. The work plan approach includes two main phases:

(1) Identify Alternatives for the Tier 1 EIS/EIR analysis. Screening and evaluation of the PSR's concept alternatives would be completed to identify any fatal flaws. Other corridor alternatives would then be identified and screened. This would consist of modifying PSR concept alternatives or developing entirely new ones.
(2) Prepare and complete the EIS/EIR.

Schedule and Key Milestones

D. Heick provided an overview of the schedule and key milestones, emphasizing the critical role of the advisory committees in the beginning of the process, allowing for maximum consultation and input before key decisions are made.

- Screen PSR Alternatives ('fatal flaw') — End of 2003
- Identify/Screen Other Alternatives — February 2004
- Identify Final Alternatives — May 2004
- Draft EIS/EIR for Public Review — September 2005
- Final EIS/EIR — End of 2006

L. Clark inquired whether the consultant team is budgeted to fill data gaps. D. Heick clarified that the team is budgeted to collect data necessary for the purpose of Tier 1 analysis. Since most of the study area is covered by Habitat Conservation Plans or pending Specific Plans, there are only a few apparent data gaps, such as parts of the northwest portion of the study area. The data will be analyzed in GIS and will also be available for future Tier 2 analysis. D. Heick encouraged the SAC to share available environmental data for specific projects with the consultant team. There was an inquiry as to whether the available data is seasonal. D. Heick said the team is getting metadata for each GIS data layer to track sources, dates, and other data attributes, and that the aerial maps include a set taken in fall and a set taken in April.

Pat McAchren, Caltrans Environmental Division, commented that the advisory committee meetings seemed to be clustered in the project's earliest phase. D. Heick said these meetings were planned that way to ensure issues were identified and discussed before early consultation was completed and before decisions were finalized. She said that additional PAC/TAC/SAC meetings are built into the administrative review process as a final screening point before moving to the next stage. P. McAchren suggested getting advisory committee input on the Administrative DEIR.

Tier 1 Process

D. Heick reminded the SAC that the Tier 1 process is not well understood by the general public. Few have been prepared in California. The Tier 1 process will not result in an identified roadway alignment. It will only identify a corridor within which an alignment will be designed and constructed at a later stage. There are some guidelines for preparation of Tier 1 or programmatic environmental documents available from FHWA, Caltrans and CEQA. These guidelines emphasize regional impacts. She emphasized it is important to remember that the outcome of this Tier 1 process will be different (less detail) than a project-level EIS/EIR document.

D. Heick explained that the process would focus on relative differences among corridor alternatives (broad area and general level of detail) and broad issues (general location, mode choice, and regional, indirect, and cumulative impacts). The process will identify mitigation strategies that would be applied to the Tier 2 environmental process.

A. Green inquired about whether the Tier 1 process would identify "fatal flaws." D. Heick answered, it would. Data collection information and mapping would be provided at the next SAC meeting. She reminded the SAC that identification of fatal flaws will focus on corridor-level analyses.

Eric Bryant, representing the proposed Placer Ranch Specific Plan, asked about the corridor's width in the central segment. D. Heick said it was identified as a 1,000-foot-wide corridor in the Project Study Report. Land within the corridor would be acquired to preserve it for the future transportation facility and to minimize impacts on agricultural land and/or adjacent resources.

Alternatives Development and Screening
D. Heick informed the SAC that the traffic model was being updated to help develop screening criteria for evaluating the PSR alternatives. Transportation screening will be segment-based, and will consider three (3) scenarios:

1) No Project (existing)
2) Year 2025/2030 (based on SACOG's 2025 Metropolitan Transportation Plan)
3) an "extended" future scenario (the MTP plus pending/anticipated urban development proposals)

L. Clark asked if the third scenario would be a horizon-based or land use-based forecast. D. Heick said it would be more land use-based, with additional criteria being developed by the TAC.

A. Green commented about a serious fuel shortage by 2030. He asked if this shortage would be included as part of the scenarios. D. Heick responded that the alternatives analysis would include mode choice. A. Green suggested using the shortage as an assumption.

All assumptions made in developing the forecasts will be available to the SAC for review. She clarified that there were no hard lines drawn for PSR alternatives at this time. The identification of a preferred corridor with a defined width will be the outcome of the Tier 1 process.

Environmental screening is currently anticipated to involve analyses of the following issues:
- Existing/Planned Land Uses
- Williamson Act Contracts/Important Farmlands
- Community Disruption/Displacement/Relocation
- Recreation Lands
- Cultural/Native American Resources
- Biological/Wetland Resources
- Hazardous Materials/Waste
- Floodplain/Hydrology
- Soils
- Potential for Growth Inducement

A. Green asked about the species that data were being collected on. D. Heick said that information was being collected on special status species. A. Green suggested that migratory birds also be studied, since they were protected even if they did not have special status. D. Heick agreed, and indicated that the project could also help to further the goals of the Placer Legacy and Natomas Basin HCPs. She said data collection and mapping efforts were ongoing.

D. Heick finished this discussion by identifying that the boundary for the transportation model extends beyond the study area to more accurately reflect traffic impacts. The PSR's conceptual alternatives will first undergo environmental impact review and then transportation screening. Any new alternatives identified will first undergo transportation screening and then environmental review.

VI. OPPORTUNITIES FOR INPUT

D. Iacofano informed the SAC that opportunities for input are built into the process through PAC/TAC/SAC meetings, public workshops at key milestones, "stakeholder" interviews, and through the formal environmental review process. The advisory committees and stakeholder interviews were helping to identify key issues early in the process. Additional opportunities for information and input will be available through the project web site and newsletter, scheduled for distribution by Fall 2003.

VII. ISSUES AND DESIRED OUTCOMES

D. Iacofano invited the SAC members to identify issues and desired outcomes related to the Placer Parkway project. The following comments were made during this discussion:

- Tom Christofk, Placer County Air Pollution control District, suggested comparing air quality impacts for the no-build alternative vs. the other alternatives.
- Eric Bryant, Placer Ranch Specific Plan, said all of the PSR corridors crossed his project development. He suggested greater coordination between proposed development and the Placer Parkway project.
- Ken Hough, SACOG, mentioned that this project has been a regional priority for SACOG for the past five years. He said that the open space buffer is a big issue. He suggested studying the draft working paper on the Dixon/Vacaville greenbelt. These cities have purchased land along the greenbelt corridor and leased them back to farmers.
- P. McAchren, Caltrans, stated that The American Farmland Trust (AFT) in Davis runs a program to promote protection of agricultural land. He suggested reviewing the Oakdale/Riverbank Open Space Plan.
- Steve Propst, Caltrans, mentioned that this project would benefit the region by relieving traffic congestion. Caltrans wants to see a good transportation project result from this process, one that meets the needs of all stakeholders. He expects a good quality document focused on long-term planning that will identify a corridor for preservation. He said that a Tier 1 process can be a good prototype for Caltrans, and believes it is the wave of the future.
- Julie Hansen, KT Development, represents a central segment landowner that just submitted a recent development application to Placer County. She is mindful of the Placer Parkway project, and commented that coordination between development proposals and the Placer Parkway project is desirable.
- L. Clark, Placer Legacy, reminded the SAC of the Lincoln By-pass project (SR 65) and controversy over the LEDPA for that project. He suggested addressing each alternative's growth inducing and cumulative impacts early in the process, since these issues are relevant to the identification of a LEDPA alternative. It is important to understand these issues early to try and avoid problems later.
- A. Green, Sierra Club, emphasized the need to preserve as much open space as possible, particularly vernal pools and other irreplaceable resources, but also bird habitat. He said this vicinity was a part of the third largest migratory bird/raptor habitat in the country even with working farms in the area. In terms of data, he suggested contacting the Audubon Society. He said that he is not opposed to some kind of a connector; but the project had to consider the LEDPA process. L. Clark noted a Christmas bird survey conducted by the Audubon Society. Jones & Stokes (consulting firm) is completing a wintering bird survey.
- Jeff Finn, California Department of Fish and Game, expressed the need to acquire land beyond the immediate corridor, for protection and preservation - as mitigation. He advised that identification and protection of mitigation lands as part of the Tier 1 process would be helpful. He said that restoration identified as mitigation should be performed before the project is constructed – before the "take". Fritts Golden, URS, pointed out that Federal and State agencies have to reach consensus about locations for mitigation. L. Clark reminded the SAC that a Habitat Conservation Plan/Natural Community Conservation Plan (HCP/NCCP) for Placer Parkway is being prepared, and that a conservation strategy will be developed by Fall 2003.

- Rob Jensen, City of Roseville Public Works, expressed concerns about increasing traffic and congestion on local streets in the City of Roseville due to growth in the region. He said that there was less traffic benefit the further north the Parkway is located. The Parkway would be an opportunity to 'funnel' traffic away from the city.
- Jack Wallace, Roseville Coalition of Neighborhood Associations, supports establishment of the Parkway. He said it would reduce congestion and air quality concerns. However, he was concerned about long-term growth inducement. He said the Parkway would allow for more development. There is a lack of regional cooperation to deal with growth issues.
- George Alves, Rural Lincoln MAC, said he had never been involved in a discussion about the Placer Parkway. He was eager to take back this information to the MAC for information and feedback.
- Joseph Cruz, Sacramento Metro Area Chamber of Commerce, identified several economic benefits of the Parkway such as moving goods, positively impacting job growth in Sacramento and around the airport, improving the quality of life, as well as safety (moving traffic off local roads).
- Joan Powell, Sun City Roseville Homeowners Association, suggested that improved public transit is a concern. There seems to be a lot of attention paid to environmental issues but not very much to transit.

VIII. NEXT STEPS

D. Iacofano concluded the meeting and announced the following next steps:

- PCTPA and consultants will consider input from TAC/SAC,
- Complete the traffic model
- Gather existing environmental data
- Bring screening criteria and data to the next SAC meeting to be held on August 14, 2003 from 1:30 to 3:30pm

PLACER COUNTY TRANSPORTATION PLANNING AGENCY

Meeting Minutes & Action Items **Final 11.03.03**

Meeting Description: Placer Parkway Corridor Preservation – Study Advisory Committee Meeting #2
Meeting Date August 14, 2003
Minutes Date: October 13, 2003 **Location:** City of Rocklin's Sunset Community Center – 2650 Sunset Blvd.

Persons Attending			
Name	**Affiliation**	**Name**	**Affiliation**
William Morebeck	Placer County Agricultural Commission	Ron Dondro for Tom Brinkman	Placer County, Public Works
Wendy Gerig	Roseville Chamber of Commerce	James McLeod for John Pedri	City of Lincoln, Public Works
Joan Powell	Sun City Roseville Homeowners Assn.	Scott Gandler for Rob Jensen	City of Roseville, Public Works
Howard Rudd for George Alves	Rural Lincoln Municipal Advisory Committee	Spencer Short for Perry Beck	City of Loomis
Loren Clark	Placer County, Planning and Placer Legacy HCP/NCCP	Pat McAchren	Caltrans, Environmental
Jeff Finn	California Department of Fish and Game	Celia McAdam	PCTPA, Executive Director
Alan Green	Sierra Club, Placer County	Stan Tidman	PCTPA, Project Manager
Ed Pandolfino	Environmental Council of Sacramento (ECOS) and Audubon Society	Denise Heick	URS, Project Manager
Julie Hanson	KT Development	Fritts Golden	URS, Environmental Manager
Jack Ritchie	South Sutter County Specific Plan	John Long	DKS Associates, Traffic
Susan Rohan for John Tallman	Proposed West Roseville Specific Plan	Daniel Iacofano	MIG, Inc., Public Outreach
Jeff Clark	Sacramento County, Public Works	Sharon Kyle	MIG, Inc., Public Outreach
Mike Lee for George Musallam	Sutter County, Public Works		
Minutes			

I. INTRODUCTIONS

The second Study Advisory Committee (SAC) meeting was held on August 14th, 2003 at the Sunset Community Center (City of Rocklin). The purpose of the meeting was to update the SAC on project progress, discuss issues and get feedback regarding transportation modeling, and the alternatives screening process and criteria.

Celia McAdam, Executive Director for the Placer County Transportation Planning Agency (PCTPA) welcomed SAC members to the meeting. She then invited SAC members to introduce themselves. Next, she turned the meeting over to Daniel Iacofano, of Moore, Iacofano, Goltsman, who explained his role as meeting facilitator and reviewed the agenda and meeting format. He turned the meeting over to Denise Heick (URS Project Manager).

D. Heick summarized the information presented and discussed at the first SAC meeting on June 27, 2003. She began with a description of the project limits, generally between SR 65 -- SR70/99 and Sunset Boulevard/Howsley Road – Baseline Road/Riego Road. She identified the three project area segments:

- western (SR 70/99 to county line)
- central (county line to Fiddyment Road)
- eastern (Fiddyment Road to SR 65)

No access is planned in the central area between Fiddyment and Pleasant Grove Roads.

She then explained the primary project need for the project as: population and employment growth, anticipated urban development, and increased travel demand with resulting greater congestion. She emphasized that PCTPA and SACOG, through both the 2000 Conceptual Plan and the 2001 Project Study Report (PSR), have adopted the project concept.

Next, she described the public involvement portion of project. This includes advisory committee meetings (TAC, SAC and PAC), public meetings, stakeholder interviews, newsletters and a project website. She reviewed the SAC's overall duties and responsibilities:

- to identify concerns, issues, and preferences
- to provide non-binding recommendations and advice to the project team
- to attend and participate in meetings
- to represent each member's interests, jurisdiction, or agency and accurately represent the project and its activities to them.

Next, D. Heick briefly reviewed the three study goals:

(1) identify corridor alternatives to be studied in the Tier 1 EIS/EIR, which meet the project's purpose and need as well as being mindful of resource agency concurrence and a future determination of the Least Environmentally Damaging Practicable Alternative (LEDPA)
(2) identify the preferred corridor alternative through the Tier 1 EIS/EIR process
(3) complete a Record of Decision (ROD) for the EIS and certify the EIR so that corridor preservation and/or acquisition could commence.

She explained that data gathered in the Tier 1 process would assist with permitting activities following the subsequent Tier 2 process. No permits are needed for the Tier 1 phase. She stressed that, in a Tier 1 process, attention is focused on general information and characteristics in the study area, emphasizing relative differences among corridor-level alternatives. In this phase, mitigation strategies are also developed that will be applied in future Tier 2 documents. She stressed that the overall objective of the Tier 1 process is to preserve a corridor as soon as possible. When funding is available, PCTPA will identify specific alignments within the selected corridor via the Tier 2 environmental review process.

D. Heick also reviewed key project milestones—from initial screening for fatal flaws, to preparation of the final Environmental Impact Statement/Report (EIS/EIR). D. Heick mentioned that information identified in public meetings and agency meetings would also be folded into the project development process. She stated that at this point in the project, the primary focus is on screening criteria and development of a baseline transportation model.

Finally, she reviewed the steps involved in the alternatives development process, which include: transportation screening, environmental screening, focus on identification of fatal flaws, and determining alternatives for study in EIS/EIR.

II. TRANSPORTATION MODELING

John Long, DKS Associates, delivered a presentation on transportation modeling.

Travel Forecast Process—The presentation began with an overview of the travel forecasting process. The overview covered three areas:

- Development of travel forecast for Need and Purpose and for alternatives screening
- A broadly defined travel forecast to adequately address project impacts
- A second forecast to expand existing (SACOG) 2025 data to consider potential future development within the study area

J. Long stated that the travel forecast process would help refine the project's need and purpose statement and would be applied to the alternatives screening process. He said that it was critical that travel forecasts address a broad area in order to accurately consider all the variables included in the project study area. He said the project team felt it important to ask the question—What is the horizon year for this project? He stated that generally a horizon is 20 years out, but the project team will be looking at 2025 to 2030 conditions. SACOG's Metropolitan Transportation Plan has a 2025 horizon year. The 2025 development forecasts for the region were adopted by SACOG in 2001. J. Long explained that the future roadway system in the Metropolitan Transportation Plan (MTP) reflects local Capital Improvement Programs and "funding-constrained" improvements. The MTP is important to this process because it is a collaborative effort with all regional agencies to forecast transportation needs.

It has been recommended by the project team that a second future scenario be developed to forecast the unique growth pressures and potential development characteristic of the project study area that are not captured in the MTP. J. Long mentioned that CEQA guidelines require that projects consider "reasonably foreseeable" development in the planning process (this helps anticipate a broader range of future conditions), which could affect the selection of a project alternative.

Loren Clark, Placer County Planning and Placer Legacy HCP/NCCP, asked if the second cumulative development scenario would be based on a 2025 horizon. J. Long said he'd be discussing this momentarily in the presentation.

J. Long said that this second cumulative development scenario would be important because this additional development could influence the selection of project alternatives. He stated that the criteria used to include projects were based on parameters consistent with the MTP. He reviewed the criteria developed (by the TAC and project team) with the SAC. Proposed screening criteria include:

1. Pending/anticipated urban development
2. Projects located within 5 miles of the corridor area
3. Projects not included in current General Plans must be more than 1,000 acres of urban development

The proposed criteria for including pending/anticipated urban development are:

1. All projects with accepted development applications
2. All potential projects determined by the relevant jurisdiction to be pertinent
3. All remaining residential capacity included in current approved General Plans within Placer and South Sutter counties west of Sierra College Boulevard

Next, J. Long discussed the list of Major Proposed Developments in project study area. They include the following:

- West Roseville Specific Plan
- Placer Vineyards Specific Plan
- South Sutter County Specific Plan

- Placer Ranch Specific Plan
- De La Salle University and Community
- Metro Air Park
- McClellan Park
- Elverta Villages
- West Lincoln

He noted that this list (which was developed in discussions with the TAC) was an initial list, and others projects may also weigh into project considerations. He also added that since most existing development projections don't include full build-out scenarios, additional information would need to be captured for the second cumulative development scenario. The second cumulative development scenario would assume full build-out of the residential land uses west of Sierra College Boulevard, including residential uses proposed in the major proposed developments, and an increase in employment proportional to growth in housing.

Based on the above parameters, the second cumulative development scenario would add approximately:

- 49,100 dwelling units
- 12,300 retail employees
- 53,500 non-retail employees
- 10,000 to 15,000 college students

to the SACOG 2025 development forecasts.

Neighborhood retail employment would be allocated within the major proposed developments. Non-retail employment would be allocated throughout South Sutter, South Placer, and North Sacramento counties. Sensitivity tests would be performed to determine how the allocation of non-retail employment would affect travel forecasts.

The following initial travel model forecasts would be prepared:

	2025 SACOG Development Forecasts	**Second Cumulative Development Scenario**
No Project Alternative	1	1
Screening of Corridor Alternatives	Several	Several

SAC Feedback & Questions

Ed Pandolfino, Environmental Council of Sacramento (ECOS) and Audubon Society, asked why the project was so focused on potential development. He also asked if the project was realistically focused on constraints, including current State population/housing projections, availability of water, and quality of life issues. He stated that the area is a hot growth area -- with a very attractive quality of life -- but this is quickly deteriorating because of a number of issues such as poorer air quality. He concluded by stating that the project may be basing forecasts on the incorrect information – would growth continue based on these constraints?

J. Long indicated the project approach was to 'bracket' these scenarios. SACOG's MTP would be considered less optimistic about growth. It is based on State- and local jurisdiction-level data, while the proposed "second cumulative

development scenario" would be more optimistic about regional growth. The second scenario would be based on a longer time frame than the MTP and include potential urban development described previously. He said the project team is trying to be realistic about proposed future growth. D. Iacofano asked if J. Long was indicating that the project is being overly aggressive about projections based on development/growth indicators. E. Pandolfino indicated he was suspicious about it. He thought it might be a developer "wish list." Rick Dondro, Placer County Public Works, said he didn't want the data to drive the project. D. Heick said that the project is being careful not to do this. The team was using the best available data and recognizes it will change over time. A. Green pointed out that SACOG data provides good "floor" for baseline information. J. Long added that the SACOG plan would be updated in 2005 and this will be helpful to the accuracy of project data.

William Morebeck, Placer County Agricultural Commission, asked for clarification about "undeveloped land". He was interested whether it was reflective of current general plans or land that was actually vacant. He commented that there is a perception that agricultural land is merely a "land bank" for future urban development. J. Long explained that in general plans there are areas that are identified for particular purposes, although no specific projects may be formally identified for that area.

R. Dondro cautioned that the project should not go beyond adopted general plans. The project needed to be careful about how scenarios were named/dated or labeled. The scenario should be carefully explained. It should be pointed out that it is not approved and the project was not proposing it. He said it should be clear with all assumptions outlined.

L. Clark said that these proposed developments were very geographically specific with a lot of data. He asked two questions:

(1) How would the scenario avoid including the 'next' development proposal that would expand the 'bracket'. He said we would have to close the door sometime. D. Heick said the project data would be revisited more than once during the process, in order to refine information as new data comes in from sources (SACOG and others). She thought this would happen as the alternatives were being screened and then again during the Tier 1 EIS/EIR analysis.

(2) How would the residential to employment ratio be determined? For example, the potential De LaSalle University development, because of its specific use, would have a better-defined ratio. D. Heick said that the process would identify where this data was coming from -- the source -- for the regional bracket. J. Long added that the TAC was considering this. They would be providing input shortly. D. Iacofano clarified that the project team's "rule of defining data" has to be realistic.

Spencer Short, Town of Loomis, A. Green, asked about the central segment having no access and whether it was logical. D. Heick said this decision was based on policy direction adopted by SACOG and PCTPA Boards .J. Long clarified that the "no access" direction was based on the preliminary planning documents -- the Conceptual Plan and Project Study Report. He added that the only potential connection in this segment would be if Watt Ave. were extended.

R. Dondro said he thought this is contradictory. He was concerned about generalizing the project description by saying that no access will happen in an area and then saying there could be a Watt Ave. connection. He mentioned the following potential alternatives: a project without a future extension of Watt Avenue, a project with a future extension of Watt Avenue, plus two land use alternatives.

J. Long clarified this would actually result in four scenarios to evaluate: with- and without a Watt Avenue extension (with the project evaluating an interchange in the event one is eventually constructed as part of a separate project) for both the SACOG 2025 MTP development scenario and for the proposed second cumulative development scenario.

S. Short asked why property in the proposed corridor wasn't being purchased now – particularly in the east and west segments near the State highways. C. McAdam said that property couldn't be purchased until the Tier 1 study was

complete. During the Tier 1 study, all jurisdictions and property owners in a study area will be informed about potential impacts of the Placer Parkway project.

Wendy Gerig, Roseville Chamber of Commerce, asked if the "no access area" in the central segment could be defined as a fatal flaw. D. Iacofano said no—this was a design consideration. E. Pandolfino thought it was a fatal flaw that would be growth inducing. He said the no access-provision does not realistically factor in development. J. Long said that it actually is a policy recommendation. He said that the "no access" zone would stay in place (for now) based on previous direction. D. Heick said at some point this issue might go to decision-makers to be revisited.

III. ALTERNATIVES SCREENING PROCESS & CRITERIA

A. ENVIRONMENTAL PROCESS & SCREENING

D. Iacofano directed SAC members, who were grouped at several tables, to look at the maps at each table. He instructed SAC members to work in groups to review information on the maps and mark up changes or additions needed as appropriate. Next, D. Heick asked everyone to take a look at the meeting handout entitled *Development of Environmental Screening Criteria*. She briefly explained the screening process as a quick assessment method to help identify, avoid, and minimize fatal flaws. She stated that the screening process would assist with prioritization related to analysis occurring during this phase of the project. She explained that the screening process would use "differentiators" -- a way to distinguish relative differences among corridor alternatives for a particular resource or issue area.

D. Heick asked the SAC members to turn to Table 2 in the handout (on pages 5-8), where a matrix labeled *Draft Environmental Screening Criteria* identified various resources/issues, assessed differentiators, and listed criteria. She explained that the associated diagram would assist SAC members with reviewing the screening process. She identified the criteria to be applied by the project team to each resource/issue area. She noted that the process and criteria were also being reviewed by the TAC. She asked the SAC to provide input as they worked through the maps during this session.

SAC members divided up into work groups, and discussed the various categories of resources/issues for the western, central, eastern segments of project. Project environmental screening covered the following categories:

- Existing/Planned Land Uses
- Williamson Act Contracts/Important Farmlands
- Community Disruption/Displacement/Relocation
- Recreation Lands
- Cultural/Native American Resources
- Biological/Wetland Resources
- Hazardous Materials/Waste
- Floodplain/Hydrology
- Soils
- Potential for Growth Inducement

SAC members noted issues, questions, and recommendations on project maps. This information will be evaluated by project team and assessed for use in developing project screening criteria. The following items were specifically identified:
(Note to attendees – it was difficult to capture all comments regarding the maps and the screening criteria during this very dynamic portion of the meeting. If substantive comments are not captured below, please annotate and return an annotated version so that our final summary will be complete. Thanks!)

Special Status Species
Identify species based on "habitat"

Refer to NCCP/HCP process, which has new data on land cover that may be useful

Wetlands
Map rice fields
Determine if more current data is available

Vernal Pools
No changes to this map

Waterfowl
Why is waterfowl separate from other species (e.g., wintering raptors)?
Important to use new data

Land Use
Identify waterfowl habitat areas
Identify public and private parcels in areas

Cultural Resources
Identify what is known and unknown

FEMA Floodplains
Consider adding a Reclamation District representative to SAC
Move color differentiation on blue area

Hazardous Materials
No changes to map

Farmland
Look at soils types
Define "prime" farmland
Identify value

General Soils
Not a differentiator

Roadfill Soils
Not a differentiator

Subsequent to the meeting (August 18, 2003), Rick Dondro provided additional comments by e-mail:

> "Since I was not able to stay to the end of the SAC meeting please find some comments below on the environmental screening process.
>
> 1) On page 6 Hazardous Waste in the Eastern Segment it says no - few sites - I would think this should be a yes due to the proximity to the landfill.
> 2) Page 7 Noise in the Central and Eastern it says No - I strongly disagree with this. There are many receptors in Roseville (e.g. Del Webb) that are within range of the Bypass - These sources are very sensitive. In addition the alignment should include noise impacts on the future

West Plan. The noise impacts on the West Plan residents could be the driving political criteria for selecting an alignment.
3) Page 7 Land Use - Eastern Segment - This area is all designated Industrial or Industrial reserve - I would say No
4) Page 8 Growth Inducement - for what its worth my opinion is Yes for all segments

Please pass on these comments to the appropriate parties
Thanks Rick"

B. ENGINEERING PROCESS & SCREENING

Gary Horton (URS, Engineer) presented the proposed process and engineering criteria for the alternatives screening process. He described the following five-steps:

- Establish Design Standards
- Prepare GIS-Level Geometric Studies
- Evaluate Off-Site Engineering Impacts
- Develop Initial Matrix to Evaluate Engineering Impacts
- Refine Alternatives for Draft EIS/EIR

G. Horton explained that conceptual design standards would consider facility type, design standards (speed, radius), access standards, and safety standards. He suggested that the facility could be a divided controlled access highway. The project team is still assessing the range of potential interchange configurations at SR70/99 (including a local interchange or a two-level trumpet interchange) and at SR 65 (including a local interchange or partial freeway to freeway interchange). Recommended traffic speeds would range from 55 mph to 70 mph. Speed would in turn provide direction on optimum curve radii. He stated the type of access control would be another key. The degree of access control is still being evaluated (limited to full access control). He said the facility type would also help to determine access control. He discussed safety standards, which determine the amount of space needed to safely recover in the event of an incident (this will influence shoulder and median widths). He said that conceptual engineering criteria would be developed to be consistent with the PSR policy direction.

He stated that once conceptual standards are set, GIS Level Geometric studies to establish a visual representation of the interchange configuration will be developed - including sufficient right of way. There will be no full physical design of a roadway or interchange within the corridor. He mentioned that issues related to drainage would be factored in, as will flood plain encroachments. In conclusion, he said the next step will be to develop a matrix to evaluate engineering impacts—this will ultimately assist with the creation of design criteria for the project.

IV. CONCLUSIONS & NEXT STEPS

Transportation Modeling

1. The proposed second travel forecast (SACOG's MTP plus potential future development proposals) generated several comments and questions. These included:

   a) Be sure that all forecasts are based on comprehensive and factual data including State and local jurisdiction data.
   b) Consider regional water availability and quality of life issues in these forecasts.
   c) Carefully explain the proposed second travel forecast and its assumptions. Be careful of labeling and dates. Point out that the potential development is not approved and this project is not endorsing it.

d) Detail how:
- Transportation screening criteria would address future proposed urban developments beyond those listed.
- Residential to employment ratio would be determined.

2. The PSR's "no access" provision created a number of comments:

a) Is this provision logical?
b) Is it contradictory if a Watt Ave. connection is to be studied?
c) Could this restriction be considered a 'fatal flaw', which does not realistically factor in development?

3. Modeling work will continue with the TAC input and SAC feedback. Updated information regarding development of the Second Cumulative Development Scenario would be shared with the SAC at the October 23 meeting.

Environmental Screening

1. Data collection will continue and mapping work will be updated to reflect TAC input and SAC feedback.

2. Input will be solicited from an interagency meeting with staff from State and federal resource agencies. This information will be updated and discussed at the October 23 meeting.

The next SAC meeting will be held on Thursday, October 23, 2003 from 2:00 to 4:00 p.m. at the City of Roseville's Corporation Yard.

PLACER COUNTY TRANSPORTATION PLANNING AGENCY

Meeting Minutes & Action Items — Final 11-19-03

Meeting Description: Placer Parkway Corridor Preservation – Study Advisory Committee Meeting #3
Meeting Date October 23, 2003
Minutes Date: November 19, 2003
Location: City of Roseville Corporation Yard – Rooms #2 and #3 – Hilltop Circle

Persons Attending

Minutes

MEETING SUMMARY

Purpose

The meeting purpose was to update the SAC on project progress, discuss issues and get feedback on modeling, and the environmental screening criteria and preliminary data for PSR alternative.

Reports on Recent Meetings

Denise Heick summarized the October 6th and 9th Scoping Meetings and informed the SAC members that the Placer County Board of Supervisors recommended that the application process for the De La Salle and Placer Ranch projects should not be delayed.

Environmental Screening Criteria and Preliminary Data for PSR Alternatives

D. Heick began with a discussion of the environmental screening criteria and preliminary data for PSR alternatives, emphasizing that the process was primarily a review of the transportation and environmental screening conducted related to the project thus far. D. Heick asked the SAC members to review this material, stating that it would be used to help identify and avoid fatal flaws. She noted that the resources/issues were differentiated by type and amongst the western, central and eastern segments. The following is a list of the

areas were covered: Air Quality, Biology: Special Status Species, Biology: Wetlands / Riparian/ Vernal Pools, Biology: Waterfowl Habitat, Community Socio-Economics, Municipal Facilities, Public Services, Historical Resources, Floodplains, Hazardous Waste, Land Use: Agriculture, Noise, and Land Use: Planned Development.

Modeling Tool Demonstration
Steve Kokotas (MIG) explained that the Arc View and Community Viz tools utilized all of the data just reviewed. He went on to explain that as different alternative Parkway routes are identified it is possible to automatically calculate specific impacts. Additionally, the program can give a comparative analysis of impacts among different route alternatives. A real time demonstration of the program was presented.

Transportation Modeling
J. Long discussed the traffic assumptions for the no build alternative and Cumulative Scenario A. He also discussed future development scenarios. He noted that overall it is believed that the new Parkway will increase Vehicle Miles Traveled (VHT) and decrease Vehicle Hours Traveled (VHT). He also explained that two new colleges are being proposed in the project study area, a branch of California State University at Sacramento in the Placer Ranch Specific Plan area, and De La Salle University in the De La Salle Specific Plan area. This could result in the addition of 49,100 dwelling units, 13,3000 retail jobs, 53,500 non-retail jobs, and 10,000 to 15,000 college students.

Conclusions and Next Steps
The meeting concluded with D. Iacofano briefly recapping the agenda/discussion items and highlighting the main questions raised during the meeting and topics noted for further investigation. He then went on to discuss the next steps including the upcoming informal NEPA/404 consultation, continuing screening of the PSR Alternatives, and the continuing environmental and engineering assessments. The next SAC meeting will be take place on February 12, 2004.

I. INTRODUCTIONS

The third Study Advisory Committee (SAC) meeting was held on October 23rd, 2003 at the City of Roseville Corporation Yard (City of Roseville). The purpose of the meeting was to update the SAC on project progress, discuss issues and get feedback on modeling, the environmental screening criteria, and preliminary data for screening of PSR alternatives.

Denise Heick welcomed SAC members to the meeting. She then turned the meeting over to Daniel Iacofano, who invited SAC members to introduce themselves. He then explained his role as meeting facilitator and reviewed the agenda and meeting format. He turned the meeting back over to D. Heick. She briefly reviewed the project, including the three main corridors identified in the PSR to connect SR 65 to SR 70/99. She also went over the purpose of the project, noting: access to jobs; accommodating growth; maximizing mobility; minimizing impacts. The project concept has been adopted by PCTPA and SACOG. She also reviewed the duties and responsibilities of the SAC, the Tier 1 process, key project milestones, and the alternatives development process.

II. REPORTS ON RECENT MEETINGS

Scoping Meetings

Approximately 30 people attended the Scoping Meeting held in Roseville on October 6th. Attendees were generally supportive of the project, and strong preferences for or against the corridor locations were not generally expressed at this meeting. Approximately 100 people attended a much livelier meeting at the Pleasant Grove School on October 9th. At this meeting, attendees expressed the opinion that the entire corridor along Pleasant Grove Road is considered by residents to be a community with no distinct boundaries. There was an emphasis on the cohesion of this community as well as the viability of continued farming in Sutter County. Attendees were generally not happy with the project and professed strong preferences regarding corridor locations. Most attendees were not in favor of the northern corridor alignment since it would have the most impact on active farming. Many individuals from the areas that in Sutter County that would be affected by a northern alignment alternative were in attendance.

Placer County Board of Supervisors Meeting

The Placer County Board of Supervisors met on October 20th. Direction was provided to the Planning Department to proceed to process applications for the De La Salle and Placer Ranch Specific Plans, and that the application processes should be coordinated concurrently with the Placer Parkway corridor identification process. General support was expressed for one or more universities (each of these Specific Plans proposes a university). BOS members said it would be possible to resolve many issues presented by these Plans by modifying the current proposals.

III. ENVIRONMENTAL SCREENING CRITERIA AND PRELIMINARY DATA FOR PSR ALTERNATIVES

Screening Criteria

D. Heick began her presentation with a discussion of environmental screening criteria and preliminary data for PSR alternatives by reviewing the transportation and environmental screening conducted to date. She described the process as a quick assessment method to help identify, avoid and minimize fatal flaws. The draft screening criteria were the subject of previous TAC and SAC meetings, and were revised based on input received at these meetings. She informed the SAC members that she had taken a revised *Draft Environmental Screening Criteria* back to the Technical Advisory Committee (TAC) for review and that the SAC should also review this document in order to add their feedback. A revised *Draft Environmental Screening Criteria* matrix (discussed at the SAC #2 meeting) was provided to the SAC.

Preliminary Draft Date for Use in Screening PSR Alternatives

The following information was employed in the next discussion:

- Large maps on the wall, each showing a different resource within the study area,
- Illustrative figures showing the intersection of PSR corridor alignment alternatives with the different resources, shown in a PowerPoint presentation and provided in hard copy to attendees, and
- The revised *Draft Environmental Screening Criteria* matrix.

Information regarding the accuracy and completeness of the resource data on these maps and figures was solicited from the SAC. The *Draft Environmental Screening Criteria* matrix was then discussed, in the context of each of the figures showing the intersection of PSR alternatives and resources, where applicable, and potential conflicts were identified.

The following resource areas were covered:

- Air Quality
- Biology: Special Status Species
- Biology: Wetlands / Riparian/ Vernal Pools
- Biology: Waterfowl Habitat
- Community Socio-Economics
- Municipal Facilities
- Public Services
- Historical Resources
- Floodplains
- Hazardous Waste
- Land Use: Agriculture
- Noise
- Land Use: Planned Development

Air Quality
D. Heick began discussion of this topic by informing the group that there were no differentiators in the Air Quality criteria yet.

Dave Vintze, Placer County Air Pollution Control District, asked if the Vehicle Miles Traveled (VMT) had been calculated for each of the corridor options. He noted that this information was vital for two reasons. First, the closer the Parkway is to development the less likely growth inducement will occur and overall fewer cars that would need to be accounted for. Second, a calculated VMT is necessary for the assessment of emission particulates to be assessed.

John Long, DKS Associates, responded to the question by saying that at present the VMT is just being addressed for the overall area. The first task was to calculate emission for the region and then later on the project will focus on the specific corridor segments.

Tom Brinkman, Placer County Public Works Department, asked about taking congestion into consideration. He said emissions should be calculated to take into account not only total VMT but also the duration of travel time due to congestion. He also asked if there was a way to account for growth inducement as well.

D. Heick responded, saying that calculations can be made but will depend upon the alignment, input from the TAC and SAC members, and the methodology used.

Biology: Special Status Species
D. Heick indicated that this resource/issue would be looked at carefully. Several Special Status Species figures was displayed for review: Giant Garter Snake Habitat, Potential Swainson's Hawk Nesting Habitat, and Potential Valley Elderberry Longhorn Beetle Habitat. She noted that vernal pool special status species are presumed present in vernal pools for purposes of this initial evaluation (vernal pools are discussed separately below).

Giant Garter Snake Habitat

D. Heick reviewed garter snake habitat in the context of looking at the different alignments. Overall, it appears that the north alignment has the fewest impacts to this species' habitat. Ed Pandolfino, Environmental Council of Sacramento and Audubon Society, asked if this calculation takes into account the lengthening of Watt Ave (and if not, how would it be addressed)? D. Heick responded by saying that at present calculations do not address Watt Avenue. The Parkway Project does not include a Watt Avenue extension. It will analyze the impacts of a Parkway interchange with a future Watt Avenue extension that might be constructed by others. Jeff Finn, California Department of Fish and Game, wanted to know which categories were going to be used in making the decision? D. Heick told the SAC members that all possible and available categories will be incorporated into the final decision making process.

Swainson's Hawk Habitat
D. Heick reviewed Swainson's Hawk habitat in the context of looking at the different alignments. J. Finn said that this data was a good start but lacking in detail as these birds can nest anywhere. He noted that you could use land cover data but the project team would need to know more specifics about which categories would be used to make decisions. E. Pandolfino suggested that updated survey data could be collected using trees at certain sites.

Valley Elderberry Longhorn Beetle Habitat
D. Heick reviewed Valley Elderberry Longhorn Beetle habitat in the context of looking at the different alignments. There was no discussion.

Biology: Wetlands / Riparian / Vernal Pools
D. Heick stated that there is potential waterfowl habitat in all three-segment areas. She went onto mention that this was an area of concern at a previous SAC meeting, mainly because this is a rest area for migratory birds and a feeding area due to the rice farms in the area. She also mentioned that there were vernal pools in all three project segments. Additionally, she mentioned that fisheries would also be assessed as an area of interest.

Wetlands / Riparian
D. Heick reviewed riparian and wetland areas in the context of looking at the different alignments. She indicated that the PSR's central alignment has the biggest impact on wetlands and that it will be necessary to gather more current data if it is available.

Vernal Pools
D. Heick reviewed vernal pool areas and vernal pool critical habitat in the context of looking at the different alignments. Two figures were reviewed, one showing the location of vernal pools or "clusters" of vernal pools identified as part of the Placer Legacy project, and the other show US Fish& Wildlife Service designated Vernal Pool Critical Habitat. She identified that the PSR's southern alignment has the biggest impact on vernal pools and vernal pool critical habitat.

Tom Christofk, Placer County Air Pollution Control District, asked why the central segment is located where it is. Is it based on resource mapping or just dashes on a map? D. Heick and J. Long both said that it is based on a Placer County General Plan line, and was identified as a potential alignment in the PSR. We are now going through a more thorough environmental evaluation that may result in revising the alignment.

Biology: Waterfowl/Upland Habitat

D. Heick reviewed waterfowl and upland habitats in the context of looking at the different alignments. These figures were developed based on input from J. Finn at the last SAC meeting. D. Heick briefly explained that waterfowl habitat is being considered separately from other species. The project team is in the process of better identifying waterfowl habitat areas.

Community Conditions/Socio Economics
D. Heick stated that the team is trying to get more specific nuances of communities and connection issues related to the project. She said that there were some issues related to schools and 4F-classified properties.

Potential Residential Communities
D. Heick reviewed the potential residential communities in the context of looking at the different alignments. There are no formal boundaries of communities in the study area. This data identifies clusters of residences and community services.

Employment Centers
D. Heick reviewed the employment centers in and around the study area in the context of looking at the different alignments. She noted that there is a real difference between the east and west segments related to employment types.

Municipal Facilities
D. Heick reviewed the municipal facilities in and around the study area in the context of looking at the different alignments. She asked the SAC to identify any facilities that were not accounted for.

Homes and Businesses
D. Heick reviewed the location of homes and businesses in the study area in the context of looking at the different alignments. Loren Clark, Placer County Planning and Placer Legacy HCP/NCCP, asked how the information regarding the locations of all the homes and businesses was generated. D. Heick stated that this was done by visual analysis using aerial photography, correlated to the other socioeconomic maps and using some county parcel data.

Community Services
D. Heick reviewed the location of community services in the study area in the context of looking at the different alignments. There was no discussion.

Public Services
Public services in the study area do not present differentiators in any segment area. There was no map data for this parameter.

Cultural Resources
For cultural resources, it was noted that data were only available in areas where cultural resource surveys have been conducted. A large part of the study area has not been surveyed. There should be no inference that certain alignments avoid cultural resources in these areas that have not been surveyed.

Archaeological Resources
D. Heick reviewed the location of known archaeological resources in the study area in the context of looking at the different alignments. There was no discussion.

Historical Resources
D. Heick reviewed the location of known historic resources in the study area in the context of looking at the different alignments. Known historic resources were identified in three categories: structures and bridges, an historic ranch complex, historic linear resources such as canals and roadways, and an historic district. All alignments affect the historic district – Reclamation District 1000; there would be no way to avoid this district with the PSR corridor alternatives as it encompasses both sides of SR 70/99. The southern alignment affects the historic ranch complex.

Floodplains
D. Heick reviewed the location of 100-year and 500-year floodplains in the study area in the context of looking at the different alignments. D. Heick noted that Sutter County plans to close the gap around some of their 100-year floodplain areas (and this could impact the central segment).

Hazardous Materials/Waste
D. Heick reviewed the location of known and potential hazardous materials/wastes sites of concern in the study area in the context of looking at the different alignments. The sites were identified based on review of a commonly used database (EDR) and evaluated for their potential to be an issue. The data only identify four potential sites of concern in or adjacent to the study area. There was a question as to what item identified as "3A" was. Future feedback indicates it is Valley Rock, a closed solid waste disposal site.

Farmland
D. Heick reviewed the location of Prime Farmland and Farmland of Statewide Importance in the study area in the context of looking at the different alignments. D. Heick also mentioned that there was concern about breaking up farms, but the data was not complete yet. A. Green asked if this map breaks down the soil by type? D. Heick said that it does not. There is a separate map that breaks down soils by type.

Noise
D. Heick reviewed the location of potential noise-sensitive receptors in the study area in the context of looking at the different alignments. The figure combined previously-reviewed data showing the locations of potential residential communities, homes and businesses, and the Del Webb Community Plan Area. D. Heick said that the analysis would need to add additional areas that could be affected. Noise experts say that on flat land, noise from Placer Parkway would likely travel about 1, 350 feet. This means that the project could be required to construct berms and other sound barriers. She went on to say that current criteria is insufficient and new criteria would need to be created.

Land Use: Future Development
D. Heick reviewed the location of planned or potential future development in the study area in the context of looking at the different alignments. All PSR corridor alignments intersect the locations of such future development. L. Clark asked if the proposed landfill should be added to the maps as it could have an impact. D. Heick agreed and said that this will be added to the map.

Summation
D. Heick reminded the SAC members that presently all this information is still in preliminary form. It will be refined for the alternatives screening process. She reminded them that this is why their immediate feedback is

crucial, as this information will be shared with the EPA and Corps of Engineers. D. Heick went on to say that in terms of growth inducement, screening factors were still under review.

IV. MODELING TOOL DEMONSTRATION

D. Iacofano introduced the next agenda topic—modeling tools. He explained how this demonstration was to be used to take the lid off the "black box" and reveal how the Arc View and Community Viz tools work. At this point D. Iacofano turned the conversation over to Steve Kokotas, MIG.

S. Kokotas began by explaining that the Arc View and Community Viz tools utilize all of the data D. Heick reviewed with the SAC. He noted that, as different corridor alternatives were identified, it was possible to automatically calculate specific impacts. Additionally, the program could give a comparative analysis of impacts among different route alternatives. A real time demonstration of the program was provided. After the presentation, D. Heick, reiterated that this tool was extremely effective at helping to refine the decision making process. She continued that this tool would be used to refine all of the PSR alternative and the respective impacts. Once this process was completed, the refined results would be brought to the advisory committees for review.

E. Pandolfino asked how many layers of data were going to be used in the refinement process? D. Heick responded that all physical environmental and socio-economic factors would be used in making the calculations. At present, there will be no weighting of the criteria.

In a follow up question, E. Pandolfino asked if the model showed growth inducement? D. Heick answered that they were not sure yet if that was entirely possible but the project team was working on adding in aspects of growth inducement. Someone asked if the program was able to factor in construction costs. D. Heick responded that construction cost factors can be built in as well, although the team is not using this aspect of the model for screening.

A. Green asked what impact the high-tension power lines would have and if they were incorporated in the maps? D. Heick responded that the power lines were not included in the maps and that the major impact they would have is on the farms that were located next to both the power line and the Parkway. This would have an impact on being able to use crop dusters. The existing and proposed power lines will be added to the mapping.

. TRANSPORTATION MODELING

J. Long discussed four topics: development scenarios, future conditions for a no build alternative, induced travel demand, and forecasts for PSR alternatives.

Development Scenarios

J. Long explained that the study area and immediate vicinity is expecting to add 49,100 dwelling units, 13,3000 retail jobs, 53,500 non-retail jobs, and 10,000 to 15,000 college students in two proposed new colleges.

Future Conditions – No Build Alternative

J. Long explained that currently two model plots for congestion were being examined. The first was based on SACOG 2025 data for the No Build alternative. The No Build model shows that 2 to 3 hours of LOS F would

occur in 2025 on segments of I-80 and SR 65, and on segments of Watt Avenue and Walerga Road. The second was Cumulative Scenario A, which adds the increasing growth development scenario to the SACOG 2025 data. Cumulative Scenario A shows that 2 to 3 hours of LOS F would occur on additional segments of I-80, SR 65, Watt Avenue, and Walerga Road, and would also occur on Baseline/Riego Road.

Induced Travel Demand

Using detailed graphic images and poster charts, J. Long went on to discuss induced travel demand. He informed the SAC members that a major new transportation facility would not only impact route choice but the distribution of trips. This will ultimately give people a wider array of travel options for getting to their destinations. He then went on to discuss how induced travel demand can come from changes in trip generation, trip distribution and mode choice. The SACMET (SACOG model) captures all but trip generation through feedback loops. This is in line with current best practices and modeling systems. Induced demand in the model shows that traffic will move from I-80 to Placer Parkway, but that the relief on I-80 will induce others to "fill up" the reduced congestion, resulting in less than would be expected improvements to I-80 traffic. Overall, it is believed that the Parkway will increase VMT and decrease VHT. This would be confirmed when VMT's have been fully calculated and the modeling of VHT has incorporated possible travel delay scenarios.

Forecasts for PSR Alternatives

J. Long explained that the southern PSR alignments would have highest volumes of traffic while northern alignments would have the lowest volumes of traffic. There would be substantially higher volumes of traffic under Cumulative Development Scenario A than under the SACOG 2025 scenario. Volumes on the Parkway east of Watt Avenue would be higher with the addition of an interchange at Watt Avenue. Ultimately the highest volumes would occur on the east and west ends of the Parkway. Southern and central alignments show the biggest reduction on I-80 and Baseline/Riego Roads and the biggest increase on SR 70/99. A Watt Avenue interchange would reduce traffic volumes in Western Roseville and portions of Baseline Road. Additionally, a Watt Avenue interchange would cause modest increases on Watt Avenue at the Sacramento County line.

D. Vintze asked if the forecast assessments account for different traffic speeds since a more accurate measure of VMT is calculated from speed. J. Long indicated that they do. In a follow up question D. Vintze wanted to know how this would impact the overall amount of emissions, because it seems to that this is just moving congestion around? J. Long indicated that the project team would be looking into the impact of overall emissions.

A. Green wondered if, with the assumption of new development, this model would be capable of capturing (this type of) development or long-term differences in land use? J. Finn added to this by asking if having a southern route was better than a northern route since it would curb growth inducement. He also wanted to know if this would reduce overall VMT and VHT. E. Pandolfino added that if Scenario A were adopted, the there would definitely be more interchanges added (how would this be accounted for?).

D. Heick and J. Long both addressed these concerns my mentioning that the models are based on SACOG projections, and on proposed development scenarios only, and that no additional interchanges are proposed added to the project study area.

T. Christofk wanted to know if you could account for different types of vehicles in the VMT since a large portion of vehicles using the Parkway would be trucks traffic. J. Long said that the SACOG model does have a

component to account for trucks—part of this design process for the Parkway was intended to relieve truck traffic on I-80.

VI. CONCLUSIONS AND NEXT STEPS

D. Iacofano briefly recapped the agenda items key topics of discussion reviewed during the meeting with SAC members. He encouraged additional feedback on both the screening criteria and the preliminary environmental data presented at the meeting. He then went on to discuss project next steps including the upcoming: 1) informal NEPA/404 consultation, 2) continuing screening of the PSR Alternatives, and 3) the continuing environmental and engineering assessments.

Future Actions

Environmental Screening Criteria and Preliminary Data for PSR Alternatives

Meeting Materials Review and Comments—SAC members were asked to review the project materials they were given during the meeting and return comments to the project team within two weeks.

Biology/Special Species Category—Additional information will need to be gathered on Swainson's Hawk habitat. SAC members suggested using land cover data and updated survey data collected using trees in specific site areas.

Land Use/Planned Development—SAC member suggested that proposed landfill be added to this map because it could have a notable impact on the project.

Finally, D. Heick reminded all the SAC members that the next meeting would be taking place on February 12, 2004.

Meeting adjourned at 4:00 PM.

MEETING SUMMARY

Purpose

The meeting was convened to review the Draft PSR Screening Evaluation Technical Memorandum, to get gather feedback on its recommendations, and to obtain input for the Tier 1 EIS/EIR alternatives.

Draft Technical Memorandum Overview

D. Heick reviewed the draft Technical Memorandum: Screening Evaluation of PSR Alternatives, which had been made available to SAC members prior to the March 12 meeting. D. Heick explained that the Technical Memorandum presented the results of the screening process used to analyze the conceptual Placer Parkway corridor alignment alternatives identified in the Project Study Report. She reviewed the organization and contents of each chapter and encouraged the SAC to provide input, correct information, and ask detailed questions.

Conclusions & Recommendations

During the meeting, the following items in **bold** were considered. SAC concurrence or recommendations are noted in *italic*.

A. Eliminating or Adjusting PSR Corridor Alignments

1. **Reroute central and southern alignments north of the current alignment to avoid a large vernal pool complex located immediately northeast of the West Roseville Specific Plan area.**

   - *SAC concurred in general with this recommendation.*

2. **Eliminate the northern corridor alignment between SR 70/99 and approximately Amoruso Acres.**
   - *SAC concurred with this recommendation. Staff and its consultants were advised to document the justification for eliminating this corridor alignment.*

3. **Modify the central corridor alignment:**

   a. Minimize encroachment into large wetland/vernal pool conservation areas at Curry Creek.

   - *SAC concurred with shifting the central corridor alignment north as described.*

   b. Adjust alignment in western segment to avoid Pleasant Grove/Sankey community and designated conservation area.

   - *SAC concurred in shifting the central corridor northward, as described, and in avoiding Sysco and working with Natomas Basin Conservancy. Some SAC members suggested eliminating the Sankey Road connection. Staff explained that since the technical memorandum recommends eliminating the north of Sankey and south of Riego connections, eliminating the Sankey Road connection would leave but one connection to SR 70/99 to be evaluated in the EIS/EIR. Studying more than one alternative connection in the EIS/EIR will provide additional or helpful information to the decisionmakers in selecting a connection to SR 70/99.*

4. **Modify the southern corridor alignment**

   a. **At eastern end, extend it west before descending south, avoiding an historic ranch complex, vernal pool areas, and future Section 4(f) properties in West Roseville Specific Plan (WRSP).**
   - *SAC concurred with adjusting the southern corridor westward to avoid these resources.*

   b. **At southern edge (parallel to Baseline Road), avoid large man-made waters and one rural residential community by moving corridor north or south**
   - *SAC concurred with gathering additional information on wetland status of water body and its potential as a mitigation site. Some SAC members recommended that the southern alignment "hug" Baseline Road.*

c. Move corridor closer to Baseline Road to minimize growth inducement

- *See Baseline Road discussion below.*

5. Work with Sutter and Placer County staff to identify working farm units; the evaluation of corridors using this information.

- *SAC concurred in recommendation to identify working farms and use in screening.*

B. Additional SAC Input

Connections to State Routes

- *Eliminate Sunset Boulevard as a potential connection to SR 65. All alternative corridor termini would be at Whitney Avenue. This direction was based on the Whitney connection having fewer environmental impacts, and TAC's observation that a full freeway interchange could not be accommodated at Sunset. Any potential connection between SR 65 and the Parkway along Sunset would be via local expressway or arterial that connected to the Parkway at Fiddyment Road or Foothills Boulevard.*

- *Eliminate the south of Riego connection at SR 70/99 -- only after discussions with Sacramento and Sacramento County. Sutter County staff recommended its elimination. Issues involve potential growth inducement and an urban separator. One SAC member suggested keeping this connection alternative until policy direction is more definitive, and to have further discussions with Sacramento County and City, and Natomas Basin Conservancy regarding their development buffer objectives in this area and whether they were compatible with a Parkway connection.*

- *The TAC agreed that direction to eliminate the western portion of the northern corridor alignment alternative (discussed in A above) would eliminate the North of Sankey connection.*

Other Direction

- Alternate diagonal southern route between Phillip Road and Baseline Road.
- Two scenarios for Baseline Road separator: 1-mile; closer to Baseline. Look at impact on farm units.
- Coordinate with Natomas Basin Conservancy re: property on Riego Road.
- Consider future SR 70/99 traffic levels and the effect on the number of lanes needed – how far apart to construct bridge abutments on SR 70/99.

SAC concurred with the following recommendations provided by the TAC:

- *Consider an alternate to the revised southern corridor alignment between Phillip Road and Baseline Road. This alternate leg of the alignment would angle cross the study area in a southwesterly direction, rather than in a north/south direction (a modification of 4a above). No additional SAC input on this item.*

- *Review two scenarios for Baseline Road/corridor separation: 1) a one mile separation between Baseline and the corridor and 2) one with a corridor closer to Baseline. The review was to be based, at least partially, on farm unit impacts. Some SAC members expressed a preference for an alignment closer to Baseline Road.*

- *Coordinate with the Natomas Basin Conservancy regarding how to avoid or mitigate a conflict with designated but undeveloped conservation property on Sankey Road north of the Sysco distribution center (same as 3b above). No additional SAC input on this item.*

- *Consider future SR70/99 traffic levels and the effect on the number of lanes needed and how far apart to construct bridge abutments. No additional SAC input on this item.*

C. Goal/Policy Issues

No Access – Fiddyment Road to Pleasant Grove Road – with the exception of a potential Watt Avenue extension.

- *SAC concurred with the TAC recommendation of not making any changes to this provision. Additional comments asked the project to consider if the no access policy would really be enforceable (due to planned development in the vicinity). Concern was expressed regarding whether the project would be able to accurately estimate the environmental affects of future interchanges.*

No Development Buffer

- *SAC concurred with the TAC recommendation of not making any changes to this provision. Agreed that the buffer size and location should be flexible (especially in the western and eastern segments) and related to performance standards. Additional comments included: The project should coordinate with county contacts regarding what current plans area were in place that could impact the original intent of this provision.*

I. INTRODUCTIONS

The 4th Study Advisory Committee (SAC) was held on February 12, 2004 at the City of Roseville Corporation Yard. Celia McAdam, Executive Director of the Placer County Transportation Agency opened the meeting and welcomed the group. Next, she asked the project team to introduce themselves to the SAC members. She turned the meeting over to Daniel Iacofano, MIG (meeting facilitator), who reviewed the agenda with the SAC. He also stressed the importance of the SAC's input at this point in the project in order to get feedback on the potential modifications, share recommendations related to goals/policies, suggest other modifications to the alignments, and identify needed corrections to information.

II. DRAFT TECHINCAL MEMORANDOM OVERVIEW

Next, Denise Heick, URS asked the SAC if they had received the project materials that were sent in advance of the meeting, and if anyone had questions before her discussion commenced. No SAC questions.

She began with a review of the Draft Technical Memorandums table of contents. D. Heick briefly described the following information in Chapters 1-3:

- Chapters 1 – Introduction/Purpose of Technical Memorandum
- Chapter 2 – Project Background
- Chapter 3 – Alternatives Identification Process. This section also covered detail about the Tier 1 Process, Screening Evaluation Process, Engineering Screening Criteria, and Least Environmentally Damaging

Alternative (LEDPA) considerations. D. Heick explained that this was a fairly elaborate process, designed to show full detail to agencies involved in review.

Next, D. Heick reviewed the project schedule with the SAC. She explained the status of critical milestones related to both current and upcoming technical assessments/advisory meetings, public outreach activities and the preparation of the Environmental Impact Statement/Environmental Impact Report (EIS/EIR). D. Heick noted that the project planned to have a public meeting in fall 2004, to share the recommendations generated from the Technical Advisory Committee and (TAC) and the SAC. The team would then take the input generated in the public meetings and the TAC and SAC project recommendations to the fall Policy Advisory Committee (PAC) meeting.

She continued with review of format of technical memorandum, reviewing Chapters 4 and 5.

- Chapter 4 – Transportation Analysis of PSR Alignments (growth projections/development scenarios/travel forecasting).
- Chapter 5 – Environmental Screening (data collection/screening criteria/data analysis of existing conditions).

D. Heick stressed that she wanted to spend the majority of meeting discussion time on Chapter 6. She asked the SAC if they had questions about what had been presented thus far. No SAC questions. She continued with brief review of Chapter 6.

- Chapter 6 – PSR Corridor Alternative Screening Summary and Recommendation. D. Heick reviewed the significant sections in Chapter 6, providing the following overview:

  Potential Fatal Flaws – D. Heick explained that project defined a fatal flaw as any condition that would render the project infeasible. She noted that the project found no fatal flaws in any of the alternative, but identified the West Roseville Specific Plan (WRSP) as presenting significant constraints. Specific issues were found in the southern alignment area relative to historic ranches, several vernal pools, and potential future recreation areas.

- Compatibility with Goals and Policies – D. Heick briefly reviewed the six goals and policies of the project with the SAC:
  Goal 1 – Create a controlled access highway.
  Goal 2 – Maximize mobility and accommodate planned growth.
  Goal 3 – Avoid growth inducement and protect rural character of agriculturally designated areas.
  Goal 4 – Minimize environmental impact.
  Goal 5 – Improve safety and minimize hazards.
  Goal 6 – Achieve feasible and equitable financing.

SAC Comments/Questions During Chapters 1-6 Overview
William Morebeck, Placer County Agricultural Commission asked for clarification on whether the potential adjusted alignments (on the map overlay used during the meeting) were created by URS. D. Heick responded that these "draft lines" were developed cooperatively among the project technical team of URS (environmental consultant) and DKS (traffic analysis consultant). W. Morebeck then asked who had made changes to the alignment since the previous SAC meeting (on October 23, 2003). D. Heick explained that the changes to the

alignment lines were the result of several rounds of internal team assessments, and the input of various resource/interest groups (along with a myriad of technical considerations). D. Iacofano added that this was an update from last round of data screenings. He said that it was very important for the SAC to respond to this information at this meeting. D. Iacofano said input from the SAC was needed to help the project team begin to set some parameters for what would be studied in more detail going forward with the Tier 1 process.

E. Pandolfino had a question about Chapter 5, Environmental Screening of PSR Alignments (Section 5.5.2, page 5-10, Riparian Areas) regarding the section on the Swainson's hawk Habitat. He felt the memo only discussed trees, and that foraging was also an issue and that additional information focused on this element of the species was very important and should be considered by the project. D. Heick noted that foraging habitat covered much of the study area and could not differentiate among alternatives; she invited E. Pandolfino to provide what additional input he might have.

III. POTENTIAL MODIFICATIONS TO PSR CORRIDOR ALIGNMENT ALTERNATIVES

Next, D. Heick proceeded with a discussion of potential modifications to the PSR corridor alignment alternatives.

Potential Modification #1 – Reroute central and southern alignments to the north for connections at Whitney Boulevard to avoid a large vernal pool complex located immediately northeast of the West Roseville Specific Plan area.

D. Heick noted that after assessment of this area, the team recommended moving the central and southern alignments north to avoid vernal pools in the vicinity. She added that the project was restricted in how it could move the alignment so as not to impact other vernal pools in the area. Eric Bryant, Placer Ranch Specific Plan, asked if Reason Farm was located in the area. D. Heick said that it was located just below this area. She said aquatic resources in the area also had to be taken into consideration with any proposed modifications. D. Heick added that another variable was avoiding City of Roseville retention basin -- the City had requested that the line be moved more easterly to avoid the basin.

SAC Comments/Questions During Potential Modification #1 Overview

D. Iacofano asked the SAC for comments on Potential Modification #1.

E. Pandolfino asked if the new alignment could run south of the vernal pools instead of north. D. Heick said a southern placement would intersect the West Roseville Specific Plan area. She added that the WRSP had been approved and there were a large number of potential 4(f) properties in this area that would create issues for an alignment.

E. Pandolfino noted that an early alignment alternative considered ran very close to Fiddyment Road, but had been eliminated because of potential impacts to the Sun City community. Jack Ritchie, South Sutter County Specific Plan, asked about the location of the "no access" area. D. Heick said that it was located between Fiddyment Road and Pleasant Grove Road. M. Quisenberry, Sutter County Agriculture Department, asked what other obstacles worked against the PSR alternatives. D. Heick said the historic ranch properties in the area could be affected. M. Quisenberry felt that if the idea were to move people more efficiently, a Fiddyment alternative would not help with traffic-flow problems in this area.

D. Heick asked J. Long to address traffic issues in this area. J. Long said that based on development planned in this vicinity, access points would be needed in order to navigate through the area (e.g., Blue Oaks and Pleasant Grove Blvd). He added that the project would have to be mindful that these access points were adequately spaced, in order to accommodate other interchanges in the area. J. Long said due to access and spacing issues identified earlier on in the project, this Fiddyment alignment had been ruled out. D. Iacofano asked J. Long to provide more detail on why it was opposed. J. Long said that pressure on policy makers from Del Webb development was the primary reason it was eliminated.

M. Quisenberry said that some of the traffic originating north of SR 65 was creating traffic issues, and he didn't believe the north routes solutions would resolve this issue.

D. Iacofano asked the SAC if other than access issues there other negatives related to this modification. M. Quisenberry said he felt the destruction of farmland was a problem. D. Iacofano said the further north the alignment pushed the more of an issue - this becomes, based on potential development.

D. Iacofano asked Fritts Golden, URS, to show (on the potential development map) which developments would be impacted by any Fiddyment Road considerations. F. Golden pointed out the following planned developments: Placer Ranch, West Roseville Specific Plan, Roseville retention basin, Roseville sphere of influence. E. Bryant asked, while considering the Least Environmentally Damaging Practical Alternative (LEDPA) and the WRSP's approval, if anything else could restrict the alignment from going any further north. E. Pandolfino said that the WRSP was not a "done deal" (he added that LAFCO would make the final decision) and that it may have to accommodate the Parkway related to this modification. D. Heick said that this would not be the best location because of overwhelming environmental issues. She added that this area was being preserved because of natural resources and would be scrutinized very closely in connection with any area plans.

E. Bryant asked J. Long about related traffic issues in this location. J. Long said that recent studies generally concluded that the northern alignments had the least traffic benefit, followed by the central alignments, and then the southern alignments, which appear to have the most traffic benefit. He added that projections identified heavy traffic volumes would be coming from several locations in the project area, such as Lincoln and Roseville. J. Long said that the most direct route had the most benefits (the project team assumed no connections at Pleasant Grove). He said that this assumption was influenced by the project's policy direction. W. Morebeck asked if less policy restrictions would open up other alternatives. J. Long responded yes to this question.

Recommendation for Potential Modification #1 *– SAC concurred in general with this recommendation. (There was discussion by some SAC members as to why the southern alignment shouldn't be located adjacent to Fiddyment Road. Staff explained that in addition to the proposed West Roseville Specific Plan, there were a number of vernal pools and an historic ranch complex that would be impacted by such an alignment* (see also No. 4 below*). Some SAC members also expressed concern about the ability to enforce the "no access" policy in the central segment of the Parkway and about the potential disruption to farming in the area.*

D. Heick reviewed the second potential modification with the SAC:

Potential Modification #2 – Eliminate northern corridor alignment from SR 70/99 to Amoruso Acres and transition it to a central and/or southern route at this location.

SAC Comments/Questions During Potential Modification #2 Overview

E. Pandolfino said he supported eliminating the northern alignment, because of growth inducement issues and other associated negative elements. E. Bryant asked if the reason for eliminating this alignment was based on impacts to Amoruso Acres. D. Heick responded no to this question. She went on to say that a straight line was assumed for any Watt Avenue extension. D. Heick said if a Watt Avenue connection happened the extension of Watt Avenue is not part of this project. A Watt connection at a more southerly location would likely reduce potential impacts related to growth inducement. She went on to say that the team was still assessing comprehensive transportation impacts in this area.

D. Heick asked if there were any SAC members who thought the northern alternative should be carried forward. E. Bryant asked if there would be other alignments considered. D. Heick said yes, but this alignment had some potential community impacts (J. Long also added traffic issues). E. Bryant asked if it were removed this early in the screening process, whether agencies might question its elimination. D. Heick said that she would be hesitant to drop it completely if agency contacts identified other merits (e.g., aquatic resources less impacted with this option). D. Iacofano added that based on this discussion it appeared that the alternative had both merits and defects, so it may need to be further assessed by several other interested parties before reaching a final decision. E. Pandolfino asked if this assumed that all the environmental resources would be preserved sufficiently with this alternative. D. Heick said no, but the project wanted to show that it made a real effort to be attentive to existing habitats and resources in this area. D. Iacofano said the project had tools available that would allow for careful evaluation of various resources and identify how to mitigate potential impacts.

Recommendation for Potential Modification #2 - *SAC concurred with this recommendation. Staff and its consultants were advised to document the justification for eliminating this corridor alignment.*

D. Heick reviewed Potential Modifications 3a and 3b:

Potential Modification #3a – Minimize encroachment into large wetland/vernal pool conservation area at the confluence of two main branches of Curry Creek to reduce habitat fragmentation and impacts.

D. Heick noted that the team recommended moving the central alignment somewhat north before it turned south to avoid habitat in area. D. Heick asked for any comments. SAC had no comments.

Potential Modification #3b – Adjust alignment in western segment to avoid Pleasant Grove/Sankey community and designated conservation area.

D. Heick explained that this modification to the central alignment was designed to avoid 1) existing housing in the Pleasant Grove community and 2) Natomas Basin Conservancy regarding mitigation impacts to their conservation area. She said that Natomas Basin Conservancy representatives said that they had no concerns about project impacts to the existing designated conservation area, as the site was undeveloped, and the HCP had a procedure to deal with impacts to such areas.. D. Heick said Sutter County wanted the project to stay to the north side of Sankey Road to avoid the existing Sysco facility.

SAC Comments/Questions During Potential Modification #3a-3b Overview
E. Pandolfino asked if the project would consider eliminating the Sankey Road connection. D. Heick said that the project was recommending the elimination of the northern alignment (and its connection to SR 70/99) based on screening. J. Long added that Sutter County wanted two connections along Sankey (with one mile spacing) because it considered this a major business hub. He went on to say that the project had various reasons for not eliminating this alignment at this point in time. D. Iacofano said from a planning vantage point it was optimum to have a robust selection of alternatives to substantiate that a wide range of considerations had been evaluated.

J. Ritchie asked if the Sankey Road and the North of Riego Road would be impacted by these two interchanges along the Parkway in this vicinity. D. Heick (supported by J. Long) said there was room for two interchanges, but it became more a design issue regarding how to make this work around the existing facilities (e.g., Sysco). J. Ritchie asked if the project could add an interchange located further east to maintain the one-mile spacing in the area. D. Heick said this could be done. J. Long said local conditions would have to be evaluated in order to fully assess this issue. J. Ritchie asked if there were problems in the area north of Riego (in general). D. Heick said that it came down to how much room was available to move interchanges and spacing in this area. She asked if there was any more input on this modification. There were no additional comments from the SAC.

Recommendation for Potential Modification 3a-3b
a. *SAC concurred with shifting the alignment north, as described.*

b. *SAC concurred in shifting the central corridor northward, as described, and in avoiding Sysco and working with Natomas Basin Conservancy. Some SAC members suggested eliminating the Sankey Road connection. Staff explained that since the technical memorandum recommends eliminating the north of Sankey and south of Riego connections, eliminating the Sankey Road connection would leave but one connection to SR 70/99 to be evaluated in the EIS/EIR. Studying more than one alternative connection in the EIS/EIR will provide additional or helpful information to the decisionmakers in selecting a connection to SR 70/99.*

D. Heick reviewed Potential Modifications 4a-4c:

Potential Modifications 4a-4c:
- **4a – Avoid historic ranch complex, large vernal pool areas, and future Section 4(f) properties in the West Roseville Specific Plan Area at the eastern end**
- **4b – Avoid large man-made water of the U.S. and rural residential community along the southern edge**
- **4c – Move the corridor closer to Baseline Road to minimize growth inducement**

SAC Comments/Questions During Potential Modification #4a-4c Overview
E. Bryant noted that one of the modifications (4a) paralleled the hypothetical extension of Watt Avenue. D. Heick located this area for the group on the posted map, confirming the location for E. Bryant.

D. Iacofano asked if there were any additional comments on these modifications. E. Pandolfino asked if the remaining alternatives would be located in the lower portion of the project study area. J. Long said that the "north of Baseline" alternative had not been finalized at this point in the project. D. Heick said the team was

still working with Placer County and the Agricultural Commission on this particular alignment issue. She added that the TAC recommended an adjustment of this modification. Under 4, TAC recommended eliminating the 'bulge' north, over the 'water ski park' by shifting the entire corridor north. Under 4c, TAC recommended considering another alternate to the revised southern corridor alignment in the area between Phillip Road and Baseline Road. TAC also suggested two scenarios for the part of the southern alignment parallel to Baseline Road: 1) a one-mile separation between Baseline and the corridor and 2) an alignment corridor very close to Baseline. D. Heick said that Placer County was developing a community plan for the area south of Curry Creek to the county line (Curry Creek Community Plan), and this effort might help the project with defining some parameters.

D. Iacofano asked if there were any possibilities below Baseline Road. D. Heick said no, because there was another development project planned for that area. J. Long said the PAC felt that there might be a need to establish some space between a Parkway and the community nearby. J. Ritchie asked if this area had specific conditions that required separation. J. Long said that the project was currently less restricted with spacing requirements in this area.

D. Heick asked for any additional comments.

Additional Comments/Questions During Potential Modification #4a-4c Overview

M. Quisenberry said it appeared that the least amount of impacts occurred in the southern corridor, and the most impacts in the northern corridor. He went onto say that the Placer Vineyards project south of Baseline Road would transport water into adjacent farm areas in the central part of project to mitigate irrigation problems in the area. M. Quisenberry said he felt that the central corridor detracted from this water plan. He added that the alignment line should be as close to Baseline as possible, to avoid cutting through farmland. D. Heick said she was familiar with the agricultural zoning in the area, but felt that the project needed more information related to the working farm units. W. Morebeck said that the Williamson Act contracts were very useful in defining locations of farm boundaries (D. Heick said the project was currently using this as a resource). W. Morebeck said that project must look into non-renewed parcel contracts (re Williamson Act land) to see the real status of farm properties. D. Iacofano said W. Morebeck would be a good resource to the project for locating the most accurate information.

Recommendations for Potential Modifications 4a-4c

a*. SAC generally concurred in this adjustment.*

b. *SAC concurred in gathering additional information on wetland status of water body and its potential as a mitigation site. Some SAC members recommended that the southern alignment "hug" Baseline Road.*

c. See Baseline Road Discussion below.

The SAC recommended the following additional direction:
The project should ensure adequate access for the Sutter Industrial area. It should also be mindful of the potential impacts to farmland being more severe in the central rather than southern alignment areas.

D. Heick reviewed the fifth potential modification with the SAC:

Potential Modification #5 – Work with Sutter and Placer County staff to more specifically identify farm units, and evaluate corridor alignments using this information to minimize impacts.

SAC Comments/Questions During Potential Modification #5 Overview
J. Ritchie asked for more information regarding the last leg of the southern alignment. D. Heick showed him on the acetate map all the remaining southern alignment variations being considered for the project. J. Ritchie asked if the re-aligned central alignment now would be altered. D. Heick showed a slight modification on the map (to the SAC). D. Iacofano recapped the alignment variations by noting that the central alignment had three scenarios, while the southern alignment had two scenarios.

Recommendation for Potential Modification #5 *- SAC concurred in recommendation to identify working farms and use in screening.*

IV. ADDITIONAL INPUT

D. Iacofano began a brief review of topics for additional input by the SAC. They included the following four discussion points:

- **Retain Sunset Boulevard connection?**
- **Retain north of Sankey connection?**
- **Retain south of Riego connection?**
- **The distance of the southern alignment from Baseline Road.**

SAC Comments/Questions During Additional Input Discussion
J. Long had a comment regarding whether to retain the south of Riego connection. He said that there were issues related to this connection being discussed as part of a joint visioning process between Sacramento County and the City of Sacramento. E. Pandolfino said he understood that the south of Riego interchange was not a preferred interchange. W. Morebeck noted that this connection was not located in an overly developed area (north of Del Paso Road). J. Long said that a buffer was being considered by Sacramento in this area. W. Morebeck said he thought that Elkhorn Blvd. to the Sacramento County Line was the correct buffer area. He said that this area was identified as a potential growth area and both the city and county would probably be recommending a buffer. W. Morebeck said he favored this alignment. J. Long said that it handled traffic most efficiently. E. Pandolfino said he felt that the south of Riego connection shouldn't be eliminated while the County and City visioning process was still underway. D. Heick asked E. Pandolfino if he was recommending keeping it alive until policy direction was clearer (he said yes.). He said that preserving the industrial area in Sutter County was important and it appeared the county preferred this alignment. The SAC recommend more discussions with the county (and discouraged eliminating this connection at this point in the project).

D. Heick shared a comment made by Rick Dondro, Placer County Public Works, at the last TAC meeting regarding the southern alignment as it headed toward Baseline Road. R. Dondro had suggested that a more diagonal direction be considered for this alignment (it would be angled across the study area in a southwesterly direction). D. Heick said the project team told him they would study this recommendation and get back to him. E. Pandolfino asked if R. Dondro had discussed this potential modification with Placer County Planning. (D. Heick said she expected him to be at the upcoming PAC meeting to discuss this in further detail.)

W. Morebeck said the he felt the main intent of the project was moving people efficiently from north to south. J. Long said he understood this concern and noted that the project was assessing this issue. D. Iacofano asked J. Long if he had a map (of the project study area) that he could share with SAC to aid this discussion. J. Long said that this area was still being studied, and he didn't have a map of the area that could be shared with the SAC during this meeting. W. Morebeck said that the original policy direction indicated that efficient movement of goods and services along I-80 was an issue. He added that the Sacramento airport primarily used this route, but currently didn't move a large volume of goods/services. W. Morebeck added that he felt this policy was based on flawed thinking and should be revisited.

D. Iacofano said that this issue should be mapped out so it can be studied with more precision. J. Long said that the project data came from current information collected from counties in the study area related to growth and traffic projections. G. Alves, Rural Lincoln MAC, noted the project needed to carefully scrutinize the reality of the current growth statistics in the vicinity of the major interchanges. D. Iacofano said it was important to get a handle on this issue and verify the existing data. He felt the project would need some clarity in order to determine if it was fully and correctly evaluating this matter (in other words, could there be any other way to look at this issue).

Other Comments/Questions
E. Pandolfino asked about the issue of prohibiting off ramps (D. Heick said that this would be discussed later during the meeting).

E. Bryant asked what the TAC recommendations where related to this topic. D. Heick shared the following information:

- TAC recommended Sunset Boulevard connection no longer be considered.
- TAC recommended a north of Sankey Road connection no longer be considered (as it is eliminated when the northern alignment is eliminated).
- TAC recommended waiting to make a final decision on the south of Riego Road connection. pending discussions with Sacramento County and the City of Sacramento.
- TAC recommended considering two Baseline Road alternatives for the southern alignment – one a mile north and one hugging Baseline.

Recommendations Related to Additional Input – The SAC concurred in the TAC recommendations below, except as noted:

- *Eliminate Sunset Boulevard as a potential connection to SR 65. All alternative corridor termini would be at Whitney Avenue. This direction was based on the Whitney connection having fewer environmental impacts, and TAC's observation that a full freeway interchange could not be accommodated at Sunset. Any potential connection between SR 65 and the Parkway along Sunset would be via local expressway or arterial that connected to the Parkway at Fiddyment Road or Foothills Boulevard.*

- *Eliminate the south of Riego connection at SR 70/99 -- only after discussions with Sacramento and Sacramento County. Sutter County staff recommended its elimination. Issues involve potential*

growth inducement and an urban separator. One SAC member suggested keeping this connection alternative until policy direction is more definitive, and to have further discussions with Sacramento County and City, and Natomas Basin Conservancy regarding their development buffer objectives in this area and whether they were compatible with a Parkway connection.

- *The TAC agreed that direction to eliminate the western portion of the northern corridor alignment alternative (discussed in A above) would eliminate the North of Sankey connection.*

V. OTHER POTENTIAL MODIFICATIONS

D. Iacofano began a brief review of topic of other potential modifications discussed at the TAC. They included the following topics:

- **Alternate diagonal southern alignment route between Phillip Road and Baseline Road**
- **Two scenarios for Baseline Road separator: a) 1-mile and b) closer to Baseline. Look at impact on farm units.**
- **Coordinate with Natomas Basin Conservancy re: property on Riego Road**
- **Consider future SR 70/99 traffic levels and the effect on the number of lanes needed – how far apart to construct bridge abutments on SR 70/99**

D. Iacofano asked if the SAC had additional comments. No additional comments from the SAC, beyond what was said earlier.

Recommendations Related to Other Potential Modifications *- SAC concurred with the following recommendations provided by the TAC:*

- *Consider an alternate to the revised southern corridor alignment between Phillip Road and Baseline Road. This alternate leg of the alignment would angle cross the study area in a southwesterly direction, rather than in a north/south direction (a modification to 4a above). No additional SAC input on this item.*

- *Review two scenarios for Baseline Road/corridor separation: 1) a one mile separation between Baseline and the corridor and 2) one with a corridor closer to Baseline. The review was to be based, at least partially, on farm unit impacts. Some SAC members expressed a preference for an alignment closer to Baseline Road.*

- *Coordinate with the Natomas Basin Conservancy regarding how to avoid or mitigate a conflict with designated but undeveloped conservation property on Sankey Road north of the Sysco distribution center (same as 3b above). No additional SAC input on this item.*

- *Consider future SR70/99 traffic levels and the effect on the number of lanes needed and how far apart to construct bridge abutments. No additional SAC input on this item.*

VI. GOALS/POLICY ISSUES & INPUT

Stan Tidman provided background on why particular policies existed, and asked the SAC to revisit various goals and policy issues. He explained that the purpose of this discussion was to generate feedback to bring forward to the PAC and the PCTPA Board. S. Tidman provided an update on questions and comments generated by the PAC at their last meeting in September 2003:

- Several PAC members expressed skepticism about if "no access" would be enforceable or be appropriate to handle traffic/land issues. Others questioned if the "no development" buffer would actually limit development and mitigate growth inducement.
- Sierra Club and ECOS both sent letters to PCTPA asked the project to analyze an alternate with more access in the central segment.
- SACOG was concerned whether the project could ensure a "no development" policy and access restrictions through use of the buffer zone.
- Peter Hill met with the project team and expressed his concern related to issues of access and growth inducement (specifically the Watt Avenue connection and growth implications related to Sacramento).

S. Tidman reported that the TAC recommended not altering any policy (and supported all goals). He went on to say that the TAC recommended revising the language of the "no access" concept in the goals and policies so it would be less ambiguous. He added that regarding the "no development" buffer issue, the TAC agreed that the buffer size and location needed to be flexible and should be related to performance standards.

SAC Comments/Questions During Goals/Policy Issues & Input Overview

"No Access" – Fiddyment to Pleasant Grove (except potential Watt Avenue)
E. Pandolfino said he felt it was unrealistic to think there would never be any on/off ramps in the central segment. He added that this would only inconvenience community members and not mitigate growth, and it seemed the entire project is resting on SACOG 's desire that this no access provision be included in the project. He concluded that the most important project goal was choosing the best route. D. Iacofano asked whether there was a method to analyze access-related impacts to come to a definitive decision regarding on/off ramps.

J. Long noted that the project currently had 4 local interchanges to consider and if a multitude of interchanges were open for assessment, the project could end up with another potential 7 options—and that this dialogue was purely speculative without clear policy direction/discussion.

There was general discussion regarding the need for a technical assessment of interchanges. D. Heick stated that the Federal Highway Authority (FHWA) stressed that a thorough technical assessment was a process that needed to be worked through diligently. J. Long said this also touched on another real challenge, related to potential traffic accommodation and growth inducement implications in the project area. He said this could potentially be difficult to accommodate. W. Morebeck concurred with E. Pandolfino (and his earlier point) and felt that everything would ultimately hinge on the final location of the alignment. D. Iacofano asked if the SAC favored the southern alignment (to alleviate traffic). E. Bryant said that the project wouldn't know where the connections would be until the final alignment was adopted. J. Ritchie cautioned that if you limited access this might be a disincentive to people using the Parkway. G. Alves said he'd be in favor of looking at additional interchanges as long as it didn't jeopardize the project process.

Recommendation Related to No Access – *SAC concurred with the TAC recommendation of not making any changes to the 'No Access except a potential Watt Avenue connection' policy. Additional comments asked the project to consider if the no access policy would really be enforceable (due to planned development in the vicinity).*

The SAC shared these additional comments: Concern was expressed regarding the project's ability to accurately evaluate the environmental affects of future interchanges.

"No Development" Buffer

D. Heick said when the project was first conceived there was little development planned in the project area, but now this has changed. Now a consideration was whether the buffer still made sense in areas where development is planned nearby. D. Heick said that the TAC recommended not making any changes to the provision, but suggested adding performance measures to implement this policy in areas where additional development is planned. E. Pandolfino said if you had development in the vicinity, it wouldn't work. He added that the wide buffer didn't make sense from a highway or environmental vantage point if there is development planned. E. Pandolfino said he did not recommend the buffer. E. Bryant said this ran counter to the existing policy.

D. Iacofano reviewed several of the original project goals with the SAC: 1) visual design, 2) habitat value that could be created, and 3) preserving the central corridor area's open space area. J. Long said that these goals were based on development in the industrial area and potential future access needs. He went on to say that FHWA required that a buffer be considered as part of the Tier 1 process since it was in the MTP. E. Bryant said that the project should check with Placer County on what current plans might possibly affect the project's goals related to the buffer. E. Pandolfino suggested that perhaps some areas could be flexibly designed to include easements in potentially impacted areas. D. Heick said she recently attended a meeting with Placer County, and they asked if the project could be flexible about the size of the buffer. J. Ritchie said maybe the buffer should conform more realistically to the existing area. D. Heick said that everyone must be mindful that this was a Tier 1 process. She noted that the project wanted to be flexible without having to re-open a policy issue.

D. Iacofano asked if the corridor could preserve a particular buffer zone (say 1000 foot) to leverage larger acreages so that from a habitat design perspective this would be a more acceptable approach. This would provide an opportunity to work with local resource agencies (this could happen later in the project, during Tier 2 or the design phase). He went onto say that if it were framed this way, it would provide more advantages for the project related to future negotiations. J. Long said the project would need to clearly define the costs of land acquisition for the buffer. E. Bryant asked who would own this right of way. Celia McAdam, Executive Director of PCTPA, said that since this is only a Tier 1 process, that hasn't been fully determined. She said it might be the South Placer Regional Transportation Authority (SPRTA) or Placer County, or perhaps a land trust entity. C. McAdam said that after Tier 1, the project would be allowed to begin the process of land acquisition or easements. She said an important concern was acquiring the right of way as soon as feasible because of escalating costs.

Recommendation Related to No Development Buffer - *SAC concurred with the TAC recommendation of not making any changes to this policy. Agreed that the buffer size and location should be flexible and related to performance standards of meeting other policy objectives.*

VII. OTHER ITEMS/CORRECTIONS

D. Heick asked that the SAC transmit to her any additional comment or corrections to the Technical Memorandum. No corrections or additional comments were made during this point in the meeting.

VIII. CONCLUSIONS & NEXT STEPS

a. Summary of Decisions – See Meeting Summary at beginning of Meeting Minutes.
b. Future Actions – SAC (and TAC) recommendations to be taken to PAC for direction. Other alternatives to be evaluated.
c. Other Issues – None raised.

Meeting adjourned at 4:00 PM.

PLACER COUNTY TRANSPORTATION PLANNING AGENCY

Meeting Minutes & Action Items — Final 8-04-04

Meeting Description: Placer Parkway Corridor Preservation – Study Advisory Committee Meeting #5
Meeting Date June 3, 2004
Minutes Date: August 4, 2004 **Location:** City of Roseville Corporate Yard

Persons Attending			
Name	**Affiliation**	**Name**	**Affiliation**
Tom Brinkman	Placer County Public Works Department	Jack Ritchie	Lennar Properties
William Morebeck	Placer County Agricultural Commission	Julie Hanson	KT Development (proposed De La Salle University)
Scott Gandler	City of Roseville Public Works	Celia McAdam	PCTPA, Executive Director
Carl Walker	City of Lincoln Public Works Department	Stan Tidman	PCTPA, Project Manager
Gordon Garry	SACOG, Research & Analysis	Fritts Golden	URS, Environmental Manager
Leland Dong	FHWA, Engineering & Environmental	Denise Heick	URS, Project Manager
David Wade	Public Attendee representing Brookfield (proposed University Park)	Garry Horton	URS, Engineering Task Manager
Ernie McPherson	Roseville Coalition of Neighborhood Associations (RCONA)	John Long	DKS Associates, Traffic
Jack Wallace	Roseville Coalition of Neighborhood Associations (RCONA)	Daniel Iacofano	MIG, Public Outreach
Jeff Clark	Sacramento Department of Public Works - Transportation	Sharon Kyle	MIG, Public Outreach
Joan Powell	Sun City Roseville Homeowners Association	Vikrant Sood	MIG, Public Outreach
Eric Bryant	Proposed Placer Ranch Specific Plan	Markus De Luca	Member of the Public, representing De La Salle University
Gary Sweeten	FHWA, Environmental	Tim Kwan	Member of the Public – property owner near the landfill
John Tallman	West Roseville Specific Plan		
Minutes			

Purpose

To provide feedback on potential corridors and interchanges to study in the EIS/EIR.

I. INTRODUCTIONS

C. McAdam welcomed SAC members and people in the audience. She asked everyone to introduce themselves before beginning the meeting.

II. ADDITIONAL DATA REQUESTED BY ADVISORY COMMITTEES

S. Tidman gave an overview of the discussion and recommendations developed at previous TAC, SAC, and PAC meetings on the Technical Memorandum – Screening Evaluation of PSR Alternatives and goal/policy review items. The

May 17 Status Report sent to all advisory committee members focused on the following topics and project team follow-up:

Water Ski/Catfish Farm Research—TAC asked the project team to determine if this property (located half-mile north of Baseline Road and immediately east of Locust Road) qualified as a Section 404 jurisdictional wetland (protected by the federal Clean Water Act). Based on an aerial photos (1962 and 1975) evaluation, the project team's biologists concluded (see Attachment C) that the water feature may have originally been constructed in a seasonal wetland that is isolated by approximately 0.5 miles from the nearest stream. The U.S. Army Corps of Engineers will make a final determination.

Baseline Road Segment Analysis—SAC and TAC requested that two corridor scenarios be evaluated parallel to Baseline Road: 1) a corridor alignment immediately north, and 2) a corridor alignment approximately one-mile north (see Figures 1 and 2). The one closer to Baseline Road had more potential environmental impacts than the one further to the north. These impacts were to vernal pools and Country Acres (an existing rural residential community). Two additional variations of the one-mile north scenario were also evaluated: a) corridor centerline – one mile north of Baseline, and b) north corridor edge – one mile north. The northern-most corridor had the least amount of potential environmental impacts.

Working Farm Units—A recommendation in the Technical Memorandum (and with a concurrence of the advisory committees) stressed the need for better information on working farm units and the screening process. The project team coordinated with the staffs of Placer and Sutter County Agricultural Departments. A working farm unit is defined as "a distinct agricultural property (that may consist of multiple parcels of land) that is being farmed or managed by one individual, family or company." The working farm boundaries are shown on the map mailed out with the May 21 Status Report follow-up. This information will be used in screening process.

Growth Inducement Definition—The PAC requested a definition of "growth inducement" and clarifications in the Technical Memorandum. The project team used Caltrans guidance (Caltrans Environmental Handbook). Attachment D summarizes this. This will be added to the Technical Memorandum along with growth inducement clarifications.

South of Riego Parkway Connection with SR 70/99—The Technical Memorandum recommended that the potential SR 70/99 connection -- south of Riego Road be eliminated. The TAC agreed only if the City of Sacramento and the County of Sacramento concurred. The project team met with City and County representatives. They agreed that potential connection should be eliminated because of their pending general plan amendment -- Natomas Vision. It would create a one-mile-wide 'urban separator' south of the Sacramento/Sutter County Line. They felt that a potential SR 70/99 connection would be growth inducing.

Clarification of the "No Access" and "No Development Buffer" Goals/Policies.—Concerns were raised by several advisory committee members and developers about two project provisions: 1) the access restriction between Fiddyment and Pleasant Grove Roads and 2) the width of the no development buffer along the future Parkway. Starting last January, the project team outlined and discussed these with each of the three advisory committees. Based on TAC input to maintain consistency with SACOG's MTP, each advisory committee agreed these provisions should not be revisited during the course of the Corridor Preservation project. However, the advisory committees agreed that several clarifications would improve the meaning of these provisions. Attachment E contains the original goal/policy text and suggested clarifications based on advisory committee direction. This includes PAC discussion on potential locations and greater flexibility for a Watt Ave. connection.

E. Bryant (proposed Placer Ranch Specific Plan representative) asked about the no development buffer clarification in Attachment E. He noted the revised access information -- but did not see anything on the potential for a narrower buffer. S. Tidman referred him to the goal on growth-inducement. He said additional clarifying information would be added on the proposed urban development in agricultural areas and the potential for reduced buffer widths.

III. MODIFIED NEPA 404 PROCESS UPDATE

S. Tidman summarized a series of meetings with the U.S. Army Corps of Engineers (USACOE) and U.S. Environmental Protection Agency (USEPA) to coordinate and consult on Clean Water Act Section 404 issues related to aquatic resources. The goal was to ensure early coordination/consultation to address as many issues as possible during the Tier 1 process. This work should streamline later environmental reviews by adding some certainty for permitting future Parkway design/construction phases.

He summarized two recent meetings. An April l agreement was reached on the process to review, clarify, and concur on key project milestones, such as the Purpose and Need Statement. At this meeting, the project team made it clear to USACOE and USEPA that the project objective was to identify one corridor and it needs to be the LEDPA (Least Environmentally Damaging Practicable Alternative). USACOE and USEPA acknowledged this objective – but indicated they could not guarantee that there would be one LEDPA corridor – there may be more than one. A May meeting addressed the draft Purpose and Need Statement. It outlines the problem and ways to solve it. During this work, the project team has worked to help USEPA San Francisco staff to understand regional transportation problems and growth issues. There is a meeting on June 7 to complete this review. Monthly meetings are set through August to address additional milestones. USACOE and USEPA concurrence on these milestones is key to maintaining the project schedule and budget.

G. Garry (SACOG) asked about EPA and ACOE staff turnover and, if any, had it affected the process to date. S. Tidman said there had been none to date.

IV. CORRIDOR ALIGNMENT ALTERNATIVES

4(a) – Modified PSR Corridors
4(b) – Additional Potential Corridors Identified
4(c) – Potential Corridors to Study in the EIS/EIR

D. Heick gave an overview of the 3-step corridor alternatives process. She noted the May 17 Status Report emailed to SAC members. Attachment A contains TAC, SAC, and PAC comments/direction on the Technical Memorandum – Screening Evaluation of PSR Alternatives. She also described the May 21 supplemental information, mailed to SAC members, including the Revised Environmental Screening Data spreadsheet and Figures 1 (Draft Potential Corridor Alternatives for EIS/EIR Evaluation) & 2 (Additional Corridor Alternatives Evaluated). The spreadsheet lists the three sets of corridor alternatives and calculates the affected acreages of the screening data contained in the Technical Memorandum (biological resources, socioeconomic resources, cultural resources, floodplains, farmland, and hazardous materials/wastes).

a) "Modified PSR Alternatives". Eleven combinations of corridor alternatives and State Highway connections from the 2001 PSR were evaluated by screening them through the environmental screening data (see the spreadsheet) by GIS layer. To illustrate the process, she showed (via Power Point and CommunityViz) how the PSR corridor alternatives were adjusted north and west to avoid or minimize vernal pool impacts.

b) "Additional Potential Corridors Identified". Based on this work and advisory committee direction (Attachment A), 11 more combinations of corridor alternatives and State Highway connections were identified. For example the potential Sunset connection at SR 65 (identified in the PSR) was eliminated. She used biological resources and community resource data parameters, the spreadsheet, and Figure 2 to review each corridor alternative.

c) "Potential Corridors to Study in the EIS/EIR". Three corridor alternatives were identified and evaluated (see Figure 1 and the spreadsheet). Two more issues were used to focus these: 1) Least Environmentally Damaging Practicable Alternative (LEDPA), satisfying the Purpose and Need Statement and identifying the

least impacts on waters of the U.S., and 2) new Caltrans interchange direction that will result in larger right-of-way areas to accommodate high-speed, free-to-freeway connections.

G. Garry asked if the interchange direction was a state-wide standard. G. Horton responded that it was based on a meeting with John Steele, Caltrans HQ geometrician. The direction is based on capacity and safety concerns.

G. Garry inquired about the effect on SR 70/99 interchanges. D. Heick provided a brief description of the effects, based on Caltrans direction. The North of Riego interchange shifted southward, to avoid conflicting with an interchange at Sankey Road. This would put the North of Riego interchange closer to the future Riego Road interchange. However, the Parkway and 70/99 interchange could be 'braided' to avoid conflict. She said the project team was still working through the issues with Sutter County. Before identifying an interchange solution, a possible (assumed) local roadway network would have to be developed.

E. Bryant asked if this Caltrans direction would eliminate the future interchange at Riego Road. D. Heick said no. However, there would be no Parkway access from the Riego Road interchange. Access to the Parkway from Riego Road would be via the local road system to one of the 'local' Sutter County interchanges.

There was a discussion regarding potential additional development areas to the north identified by the Blueprint process. D. Heick said based on the team's understanding of work by Placer Legacy (Alternative Conservation Opportunities Area Plan) and Placer County's Visioning Plan, neither indicated development occurring north of the northern most Parkway project alignment.

SAC member John Tallman, asked whether shifting the North of Riego – North of Baseline alternative onto Riego Road should be done to avoid congestion at SR 70/99. J. Long said this would affect local circulation, and that the PAC had long ago rejected this idea.

D. Heick indicated the current set of corridor alternatives no longer consider a potential SR 70/99 connection south of Riego. The project team, following advisory committee direction, met with City of Sacramento and Sacramento County. The City and the County staff recommended the connection be eliminated because of its growth-inducing potential. The City and County are processing the Natomas Vision that would create a one-mile urban separator south of the Sutter/Sacramento County line.

She also mentioned an approximate 20-acre 'wetland' feature near the Placer/Sutter County line that appears to be actively farmed. The project team would explore this and, if not a wetland, would revise the spreadsheet. It would bring the "North of Riego – North of Baseline" corridor alternative's wetland impact total more in line with the other two alternatives.

D. Heick shared TAC direction to explore another segment on the "Sankey – North of De LaSalle" corridor alternative. This would eliminate the Sankey connection with a north-south segment along the Placer/Sutter County line (Locust Rd.) to north of Riego Rd. The spreadsheet ("North Riego – North of De LaSalle") shows this option.

J. Ritchie (Lennar Properties) asked why the potential North of Riego interchange was moved south (closer to Riego Rd.) and not to the north. D. Heick said that moving it north would create spacing problems along SR 70/99 with a Sankey Rd. interchange.

D. Heick then compared the three "Draft Potential Corridor Alternatives for EIS/EIR Evaluation" to the following environmental data map layers (with specific comments on some):

- Special Status Species Habitat
- Riparian, Wetland and Conservation Areas

- Vernal Pool Critical Habitat (most corridors avoid)
- Vernal Pool Complexes (only minimum impacts)
- Socioeconomic Resources (clips HydroPower site, minimizes Reason Farm impacts and much of the vicinity vernal pool complexes, need more information on Roseville's Swainson's Hawk mitigation area, impacts scattered residences, allows only one 'local' interchange along Sankey, and allows two locals along the north of Riego segment)
- Cultural Resources
- Floodplains (there appear to be no definitive "Sankey Gap" closure plans, which would result in expensive improvements in the 100-year floodplain)
- Hazardous Waste
- Farmland Designations (each corridor alternative does a better job of preserving farmland)
- Potential Major Development Areas (affects the west edge of the adopted West Roseville Specific Plan, pretty consistent with proposed Placer Ranch Specific Plan's features and constraints, two corridor alternatives affect the proposed De LaSalle University project area, potential proposed Brookfield and Blue Oaks involve vernal pool concerns)

G. Garry summarized SACOG's Blueprint project. The Blueprint scenario likely to be adopted by the SACOG Board shows more urban development north of Baseline/Riego. He asked if this additional development should be considered for the Parkway project.

D. Heick noted that the North of De LaSalle corridor alternative segment was similar to Placer County's proposed 'growth boundary'. This boundary, from the proposed Habitat Conservation Plan and the Natural Communities Conservation Plan, would foster conservation opportunity areas to the north and urban development opportunities to the south. She added that PCTPA and member jurisdictions have participated in the Blueprint process. However, the Blueprint's "Placer Parkway" has several varying options such as a southern alignment with more access points on the central segment. This arrangement is not consistent with adopted PCTPA or SACOG Board policies for the Parkway project. It would conflict with the project's purpose and need, including its intent to be a high-speed and limited access regional transportation facility.

C. McAdam said PCTPA has had an on-going dialogue with SACOG about the Blueprint and environmental constraints. She described the Blueprint project as a visioning process. Before final approval, it would need environmental clearance. She said the Blueprint scenarios show Parkway options that we already know are not environmentally sound. SACOG wants to move forward.

D. Iacofano asked how SACOG saw the Blueprint process coordinating with the Parkway's corridor preservation planning efforts. G. Garry said the SACOG Board was scheduled to adopt the Blueprint in December 2004. It would be a land use plan supported by transportation policies and priorities. A number of roadway and transit options were designed to test major facilities like the Placer Parkway. The Blueprint was not laying out an alignment – but providing land use and transportation priorities. He said the Blueprint would only be a success if local jurisdictions adopted and implemented it.

D. Heick said she understood a Blueprint scenario included a more northerly Parkway alignment. G. Garry said yes. D. Heick said the project's corridor alternatives screening process recommended elimination of the northern PSR corridor alternative.

D. Iacofano asked what the Blueprint's vision is for the Placer Parkway. G. Garry said there was no consensus. Two visions have been discussed: 1) to act as a buffer between open space and urban development or 2) as a 'main street' for pending western Placer County development with multiple access points especially if there were to be development north

of the Parkway. D. Heick re-iterated her point about the inconsistency with the project's purpose and need and goals/policies.

M. De Luca (public attendee -- De LaSalle University and Community Specific Plan) mentioned the County's proposed Curry Creek Community Plan and potential development south of Pleasant Grove Creek. He questioned whether the Parkway's limited access policy in this segment was realistic.

D. Heick re-counted the extensive policy review just completed by the three advisory committees on limited access between Fiddyment Rd. and Pleasant Grove Rd. The direction was clear – there would be no more than one potential connection along in the central segment.

D. Iacofano remarked that, with good coordination between the Blueprint and Parkway corridor preservation projects, the "business-as-usual" approach to development with urban sprawl could be avoided. The Blueprint's land use scenarios and the Parkway's limited access provisions in this area could be a unique opportunity for something better.

L. Dong said that while there had been no discussion of the Curry Creek Community Plan, local roadways could cross over the Parkway without having direct access. D. Heick indicated the community plan would have a local circulation plan and could address Parkway restrictions.

G. Garry said one of the Blueprint's vision for the Parkway was for a potential 'main street' – a larger facility – up to 6 lanes. D. Heick said the Parkway was initially planned to be 4-lanes and could be expanded to 6 lanes. More access, such as may be implied by a "main street" did not meet the purpose and need or advisory committee direction.

D. Iacofano asked if any SAC member could identify any 'fatal flaws' with the alternatives. J. Tallman thought the Parkway corridor should be on or closer to Baseline/Riego. He felt that none of the potential alternatives addressed current traffic problems on Baseline/Riego. And, if Parkway traffic merged with Baseline/Riego traffic from Placer Vineyards and the West Roseville Specific Plan, it would create a horrific traffic situation.

J. Long said through the Conceptual Plan and PSR processes, the PAC gave staff clear direction not to have the Parkway on the Baseline/Riego alignment. They directed that it should be to the north – but did not specify how far north. They wanted to maintain Baseline and Riego for local traffic. He said having multiple interchanges at SR 70/99 would be better for traffic flows. He said the two connected interchanges would be 'braided' with adequate distances for decision making. He added that Baseline eventually would be 6 lanes with access points every ½-mile or so.

D. Heick added that the Purpose and Need Statement emphasized the Parkway connection between SR 65 and SR 70/99. The Parkway is not intended for local circulation. T. Brinkman said there was no local roadway plan for the proposed Curry Creek Community Plan. D. Heick said the Blueprint scenarios proposed a lot of urban development in this area. The proposed community plan could be a part of it. The Tier 1 process would take 2 to 3 more years to complete. By that time, there would be more certainty about development. She stressed the need to preserve reasonable corridors through the area so the Parkway would not be precluded by urban development.

J. Tallman indicated he thought the potential Parkway interchange north of Riego and the future Riego Rd. interchange were too close. J. Long did not agree. More information would be provided. G. Horton said the two interchanges would have adequate merge/weave lanes and would be much more efficient. J. Long said access to Sutter County's future industrial area was a major consideration. The County felt that one interchange would limit accessibility.

E. Bryant asked if there would be any difference in travel time and whether cost differences had been estimated. J. Long said the Technical Memorandum had travel time information. He said the latest set of alternatives would have fairly little travel time variation. No costs had been identified to date. D. Heick mentioned that the potential Sankey Rd. interchange and segment to the east would be more costly because of the floodplain.

M. De Luca raised concerns with the yellow alignment ("North Riego – South De LaSalle") corridor alternative. He said the proposed development was to be a pedestrian-oriented community with high residential densities. Planning this development would be hard to do with a 6-lane highway going through the community. He asked about the PSR's northern corridor alternative (parallel to Sunset Blvd. West and then connected with SR 70/99 north of Sankey Rd.).

D. Heick recapped action on the PSR northern corridor alternative. It had been evaluated and eliminated based on the Technical Memorandum and advisory committee direction. She said the latest current corridor alternatives were all better. M. De Luca felt the "yellow alignment" did not address biological resource and drainage problems. D. Heick used the CommunityViz program to illustrate vicinity resources and impacts – particularly the number and location of stream crossings. She followed up by saying the advisory committees specifically asked for more 'direct' routes between SR 65 and SR 70/99. She noted that neither the proposed Placer Ranch nor De LaSalle projects had been permitted. Placer County was trying to preserve options for a Parkway corridor.

J. Hanson said the yellow corridor alignment was most problematic for De LaSalle. The developer was trying to observe Blueprint objectives of greater densities and 'walkability'. It would go through the central plan area. She said Placer County was trying to bridge the gap. In meetings, the County wants to preserve alignments through the proposed project. The blue ("Sankey – North De LaSalle") corridor alternative would be the least "awful."

W. Morebeck (Placer County Agricultural Commission) preferred the southern alignment because it had less impact on agriculture. His first preference would be for the corridor to be on Baseline Rd. He added that having two interchanges near Riego would be a nightmare. One interchange would be better than two. He asked where an example existed and if it worked.

J. Clark said if I-80 and Truxel Rd. had braided ramps, traffic would be much better. J. Long said one major interchange would not be good for traffic flow. He said Caltrans preferred less concentration.

D. Heick referred to the active farming units map and said that in Sutter County, Sankey Rd. acted as a dividing line between farms. A potential connection there would have no affect. In the southwest, a Parkway connection north of Riego would divide farms – but much of this area is already zoned for commercial/industrial uses. D. Iacofano noted that no one corridor alternative meets all criteria – each is a series of trade-offs. Joan Powell (Sun City – Roseville Homeowners Association) thought the northern corridor alternative ("Sankey – North of De LaSalle") would be better for commuters.

E. Bryant said Riego would carry more traffic than Sankey. He asked why the 70/99 connection could not be moved north – closer to Sankey. D. Heick used CommunityViz to illustrate Pleasant Grove community impacts if this option were pursued.

4(d) -- Potential Interchange at Watt Ave.

D. Heick introduced the project team's approach to explore a potential Watt Ave. connection. The environmental review would have to analyze the impacts of a potential connection in the central segment. The question was where such a connection might occur. The project team wants to identify the limits of reasonable locations and present the 'worst' case. She re-iterated that identifying and evaluating a Watt Ave. extension is not a part of the project.

J. Long summarized the proposed process. He said there would be a lot of uncertainty. The environmental review would identify a minimum number of possible locations where Watt Ave. might connect to each corridor alternative. To do this, assumptions for a local roadway system will have to be made. The TAC would help to make the estimation of this system. Then, sensitivity tests would be conducted for the various potential connections based on the assumed local circulation system. Changes in travel time would then be determined. The project team will meet with Roseville and Placer County staff. The results would be shared with the TAC and then the SAC.

M. De Luca felt if the Watt connection were too far north, there would be biological resource concerns.

V. CONCLUSIONS AND NEXT STEPS

Summary of Decisions and Future Action

- More TAC and SAC meetings will be scheduled. Each member will be notified.
- There will be August 23 and 26 public meetings in Roseville and Pleasant Grove to review the corridor alternatives to be evaluated in the EIS/EIR.
- The project team was directed to coordinate with SACOG's Blueprint scenario for the Parkway as a "main street" concept and the southern alignment (consistent with adopted Parkway goals).
- The project team was directed to further assess conflicts from the diagonal alignment relative to De La Salle versus a "more direct alignment."
- The project team was directed to get more information on the 70/99 interchange's proximity to Riego Road (with respect to potential traffic congestion at this location).
- The project team was directed to continue discussion with Placer County Agricultural Commission regarding potential agricultural issues.
- The project team promised to keep the SAC informed regarding all upcoming project developments.

PLACER COUNTY TRANSPORTATION PLANNING AGENCY

Meeting Minutes & Action Items — Final: 05-26-06

Meeting Description:	Placer Parkway Corridor Preservation – Study Advisory Committee Meeting #6		
Meeting Date:	August 25, 2005	**Location:**	Roseville Corporation Yard

Persons Attending

Name	Affiliation	Name	Affiliation
SAC Members:			
Bill Moore	City of Roseville Public Works Department	Dan Mason	Sacramento Metro Chamber
Rob Jensen	City of Roseville Public Works Department	Joan Powell	Sun City CRC Representative
Lisa Wilson	Sutter County Planning Department	Dave Butler	Sacramento Metro Chamber of Commerce
William Morebeck	Placer County Agricultural Commission	Eric Tattersall	US Fish and Wildlife Service
Ernie McPherson	Roseville Coalition of Neighborhood Associations	Julie Hanson	KT Development
John Costa	Building Industry Association – Superior California	Terry Davis	Sierra Club of Placer County
Eric Bryant	Proposed Placer Ranch Specific Plan	Jack A. Ritchie	Proposed South Sutter County Specific Plan
John Deeter	Environmental Council of Sacramento	Loren Clark	Placer County Planning Dept.
Jeff Finn	California Department of Fish and Game	Tom Brinkman	Placer County Public Works Department
Staff:			
Celia McAdams	PCTPA, Executive Director	Stan Tidman	PCTPA, Project Manger
Joanne Koegel	Koegel & Associates	Denise Heick	URS, Project Manager
John Long	DKS Associates, Traffic Task Manager	Gary Horton	URS, Engineering Task Manager

Ed Armstrong	Foothill Associates	Deanne Green	Brookfield Land
Kate Kirsh	Foothill Associates	Mark Rayback	Wood Rodgers
Ken Whitney	Foothill Associates		

1. Meeting Purpose

The purpose of the meeting was to obtain SAC input and recommendations on the screening results for the two Foothill Associates' alignments along with TAC input and recommendations, the draft revised second cumulative development scenario for the EIS/EIR analysis, and an update on coordination with federal resource agencies.

Placer County Transportation Planning Agency (PCTPA) staff and consultants provided the following handouts at the meeting (these handouts were also made available on URS Corporation's (URS) ftp site before the meeting):

- Benefits and Drawbacks of Foothill Alignments and TAC Recommendations
- Foothill Associates Report, December 10, 2004
- Environmental Screening Data (matrix)
- Foothill Alignment Alternatives (map)
- PCTPA and Foothill Associates corridors (map)
- Draft Planned and Programmed Major Transportation Improvements and Development Projects (map)
- Draft Development Scenarios for Western Placer County EIRs (matrix)
- Purpose and Need
- Screening Criteria for modified NEPA/404 process
- Current EPA Proposals for Avoidance Alternatives

Celia McAdams, Executive Director, PCTPA, opened the meeting and welcomed the members to the 6th SAC meeting. Joanne Koegel, meeting facilitator, asked for introductions and provided an overview of the agenda. Stan Tidman did a brief project update including purpose and need; environmental review; the four recommended corridor alignment corridors (August 2004), and project issues (tiering, resource agency coordination, pending urban development proposals, and scheduling).

2. Foothill Associates Alignment Screening

A. Background

Denise Heick (URS) explained how she would address this agenda item – background, TAC meeting and results, specific benefits/drawbacks, and then ask for SAC input. She began, using a map, by orienting the SAC to the four recommended corridor alignment alternatives via the 2003/2004 screening process and the additional ones evaluated by Foothill Associates (Foothill).

The four corridor alignment alternatives recommended for analysis in the Tier 1 EIS/EIR by the Advisory Committees, via the 2003/2004 screening, are numbered 1 to 4, as follows (mapped colors):

#1 – (red) is the southernmost, one mile north of Baseline Road, connecting to SR 70/99 north of Riego

#2 – (orange) is the diagonal connecting to SR 70/99 north of Riego

#3 -- (blue) is just north of the proposed Regional University and Community Specific Plan, connecting to SR 70/99 north of Riego

#4 -- (yellow) is just north of the proposed Regional University and Community Specific Plan, connecting to SR 70/99 at Sankey

The four corridor alignment alternatives identified in the Foothill Associates report are identified as follows (marked in black dotted line):

- Foothill alignment 1N is their northerly alignment just south of Sunset Blvd. West, connecting to SR 70/99 at Sankey
- Foothill alignment 1S is their northerly alignment just south of Sunset Blvd. West, connecting to SR 70/99 north of Riego

- Foothill alignment 2N is their more southerly alignment just south of the City of Roseville Retention Basin, (near Phillip Rd.) connecting to SR 70/99 at Sankey
- Foothill alignment 2S is their more southerly alignment just south of the City of Roseville Retention Basin, (near Phillip Rd.) connecting to SR 70/99 north of Riego)

Ms. Heick referred to the Environmental Screening Data matrix that provides detailed results from the 2003/2004 and Foothill screening analysis. She clarified that the focus of the meeting was to discuss the significant comparative differences in impacts of the Foothill alignments with comparable alternatives already recommended for Tier 1 EIS/EIR analysis by the Advisory Committees.

Ms. Heick clarified that the red lines on the map (over the black dotted lines) show the 4,600-foot curve radii (screening criteria). The green lines (over the Foothill 2 alignment) over Pleasant Grove Creek and south of the retention basin indicate an alignment that would accommodate a minimum design speed of 70 mph. Ms. Heick clarified that based on TAC input, Foothill alignments 2N and 2S were modified to meet a minimum design speed of 70 mph, and then screened for impacts.

Ms. Heick informed the SAC that Foothill Associates had submitted their report to the South Placer Regional Transportation Agency (SPRTA) on December 10, 2004. The report offered a different screening analysis of the four recommended corridor alignment alternatives along with the additional Foothill alignments. The SPRTA Board directed PCTPA to evaluate the Foothill alignments at the March 1, 2005, board meeting, and notice to proceed was given on April 6, 2005.

Ms. Heick explained that the staff and consultants had worked with Foothill Associates on data validation and screening of the new proposed alignment alternatives. The results were provided on the Environmental Screening Data matrix. Ms. Heick informed the SAC that there was agreement with Foothill Associates on GIS data except for minor differences as noted on the matrix. This conclusion was made after appropriate adjustments were made to the December 2004 numbers originally provided by Foothill.

Ms. Heick informed the SAC that the data validation/screening work identified two other issues for SAC input and comments:

- In some locations, Foothill alignments did not use the 4600-foot curve radius identified as screening criteria for engineering parameters for the project; and,
- The Parkway connection with a future Watt Avenue extension.

B. August 10, 2005 TAC Meeting Background

Ms. Heick summarized the screening methodology and results from the August 10 meeting. She covered in some detail the 4,600-foot curve radius and the potential Parkway connection to a future Watt Ave. extension.

(1) 4,600-Foot Curve Radius

D. Heick introduced the discussion on curve radius and design speed. She said the 4,600-foot curve radius and 70 mph design speed were the engineering screening criteria used for all of the alternatives to date. These criteria were based on Caltrans concerns with safety and flexibility, and so as to not restrict where within the corridor an alignment could be placed.

She said the Foothill alignments did not use this criterion. For example, the Foothill Nos. 2N and 2S alignments near the Pleasant Grove Creek used a curve radius less than 4,600 feet which would result in a lower design speed. It also would create more encroachment into the future retention basin plus create more environmental impacts. The reduced curve radii on Foothill Nos. 1 and 2 alignments would have additional impacts to Swainson's hawk nesting habitat, Valley Elderberry Longhorn Beetle habitat, wetlands, and riparian areas. She said the TAC directed the project team to determine if an alignment could be developed based on a minimum 70 mph design speed. Garry Horton added that the 4,600-foot curve radius would allow greater flexibility for siting future roadway alignment in the corridor. A 4,600-foot curve radius would allow for a design speeds between 75 and 80 mph – depending upon alignment location.

Ms. Heick said that the screening for the adjusted (to the 4,600-foot curve radius) north and south curves on Foothill Alignment Nos. 1N and 1S showed no substantial changes to resources impacts. The project team focused on adjusting Foothill Alignment Nos. 2N and 2S to meet the 70 mph design speed. The resulting alignments showed no significant changes to vicinity resources compared to the original one. And, it avoided the greater effects to the retention basin. Rob Jensen commented that the adjustments were exactly what the TAC wanted.

Ms. Heick asked the SAC if this work was clear and asked for input. Julie Hanson, KT Communities, indicated the approach reflected the past TAC discussion and thought it was good. Kate Kirsh from Foothill Associates asked about the 4,600-foot radius curve slide and its reference to greater impacts on resources. She thought it would lower Swainson's Hawk impacts. Ms. Heick clarified that while there was reduced impact on some resources, other resources would be impacted more.

(2) Potential Connection to Future Watt Avenue Extension

D. Heick introduced this item by re-iterating that the Corridor Preservation project would not include an analysis of a future Watt Ave. extension. The project's environmental document would analyze a potential future Watt Ave. connection to the Parkway, if one were proposed by others. To do this, Placer County and Roseville Public Works staffs assumed a potential roadway network for this portion of the study area. – for analysis purposes only. An assumed Watt Ave. interchange for each Parkway corridor alternative (identified to date) has been initially reviewed.

Ms. Heick summarized the TAC discussion. The Foothill Alignment Nos. 1N and 1S could potentially make a connection with a Watt Ave. extension. However, it was determined that this alignment had the least traffic benefits due to its northern location. The Foothill Alignment Nos. 2N and 2S might have some benefit because the potential connection would be shifted north and west from PCTPA's Alternative 4's (yellow) connection point. This would be a logical location for an extension of Blue Oaks Blvd. Rob Jensen from the City of Roseville Public Works Department agreed.

(3) TAC Direction & Recommendations Summary

D. Heick referred to the Benefits/Drawbacks handout and summarized TAC action:

- Foothill Alignment Nos. 1N and 1S – eliminate it.

- Foothill Alignment Nos. 2N and 2S – relax the 4,600-foot curve radius, re-draw a corridor alignment to meet the 70 mph design speed criterion, and re-screen the resultant corridor alignment.

To describe the basis for the TAC action, she used the following natural and man-made environment slides to illustrate the screening process/general conclusions along with the following important screening notes:

- ✓ No attempt was made to 'weight' one environmental parameter with another.

- ✓ The Foothill alignments screening, like the previous screening process (2003/2004), had a bias to avoid/minimize impacts to aquatic resources. It was important for LEDPA and future Section 404 permitting considerations.

- ✓ Vernal pool critical habitat was recently removed from consideration a recent U.S. Fish and Wildlife Service decision. However, this screening criterion was retained to be consistent with the 2003/2004 screening.

- ✓ Data collected for the screening work is at a Tier 1 level – based on GIS data layers. It is not detailed, on-the ground – specific data. It is appropriate for the screening process and Tier 1 analysis combined

with the project team's knowledge of the area (Reasons Farms EIR, West Roseville Specific Plan peer review, ENRON Energy Park).

- ✓ Similar Foothill alignments were compared to similar PCTPA alternatives. These comparisons of 'like' alternatives seemed to be a logic way to compare the alignments and alternatives. For example, Foothill Alignment No. 2N (SR 70/99 connection at Sankey) was compared to PCTPA No. 4 (yellow) alternative.

- ✓ If a difference of 10% or more for resource impacts resulted between the Foothill alignment and PCTPA alternatives, it was reported (see benefits/drawbacks list). Otherwise, the impact was not considered substantial. The Engineering Screening Data spreadsheet (matrix) provides the specific detail. Ms. Heick summarized the comparison of Foothill alignments to the PCTPA alternatives:

  - Waterfowl and Other Upland Wildlife Habitat. All but Foothill Alignment No. 1N have less impacts to Upland Wildlife Habitat; all but Foothill Alignment No. 1N have more impacts to Waterfowl Habitat.
  - Potential Special Status Species Habitat. Foothill Alignment No. 1N has less Giant Garter Snake impacts. All of the Foothill alignments have less VELB impacts. Foothill Alignment Nos. 1S and 2S have less impacts to Swainson's Hawk nesting habitat.
  - Riparian, Wetland and Conservation Areas. All Foothill alignments have more impacts.
  - Vernal Pool Critical Habitat. Foothill Alignment Nos. 2N and 2S have less impacts.
  - Vernal Pool Complexes. All Foothill alignments have more impacts.
  - Socioeconomic Resources. Foothill Alignment Nos. 1N and 1S have more impacts to farms and homes.
  - Identified Cultural Resources. No substantial difference between Foothill alignments and PCPTA alternatives.
  - Floodplains. 100-year – roughly similar. 500-year – Foothill Alignment Nos. 1N and 2N (those with a Sankey connection) have less impacts.
  - Hazardous Waste Sites of Potential Concern. Similar to the PCTPA alternatives, the Foothill alignments have no impacts.
  - Farmland Designations. All Foothill alignments have less impacts to Farmland of Statewide Importance. Foothill Alignment Nos. 1S and 2N have more impacts to Prime Farmland.
  - Working Farm Units and Power lines. No substantive difference.

Ms. Heick stopped at this point and asked for SAC member questions. She stated the screening work was an honest attempt for an open and even-handed screening process. There were no SAC member questions.

C. TAC Benefits/Drawbacks Summary

Ms. Heick then described specific benefits and drawbacks to each of the Foothill alignments along with TAC direction/recommendations.

Ms. Heick listed the draft benefits and drawbacks. She qualified draft drawbacks item on aquatic resources with asterisks by noting that there had always been a bias to NEPA/404 issues through the first screening. Ms. Heick also clarified that vernal pool critical habitat was still a screening criteria and had not been dropped from the impact analysis.

Ms. Heick explained that the screening process applied to the Foothill alignments was the same as applied to previously considered alignments. There was no ranking/weighting in the process. The only priority was a bias toward aquatic resources, since that was the focus of the permitting agencies. All the values are reflected in the matrix.

The comparisons (i.e., benefits and drawbacks) were made to the four already identified potential alignment alternatives on the basis of which alignments were most alike. The Foothill alignments connecting at Sankey were compared to the potential alignment alternative connecting to SR 70/99 at Sankey (#4 – yellow), the Foothill Alignment 2S was compared to the potential alignment alternative north of the proposed Regional University and

Community Specific Plan area connecting to SR 70/99 north of Riego (#3 – blue), and the Foothill Alignment 1S was compared to all potential alignment alternatives connecting to SR 70/99 north of Riego.

- **Foothill Alignment No. 1N**

  The listed benefits and drawbacks were cited. Ms. Heick emphasized that, via Placer County's Conservation Plan (PCCP) process, the federal resource agencies indicated that any alignment north of Peasant Grove Creek would be considered a problem. She described PCTPA Alternative No. 4 (yellow) as being drawn based on coordination with the draft PCCP – the fuzzy dividing line between conservation/open space opportunities to the north and development opportunities to the south. She also said that the TAC had offered more explicit reasons to the drawback related to reduced traffic benefits. These reasons were that the alignment would be used less by Roseville travelers, and there would be no connection to a potential Watt Ave./Blue Oaks Blvd. interchange. She asked Rob Jensen for input. He said the summary was correct – Roseville wants help for the local roadway system. This northern alignment would provide no benefit.

  There were no SAC comments or questions.

- **Foothill Alignment No. 1S**

  D. Heick said that generally the list of benefit/drawbacks for this alignment was similar for #1N.

  SAC discussion followed. William Morebeck from Placer County Agricultural Commission asked for a clarification on what benefits and drawbacks were. Ms. Heick answered that the list of benefits and drawbacks showed how the Foothill Alignments compared to similar PCTPA alternatives. He then asked whether soil data was used to determine farmland designations. Ms. Heick clarified that the consultants used data provided by the State Department of Agriculture. She referred to the Technical Memorandum and its series of maps. Mr. Morebeck cited the case of Toad Hill in the northern part of the study area that is not designated as Prime Farmland but is in fact cultivated as a rice field. He wondered how a road would benefit farming operations, and suggested adding 'Relative' to the Benefits and Drawbacks heading.

- **Foothill Alignment No. 2N**.

  D. Heick reviewed the benefits and drawbacks list.

  SAC Discussion followed. W. Morebeck asked if the analysis involved using soils. D. Heick answered that the analysis was based on Prime Farmland and Farmland of Statewide Importance. The soils work completed for the Technical Memorandum did not result in any substantial differentiation.

  J. Hanson asked about vernal pool comparisons. D. Heick said the Foothill Alignments were compared to similar PCTPA alternatives. In this case, this alignment was compared to the PCTPA corridor alternative that connected to Sankey Rd. at SR 70/99 (No. 4 – yellow).

  Kate Kirsh from Foothill Associates pointed out that impacts to Prime Farmlands was incorrectly listed as a drawback. Ms. Heick acknowledged that this was a mistake and would be corrected.

  K. Whitney, Foothill Associates, asked why the alignments were not compared to all of the PCTPA alternatives. D. Heick responded that an analysis like this would result in false comparisons. The data in the spreadsheet identified whether there would be any problems. This screening process tried to make comparisons based on like resources/conditions.

- **Foothill Alignment No. 2S**

  D. Heick reviewed the draft potential benefits and drawbacks list. Ms. Heick pointed out that a connection to a future Watt Ave. extension (mentioned earlier) would be a benefit. She also pointed out that the alignment had been adjusted to meet the design speed of 70 mph engineering screening criterion and minimized encroachment into the Roseville retention basin area, as per TAC recommendation.

  SAC discussion followed. Terry Davis from the Sierra Club pointed out that just as the TAC recommended eliminating Foothill Alignment Nos. 1N and 1S because it was north of the draft PCCP's Conservation

Opportunity Area boundary, Foothill Alignment Nos. 2N and 2S should also be eliminated. He commented that this alignment would also have more vernal pool impacts. He asked if there were any agency concerns.

J. Finn, California Dept. of Fish and Game said that the USACOE and USEPA agreed with the TAC direction to eliminate Foothill Alignment Nos. 1N and 1S. He said there was more flexibility to the south. T. Davis asked if the agencies had looked at Foothill Alignment Nos. 2N and 2S for concerns. J. Finn responded they had not.

Ms. Heick said this alignment is south of Pleasant Grove Creek. It had some benefits as well as more drawbacks – specifically to vernal pool/wetlands. She indicated it did not rise to a fatal flaw level.

Jack Ritchie, Lennar Communities, asked if the TAC resolution didn't solve all these issues. Tom Brinkman, Placer Co. Public Works, responded that the adjustment was not really a benefit or drawback. D. Heick clarified that this alignment would be less flexible (less than the 4,600-foot curve radius); however, it would meet minimum safety standards via more engineering. If the 70 mph design speed criterion were maintained, FHWA and Caltrans TAC members supported it. If this alignment were forward on to the Tier EIS/EIR for analysis, this issue might be treated as something else – not a benefit or drawback. Julie Hanson from KT Development said that the whole point was screening and to determine whether it was worthy to recommend as an alternative to the PAC and SPRTA Board like the four PCTPA ones. She agreed that the alignment should not be eliminated at this point.

Mr. Jensen suggested another clarification. Drawbacks are not an issue here – it is not a safety issue. The TAC concluded that if an alignment could be drawn using the 70 mph design speed – that the alignment would be safe. It would just be less flexible than the 4,600-foot curve radius.

D. SAC Review -- Benefits/Drawbacks

J. Koegel said that SAC direction and recommendations were needed for PAC consideration. She indicated this direction and recommendation did not have to be similar to the TAC's. But, she asked for a confirmation of the process – whether everyone was in agreement that the process was fair and accurate. She stressed the need for SAC comments. SAC review focused on the following items.

Other benefits or drawbacks. J. Koegel asked the SAC whether there were other benefits and drawbacks to be considered. The SAC did not identify any more.

Foothill Alignment #1. J. Koegel reminded the SAC that the TAC recommended eliminating it. She said that she realized a vote was not necessary – but the SAC's position was needed. E. Bryant said he was fine with eliminating it. J. Koegel asked if the SAC agreed. The group indicated agreement. There was no disagreement. There was not audience disagreement.

Foothill Alignment #2. J. Koegel asked if there were any discussion on the adjusted alignment based on the TAC's direction to develop an alignment that would maintain a minimum 70 mph design speed and then re-screen it. E. Bryant asked about a concern with an 'apples-to-apples' comparison – using the same design speed for all screening. If different ones were used the analysis could be confusing. D. Heick responded that the 70 mph design speed was the screening criteria for all the work. The TAC directed the project team to re-examine the other four (PCTPA) corridor alternatives to determine whether additional resources could be avoided via a reduced curve radius. No substantial changes to resource impacts resulted.

Mr. Davis felt that both Foothill Alignment No. 2N and PCTPA Alternative No. 4 (yellow) were very close to each other and that only one of the two alternatives should be selected for further analysis. Mr. Davis pointed out that since the Foothill Alignment No. 2 has a higher impact on vernal pools, it should be eliminated from further review. Mr. Morebeck agreed and pointed out the in addition to impacts on vernal pools, Foothill alignment 2 also has a higher impact on farmlands.

Mr. Whitney pointed out that PCTPA Alternative No. 4 (yellow) has a higher impact on vernal pool critical habitat than the Foothill Alignment No. 2N. He said the critical habitat designation was gone because of economic vs. habitat reasons.

Ms. Hanson pointed out that Foothill Alignment No. 2N has significantly fewer impacts on Prime Farmland and Farmland of Statewide Importance. With regard to vernal poll complexes, she said that if Foothill Alignment No. 2S were eliminated – then all of the PCTPA corridor alternatives should be eliminated. Ms. Heick clarified that all alignments with a SR 70/99 connection north of Riego will have higher vernal pool impacts in general than the Sankey Road connection.

E. Bryant asked what the next step would be – more analysis? D. Heick answered – yes. He asked if some of the identified impacts could change or be refined. D. Heick said the screening work was done on baseline data. A more complex analysis would be completed with the Tier 1 EIS/EIR. E. Bryant asked if keeping more alternatives in the analysis would make the final one more apparent. Ms. Heick noted that PCTPA and the consultants are looking for a reasonable range of alternatives to study in the EIS/EIR. Having more alternatives at this stage will not be an issue.

John Costa from the Building Industry Association said if there would more analysis – then all alternatives should go forward. John Deeter agreed they were worthy of study. G. Carpenter said to add the one with the Sankey Road connection. Sutter County wants it.

Tom Brinkman from Placer County Public Works Department suggested carrying forward Foothill Alignment Nos. 2N and 2S. J. Koegel asked if there were any objections. Ms. Hanson inquired whether eliminating Foothill Alignment No. 2S at this stage would prevent it from being studied in the future. Ms. Heick explained that PCTPA and the consultants have the data on this alignment and it can be formulated in the analysis at a later stage, but clarified that if Foothill Alignment No. 2S seems a reasonable alternative then it should be studied as a complete alignment, not in pieces.

Jeff Finn from the Department of Fish and Game said the agencies have not analyzed Foothill Alignment #2. If Foothill Alignment #1 is eliminated, then the wildlife agencies would defer to USACOE/USEPA on wetlands vs. habitat issues.

Mr. Brinkman also pointed out that while Sutter County is opposed to an alignment that connects north of Riego that alone is not reason enough to eliminate 2S.

SAC members took a vote on this issue. The majority of SAC members voted to keep both Foothill Alternative Nos. 2N and 2S in the range of alternatives. Two members (Julie Hanson and Tom Brinkman) voted to only keep 2N in the range of alternatives and to eliminate alignment 2S. Three members (John Deeter, Terry Davis and William Morebeck) voted to eliminate both alternatives from further analysis.

T. Davis, Sierra Club stated he wanted to indicate a strong dissenting objection. He said PCTPA corridor Alternative No. 4 (yellow) and Foothill Alignment No. 2N were so close together.and the PCTPA alternative avoids more vernal pool complexes. So, it was reasonable not to consider Foothill Alignment Nos. 2N or 2S. J. Deeter, ECOS, and W. Morebeck, Placer Co. Agricultural Commission agreed.

SAC Recommendations:

1. ***Eliminate Foothill Associates' Alignment Nos. 1N and 1S from further consideration.***

2. ***Retain Foothill Associates' Alignment Nos. 2N and 2S, as adjusted to a 70 mph design speed within a 1,000-foot-wide corridor as an alternative for analysis in the Tier 1 EIS/EIR.***

3. Draft Revised Second Cumulative Development Scenario

John Long, DKS Associates (DKS), explained that staff and consultants are developing a revised second cumulative development scenario (CDS) for the study area to evaluate cumulative impacts of the proposed project in the environmental document. Mr. Long explained that two cumulative development scenarios were developed for the screening process – 1) based on SACOG's 2025 MTP and 2) the MTP plus recently approved and pending urban developments in western Placer County.

Since FHWA requirements dictate that a planning horizon be 20 years beyond the date when the project becomes operational, which is 2020 by PCTPA estimates, the horizon has shifted out to 2040. So the environmental document must define and analyze a second cumulative development scenario that reflects reasonable 2040 conditions.

Mr. Long explained that staff and consultants are looking at two sources of information for the second CDS. The first source is the Sacramento Area Council of Government's (SACOG) Blueprint Project that has a planning horizon of 2050. In October 2004, the TAC agreed to use 80% of the 2000 to 2050 growth in the Blueprint as a way to arrive at 2040 growth projections outside of the immediate study area, plus residential buildout (and a corresponding amount of non-residential build-out) for the projects identified by the TAC in the more immediate study area. Since that time, Placer County, Lincoln, Roseville, and Rocklin and consultants have been separately working to define a cumulative development scenario for western Placer County. This scenario would be used to evaluate a number of specific plan EIRs and Lincoln's general plan update.

Mr. Long referred to a transportation improvements map and a table summarizing development levels that help describe this cumulative development scenario.

Mr. Long informed the SAC that a comparison of development levels under SACOG's 2050 Blueprint and second CDS suggests that there is little difference in aggregate numbers at the county level, but that there is a difference in how the development is distributed. The total development in the cities under the County's CDS is close to those in the 2050 Blueprint.

While the Blueprint allocates more development in the proposed major development project in the West County area, the Placer County CDS allocates more development in other unincorporated areas of the county. Mr. Long concluded that the draft Placer County CDS numbers will not change much and seemed reasonable to use.

Mr. Long said the TAC recommended the use of the Placer County/Cities CDS as the basis for the project's revised second CDS in the Tier 1 EIS/EIR. He asked for SAC input and comments.

SAC Recommendation:

Agree with TAC recommendation.

4. Federal Resource Agency Coordination

Mr. Tidman informed the SAC that PCTPA has been working for two years with federal resource agencies to address their concerns regarding aquatic resources related to the Tier 1 process. Mr. Tidman explained that PCTPA is engaged in a modified NEPA/404 process and has made significant progress with the agencies.

Mr. Tidman said that the agencies approved a Purpose and Need Statement for the proposed project in January 2005, and the screening criteria for identifying the range of alternatives for EIS/EIR analysis in May 2005. Since June 2005, staff and consultants have been developing the range of reasonable alternatives.

Mr. Tidman explained that the range of alternatives would likely include one or two 'avoidance' alternatives proposed by the Environmental Protection Agency (EPA) with agreement from the U.S. Army Corps of Engineers. In addition, separate from the alternatives, PCTPA will study the effects of a different land use scenario combined with Transportation System Management (TSM) in the vicinity of the project. This study would test the effects of more dense land uses than proposed by the Blueprint process in the vicinity of Baseline Road. This study will be undertaken and a discussion will be included in the EIS/EIR.

The two avoidance alternatives currently proposed by the federal agencies include:

- A shorter Parkway with TSM; and
- An expanded buffer and restrictive conservation easements to protect aquatic resources.

Mr. Tidman added that the modified NEPA/404 process has reached agreement that the four recommended corridor alignment alternatives are appropriate for inclusion in the range of alternatives for Tier 1 EIS/EIR analysis.

5. Next Steps

Mr. Tidman listed the following next steps in the planning process and closed the meeting:

- Review and discuss the Foothill Associates' alignments with the Policy Advisory Committee on August 31, 2005.
- Request approval from the SPRTA Board on the alternatives to be studied in the Tier-1 EIS/EIR, at the September 28, 2005, board meeting.
- Distribute a newsletter to all property owners in the study area, and to the broader mailing list, with information on the Foothill Associates' alignments and the current process.
- Work with EPA and FHWA to develop and screen avoidance alternatives.
- Re-initiate the technical studies.
- Schedule Project Development Team (PDT) meetings to share information and updates.

Appendix B
Policy Advisory Committee (PAC) Meeting Summaries

PLACER COUNTY TRANSPORTATION PLANNING AGENCY

Meeting Minutes & Action Items — Final 12.05.03

Meeting Description: Placer Parkway Corridor Preservation – Policy Advisory Committee Meeting #1
Meeting Date September 11, 2003
Minutes Date: 12.12.03 **Location:** City of Roseville Corporation Yard

Persons Attending			
Name	**Affiliation**	**Name**	**Affiliation**
Bill Santucci	Placer County Board of Supervisors	Celia McAdam	Executive Director, PCTPA
Robert Weygandt	Placer County Board of Supervisors	Stan Tidman	Project Manager, PCTPA
Dennis Nelson	Sutter County Board of Supervisors	Denise Heick	URS, Project Manager
Tom Cosgrove	Lincoln City Council	Fritts Golden	URS
Peter Hill	Rocklin City Council	Gary Horton	URS
Gina Garbolino	Roseville City Council	Sharon Kyle	MIG, Inc.
Jan Christofferson	Placer County -- County Executive Officer Ex-Officio Member	Daniel Iacofano	MIG, Inc.
Larry Combs	Sutter County – Administrative Officer Ex-Officio Member	Others Attending Listed Below as Observed (did not sign in so list is incomplete)	
Jody Lonergan	Caltrans District 3 – Ex-Officio Member	John Marin	Tom Brinkman
		Rick Dondro	Marcus LoDuca

Minutes

MEETING SUMMARY

Purpose
The meeting purpose was initiate the Policy Study Advisory Committee (PAC), to review and confirm project goals, discuss issues, and obtain feedback on the project and the Tier 1 EIS/EIR process.

Introductions
Daniel Iacofano acted as meeting facilitator and welcomed the group. He asked for self-introductions from the meeting attendees. He reviewed the meeting purpose and agenda, and mentioned the relevant discussion materials contained in meeting information packets.

PAC Membership and Role

D. Iacofano provided the PAC with direction regarding their roles and responsibilities, serving as an information conduit between project staff, PCTPA and elected officials from jurisdictions directly impacted by the project. He emphasized that their active participation and involvement was important to the success of the project planning effort. He concluded by stating the PAC's primary role would be to provide policy recommendations related to the needs of the various jurisdictions within the project study area.

Project Background

Celia McAdam provided a project overview, identifying the parkway as a multi-modal corridor, and high priority regional transportation project which would connect western Placer County with Sutter County's industrial development area and airport to the west. The total estimated project cost is between $200 – 300 million. Funding is not anticipated until 2015 or later.

The project need was based on regional projections that the SR 65 corridor would be among the fastest growth areas in the state over the next 20 years. This predicted increase in population pointed to a parallel increase in travel demands, and the need to improve the existing transportation corridor connections. The project's purpose is to improve access and mobility, reduce congestion associated with urban growth, minimize environmental impacts, and ease congestion impacts on local roadways.

A Conceptual Plan, completed in 2000, established the advisory committee input process, defined initial project scope, outlined policy guidelines, and developed funding scenarios. A Project Study Report (PSR), completed in 2001, identified preliminary engineering and environmental issues, clarified policy direction, and evaluated alignment alternatives. PCTPA and SACOG Boards adopted both documents.

Placer Parkway Goals -- Identified in the Conceptual Plan & PSR

There are six goals and accompanying policies. PAC feedback was solicited for each goal:

- *Goal 1 – Create a Controlled-Access Highway. The PAC acknowledged the work of previous studies on this goal and supporting policies. PAC members generally agreed with the goal, but raised questions about whether the goal was realistic or achievable. They indicated several issues (access, ownership/operation, and funding) need clarification during remaining project phases.*

- *Goal 2 - Maximize Mobility and Accommodate Planned Growth. There was general consensus from the PAC regarding this goal and its supporting policies. Specific issues to clarify include Baseline/Riego impacts at SR 70/99 and potential Watt Ave. extension/interchange.*

- *Goal 3 – Avoid Growth Inducement and Protect Rural Character of Agriculturally Designated Areas. PAC members generally agreed with the goal, but raised questions about whether it was realistic or achievable. There are questions about the buffer and no-access provisions and how they would be implemented.*

- *Goal 4 - Minimize Environmental Impacts. There was general consensus from the PAC regarding this goal and its supporting policies.*

- *Goal 5 - Improve Safety/Minimize Hazards. The PAC agreed with this goal and its supporting policies.*

- *Goal 6 – Achieve Feasible and Equitable Funding. The PAC agreed in principle with this goal but raised implementation concerns.*

Work Plan Approach

The project's work plan was outlined with information on the project goals, Tier 1 environmental review, proposed schedule, and key milestones. The three primary project goals for the environmental review are:

1) *Identify Alternatives for study in the Tier 1 EIS/EIR*
2) *Identify Preferred Corridor*
3) *Complete a Record of Decision (EIS)/Certify the EIR to allow corridor land acquisition*

The Tier 1 process would identify relative differences among corridor-level alternatives based on a broad/general level of detail. The Tier 1 process is not a well-defined one. It is not a process that is familiar to the general public. Because of this uncertainty, the project team is soliciting input from the project's Technical Advisory Committee (TAC) and its Study Advisory Committee (SAC) as well as engaging in early coordination with federal and State reviewing agencies.

The project's schedule and key milestones are:

- *Screen PSR Alternatives ("fatal flaws")* *End of 2003*
- *Identify/Screen Other Alternatives* *February 2004*
- *Identify Final Alternatives* *May 2004*
- *Draft EIS/EIR for Public Review* *September 2005*
- *Final EIS/EIR* *End of 2006*

Highlights from the Alternatives Identification and Screening Process included travel model forecasts, pending/anticipated major development projects, and data collection/mapping. Transportation modeling information is being updated from the 2001 PSR. Three forecasts would be prepared:

1) *No Project (existing conditions)*
2) *Year 2025/2030 (based on SACOG's 2025 Metropolitan Transportation Plan)*
3) *Second Cumulative Development Scenario (the MTP plus several pending/anticipated urban development proposals)*

The following proposed developments were identified for possible inclusion in the screening process:

- *West Roseville Specific Plan*
- *Placer Vineyards Specific Plan*
- *South Sutter County Specific Plan*
- *Placer Ranch Specific Plan*
- *De La Salle University & Community*
- *Metro Airpark*
- *McClellan Park*
- *Elverta Villages*
- *West Lincoln*

The Resource Mapping for Environmental Screening will be based on existing GIS-based data to distinguish relative differences among corridor alternatives for a particular resource or issue area. This information is being reviewed by the TAC, the SAC and resource agencies.

PSR Concept Alternatives

Concept alignments from the 2001 PSR were described. The project team, based on PSR guidance, data collection/mapping work and limited fieldwork, refined the concept alignments. The map in the PAC packets provided at the meeting illustrated the 500'- and 1,000'-wide corridor widths and potential interchange locations.

Project Issues

Several project issues – most of which were addressed during the staff presentation and PAC discussion, included:

- *Pending/anticipated development proposals – timing and effects on corridor alternative alignments*
- *Corridor alternatives – there would likely be no "preferred" corridor alternative identified until the Tier 1 process was completed.*
- *Tier 1 – first of its kind in northern California and need for early/continuing coordination with FHWA, Caltrans, and federal/State resource agencies*
- *Potential environmental impacts & LEDPA – agriculture, biological resources, growth-inducement, and addressing federal concerns*

Opportunities for Input

Public outreach includes:

- *Ongoing advisory committee meetings to assess data and policy issues*
- *Stakeholder interviews conducted with diverse community, business, agency, and environmental contacts*
- *Community meetings*
- *Development of project newsletters*
- *Creation of dedicated project web site*
- *Upcoming public scoping meetings on October 6, October 9*

INTRODUCTIONS

The first Policy Advisory Committee (PAC) meeting was held on September 11th, 2003 at the City of Roseville's Corporation Yard. The purpose of the meeting was to initiate the Policy Advisory Committee, to discuss issues, and get feedback on the proposed project and its Tier 1 EIS/EIR.

Daniel Iacofano, who acted as the meeting facilitator, began the meeting by welcoming the group, and asking for self-introductions from the participants. D. Iacofano also reviewed the meeting agenda, and discussed material in the meeting information packets.

I. PAC MEMBERSHIP AND ROLE

D. Iacofano provided the PAC with specific direction regarding their roles and responsibilities. He stated that the PAC's primary role was to serve as an information conduit between project staff, PCTPA and among elected officials from jurisdictions directly impacted by the project. He stressed that their active participation and involvement was very important to the success of the project planning efforts. Project planning would be an open process and no decisions have been set in stone. He said the PAC's role would be to provide the technical staff with policy recommendations related to the needs of the various jurisdictions within the project study area. He also mentioned that PAC meetings would be facilitated and comments would be recorded through meeting minutes. An "issues bin" would document comments not called out on the agenda.

II. PROJECT BACKGROUND

Overview

Celia McAdam provided a project overview, identifying the parkway as a multi-modal corridor, and high priority regional transportation project which would connect western Placer County with Sutter County's industrial development area and airport to the west. The Parkway study area is divided into three segments: western segment (SR 70/99 to the county line), central segment (county line to Fiddyment Road), and eastern segment (Fiddyment Road to SR 65). She estimated the project cost as between $200 – 300 million, and stated that the funding was not anticipated until 2015 or later.

Need

C. McAdam stated that the need for the project was based on regional projections that the SR 65 corridor would be among the fastest growth areas in the state over the next 20 years. She went on to say that this predicted increase in population pointed to a parallel increase in travel demands, and the need to improve the existing transportation corridor connections.

Purpose

C. McAdam identified that the purpose of the project was to improve access and mobility, reduce congestion associated with urban growth, minimize environmental impacts, and ease congestion impacts on local roadways.

History

C. McAdam provided a brief project history, stating that a Conceptual Plan, completed in 2000, established the advisory committee input process, defined initial project scope, outlined policy guidelines, and developed funding scenarios. A Project Study Report (PSR), completed in 2001, identified preliminary engineering and environmental issues, clarified policy direction, and evaluated alignment alternatives. The PSR also clarified several policies: 1) controlled access, 2) need to preserve rural character of agriculturally-designated land in the area, and 3) the delineation of a 1,000-foot no-development buffer zone. She noted that both the Conceptual Plan and PSR were developed and adopted through the cooperation of regional and local planning entities. PCTPA and SACOG Boards adopted both documents.

III. PROJECT GOALS

Goals Identified in Conceptual Plan and the PSR

C. McAdam outlined the six goals and associated policies. She encouraged questions and comments on each.

1. Create a Controlled-Access Highway
2. Maximize Mobility and Accommodate Planned Growth
3. Avoid Growth Inducement and Protect Rural Character of Agriculturally Designated Areas
4. Minimize Environmental Impacts
5. Improve Safety/Minimize Hazards
6. Achieve Feasible and Equitable Funding

Goal 1- Create a Controlled-Access Highway

This goal is to connect SR 65 and SR 70/99. Supporting policies are to:

- identify a precise alignment and preserve right-of-way as soon as possible
- carefully evaluate development proposals that might preclude potential alignments

PAC Feedback

Larry Combs (Sutter County, Chief Administrative Officer) asked if the controlled access feature was shown on the project alignment alternatives corridor map. Fritts Golden (URS) commented that the entire project would likely become a controlled access facility.

Jody Lonergan (Caltrans District 3) said Caltrans considers controlled access as a facility that includes the purchase of access control when right-of-way is purchased.

L. Combs asked about facility ownership and whether it would be built to State standards to maintain all options.

Peter Hill (City of Rocklin) requested more information on the "no access" provision in the middle of the project.

Dennis Nelson (Sutter Co.) asked if the driveways in controlled access would also be restricted. C. McAdam said she believed this would be worked out upon purchase of property near the parkway.

L. Combs inquired about whether a joint powers authority would operate and maintain the facility vs. counties.

Tom Cosgrove (City of Lincoln) -- there was a lot of discussion about facility ownership and standards early on in the project. He said that issues of this nature probably need to be revisited by the PAC. He also said that agricultural concerns were a key to the access issue in earlier studies – particularly ways to preclude urban development and ways to be less growth-inducing.

Rick Dondro (Placer County Public Works) said that the facility was to be at-grade initially and up-gradable for future interchanges.

Gina Garbolino (City of Roseville) thought J. Lonergan's definition was the appropriate one for controlled access.

C. McAdam said controlled access also referred to restrictions in the type of usage allowed for the facility. She explained the 500'-wide corridor for the eastern and western segments and the 1,000'-wide corridor between Fiddyment and Pleasant Grove Roads.

T. Cosgrove thought the controlled access concept was created to protect farmland. He said the concept was created to protect agricultural uses with the Parkway buffer.

G. Garbolino said that Placer County jurisdictions may agree on the buffer, but was concerned about Sutter County and industrial development near SR 70/99. D. Nelson agreed with G. Garbolino that this issue would have to be worked out to accommodate county development plans.

D. Iacofano said some adjustments would have to be made in segments, but a design standard would need to be set. D. Nelson said this would have to be worked out to work with real traffic issues in each county. G. Garbolino said the public envisions or sees a throughway vs. a lot of potential interruptions. T. Cosgrove said the eastern/western segments were always understood to be accessible, only the central segment would not.

P. Hill asked if the map in the meeting packet identified all current alternatives -- or just potential alternatives – and what the status of interchanges were. C. McAdam said that the PSR alternatives were conceptual. Others would also be identified. One of the purposes of the PAC was to provide policy direction to help define them.

R. Dondro said that the project was moving from theoretical alternatives to actual alternatives. He said that the alternatives, and other project elements, are being discussing by entities like Placer Legacy related to their planning efforts.

Jan Christofferson (Placer County Executive Officer) noted that there will be a Placer County Board of Supervisors meeting on October 20 to discuss potential urban development projects in western Placer County as well as the Placer Parkway project.

D. Heick (URS) said that the potential major development map in the information packet would be discussed in detail later in the meeting (PSR Alternatives). She said this map was a starting point to move forward with existing alternatives related to land use issues, resource issues, traffic modeling, etc. She said that the assessment of alternatives was happening now, and all elements are being considered. She added that the project team was open to all suggestions, and input from the PAC was very important.

J. Lonergan addressed the question about whether Parkway ownership and operation could be given to Caltrans. She said possibly. She said it could potentially be considered a segment of SR 102. State adoption would require a petition and construction to Caltrans standards.

Goal 1 - Conclusion: The PAC acknowledged the work of previous studies on this goal and supporting policies. PAC members generally agreed with the goal, but raised questions about whether the goal was realistic or achievable. They indicated several issues (access, ownership/operation, and funding) need clarification during remaining project phases.

Goal 2- Maximize Mobility and Accommodate Planned Growth

This goal is to provide a free-flowing regional facility that will accommodate growth under existing general plans. Supporting policies are to:

- Provide a high-speed, very limited access facility
- Maintain a Level of Service (LOS) C
- Maintain or improve travel times between SR 65 and SR 70/99

C. McAdam stated that it was important to address growth/mobility. She went onto say that there was a need to improve the speed and level of service in the corridor area.

PAC Feedback

L. Combs asked if the EIR would address growth inducement issues and potential urban development – specifically the reality of potential development. He had discussed these issues with J. Christofferson. He was particularly concerned about Baseline Road and Riego Road. The project needed to address Baseline/Riego expansion and how the Parkway would affect traffic. The project needed to deal with the reality of traffic at SR 70/99. He said that Sutter County would be on the receiving end of traffic issues.

C. McAdam said the Baseline/Riego issues are a reason that a Watt Avenue extension is still a consideration. Bill Santucci (Placer County) said Sacramento will have the same problem at SR 70/99.

Robert Weygandt (Placer County) said the visioning meeting (Placer County Board of Supervisors) on October 20 would focus on growth issues in the project area. The first step would be to obtain direction from the County. (This is the same meeting referred to by J. Christofferson.)

R. Weygandt said that urban standards may need to be adjusted to address access. L. Combs asked if this meant no other north/south connection besides Watt. R. Weygandt said if the Board approved a Watt Avenue element (with no other west interchange alternative indicated), another connection would need to be identified in the area.

T. Cosgrove has studied the alternatives map and thinks that Baseline and Riego Roads will have heavy traffic no matter what the connection. Because of the project's long timeline, the Baseline/Riego issues will have to be addressed now.

P. Hill said that if the northern corridor alignment were chosen, there would be no close connection to the Parkway. This corridor would not be utilized by Sacramento for traffic going north/east. T. Cosgrove thought that even if the final alternative were out-of-the-way, people would still use it to avoid traffic congestion. B. Santucci said that the final alternative has to be efficient in order to be used by most people.

L. Combs asked if the Parkway would reduce traffic on Baseline Road by taking traffic from the north. R. Dondro said that traffic studies show that people will go out of their way to get off I-80 – particularly near Rocklin and areas to the north. South of Roseville, however, people would not.

Goal 2 - Conclusion: There was general consensus from the PAC regarding this goal and its supporting policies. Specific issues to clarify include Baseline/Riego impacts at SR 70/99 and potential Watt Ave. extension/interchange.

Goal 3: Avoid Growth Inducement/Protect Rural Character of Agriculturally-Designated Areas
Supporting polices are:

- No access in areas currently designated for agriculture
- Create a no-development buffer zone along the Parkway
- Control signage along the corridor

C. McAdam asked the PAC if they felt that the "no access" policy in the central segment would assist with this goal.

PAC Feedback

T. Cosgrove said that in order for the project to get support, it will need to address how to mitigate growth inducement and access. This will be a complex area to navigate, since local jurisdictions will weigh in on project-related decisions.

G. Garbolino asked how the project would enforce the no access feature. John Marin said this wouldn't be a problem for some properties in the area.

G. Garbolino asked about how many acres were in the central segment? T. Cosgrove said approximately 37,000 acres.

C. McAdam asked all PAC members to review the map carefully, and to relay questions to the project team.

P. Hill said the "no development" buffer would work well until the first interchange was built. Interchanges would all have some development adjacent to them. He thought developers would work around this issue to get people to facilities. D. Iacofano asked P. Hill if this related to whether the no access concept would actually work, pointing to the possibility of developers simply building facilities at the end of the access area. T. Cosgrove said this issue was discussed at the last PSR PAC meeting (several years ago). During that discussion, it was suggested that developers be allowed some access to the area (either at the beginning/or end) of the corridor. He said that when this decision was made years ago to limit access, less development existed and less development was being proposed. P. Hill said he did not have problems with access at both ends of the corridor – he would be concerned if no access was the objective for the entire corridor.

T. Cosgrove said that vicinity land uses are controlled by several local jurisdictions. The question was whether the local jurisdictions would inhibit growth or not. The local jurisdictions would determine this.

B. Santucci asked what the original idea for the buffer along the central segment was. C. McAdam said the idea was to limit growth. R. Weygandt said the "no access" feature was created to efficiently handle traffic and land issues. T. Cosgrove said some visual/aesthetic issues were also factors. Design features such as a wide median would be more pleasing.

P. Hill indicated he did not agree with the approach to reduce growth-inducing effects. He described how I-80 when initially constructed through Rocklin had no traffic. Then Roseville began to grow. J. Lonergan cited I-5 (Colusa to Glenn Co.) as an example of a limited access facility that did not induce growth. P. Hill said the no access issue could be setting-up future elected officials with a lot of problems. T. Cosgrove suggested that community preference could play a role.

Goal 3 – Conclusion: PAC members generally agreed with the goal, but raised questions about whether the goal was realistic or achievable. There are questions about the buffer and no-access provisions and how they would be implemented.

Goal 4: Minimize Environmental Impacts
Policies supporting this goal are to:

- Avoid existing homes
- Avoid high value agricultural operations
- Avoid streams, creeks, riparian corridors, and sensitive habitat

PAC Feedback:

L. Combs asked if detailed information on existing habitat is shown on maps. C. McAdam referred to the maps hanging in room.

D. Iacofano said that one of the goals of the project was to minimize as many environmental impacts as possible. Realistically, the project could not avoid all impacts. So, impacting as few as possible would be an objective. T. Cosgrove pointed out that if one alignment avoided one habitat it could affect another.

L. Combs asked if Placer County had a Habitat Conservation Plan in place to help address environmental mitigation. He said Sutter Co. and the City of Sacramento completed the Natomas Basin HCP. It covers a portion of the project study area. D. Heick said that the Placer County HCP/NCCP was not yet complete. The project team was working with data from both the Natomas Basin HCP and the Placer Legacy HCP/NCCP.

Goal 4 – Conclusion: There was general consensus from the PAC regarding this goal and its supporting policies.

Goal 5: Improve Safety/Minimize Hazards
Policies supporting this goal are:

- Improve emergency response times and evacuation options during natural disasters
- Provide a high design level to avoid potential safety issues

PAC Feedback:

There was no PAC feedback.

Goal 5 – Conclusion: The PAC agreed with this goal and its supporting policies.

Goal 6: Achieve Feasible and Equitable Funding
Policies supporting this goal are:

- Require development in areas served by the corridor to finance a share of the Parkway
- Identify and pursue all existing and potential public and private funding sources for planning, design, and construction

PAC Feedback:

Marcus LoDuca said there would be an equity issue that would be inconsistent with this goal. If developers have no access to the Parkway, would it be fair to assess them for improvements? He said this could also affect developer-based financing.

C. McAdam agreed that lack of access could turn away some developer interest. But, anticipated growth in the general area that does have access would make up for the loss of potential funding in the central segment area. L. Combs said this would not hurt developers who do not build in the area.

T. Cosgrove said that the issue of who pays for the facility was crucial. He indicated that industrial development in the eastern and western segments probably should not have to pay for central segment improvements. The Parkway needs to be viewed as a regional corridor including the airport. It will more than a Sutter County and Placer County facility. C. McAdam acknowledged that honoring this goal would definitely be a challenge.

C. Iacofano— there would be pockets of opportunities related to this project goal.

Goal 6 – Conclusion: The PAC agreed in principle with this goal but raised implementation concerns.

IV. WORK PLAN APPROACH

D. Heick provided the PAC with an overview of the work plan approach. She started with a description of the Tier 1 process. She emphasized the process would identify relative differences among corridor-level alternatives at a broad level of detail. She also pointed out that the Tier 1 process was not a well-defined one. It is not a process familiar to the general public. Because of this uncertainty, the project team was soliciting input from a variety of sources including the TAC and SAC as well as early coordination with federal and State reviewing agencies. The project was now undergoing a process to identify corridor alternatives to eventually study in the Tier 1 EIS/EIR. This process involved assessment at a GIS-level (Geographic Information System) of detail to identify general location, mode choice, etc. The Tier 1 process would help identify strategies for mitigation, which would be applied in the Tier 2 (project-level) environmental process.

C. McAdam added that the Tier 1 process was designed to speed up the process of addressing the need to preserve land for a future facility.

Project Goals

D. Heick reviewed the three primary project goals for the Tier 1 EIS/EIR:

(1) The first goal is to identify corridor alternatives for study in the Tier 1 EIS/EIR, consistent with the project's purpose and need, and LEDPA requirements.

B. Santucci asked if the LEDPA would be identified in the second tier of environmental documentation, and what did it stand for? D. Heick said that LEDPA stands for "Least Environmentally Damaging Practicable Alternative." Prior to

construction, a Section 404 permit will be required from the U.S. Army Corps of Engineers (ACOE), and a determination needs to be made during that process that the project selected for construction is the "LEDPA" alternative. In this current Tier 1 project, no permit is required. However, the project team is in early consultation with the ACOE, EPA and other agencies to discuss and get direction to complete the Tier 1 process as well as to facilitate subsequent Tier 2 reviews. Even though the formal LEDPA process would not be required for the Tier 1 review, the ACOE and EPA are interested in assisting the project team in developing a LEDPA-like process for corridor identification. This would be helpful for the overall success of the project, and could avoid corridor LEDPA issues being raised during the Tier 2 process.

D. Heick said that she didn't know for sure when the LEDPA-like process would be completed, as the project team is meeting with the Corps and EPA to work out the details. The formal LEDPA process would be completed prior to obtaining permits from the ACOE after the later Tier 2 process.

(2) The second project goal is to identify a preferred corridor.

D. Heick said that alternatives evaluation would happen later in the project process, after the SAC/TAC reviewed more refined data. She also said public meetings would help to get further input.

L. Combs outlined two vicinity habitat conservation plans (HCPs) – the recently completed Natomas Basin HCP and one being developed for the SR 70/99 area with Yuba County. He asked if an HCP had to be completed before urban development and transportation facilities were built. R. Weygandt said that Placer Legacy is an HCP now underway and the Parkway is one of the proposed improvements being assessed in it. L. Combs said that Placer Legacy would be helpful in getting the Parkway project approved. D. Heick said that the project team would consult with the Natomas Basin and Placer Legacy HCPs regarding environmental/conservation planning. The Parkway project would attempt to work in concert with both HCPs.

(3) D. Heick identified that the third project goal is to obtain a (federal) Record of Decision and (CEQA) Certification of the EIR, to start corridor acquisition and preservation.

Schedule

D. Heick reviewed project schedule milestones:

- Screen PSR Alternatives ("fatal flaws") End of 2003
- Identify/Screen Other Alternatives February 2004
- Identify Final Alternatives May 2004
- Draft EIS/EIR for Public Review September 2005
- Final EIS/EIR End of 2006

D. Heick noted that draft alternatives identified for the Tier 1 EIS/EIR analysis would be reviewed with the PAC. L. Combs asked whether the Placer/Sutter Boards of Supervisors had weighed in on the project as it stands. D. Heick indicated the PAC's role was to provide input and to represent their jurisdictions by attending meetings. Several PAC members stated that the full Boards of Supervisors and each affected City Council need to weigh in on the project. D. Iacofano suggested that the project team conduct briefings and schedule presentations to these groups to get consensus on project elements. D. Heick said the PAC could also request individual briefings to bring folks up to speed. L. Combs suggested that the project not wait until the end of the planning process to speak with these groups. E-mailing progress reports would be helpful.

Alternatives Development & Screening Process

D. Heick discussed the Alternatives Development/Screening process. She reviewed the various transportation modeling, environmental, and engineering screening processes and timeline for pivotal activities. Initial findings related to PSR

alternatives screening would be discussed with the TAC/SAC in October. Other potential corridor alternatives would subsequently be identified.

Initial Travel Model Forecasts

Heick explained that the transportation modeling information was being updated from the 2001 PSR. Three forecasts would be prepared:

- No Project
- Year 2025/2030 (based on SACOG's 2025 Metropolitan Transportation Plan)
- Second Cumulative Development Scenario (the MTP plus several pending/anticipated urban development proposals)

She referred to a list (below) and a map of Major Proposed Developments in the project area. These potential projects would affect growth and employment projections in the study area. The project team is developing a second travel forecast model based on this more robust condition. The specifics of this model are being developed with TAC input.

T. Cosgrove asked whether there was a plan to make this information available on the project web site. D. Heick said that a dedicated Placer Parkway web site was being developed, and that this information would be made available. PCTPA also has information posted on its web site.

T. Cosgrove asked whether SACOG's developing Blueprint model would be considered a for alternatives analysis. D. Heick—said that perhaps some information would be used, such as revised land use forecasts, at later stages in the process. The schedule for the Tier 1 process is to identify corridor alternatives before the Blueprint process is completed.

Major Proposed Developments

D. Heick identified and briefly reviewed the following list of proposed developments. She asked for PAC feedback on how to realistically evaluate them for possible screening consideration.

- West Roseville Specific Plan
- Placer Vineyards Specific Plan
- South Sutter County Specific Plan
- Placer Ranch Specific Plan
- De La Salle University & Community
- Metro Airpark
- McClellan Park
- Elverta Villages
- West Lincoln

There were no PAC comments.

Resource Mapping for Environmental Screening

Next, D. Heick went on to review the process of resource mapping for environmental screening. D. Heick referenced the various resource/issue maps on the wall for detail. She went on to explain that the process takes existing GIS-based data, and it is then reviewed by the TAC, SAC and other resource agencies, for review for accuracy, and to identify various differentiators among environmental topics. The project team will then apply the data and screen the PSR alternatives, and then identify potential other alternatives.

There were no comments from the group on this topic.

IV. PSR CONCEPT ALTERNATIVES

D. Heick referred to the PSR alignment alternatives map in the meeting information packets. The project team has refined the conceptual alignments according to PSR guidance, data collection/mapping work, and limited fieldwork. She pointed out the 500- and 1000-foot corridor widths and the placement of potential interchanges. She asked the group for feedback regarding the refined concept alternatives.

L. Combs noted that potential Pleasant Grove Road interchanges would be a problem for Sutter County. His concern focused on high-speed travel associated with the amphitheater to the north in Yuba County. He stated that the Board of Supervisors hadn't discussed this issue formally, but he wanted to point this out to the project team. He suggested consulting the Sutter County General Plan and Zoning Ordinance map. He said that an alternative interchange location further west of Pleasant Grove would work more efficiently. He went on to say that if the Parkway crossed Riego Road, there might be associated problems. He also noted that there might be environmental implications to locating an alternative along Sankey Road because of potential Natomas Basin HCP habitat areas.

D. Heick noted that based on comments generated by the PAC, the map will be revised, and distributed for review to the TAC for comment prior to being displayed at the upcoming public scoping meetings.

P. Hill asked about the number of bridges to be built and if any local ones would be needed to protect sensitive areas and to provide access to farms? D. Heick responded that was early in the project planning process, but these questions would be assessed for consideration. Local access would need to be maintained.

VI. PROJECT ISSUES

Stan Tidman reviewed the topic of project issues – most of which had been addressed during the staff presentation and PAC feedback. These issues included:

- Pending/anticipated development proposals – timing and effects on corridor alternative alignments
- Corridor alternatives – there would be no "preferred" corridor alternative identified until the Tier 1 process was completed
- Tier 1 – first of its kind in northern California and need for early/continuing coordination with FHWA, Caltrans, and federal/State resource agencies
- Potential environmental impacts & LEDPA – agriculture, biological resources, growth-inducement, and addressing federal concerns

T. Cosgrove asked if the map shown on page 11 of the PSR (showing very specific alignment alternative locations) could be perceived as the final project alternative. S. Tidman responded that the PSR concept alignments were preliminary. They were based on input developed during the PSR process (preliminary engineering and environmental studies). They were for programming purposes and to develop preliminary cost estimates. The project team understands that the PSR alternatives will need to be put in proper context for the general public, and to continue to reiterate that the entire study area is being considered for appropriate alternatives.

P. Hill raised a concern about the 1,000'-width for the central segment and whether any options had been taken on this land.
D. Heick responded that the project had the most current public information from each jurisdiction related to development/general plans, parcel ownership, etc., but not information at the level of detail that would identify options on individual parcels.

C. McAdam agreed that the project would work with the existing land uses that jurisdictions have assigned. She stressed that the project needed to be aware that information about development would have to come from county contacts in order to continue to get the most accurate picture regarding future land use plans.

G. Garbolino asked if it would be easier to get Parkway approvals for the environmental review and then worry about development as a secondary issue. Another (unidentified) PAC member stated that this dilemma could be an opportunity for the project team to coordinate with County staff on how to plan realistically, related to development.

T. Cosgrove said the project needs the ability to look at the corridor and accurately predict the best method to assess existing conditions, mitigate growth inducement, and consider development plans.

VII. OPPORTUNITIES FOR INPUT

D. Iacofano reviewed public outreach efforts that have been planned or conducted in relation to the project:

- Meetings with TAC, SAC, and PAC members to assess project data and policy issues
- Stakeholder interviews conducted with diverse community groups, businesses, agencies, and environmental contacts
- Community meetings
- Development and distribution of project newsletters
- Creation and launch of a dedicated project web site

VIII. NEXT STEPS

D. Iacofano reviewed future planned project milestone activities related to the project.

- Complete traffic model
- Finalize resource mapping and screening criteria
- Screen PSR alternatives
- Identify/screen other alternatives
- Conduct public scoping meetings on October 6, and October 9

He urged the PAC (and other advisory committee members) to attend the October 6 and October 9 public scoping meetings, if possible.

D. Iacofano stated that the next PAC meeting was scheduled for February 2004. D. Heick added that since that was many months from now, a special meeting may be scheduled between now and February. D. Iacofano stated that the PAC would be communicated with through email regarding any project-related news and information.

Future Actions

- The PAC recommended that the project team schedule briefings and/or project updates for Placer and Sutter County Boards of Supervisors and the cities of Lincoln, Rocklin, and Roseville. Each of these jurisdictions would eventually take action on the proposed project.
- The project team will complete the preliminary identification of alternatives and share them with the PAC.
- Another PAC meeting may be scheduled (before spring of 2003) -- depending upon the outcome of the Placer County Board of Supervisors' West Placer Land Use Visioning Workshop on October 20, or other events.

Close

Meeting adjourned at 3:40 PM

PLACER COUNTY TRANSPORTATION PLANNING AGENCY

Meeting Minutes & Action Items **FINAL 5-26-0**

Meeting Description: Placer Parkway Corridor Preservation –Policy Advisory Committee Meeting #2
Meeting Date March 4, 2004
Minutes Location: City of Roseville Corporate Yard – Rooms #2 and #3
Date: Hilltop Circle

	Persons Attending		
Name	**Affiliation**	**Name**	**Affiliation**
Bill Santucci	Placer County Board of Supervisors (District #1)	Jeff Clark	Sacramento Public Works Agency – Transportation
Robert Weygandt	Placer County Board of Supervisors (District #2)	Tom Brinkman	Placer County Public Works

Minutes			

MEETING SUMMARY

Purpose

The meeting was convened to review with the PAC the Technical Memorandum on the Screening Evaluation of PSR Alternatives, and to receive PAC feedback on the Memorandum's recommendations and direction on goal/policy issues.

Technical Memorandum Overview

Stan Tidman reviewed the Technical Memorandum, which had been made available to PAC members prior to the meeting along with a briefing package that included combined TAC/SAC recommendations. He explained that the Technical Memorandum had been prepared to present the results of the screening process used to analyze the conceptual Placer Parkway corridor alignment alternatives identified in the 2001 Project Study Report (PSR). He reviewed the organization and contents of each chapter, and encouraged the PAC to provide input, correct information, and ask detailed questions. Recommended potential modifications

were included in the Technical Memorandum and discussed by the PAC.

Recommendations and Conclusions

During the PAC meeting, the following items in **bold** were considered. PAC actions and recommendations are noted in *italic*.

A. Potential Modifications Eliminating or Adjusting PSR Corridor Alignments

#1. Reroute central and southern alignments north of the current alignment to avoid a large vernal pool complex located immediately northeast of the West Roseville Specific Plan area.

PAC concurred with TAC/SAC to route the central and southern alignments north to avoid sensitive areas. Some PAC members expressed concern about the 'jogs' in the alignment and felt they might discourage use of the future Parkway.

#2. Eliminate the northern corridor alignment between SR 70/99 and approximately Amoruso Acres.

PAC concurred with dropping the northern corridor alignment between SR 70/99 and a point just east of Amoruso Acres on Sunset Boulevard West.

#3. Modify the central corridor alignment:

#3a. Minimize encroachment into large wetland/vernal pool area and conservation area at Curry Creek.

PAC concurred with TAC/SAC in shifting the central corridor alignment north in the vicinity of the confluence of two branches of Curry Creek. In response to a more southwesterly direction for the alignment, the PAC felt that this warranted further study.

#3b. Adjust alignment in western segment to avoid Pleasant Grove/Sankey community and designated conservation area.

PAC concurred in shifting the central corridor northward to avoid a part of the Pleasant Grove/Sankey community and the designated conservation area.

#4. Modify the southern corridor alignment

#4a. At eastern end, extend it west before descending south, avoiding an historic ranch complex, vernal pool areas, and future Section 4(f) properties in West Roseville Specific Plan.

PAC concurred with adjusting the southern corridor westward to avoid resources noted.

#4b. At southern edge (parallel to Baseline Road), avoid large man-made waters and one rural residential community by moving corridor north or south

PAC supported moving the alignment one mile north of Baseline Road and eliminating an alignment close to Baseline.

#4c. Move corridor closer to Baseline Road to minimize growth inducement

PAC recommended eliminating an alignment closer to Baseline Road.

#5. Work with Sutter and Placer County staff to identify working farm units; the evaluation of corridors using this information.

PAC concurred with the recommendation of continued coordination with Placer and Sutter County agricultural staff to identify working farms for use in evaluating alignments.

B. Other Potential Modifications

Recommendations for Other Potential Modifications

In response to a suggestion of a more southwesterly direction for the ascending portion of the southern alignment, the PAC felt that this warranted further study.

C. Additional Direction

Connections to State Routes

Sunset Boulevard Connection – *PAC concurred with eliminating this connection*.
North of Sankey Connection – *PAC concurred with eliminating this connection*.
South of Riego Road Connection – *PAC recommended eliminating this connection (due to potential growth inducing factors) after meeting and assessing it with the City of Sacramento and Sacramento County*.

D. Goal/Policy Issues & Input

No Access – Fiddyment Road to Pleasant Grove Road – with the exception of a potential Watt Avenue extension.

PAC reaffirmed that there would be one potential access point between Fiddyment Road and Pleasant Grove Road. The PAC requested that the project team define growth inducement in the Technical Memorandum and provide additional information to eliminate apparent inconsistencies, and to reexamine the Watt Avenue connection. The project team clarified that any future Watt Avenue extension would not be a part of the Placer Parkway project, but that the Parkway project would study a potential future connection with it.

No-Development Buffer

PAC stressed that the idea of the no-development buffer must be reaffirmed in terms of the current development situation. The PAC concurred that the buffer size and location should be flexible and related to performance standards, and should maximize opportunities to incorporate adjacent sensitive areas into the buffer. The Parkway should include a component protective of agriculture and it needs to be elastic, i.e., have the ability to expand if necessary.

MEETING NOTES

I. INTRODUCTIONS

The 2nd Policy Advisory Committee (PAC) was held on March 4, 2004 at the City of Roseville Corporation Yard. Celia McAdam, Executive Director of the Placer County Transportation Agency (PCTPA) opened the meeting and welcomed the group. After introductions around the room, she turned the meeting over to Stan Tidman, PCTPA Project Manager, to review project activities since that last PAC meeting in 2003.

S. Tidman provided an overview of the project purpose as a regional transportation facility; goals related to the 2000 Conceptual Plan/PSR; design and construction costs /timeline and the corridor preservation process (the environmental review process, Tier 1 process); and final property acquisition/project right-of-way. He also discussed issues reviewed the September 2003 PAC meeting, including:

- Tier 1 Environmental Review Process
- Coordination with Resource Agencies (Finding agreement related to the Least Environmentally Damaging Practicable Alternative)
- Goals/Policies (Access, No development buffer)
- Pending and Anticipated Development in Project Area—West Roseville Specific Plan, Placer Ranch Specific Plan, De Salle University and Community
- Curry Creek Community Plan
- Development of the Technical Memorandum (S. Tidman briefly discussed the discussions and recommendations related to the Memorandum from recent Technical and Study Advisory Committee meetings)

Project Schedule Review
S. Tidman discussed current project status related to overall schedule/activities. He briefly covered the status of critical milestones related to both completed and planned technical assessments/advisory meetings, public outreach activities (upcoming meetings planned in fall 2004) and the preparation of the Environmental Impact Statement/Environmental Impact Report (EIS/EIR), planned for fall 2005. S. Tidman mentioned that the team was closely coordinating with resource agencies (Army Corps of Engineers and Environmental Protection Agency) regarding the LEDPA, and the possibility that this could cause the schedule to slip slightly.

II. DRAFT TECHNICAL MEMORANDUM OVERVIEW

S. Tidman began with a review of the Technical Memorandum content:

Chapter 1 – Introduction/Purpose of Technical Memorandum
Chapter 2 – Project Background
Chapter 3 – Alternatives Identification Process.
Chapter 4 – Transportation Analysis of PSR Alignments (growth projections/development scenarios/travel forecasting).
Chapter 5 – Environmental Screening (data collection/screening criteria/data analysis of existing conditions).

Chapter 6 – PSR Corridor Alternative Screening Summary and Recommendation.

Potential Fatal Flaws

S. Tidman explained that for the project a fatal flaw was defined as anything that would stop the project or would not meet its purpose and need. He noted that during review of the corridor alignments, no fatal flaw had been revealed; however, some constraints had been identified.

Compatibility with Goals and Policies

S. Tidman briefly reviewed the six goals and policies of the project:

Goal 1 – Create a controlled access highway.
Goal 2 – Maximize mobility and accommodate planned growth.
Goal 3 – Avoid growth inducement and protect rural character of agriculturally designated areas.
Goal 4 – Minimize environmental impact.
Goal 5 – Improve safety and minimize hazards.
Goal 6 – Achieve feasible and equitable financing.

III. POTENTIAL MODIFICATIONS TO PSR CORRIDOR ALIGNMENT ALTERNATIVES

S. Tidman discussed potential modifications to the PSR corridor alignment alternatives. The five potential modifications were identified during the screening of the PSR alternatives, a process designed to reduce potential adverse impacts.

Potential Modification #1 – Reroute central and southern alignments to the north for connections at Whitney Boulevard to avoid a large vernal pool complex located immediately northeast of the West Roseville Specific Plan area.

Potential Modification #1 Comments

Jody Lonergan, Caltrans District 3, asked if the alignment map being referenced during the meeting (a large full color map of the project study area used to orient the PAC during alignment discussions) was included in the Technical Memorandum. She said she thought it would be helpful for all the PAC members to have such a map to refer to during the meeting. S. Tidman said the map was not in the Technical Memorandum, but he could provide a copy.

Peter Hill, City of Rocklin-City Council said he was confused about information presented in the Technical Memorandum and the potential modifications shown in the presentation map. He followed up by asking how the meeting briefing package materials distributed to PAC members prior to the meeting corresponded to information being presented during the meeting. J. Lonergan she was also confused by the PAC meeting briefing package information and how it correlated to the alignment map being used as a reference for the group discussion. S. Tidman clarified that the PAC was being asked to respond (with questions, adjustments, and additional recommendations) to the modifications being shown as part of the presentation, and as recommended in the Technical Memorandum. Denise Heick, URS Project Manager, responded that she understood how the information could be confusing, but the maps referenced during the

meeting were still conceptual and were not available for distribution until after they had been reviewed by the project's traffic engineers. They were sketches of how the recommendations in the Technical Memorandum would look.

Bill Santucci, Placer County Board of Supervisors (District 1), asked if modification #1 showed any changes to the central segment. D. Heick responded, yes; she indicated where resources were located that led to the recommended modification.

Larry Combs, Sutter County-County Administrative Officer, said the directness of the route was a primary concern to project area travelers. He was concerned that people might use local roads as alternatives to the Parkway if it were to twisting, and stressed that decisions related to alignment routes should be assessed in a simple and logical manner. L. Combs said that he wanted to review traffic analyses to see what impacts were projected as the area developed. John Long, DKS Associates (traffic consultant), responded that a series of scenarios had been analyzed for the project. He said there was environmental trade-offs related to the alignment scenario, and associated traffic implications.

L. Combs said he felt that the project analysis was projecting minor growth in Sutter County, and he thought this was inaccurate based on known plans and discussions with developers. He wondered how this would be reconciled. J. Long responded that the project team had developed additional scenarios working with the TAC, and then studied projections related to planned/existing development in each county located in the project area. One scenario was to use the MTP (which shows little development), the other was a scenario that tests greater growth and development.

Dan Silva, Sutter County Board of Supervisors, asked staff what was considered the most contentious project issues. C. McAdam responded that policy issues such as, no-development buffers and no access in the central segment except a possible Watt Ave. extension seemed to be the principal issues.

T. Cosgrove agreed that working through the issues related to access and the buffer zone would be one of the major project hurdles during agency coordination. He noted that these policies had been developed to address the issue of growth inducement.

C. McAdam stated that potential modification #1 was based primarily on avoiding vernal pools. She asked the group if they concurred with this premise. B. Santucci said he was curious about the jogs in the alignments and felt they might discourage use of the Parkway. To get a straighter alignment it may be necessary to look at potential impacts and offset them. He also expressed concern with the southern route that had a lengthy north/south segment. T. Cosgrove referenced the "Marconi Curve" project (SR 160 – north of Sacramento), which was designed to avoid a farm well and ended up becoming a concession that everyone had to live with. He asked if there was a benefit to using the corridor to acquire and protect environmentally sensitive areas.

Robert Weygandt, Placer County Board of Supervisors (District 2), said a meandering roadway was not a problem as long as it didn't compromise the speed of roadway users. T. Cosgrove said the project should think of the most convenient route for the alignment, otherwise people would find alternative routes on surface streets. A good alignment would make it more likely to be supported by the community. L. Combs said the Marysville area becoming a bottleneck, and commuters coming south on Highway 99 would be looking for an alternate route across to Highway 65. He said this would take people over Howsley and other east-west roads.

L. Combs stressed that the highway connections had to be convenient to users. B. Santucci agreed with T. Cosgrove and L. Combs that if the connections to the Parkway were not convenient people wouldn't use it. Part of the intent of the Parkway was to get people off Baseline.

J. Lonergan said, based on her experience on similar projects, agency agreement on the LEDPA was essential. She stressed that agencies could tie up the project if they don't agree that the LEDPA was identified. Gina Garbolino, City of Roseville-City Council, said that the project should seek to choose an alternative that best meets the transportation needs of the area, while acknowledging the agencies have influence.

D. Silva noted that this is a regional project, and he believed commuter connectivity to job centers would be an important issue for the project to address. He said the most practical route is one that moved travelers efficiently. T. Cosgrove said during the project's history the Parkway looked at centers of commerce and residences, plus the need to get people to Sacramento. He felt that EPA wasn't as concerned with commuter needs as other issues, but they could potentially stall the project if it didn't address environmental issues. C. McAdam said that addressing the various project needs continued to be challenging.

Recommendation for Potential Modification #1
PAC concurred with the TAC/SAC conclusions, and agreed to routing the central and southern alignments north to avoid sensitive areas.

Potential Modification #2 – Eliminate northern corridor alignment from SR 70/99 to Amoruso Acres and transition it to a central and/or southern route at this location.

S. Tidman noted that the alignment went through an agricultural area that is important to Sutter County. He said this alignment offered the least traffic benefits and had the greatest potential among the alternatives for growth inducement. However, it appeared to have the fewest environmental impacts to aquatic resources.

Potential Modification #2 Comments

D. Heick said that the elimination of the northern alignment should be tempered by the implications for identifying the LEDPA. She added that in the NEPA/404 process the environmental benefits of the route would need to be compared to the modified alignment scenarios (rather than to the original alignments). D. Silva said he was not yet in favor of dropping the alignment. J. Lonergan asked how large the environmental difference was. She made note of another project where they could not get EPA to agree to a less than 4 acre difference between alternatives. She pointed to her past experience with the EPA potentially stalling a project with questionable LEDPA impacts. D. Heick said there were no riparian impacts and about 31 acres of wetlands impacts on the alignment. Others had more, between 28-60 acres on other project alignments. T. Cosgrove concurred that EPA could be unyielding in its environmental impacts stance. J. Lonergan asked if proposed alignments were based on development and non-development scenarios. D. Heick responded that the project based the alignments on both development and non-development scenarios.

Rick Dondro, Placer County Dept. of Public Works (representing Jan Christofferson, Placer County Executive Officer), said he believed that this northern route was not very direct, and relieving Baseline Road wasn't optimal with this alignment. L. Combs asked if the northern alignment could continue across

on Howsley rather than dip down to Highway 70/99. G. Garbolino said this northern connection would be very inconvenient for anyone in the Roseville area. People headed south would see no travel benefits and would use Baseline Road.
T. Combs asked if the project could go outside of the study area in the northern area to consider other alignment modifications. J. Long said that during the project development, it was found that the areas to the north had the fewest traffic benefits. C. McAdam added that the spacing needed between interchanges also figured into the configuration of this alignment.

P. Hill asked about the downside of leaving this alignment in for another round of analysis. If this option was left in, would it be considered for evaluation during future environmental assessments? D. Heick said the choices were to leave it in for further review, or the PAC could agree to eliminate it. P. Hill said he didn't feel the northern alignment was of benefit to the cities of Roseville or Rocklin, so it should be eliminated. T. Cosgrove said he believed some agencies would prefer this alternative because of its environmental merits. We don't know if resource agencies will want it back in. G. Garbolino said she didn't care if agencies preferred the alignment, the point was to provide benefit to the communities. D. Heick said realistically the project team must work with the agencies in order for the project to move forward. Lack of cooperation could slow down the project. G. Garbolino suggested that perhaps there were other alternatives that could be reviewed and considered, since the evaluation process was still ongoing.

C. McAdam asked what the PAC's decision was regarding the northern alignment modification. She asked whether the PAC wanted additional information to assist with the decision making process. The project team could also bring back more information from upcoming agency meetings for the PAC to consider. G. Garbolino said she didn't support this alignment. B. Santucci said he didn't support this potential modification. R. Weygandt said the group must think strategically regarding demonstration of a thorough evaluation process for any alternative presented. L. Combs said the project must look at the alternatives in the context of current conditions, not merely based on past historic considerations that may have changed.

C. McAdams asked if there were any objection to adopting modification #2 eliminating the northern alignment. There was general consensus from the PAC to drop the alignment.

Recommendation for Potential Modification #2
PAC concurred with the elimination of the northern corridor alignment between 70/99 and a point just east of Amoruso Acres on Sunset Boulevard West.

S. Tidman then introduced potential modifications 3a and 3b.

Potential Modification #3a – Minimize encroachment into large wetland/vernal pool conservation area at the confluence of two main branches of Curry Creek to reduce habitat fragmentation and impacts.

Potential Modification #3b – Adjust alignment in western segment to avoid Pleasant Grove/Sankey community and designated conservation area.

There was general concurrence among PAC members to adopt these modifications.

Recommendation for Potential Modifications 3a-3b.
a. *PAC concurred with SAC/TAC regarding shifting the central corridor alignment north in the vicinity of*

the confluence of the two branches of the Curry Creek).

b. *PAC concurred with SAC/TAC regarding shifting the central corridor northward to avoid part of the Pleasant Grove/Sankey community and a conservation area.*

S. Tidman then introduced potential modifications 4a through 4c.

4a – Avoid historic ranch complex, large vernal pool areas, and future Section 4(f) properties in the West Roseville Specific Plan Area at the eastern end.

4b – Avoid large man-made water of the U.S. and rural residential community along the southern edge.

4c – Move the corridor closer to Baseline Road to minimize growth inducement.

Potential Modifications #4a-c Comments

D. Silva asked where the modification was located on the large presentation map. D. Heick indicated the locations in question.

R. Dondro noted that the water feature (water ski park/catfish pond) near Baseline Road was man-made, possibly constructed over an historic wetland area. The "community" above Baseline Road is very loosely defined. D. Heick said the TAC suggested that the project team undertake more research into this topic. The project team researched the history of the area and identified seasonal wetlands in historic air photos.

T. Cosgrove suggested that the closer the Parkway is to Baseline Road the less the traffic benefit would be to the area. G. Garbolino agreed. R. Dondro said two major transportation facilities next to each other would not provide traffic benefits to this area. B. Santucci said he didn't support having a Parkway next to Baseline, that it would create lawsuit after lawsuit, and that Placer Vineyards and other developers would probably oppose to this notion. J. Long added that a factor would be the location of future interchanges and efforts to avoid the community in this area. T. Cosgrove recommended moving the alignment be one-mile north of Baseline Road to optimize this route.

D. Heick added that other considerations related to this option include, the southern alignment hugging Baseline Road, along with development of the Sutter County community plan. She suggested that the outcome of the plan might be consistent with mitigating growth inducement in this area. T. Cosgrove added that the Parkway would cause some growth inducement (no matter where it was ultimately located); having it close to Baseline Road would be only a temporary "urban edge".

There was consensus among the PAC members for a 1-mile separation between Baseline Road and the alignment.

Recommendations for Potential Modifications 4a-4c
a*. PAC concurred with SAC/TAC regarding adjusting the southern corridor westward to avoid natural and cultural resources.*

***b.& c**. PAC supported moving the alignment paralleling Baseline Road one mile-north of the road and eliminate an alignment close to Baseline Road.*

S. Tidman then introduced modification #5.

Potential Modification #5: Work with Sutter and Placer County staff to more specifically identify farm units, and evaluate corridor alignments using this information to minimize impacts.

Potential Modification #5 Comments

P. Hill said he agreed with preserving working farms, but wanted some clarification on the definition of working farms. D. Heick said the working farms were single operations with features such as irrigation system connectivity and that contributed to agricultural viability. T. Cosgrove noted that some may claim to be "working farms" but were not contributing. D. Silva spoke of the need for connectivity for equipment usage and movement. D. Heick noted the intent was to understand what is happening in terms of farm units.

P. Hill asked when this determination needed to be finalized. D. Heick said within the year. T. Cosgrove said the project would have to make sure the working farms were legitimate entities.

Recommendation for Potential Modification #5
PAC concurred with the recommendation for continued coordination with Placer and Sutter County agricultural staff to identify working farms (and gathering more conclusive data).

IV. OTHER POTENTIAL MODIFICATIONS

S. Tidman next brought up the subject of other potential modifications that had not been discussed.

Other Potential Modifications Comments:

R. Dondro expressed concern with the north-south segment of the modified southern alignment being out-ofdirection for Parkway users. He briefly discussed what he felt was a better alignment -- a diagonal alignment that angled across the study area in a southwesterly direction before paralleling Baseline Road. He mentioned that this concept was discussed at TAC/SAC meetings and both concurred that this modification merited further study. It was recognized that there may be issues with farmlands and wetlands, and the proposed modified alignment was not yet set. S. Tidman said the TAC/SAC had agreed to consider such an alignment.
B. Santucci said it was worth study, and there was consensus on this.

S. Tidman mentioned that the project team had recently met with Sutter County and there had been a suggestion to mover the Parkway corridor north of Sunset Blvd. West. L. Combs said that people from Yuba City and Marysville would be looking for an alternate to Highway 65, and would take Highway 99 south and look for ways to get to Highway 65 lower down; he believed there was a need for a northern connector. R. Dondro said over time the surface roads would be improved and have the ability to connect east-west. This would supplement the Parkway. L. Combs noted that 12,000 new homes were scheduled to be built to the north.

J. Long said the issue was recognized. Development scenarios would be crafted to include what is not in the MTP. Perhaps traffic data (south Yuba county growth forecasts) that were not part of the initial SACOG forecasts would need to be assessed. He said that the project team would need to discuss this recommendation with the TAC, for feedback and discussion. L. Combs said he needed understand how it was all going to work together. R. Jensen explained that traffic volumes could be layered over existing traffic models and then updated and re-evaluated.

Recommendations Related to Other Potential Modifications *– In response to Rick Dondro's suggestion of a more southwesterly direction for the alignment, the PAC felt that this warranted further study.*

S. Tidman continued with a discussion related to additional connections, and direction from the PAC:

V. ADDITIONAL DIRECTION

- **Retain Sunset Boulevard connection?**

PAC Comments
R. Dondro shared that the TAC recommended eliminating the Sunset connection to the Parkway. A future connection to Sunset would be via a local road. P. Hill said that he supported eliminating this connection.

Recommendation Related to Retaining the Sunset Boulevard connection
PAC recommended eliminating this connection.

- **Retain north of Sankey connection? (which was western end of northern alignment)**

Recommendation Related to Retaining the north of Sankey connection
PAC recommended eliminating this connection.

- **Retain south of Riego connection?**

Comments
The project team shared that they had been in recent discussions with the city and county of Sacramento, and proposed eliminating this connection due to potential growth inducing factors.

Recommendation Related to Retaining south of Riego Road connection
The PAC suggested eliminating this connection (due to potential growth inducing factors), but only after the project team met with the City of Sacramento and Sacramento County for their views.

VI. GOALS/POLICY ISSUES & INPUT

C. McAdam facilitated a discussion regarding goals and policies, and asked for PAC feedback and recommendations. She said the project team was looking for reaffirmation of goals:

Policy: "No Access" – Fiddyment to Pleasant Grove (except potential Watt Avenue)

C. McAdam noted that the Sierra Club and others wanted a study of more access in the Central Segment, because they felt that it would eventually occur. SACOG said the project should be studied with the no

access concept. The TAC and SAC input on this issue was not to re-visit or consider any changes to this provision. The Parkway, with this provision, is in SACOG's MTP.

Comments Regarding No Access

P. Hill shared that he recently met with the project team to discuss concerns related to access. He said he thought the Watt Avenue would probably be connected at a future date. He went on to say he did not know what the "unwanted impacts" to Sacramento were related to a Watt Avenue connection were, and to be sure Sacramento did not have a veto. P. Hill said he wanted more discussion in the Memorandum on growth inducement. He said properly defining the term "growth inducement" would help reduce concerns by the environmental community. He noted a recent UC Berkeley paper that indicated highways redistributed growth rather than induced it. P. Hill referred to Chapter 5 (Environmental Screening for PSR Alignments), section 5 (5-3) of the Draft Technical Memorandum, which discusses implications related to growth inducement and impacts from each alignment. He said he felt that this section was confusing in how it referred to Watt Avenue. He asked G. Garbolino how she thought the Watt Avenue connection would impact the City of Roseville. P. Hill also wondered if there was flexibility in the project to move Watt Avenue west to provide better linkage with the parkway corridor, or if the connection could be with another road, not specifically Watt Avenue.

C. McAdam clarified that the project would not be studying a Watt Avenue extension. Although she agreed that the issue of defining an access point in the Central Segment would be very crucial and should be assessed.

J. Long shared that the project team had been in recent meetings with various jurisdictions regarding the implications of a Watt Avenue connection. He said the project team would have to work with the TAC, and factor in some sensitivity analysis to determine how this would impact recent assessments. P. Hill said he wanted to know more about Sacramento County's issues related to Watt Avenue. He referenced Chapter 6 (PSR Corridor Alternative Screening Summary and Recommendations), section 6.2, Compatibility with Goals and Principles (page 6-5) and the discussion of Growth Inducement and Watt Avenue.

D. Heick said she thought Chapter 5, section 5-3 related to growth inducement should be amended to address this issue related to Watt Avenue. P. Hill said he felt the term of growth inducement needed further clarification and a more direct link to show its potential project impacts, and he wanted to know what "increased growth pressure" was. T. Cosgrove said the project would need to coordinate closely with the EPA and FHWA to address issues related to growth inducement. He said he understood the definition to mean potential growth, independent of the project. T. Cosgrove said different agencies define growth inducement differently. He thought the EPA would attach growth inducement to the project's presence, but did not se if the is already potential for growth how the roadway could induce growth. R. Weygandt said that the project needed to carefully consider how to assess growth inducement.. He said the EPA didn't have the power to determine how local community growth would be determined, but we need to get on the same page with them; but we maybe bending over too much regarding growth. R. Weygandt reminded the project team that there were resources available to support the project (i.e., Sutter County community plan, Placer Legacy, etc.).

T. Cosgrove said the team should define the "highest possible use" of the project area related to growth inducement.

G. Garbolino said the project should clarify that it is trying to accommodate related predicted growth in

the area (and move away from the term 'growth inducement'). She also felt that a Watt Avenue extension and connection were needed to get the best use out of the Parkway.

C. McAdam clarified that the PAC was recommending that the team needed a definition of growth inducement, and not limit it to a Watt Avenue connection.

R. Weygandt wanted the project to mirror the environmental goals, but not be dictated to.

P. Hill requested additional information related to 'issues' of a Watt Avenue extension as they relate to Sacramento County.

J. Long said the Technical Memorandum addressed Watt Avenue and included a description from the Metropolitan Transportation Plan (MTP). He said the MTP stated that even with volume changes based on the introduction of the Parkway, no great impacts (traffic congestion) were predicted. The plan suggested that the largest differentiator would be based on predicted development in various county areas.

T. Cosgrove said his experience working with agencies on projects is that once you do good things with a project, they are put into the baseline conditions and you get no credit if you give too much in the beginning.

J. Clark said he believed any change in Watt Avenue would bring out opposition. R. Weygandt said perhaps calling the Watt Avenue connection something less specific, such as the "Central Connection" might avoid some objections.

Recommendations Related to Limited Access

- *PAC reaffirmed that there would be one potential access point between Fiddyment Road and Pleasant Grove Road.*
- *The PAC requested that the project team define growth inducement in the Technical Memorandum and provide additional information to eliminate apparent inconsistencies, and to re-examine the Watt Avenue connection.*

Policy: "No Development" Buffer

C. McAdams reminded the PAC that the no-development buffer concept was for a 500-foot wide corridor in the east and west segments, and a 1,000-foot corridor in the central segment. The TAC had recommended that in areas now planned for development, there be flexibility in its width.

Comments Regarding No-Development Buffer

T. Cosgrove said that "no development" as a concept, should to be defined with more flexibility in order to mitigate potential environmental issues. It could be used to maximize protection of sensitive areas. R. Weygandt agreed that this concept should be more flexible, and pointed to the county's community plan to help provide direction on this and several project-related issues in the study area. D. Silva said he felt that high value agriculture) needed to be considered, and farm related resources protected. He asked who would oversee the buffer in the long run. C. McAdam said this was still being assessed as part of the project planning process. D. Silva added that flexibility related to this concept was most important.

Recommendations Related to No-Development Buffer .

- *PAC stressed that the idea of the no-development buffer must be reaffirmed in terms of the current development situation.*
- *The PAC concurred that the buffer size and location should be flexible and related to performance standards, and should maximize opportunities to incorporate adjacent sensitive areas into the buffer. The Parkway should include a component protective of agriculture and it needs to be elastic, i.e., have the ability to expand if necessary.*

VII. OTHER ITEMS/CORRECTIONS

None.

VIII. CONCLUSIONS & NEXT STEPS

a. Summary of Decisions

D. Heick asked for PAC to review the draft meeting minutes carefully once they were distributed, to make sure all recommendations and nuances of the discussion were accurately captured.

b. Future Actions

D. Heick said the project team would send out an alignment map with modifications added by the PAC in approximately one month. C. McAdam said the PAC would be meeting later in 2004 after the fall public meetings. D. Heick said the team would be in touch with the PAC on an interim basis by email.

c. Other Issues

None.

Meeting adjourned at 12:05 PM.

PLACER COUNTY TRANSPORTATION PLANNING AGENCY

Meeting Minutes & Action Items **Final 11.22.04**

Meeting Description: Placer Parkway Corridor Preservation –Policy Advisory Committee Meeting #3
Meeting Date September 14, 2004
Minutes Date: November 3, 2004
Location: City of Roseville Corporate Yard – Rooms #2 and #3 – Hilltop Circle

Persons Attending			
Name	**Affiliation**	**Name**	**Affiliation**
Bill Santucci	Placer County Board of Supervisors (District #1)	Scott Gandler	City of Roseville
Robert Weygandt	Placer County Board of Supervisors (District #2)	Jennifer Pereira	Administrative Aide – District 2 Placer County
Tom Cosgrove	City of Lincoln, City Council	Jim Holmes	Candidate for Placer County Board of Supervisors
Gina Garbolino	City of Roseville, City Council	Eric Bryant	Bryant Properties
Jan Christofferson	Placer County Executive Officer	Celia McAdam	PCTPA, Executive Director
Larry Combs	Sutter County, County Administrative Officer	Stan Tidman	PCTPA, Project Manager
Dan Silva	Sutter County Board of Supervisors (District #5)	Denise Heick	URS, Project Manager
Jody Jones	Caltrans District 3	Garry Horton	URS, Traffic Manager

Yushuo Chang	Placer County APCD	Sharon Kyle	MIG, Inc., Public Outreach
Rick Dondro	Placer County DPW		
Minutes			

Purpose

To review and obtain feedback and direction on the four potential alternatives being considered for the Tier 1 EIS/EIR; to approve changes in previously discussed goal/policy clarifications; and to update coordination efforts with several other concurrent planning processes.

I. INTRODUCTIONS

Daniel Iacofano (MIG) noted that the meeting would focus on bringing the PAC up to date regarding project progress, including corridor alternatives and Tier 1 EIS/EIR efforts. He reviewed the meeting agenda and emphasized the importance of PAC member feedback on all items, particularly about the potential corridor alignment alternatives.

II. PROGRESS ON PHASE 1 – DEFINING ALTERNATIVES FOR STUDY IN TIER 1 EIS/EIR (INFORMATION/FEEDBACK ITEM)

Stan Tidman (PCTPA Project Manager) briefly oriented attendees to the project area map, and provided background on study boundaries and the west/central/east segments.

Placer Parkway – The Concept

S. Tidman reviewed the corridor concept, explaining that the Placer Parkway was designed to be a regional facility connecting State Route 65 and State Route 70/99. Sunset Boulevard West and Howsley Road bound the project area on

the north and Baseline Road and Riego Road on the south. He noted that earlier planning documents for the Parkway include a 'Conceptual Plan' and 'Project Study Report'.

Project Goals
S. Tidman explained that the earlier planning documents formed the basis for conceptual alignments, preliminary engineering/cost estimates, funding strategies, and six goals for the Parkway. The goals are:

1. Controlled access highway
2. Maximize mobility and accommodate planned growth
3. Avoid growth inducement/protect rural character
4. Minimize environmental impacts
5. Improve safety/minimize hazards
6. Feasible and equitable funding

He noted that at PAC meetings in September 2003 and March 2004, the second and third goals were discussed at length. The focus on these particular goals related to concerns about access in the central segment, planned development, and community-specific impacts.

Design and Construction
S. Tidman reiterated that the current estimated construction costs for the Parkway range from $200 million to $300 million (2000 dollars). Construction funding is anticipated in approximately 2015.

Purpose and Need
He next discussed the project's purpose and need statement, which is driven by current and projected rapid residential and employment growth in Placer and Sutter counties. These would yield significant transportation problems. The project solution would be to preserve a corridor for a future facility (to reduce congestion on local roads and accommodate planned employment growth).

Corridor Preservation
In light of the rapid growth occurring and projected in the region, and to ensure long-term mobility in the region, S. Tidman reiterated the importance of preserving a corridor for development of a future Parkway. The corridor would vary in width. It would be 500 feet wide in the east and west segments and 1,000 feet wide in the central segment. The primary objectives in this phase of the project are to identify corridor alternatives and complete the environmental review process. A tiered EIS/EIR approach is being used because it focuses on broad issues appropriate to the scale of the study and to the objective of this phase -- to preserve a corridor. The document also will include impact mitigation strategies. The design and construction of the Parkway would be reviewed in a Tier 2 document at a future date. He stated that based on the project's current schedule the Tier 1 EIS/EIR should be completed between 2006 and 2007.

Issues
S. Tidman noted the several recurring project issues:

- *Location of Corridor Alignment Alternatives*—Identification of potential corridor alignment alternatives to be considered in the Tier 1 EIS/EIR
- *Tier 1 Environmental Review*—Complex process designed to move the project process forward more expeditiously (continued project team coordination with associated project stakeholders, FHWA/Caltrans in particular)
- *Resource Agency Coordination*—Additional project step added to support the final project alignment decision process (through agency concurrence regarding the Least Environmental Damaging Practicable Alternative-LEDPA)
- *Pending and Anticipated Urban Development*—Issues (ongoing and emerging) related to timing and overlapping planning processes in various jurisdictions

II.(a) Potential Corridor Alignment Alternatives

S. Tidman outlined the screening process used to identify the four potential corridor alignment alternatives. This work began with the concept alignments from the 2001 Project Study Report (PSR). He noted that the project team evaluated these PSR conceptual alternatives using a transportation, engineering, and environmental screening process designed to detect major issues and fatal flaws. The results of the initial screening were described in a Technical Memorandum (January 2004). The Technical Memorandum also included several recommendations regarding the PSR concept alignments with respect to avoiding or minimizing impacts to resources and communities.

The alternatives refinement process took into consideration additional information provided by the advisory committees, as well as public meeting and NOI/NOP comments. He stated that the project team initiated a second round of the screening for the refined alignment alternatives. Through this refinement process and in meetings with the advisory committees and coordination with various city and county contacts, the project team identified additional potential corridor alignments for further evaluation, which resulted in identification of four potential alignment alternatives for Tier 1 EIS/EIR analysis.

S. Tidman illustrated the screening process by comparing the PSR concept alignments with the four potential corridor alignment alternatives. He used the following environmental issues/existing conditions criteria to make the comparison:

- Vernal pool complexes
- Riparian, wetland & conservation areas
- Socioeconomic resources (existing homes, businesses, farm buildings)
- Floodplains
- Working farm units/Power lines

These examples illustrated how resource avoidance led to the four potential corridor alignment alternatives.

Thematic Finding from Public Meetings

D. Iacofano reported on the August public meetings held in Placer County (Roseville) and Sutter County (Pleasant Grove). He explained that the purpose of the meetings was to review potential corridor alignment alternatives being considered for evaluation as part of the Tier 1 EIS/EIR, and to obtain feedback from interested stakeholders.

At the Roseville meeting, key public meeting comments were:

- *Explain the evaluation process that will determine the final alignment.*
- *Provide more detailed rationale for the "buffer areas" and what will happen to properties adjoining these areas.*
- *Provide an explanation about the land appraisal process and project timing related to appraisals.*
- *Ensure that property owners are justly compensated for their land.*
- *Indicate how the project timing relates to appraisals.*
- *Indicate how far outside the project study area impacts will be assessed.*

D. Iacofano reported that there was a great interest in impacts to property values, and the process in place to ensure fair compensation for land acquired by the project. Community members wanted to ensure that the project evaluation process was fair and complete. He noted that several people expressed concern about trade-offs between "people and species". An example of this expressed by community members was with regard to the status of working farms versus the value of biological resources (such as vernal pools and various species).

At the Pleasant Grove meeting, key public comments were:

- *Determine how traffic impacts generated by Placer County can be mitigated without negatively impacting Sutter County.*
- *Ensure that property owners play a role as major stakeholders in the project planning process.*
- *Clarify the status of parcels affected by the alignment alternatives, and how the project will determine fair market value for properties acquired.*
- *Maintain the integrity of farmlands and farm operations.*
- *Ensure the project doesn't negatively impact the quality of life in this community.*

D. Iacofano reported that people at the Sutter County meeting expressed concerns about the potential for proportionately larger project impacts to the Pleasant Grove community due to its being relatively more geographically isolated, and the perception that Sutter County would bear the burden of negative project impacts. He noted that the community also voiced frustration that, as they perceived it, traffic impacts from Placer County would be shifted to Sutter County. D. Iacofano added that community members stressed the importance of their becoming more actively involved in planning discussions as key stakeholders. Impacts to their general quality of life were a significant concern.

Discussion:
Gina Garbolino (City of Roseville) inquired why the North of Riego Road to South of De La Salle (diagonal) alignment went through the De La Salle property. Her concern was about potential negative impacts to De La Salle University and village concept being planned at this location.

S. Tidman responded that the topic of adjusting this alignment was discussed at length with the PAC (and other advisory committees). All parties agreed to the need to find a more direct (diagonal) route. This diagonal alignment is viable because it avoids many environmental resources in the area (e.g., vernal pools, conservation areas). This one would remain a viable choice unless there was a good reason to eliminate it.

Denise Heick (URS) added that it was clear that the more direct alignment would go through a prospective project area. It was noted that no construction has taken place and the project hasn't been formally approved or permitted (it is currently in the pre-application process).

Bill Santucci (Placer County Board of Supervisors) asked who would make the final decision regarding the status of this particular alignment as an alternative. D. Heick responded that PCTPA, the South Placer Regional Transportation Authority (SPRTA), and the Federal Highway Authority (FHWA) ultimately make the decision. The project needs to identify the Least Environmental Damaging Practicable Alternative (LEDPA) to satisfy future permitting requirements. She noted that, therefore, the project could not make a decision to eliminate a potential alignment that may include the LEDPA solely based on a development project that hasn't been approved or permitted.

G. Garbolino asked what would happen once the final alignment choice(s) had been concluded. She wondered if the project team would send the regulatory agencies one preferred alignment or four choices. D. Heick said the objective of the Tier 1 process was to identify one final corridor for preservation. She emphasized that the project still needed more input from PAC members, as well as continued coordination with Sutter County, Placer County, and resource agencies regarding the evaluation process. The project team needed to develop a choice of potential alternatives that would be considered seriously by the resource agencies. She added that presenting choices that wouldn't stand up to agency evaluation didn't make sense strategically for the project.

Robert Weygandt (Placer County Board of Supervisors) asked Jody Jones (Caltrans) how much power agencies had in determining or changing alignments. He stressed the importance of the Parkway project staying on schedule with its activities.

J. Jones noted that resource agencies do not necessarily care about what alternatives are presented to them. For a Willits project, Caltrans was directed to an alternative that was not even being considered. She added that the agencies do care that a particular alternative meets the LEDPA standards. They are very stringent about this process. The resource

agencies are more likely to develop their own alignment variation if they are not provided a thoroughly supported array to evaluate.

T. Cosgrove asked if the resource agencies made the final decision (about the alignment) what was the point of all the evaluation and array of choices the project team developed for consideration. D. Iacofano said that the project team was displaying detailed information (for the resource agencies) upon which further analysis could proceed. D. Heick noted that the project team was working with resource agencies to head off any issues based on lack of full disclosure of information. She said the project team hoped that early agency coordination in Tier 1 would lead to a suite of corridor alternatives from which to choose a preferred alternative.

G. Garbolino asked if the resource agencies knew about the corridor alignment alternative choices developed by the project team thus far. D. Heick answered yes, these are a matter of public information.

T. Cosgrove said that the resource agencies' role strengthened his belief that the De La Salle University project should be built as soon as possible. B. Santucci agreed, saying the Placer County had invested a great deal of effort on behalf of the university project (and that should be taken into consideration even if it is not yet 'on the books').

Celia McAdam (PCTPA Executive Director) added that her experience working on the Lincoln Bypass project enlightened her about the complexities of getting agency support for projects. She noted that even with compelling evidence that a project wouldn't cause major impacts, the permitting process was grueling. C. McAdam stressed the importance of early agency coordination and involvement in the alternatives assessment process (to increase the likelihood of agency support of the final alignment alternative during Tier 2).

R. Weygandt asked if the project team had been coordinating with county planning and conservation resource agencies regarding De La Salle University. He noted that the PCTPA project's final alignment won't be identified for at least one year, and stressed the importance of the PCTPA project staying on schedule so that the university planning efforts would not be negatively impacted. D. Heick responded that there had been ongoing coordination with the county planning department and with Placer Legacy (related to various areas within its Habitat Conservation Plan area) to assist with designing alignments that separate development from conservation areas. She added that this is an ongoing process.

T. Cosgrove felt that there needed to be some policy level discussion regarding project need and purpose in light of current planning efforts (to address whether some alignments such as the 'diagonal' one adequately served the purpose and need). D. Heick noted that the wording of the P/N was being discussed with the resource agencies, but was based on the project's own goals and policies. The question of what was regarded as 'development' was in flux. The distinction is made between what is currently planned (and approved) and what is 'future' development. With regard to whether there would be a preferred alternative, the Draft Tier 1 EIS/EIR might not indicate a preferred alternative, but the team would wait until the Final Tier 1 EIS/EIR to indicate a preferred alternative (when more information and public input is available).

B. Santucci asked what the difference was between the data gathering process related to planned development, and approved projects. D. Heick reiterated that the Parkway project acknowledged both existing general planning efforts, and potential future projects, but that potential projects could not be considered as having the same status as existing projects or areas currently planned for development. C. McAdam said that project must be mindful of not assuming any future decisions related to planning efforts. She added that PCTPA (and the project) couldn't presume any decision of the Board of Supervisors on any project.

Larry Combs (Sutter County Administrative Officer) said that he didn't have any major changes in perspective. He noted that the North of Riego Road alternative might not be acceptable if it affected the opportunity for developing an interchange at SR 70/99 and Riego Road itself. B. Santucci inquired as to the reasoning behind the spacing between the North of Riego alignment and Riego Road. D. Heick said the current location was based on direction from Caltrans with

regard to safety issues (associated with less than one mile weaving distance between Sankey Road and the earlier location of the North of Riego interchange). The alignment was moved south to provide the necessary distance between a North of Riego interchange and a Sankey Road interchange, and the design concept provides for braided ramps at a future Riego/70/99 interchange. This would change how SR 70/99, the Parkway, and Riego Road relate to each other with regard to access.

T. Cosgrove stated that in many ways the alignment alternatives look very similar, with variations. He added that it was his understanding that the alignment alternatives were to provide very distinct choices. He said he didn't feel there was a problem with the number of choices, he just noted little difference between how they were configured in the study area. D. Iacofano asked if the PAC had a problem with the array of alternatives overall.

The PAC answered that they were generally satisfied with the choice of alignment alternatives.

D. Heick noted that the project team's job was to document the process used to narrow the study area, and then work to get the alternatives defined, based on eliminating those that had problems associated with them. She added that as the project moved forward the team would provide detailed explanations regarding why certain alignments were included and why others were rejected. A technical memo may be needed to document this process in detail.

D. Silva asked whether a Sunset Boulevard West - Howsley Road alignment was considered. John Long (DKS) said initially there was such a corridor. The conceptual plan established the north project boundary. He noted that the project team couldn't take a corridor alignment too far north because of vernal pool impacts and problems connecting it with SR 65. Anything that far north also greatly reduced the Parkway's traffic benefit. D. Silva added that people traveling towards Yuba City have indicted that this would be the most direct way to get to Roseville.

R. Weygandt acknowledged the rationale behind the screening and refinement process, and the necessity for agency support (for both the methodology and alignment choices). He noted the importance of the project team coordinating closely with county planning officials. D. Heick responded that the project team has been involved in ongoing coordination efforts with Placer Legacy, County planning staffs, and local developers. Lines of communication are good.

L. Combs asked what agency representatives the project team consulted with regarding the decision about an earlier proposed southern alignment into northern Sacramento County. D. Heick said that in discussions with all the advisory committees, they supported dropping this alignment, but deferred to City and County of Sacramento planning representatives. The team met jointly with representatives from both jurisdictions who concurred with dropping this potential alternative.

II.(b) Next Steps

S. Tidman reviewed the project activities needed to move forward with the alternative selection process:

- Complete Alternatives Identification
- Account for Scheduling Considerations. The Modified NEPA/404 Process is slowing the process. The project team is aware that project delay will affect Placer County's work to process the proposed university specific plans. The Project Development Team would be consulted to discuss ways to stay on schedule and to continue resource agency coordination. He also noted that an upcoming Sutter County advisory ballot measure could affect the current general plan, potentially resulting in some residential use in commercial/industrial designated areas. This may affect project roadway components, alignment configurations, and connections to SR 70/99. The project team will be meeting with Sutter County Department of Public Works representatives and developers to discuss the implications of the ballot measure.
- Begin Tier 1 EIS/EIR
- Continue Public Outreach Process

III. GOALS AND POLICY CLARIFICATIONS (ACTION ITEM)

C. McAdam reminded the meeting participants that the project team addressed the topic of goals and policy clarification at the last PAC meeting (March 2004). Direction to clarify the wording of some goals and policies was provided at this earlier PAC meeting. Most were provided to the PAC in a May 17 Staff Report and again (with one addition) in the Staff Report for this meeting. No comments were received on either version of these clarifications. C. McAdam reviewed the clarifications and asked the PAC to provide confirmation/consensus on them.

- **Goal 2: Maximize mobility and accommodate growth under existing general plans**

1. Revise the third "Potential Implementation Mechanism:"

~~Do not allow~~ Restrict access in the 7-mile segment between Fiddyment Road and Pleasant Grove Road to one potential connection to a future extension of Watt Avenue or another nearby roadway extension. ~~but study the impacts of access at a Watt Avenue extension.~~ Study the impacts of Placer Parkway with and without such a connection.

- **Goal 3: Avoid growth inducement and protect rural character of agriculturally designated areas**

1. Revise the second Policy:

Create a no-development buffer zone along Parkway. This buffer zone is to be flexible for agriculturally-designated land undergoing urban development. The buffer zone is to be based on performance standards on a case-by-case basis. The buffer zone should maximize opportunities to incorporate adjacent sensitive areas.

2. Revise the first "Potential Implementation Mechanism:"

Request State legislature to adopt Parkway as State route and have legislation restrict access (i.e., allow only one potential ~~no~~ access between Fiddyment Road and Pleasant Grove Blvd ~~except~~ at an extension of Watt Avenue or another nearby roadway extension).

3. Revise the second Potential Implementation Mechanism:

Buy agricultural/conservation easements in areas along Parkway to prevent development within the buffer zone.

T. Cosgrove asked for clarification regarding the reference to "existing general plans". D. Heick responded that "existing general plans" referred to Board of Supervisors approved plans only. C. McAdam noted that the project team was aware of the nuances regarding the various planning efforts underway in Placer and Sutter counties, and continued to work with the respective jurisdictions and various developer representatives.

D. Silva expressed a concern about local road continuity across the Parkway and how this might affect emergency services. Several project team members responded that this topic had also been noted by several stakeholders, and that the project would restore local access. This would be evaluated in detail in Tier 2.

IV. MULTIPLE CONCURRENT PLANNING PROCESSES (INFORMATION ITEM)

S. Tidman cited ten different planning or development projects in or just outside of the corridor preservation's project area. Each had different issues, processes, and schedules. Most of these reviews and their accompanying environmental work would be done before the corridor preservation's Tier 1 EIS/EIR. He said there appeared to be a lot of confusion about how the Parkway project 'fit' with these as well as how they were being coordinated among several jurisdictions. He reported that the project team continued to meet with representatives for De La Salle University and Community, Placer Ranch, and local jurisdictions including Public Works departments to sort out various land use planning issues. He noted that the project team also met with SACOG (re. its Blueprint planning process and to review their vision of the Parkway project). S. Tidman noted at that meeting the intention to follow the Parkway project's stated goals and policies (as adopted by the SPRTA and SACOG boards) and to work through environmental permitting considerations. A 'Main Street' concept with multiple access in the central segment was not compatible with Parkway goals and policies. It was acknowledged that some local plans might not mesh with the more regional perspective SACOG takes. There was agreement between the project team and SACOG that the Blueprint's land use scenario and supporting transportation policies being put forward would mirror the Parkway project's goals and policies.

S. Tidman added that the project would continue its coordination efforts, with the primary focus being the development of a reasonable range of alternatives to satisfy federal requirements.

T. Cosgrove noted that many resource agencies had a very 'linear' review process that can prove time consuming. He suggested that the project team get all the resource agencies in a room at one time work through outstanding issues. C. McAdam shared that EPA and COE were meeting with the project team in the Modified NEPA/404 process. However, U.S. Fish and Wildlife Service (USFWS) had not been responsive to invitations, attending no NEPA/404 meetings to date. C. McAdam added that it was virtually impossible to convene all parties at once to discuss issues, and that resource agencies have there own way of working through their review processes. There is no guarantee as to what an 'agreement' would mean, as agencies sometimes change their minds later.

V. CONCLUSIONS AND NEXT STEPS

D. Heick noted that this would probably be the last general PAC meeting for this year—unless the PAC indicated a need to meet again. The Tier 1 EIS/EIR process may be initiated before the next PAC meeting. She stated that the project team would remain in contact with the PAC membership through email.

Rick Dondro, Placer County Public Works, asked if FHWA and the SPRTA Board would make final corridor alignment choices. D. Heick confirmed that this was the process, with input from Sutter County, Placer County, and resource agencies. She cautioned the PAC about not prematurely eliminating an alignment based on future planning decisions, as the resource agencies were interested in identifying a LEDPA, which could traverse potential future projects.

T. Cosgrove asked everyone to remember to temper final alignment recommendations, and not be influenced by uncertain future planning decisions. Also, to be aware that issues extended beyond only the environment. B. Santucci said that if the current project focus was to evaluate the range of alternatives, he could support where the project was in that process. There is a need to take into account all the pluses and minuses in the characteristics of each alternative.

PLACER COUNTY TRANSPORTATION PLANNING AGENCY

Meeting Minutes & Action Items **Final: 05-26-06**

Meeting Description:	Placer Parkway Corridor Preservation Study – Policy Advisory Committee Meeting #4		
Meeting Date:	August 31, 2005	**Location:**	McBean Pavilion, Lincoln

Persons Attending

Name	Affiliation	Name	Affiliation
Bill Santucci	Placer County Board of Supervisors (District #1)	Jan Christofferson	Placer County Executive Officer (Ex Offico Member)
Robert Weygandt	Placer County Board of Supervisors (District #2)	Celia McAdams	PCTPA, Executive Director
Dennis Nelson	Sutter County Board of Supervisors (District #2)	Stan Tidman	PCTPA, Project Manger
Tom Cosgrove	City of Lincoln, PCTPA Board, SACOG Representative	Joanne Koegel	Koegel & Associates
Peter Hill	City of Rocklin, SPRTA Board	Denise Heick	URS, Project Manager
Gina Garbolino	City of Roseville, PCTPA Board, SPRTA Board	John Long	DKS Associates, Traffic Task Manager
Jody Jones	Caltrans, District 3 Director (Ex Offico Member)	Gary Horton	URS, Engineering Task Manager
Larry Combs	Sutter County – County Administrative Officer (Ex Offico Member)	Vikrant Sood	MIG, Public Outreach

Note: Approximately 25 to 30 people were in the audience. These included project vicinity property owners, elected officials, several Technical and Study Advisory Committee members, and Foothill Associates' staff.

1. Meeting Purpose

The purpose of the meeting was to present information to the PAC and to get input on the following topics:

- Make a recommendation to the South Placer Regional Transportation Authority (SPRTA) on the screening analysis for the two Foothill Associates' alignments, considering the Technical Advisory Committee (TAC) and Study Advisory Committee (SAC) recommendations;
- Review and comment on the draft revised second cumulative development scenario; and
- Discuss and provide feedback on the modified NEPA/404 process.

The PAC recommendation is to be presented to the SPRTA Board on September 28, 2005. Placer County Transportation Planning Agency (PCTPA) staff and consultants provided the following handouts at the

meeting (these handouts were also made available on URS Corporation's (URS) ftp site before the meeting):

- Policy Advisory Committee Staff Report – Celia McAdam, PCTPA Executive Director – August 26, 2005
- Foothill Associates Report - December 10, 2004
- Environmental Screening Data – August 18, 2005 (matrix)
- Proposed and Modified Foothill Associates corridors Shown with PCTPA Potential Corridor Alignment Alternatives – August 18, 2005 (map)
- Relative Benefits and Drawbacks of Foothill Alignments and Recommendations made by TAC and SAC
- Planned and Programmed Major Transportation Improvements and Development Projects (map)
- Draft Development Scenarios for Western Placer County EIRs (matrix)
- Purpose and Need Statement
- Screening Criteria for Selection of Range of Alternatives
- Current USEPA Proposals for Avoidance Alternatives

Celia McAdams, Executive Director, PCTPA, opened the meeting and welcomed the members to the 4th PAC meeting. She introduced Joanne Koegel, meeting facilitator, who asked for self-introductions and provided an overview of the agenda. Stan Tidman provided a brief project update. This included a review of Placer Parkway basics; project objectives; process highlights (public outreach, the four recommended 2004 corridor alignment alternatives, and SPRTA Board direction to screen the Foothill alignments), and several project challenges.

2. Foothill Associates Alignment Screening

Denise Heick, URS, introduced the Foothill Alignment screening work by outlining the background (initial Foothill report, SPRTA Board direction, data validation, and screening) and results of the Foothill Alignments screening process (GIS data and adjustments, curve radius, and Watt Ave. connections). She referred to the handouts and slides showing the 2004 recommended corridor alignment alternatives and the Foothill alignments.

A. TAC Summary & Recommendations – August 10, 2005

Ms. Heick summarized this meeting's highlights. She reviewed some TAC issues including the 4,600-foot curve radius screening standard (safety/flexibility), a potential Parkway connection with an extension of Watt Ave., and screening methodology comments. The TAC's recommendations were to:

- Eliminate Foothill Alignment Nos. 1N and 1S (north of Pleasant Grove Creek).
- Re-draw Foothill Alignment Nos. 2N and 2S (south of Pleasant Grove Creek) based on a reduced curve radius (less than 4,600 feet) that would meet a minimum design speed of 70-mph and re-screen the revised alignment.

Peter Hill, City of Rocklin, asked for an explanation of the 70-mph design speed, 4,600-foot curve radius, and why the curve radius was relaxed. Ms. Heick answered that the design speed and curve radius were engineering screening standards to ensure safety and maximum flexibility to locate a future roadway within a corridor. Garry Horton, URS, added that the 4,600-foot curve radius standard was used for all of the potential corridor alignment alternatives. P. Hill asked if the relaxed curve radius for the revised Foothill Alignment Nos. 2a and 2b met the required 70 mph design speed. D. Heick responded yes – it did. Ken Whitney (Foothill Associates) asked if 70 mph was the minimum design speed. Ms. Heick responded that it was.

B. SAC Summary & Recommendations August 25, 2005

Ms. Heick summarized this meeting's highlights and the its recommendations:

- Eliminate Foothill Alignment Nos. 1N and 1S.
- Carry forward the revised Foothill Alignment Nos. 2a and 2b (reduced curve radius – meeting 70 mph design speed) with SR 70/99 connections at Sankey Rd and north of Riego Rd., respectively.

C. Overview of Benefits/Drawbacks – As Agreed to by TAC & Modified by SAC

Ms. Heick reviewed TAC/SAC conclusions, via the screening work, as benefits and drawbacks for each Foothill Alignment. She indicated that Foothill Alignments were compared with similar 2004 corridor alternatives:

- Foothill Alignments #1N and 1S were compared with 2004 corridor alternative #4 (yellow).
- Foothill Alignment #2S was compared with 2004 corridor alternative #3 (blue)
- Foothill Alignment #2N was compared with 2004 Corridor alternative #4 (yellow)

Foothill Alignment -- 1N

Relative Benefits:
- Giant Garter Snake
- Valley Elderberry Longhorn Beetle
- FEMA 500 yr. Floodplain
- Farmlands of Statewide Importance

Drawbacks:
- Aquatic Resources**
- Riparian Habitat
- Farms/Homes
- PCCP Conservation Opportunity Area: Significant Agency Opposition
- Reduced Traffic Benefits: Location would draw fewer users from local roadways; no connection to a potential Watt/Blue Oaks interchange

Foothill Alignment – 1S

Relative Benefits:
- Upland Wildlife Habitat
- Swainson's Hawk Nesting Habitat
- Valley Elderberry Longhorn Beetle
- Farmlands of Statewide Importance

Drawbacks:
- Aquatic Resources**
- Waterfowl, Riparian Habitat
- Farms/Homes
- Prime Farmland
- PCCP Conservation Opportunity Area: Significant Agency Opposition
- Reduced Traffic Benefits: Location would draw fewer users from local roadways; no connection to a potential Watt/Blue Oaks interchange

** Emphasis was placed on aquatic resources due to permitting concerns.

Ms. Heick re-stated each benefit and drawback for both of these alignments. Bill Santucci, Placer County Board of Supervisors, asked about SR 70/99 connections. Ms. Heick indicated these alignments had connections at Sankey Rd. (1N) and north of Riego Rd. (1S).

For both of these alignments, she emphasized resource agency concerns (U.S. Fish & Wildlife Service, U.S. Environmental Protection Agency, and California Dept. of Fish and Game) regarding the location north of Pleasant Grove Creek, substantial aquatic resources impacts, and reduced traffic benefits because of the northern location, fewer users, and problems with a potential Watt Ave. connection.

Foothill Alignment – 2S

Relative Benefits:
- Upland Wildlife Habitat
- Valley Elderberry Longhorn Beetle
- Farmlands of Statewide Importance
- Vernal Pool Critical Habitat**
- Connection to future Watt Ave. extension

Drawbacks:
- Vernal Pool Complexes**
- Waterfowl, Riparian Habitat
- Reduced Flexibility within Corridor Curve Radius

**Emphasis was placed on aquatic resources due to permitting concerns.

Ms. Heick indicated that these alignments could benefit a potential Watt Ave. connection. She said the vernal pool critical habitat designation in the area was removed by the U.S. Fish and Wildlife Service recently. However, the screening variable was retained for the Foothill alignment's screening to be consistent with the earlier screening process. She emphasized that there would be more vernal pool impacts for this alignment. Also, that there would be somewhat reduced flexibility with the reduced curve radius – but it would meet the 70 mph design speed.

Foothill Alignment – 2N

Relative Benefits:
- Upland Wildlife Habitat
- Valley Elderberry Longhorn Beetle
- Swainson's Hawk Nesting Habitat
- Farmlands of Statewide Importance
- Vernal Pool Critical Habitat**
- FEMA 500-year Floodplain
- Connection to future Watt Ave. extension
- Prime Farmland

Drawbacks:
- Vernal Pool Complexes**
- Waterfowl, Riparian Habitat
- Reduced Flexibility within Corridor Curve Radius

The benefits and drawbacks were similar to the ones listed for Foothill Alignment No. 2S.

Gina Garbolino from the City of Roseville inquired about the distance between the Sankey connection and the Riego Road interchange. Ms. Heick informed the PAC that the approximate distance between the two interchanges is 2 miles. Ms. McAdams informed the PAC that while the SAC voted to include Foothill Alignment Nos. 2N and 2S, there were 3 dissenting votes for eliminating both alternatives from the analysis and 2 votes to only include Foothill Alignment No. 2N in the analysis.

Bill Santucci from the Placer County Board of Supervisors inquired why some SAC members wanted to eliminate Foothill Alignment No. 2. Ms. Heick explained that the representative from the Agricultural Commission cited impacts on agricultural resources and the representative from the Sierra Club cited impacts to vernal pool complexes as the rationale for their decision.

Jody Jones from Caltrans District 4 pointed out that the data suggests that the alignment benefits farmlands. Ms. Heick clarified that while the data refers to farmland mapping information, the SAC member was referring to actual conditions on the ground.

Tom Cosgrove from the City of Lincoln inquired whether there was sufficient difference between Foothill Alignment No. 2 and the corridor alternative No. 4 (yellow) to justify studying both alignments. Ms. Heick stated that there was some difference between the two and that there was no fatal flaw in either alternative.

D. Public Comment

Ms. Koegel invited public comment before the PAC made a decision. In total, five members of the public provided oral comments at the PAC meeting.

Eric Hansen: Mr. Hansen informed the PAC that his family has owned an organic farm for 70 years that would be impacted by the alternatives near Pleasant Grove Rd. He said that while the State did not classify this land as good farmland, the alternative would destroy a productive operation.

Peter Hill from the City of Rocklin clarified to Mr. Hansen that the PAC is not making recommendations on alternative alignments at this meeting. It is only deciding which alignments to study further. Ms. Garbolino said that all public comments would become part of the official record.

Gaynell Gleason: Ms. Gleason informed the PAC that she owns a cattle ranch south of Sunset Boulevard West. She also indicated there are 200 homes in Amoruso Acres, to the north across Sunset Boulevard West. She pointed out that the Foothill Alignment No. 1 would impact all these properties. If the Parkway followed this alignment along Sunset Boulevard West, it would eliminate approximately 60% of these homes and farm operations. Ms. Gleason informed the PAC that she is against the alignment. She also pointed out that the analysis of these two additional alignments raised a conflict of interest since developers are funding the study. Ms. Gleason questioned why the alignment corridors are 1,000-feet wide. She also inquired why they could not be shifted to Phillips Road that did not have productive farmland around it. She said the right-of-way would be along the retention basin and would not have to take more land. Bill Santucci asked if the Yellow Alternative interfered with ranch operations. Ms. Gleason replied – no. Ms. Gleason agreed with TAC and SAC recommendations to eliminate Foothill Alignment Nos.1N and 1S.

Deborah Waterbury: Ms. Waterbury informed that PAC that she owns a 400-acre organic farm, south of Sunset Boulevard West and east of Locust that would be bisected by the Foothill Alignment Nos.1S and 1S. Ms. Waterbury agreed with Ms. Gleason about shifting the alignments to Phillips Road. Ms. Waterbury agreed with TAC and SAC recommendations to eliminate Foothill Alignment Nos. 1N and 1S.

Joel Neves: Mr. Neves agreed with TAC and SAC recommendations to eliminate the Foothill Alignment Nos. 1N and 1S. The alignment would impact his parcel in Amoroso Acres. Mr. Neves asked why the alignments could not be shifted to the south away from Amoroso Acres. Ms. Heick clarified that the alignments, as currently designed, minimize impacts on vernal pool complexes in the area.

George Carpenter: Mr. Carpenter introduced himself as the project manager for the proposed 7,500-acre South Sutter County Specific Plan. He pointed out that a recent study session, the Sutter County Board of Supervisors indicated their preference for a SR 70/99 connection at Sankey Road. This connection is assumed in the proposed specific plan. Mr. Carpenter asked the PAC to eliminate the north of Riego connection and not advance the southerly alignments for further analysis.

Mr. Tidman clarified that PCTPA is in communication with Sutter County staff for Parkway and specific plan coordination. He mentioned a November 2004 study session with the Board that outlined the two potential SR 70/99 connections (north of Riego and at Sankey). At that meeting, the Board indicated its preference for the Sankey Rd. connection and recognized the need to study more than one SR 70/99 connection.

Dennis Nelson, Sutter County Board of Supervisors, referred to the County's study session the previous night. He re-iterated that the Sutter County Board preferred the Sankey Road connection and would like to see both Foothill Alternative Nos. 1S and 2S eliminated. He said the plan for the proposed specific plan showed development over the area adjacent to the north of Riego connection. Ms. Heick said no decision had been made on the specific plan – it is still in process. She clarified that, at this point, elimination of alternatives can only happen through the screening process. Joanne Koegel asked Mr. Nelson if he had an objection. He said that he had no concern with the process – he could not stop it. He said he was opposed to all of the connections to the south.

Tom Cosgrove from the City of Lincoln said he appreciated Sutter County's position. He cited the Lincoln By-pass (SR 65) example. This environmental work was studied for 10 years. Because of this time, he said some of the options for various alignments were precluded by new development. The federal resource agencies did not agree that those alignments were precluded. They do not consider impacts on newly developed land. At one point, the alternative through the developed parts of the City was determined to be the least environmentally damaging practicable alternative (LEDPA) even though it was already built up.

E. PAC Recommendations

Joanne Koegel then asked for PAC comments and recommendations. She asked the PAC to start with Foothill Alignment Nos. 1N and 1S. Dennis Nelson indicated he only favored the alignment with the Sankey Rd. connection. There was general discussion. The PAC recommended taking out Foothill Alignment #1N and 1S, with Dennis Nelson indicating he did not want 1N eliminated.

A member of the public inquired whether there was a possibility of the Foothill Alignment Nos. 1N and 1S coming back into the environmental analysis later. Ms. McAdam clarified that after the SPRTA Board agrees to eliminate the alternative, the likelihood of that alternative coming back into the analysis is low. However, she added that PCTPA had to work with the federal resource agencies on alternatives – so it would be hard to predict the outcome of that process.

The PAC then discussed Foothill Alignment Nos. 2N and 2S. There was agreement to recommend Foothill Alignment No. 2N (Sankey Rd. connection) as an alternative.

Foothill Alignment No. 2S involved more discussion. Mr. Hill pointed out that he understood the concerns of Sutter County. But, he preferred keeping No. 2S in the range of alternatives since it would make the environmental analysis more robust. It would not limit the parameters of the study. Ms. Garbolino agreed. She pointed out that a large part of alignment 2S is already being studied via alternatives with SR 70/99 connection north of Riego Rd. The PAC agreed to recommend to the SPRTA Board that Foothill Alignment #2S be eliminated based on a split vote
Mr. Hill summarized the PAC recommendation to the SPRTA Board. The range of alternatives would include the original (2004) four corridor alternatives, and Foothill Alignment No. 2N. Ms. Heick reminded the PAC that the final range of alternatives would also include the avoidance alternatives that are being developed in coordination with the USEPA. Ms. McAdams informed the PAC that a final map of the range of alternatives will be distributed for information after the SPRTA Board meeting on September 28, 2005.

3. Draft Revised Second Cumulative Development Scenario

John Long, DKS Associates (DKS), a revised second cumulative development scenario (CDS) is being developed for the study area to evaluate cumulative impacts of the proposed project in the environmental document. He said that staff and consultants are looking at two sources of information for the second CDS. The first source is the Sacramento Area Council of Government's (SACOG) Blueprint Project that has a planning horizon of 2050. In October 2004, the TAC agreed to use 80% of the 2000 to 2050 growth in the Blueprint as a way to arrive at 2040 growth projections outside of the immediate study area, plus residential buildout (and a corresponding amount of non-residential build-out) for the projects identified by the TAC in the more immediate study area. Since that time, Placer County, Lincoln, Roseville, and Rocklin and consultants have been separately working to define a cumulative development scenario for western Placer County. This scenario would be used to evaluate a number of specific plan EIRs and Lincoln's general plan update.

Mr. Long informed the SAC that a comparison of development levels under SACOG's 2050 Blueprint and second CDS suggests that there is little difference in aggregate numbers at the county level, but that there is a difference in how the development is distributed. The total development in the cities under the County's CDS is close to those in the 2050 Blueprint. Mr. Long concluded that the draft Placer County CDS numbers will not change much and seemed reasonable to use.

Mr. Long said the TAC and SAC recommendations were that the proposed CDS was reasonable. Mr. Cosgrove pointed out that build-out could happen sooner than 2040 and these trends should be tracked to make a stronger case for the Placer Parkway. Ms. Koegel asked for PAC direction. The PAC agreed with the TAC and SAC recommendation to use the revised CDS.

4. Federal Resource Agency Coordination

Mr. Tidman summarized the progress on the modified NEPA/404 process with the federal resource agencies. The objective of this work was to address as many aquatic resource issues as possible during the Tier 1 EIS/EIR rather than wait until the Tier 2 design and construction phase. He said agreement was reached on the Purpose and Need Statement and the Screening Criteria for the Range of Alternatives.

Work is underway to identify the range of reasonable alternatives. This work was focusing on 'avoidance' alternatives proposed by the U.S. Environmental Protection Agency (USEPA). Concepts being discussed are a Shorter Parkway & Transportation System Management (TSM) and an Expanded Corridor Buffer to protect vicinity resources. The group agreed that a USEPA idea to analyze more intensive land uses

along Baseline Rd. along with greater TSM would be discussed in the Tier 1 EIS/EIR – not as a separate alternative.

Mr. Tidman added that the resource agencies agreed that the four (2004) recommended corridor alignment alternatives were appropriate to include in the range of alternatives for Tier 1 EIS/EIR analysis.

Ms. Garbolino inquired whether the avoidance alternatives would be included in the analysis and what would happen if the USEPA/Corps of Engineers alternative was not chosen as the final alternative. Mr. Tidman confirmed that these 'avoidance' alternatives would be considered equal to all other alternatives in the environmental analysis. Ms. McAdam clarified that if the EPA does not consider the final alternative as the least environmentally damaging practicable alternative (LEDPA), they will deny permits. Therefore PCTPA needs to work with USEPA and the Corps closely on choosing the final alternative.

Ms. Heick clarified that while the avoidance alternatives will be studied in the Tier 1 EIS/EIR, they still need to meet the project's Purpose and Need. Mr. Cosgrove cautioned the staff and consultants to make sure that the avoidance alternatives that get added to the range of alternatives are feasible alternatives. Mr. Cosgrove also raised the concern that federal resource agencies might consider an alternative that goes through urban areas as the LEDPA alternative. Jody Jones reinforced these comments. She said that each alternative carried forwarded into the EIS/EIR should be considered carefully because any one of them could result in the selected corridor. She urged the project team not to carry forward any alternatives that did not meet Purpose and Need.

Mr. Cosgrove asked the staff and consultants to resolve these issues early to avoid LEDPA related issues later in the process, like with the Lincoln Bypass project.

5. Next Steps

Mr. Tidman listed the following 'next steps' for the project: and closed the meeting:

- Request approval from the SPRTA Board on the alternatives to be studied in the Tier-1 EIS/EIR, at the September 28, 2005, board meeting.
- Continue to work with the resource agencies to refine avoidance alternative concepts.
- Re-initiate the technical studies.
- Schedule Project Development Team meetings to share information and updates.

Appendix C
Project Development Team (PDT) Meeting Summaries

SUMMARY OF PROJECT DEVELOPMENT TEAM MEETINGS

PDT MEETING #1 – September 23, 2003

Meeting participants included representatives from FHWA, Caltrans, Sutter County, PCTPA, URS Corporation, and DKS Associates. Agenda items included:

Lead/Cooperating Agency Status
Resource Agency Coordination
Type of Environmental Impact Report
Travel Demand Forecast Model
Data Collection and Mapping
FHWA/Caltrans Guidance
Alternatives Screening
Purpose and Need

Key decisions included:

- Confirmed FHWA as federal (NEPA) lead agency; Caltrans would not be a Co-Lead Agency or Responsible Agency.

- Caltrans memorandum of March 28, 2003 indicates simultaneous Caltrans HQ and legal review of the Draft EIS/EIR. Caltrans will be responsible for NEPA review for FHWA, endeavoring to process a clean document. It is then passed on to FHWA for review and approval of release.

- Sutter County expressed interest in being a CEQA Co-Lead Agency with SPRTA. A draft joint agreement between SPRTA and Sutter County was being reviewed.

- Positive feedback was provided regarding development of a modified NEPA/404 process with the U.S. Army Corps of Engineers (COE) and other federal agencies. The need for early consultation with federal and state resource agencies was stressed.

- The project team would coordinate with Lincoln and Rocklin TAC/SAC members, Pleasant Grove School principal, and others about any additional groups to include in the public outreach process.

- The EIR would be a "Program" EIR rather than a "Master" EIR.

- The project study area was expanded to include Baseline/Riego Roads.

PDT MEETING #2 – November 24, 2003

Meeting participants included representatives from FHWA, Caltrans, Sutter County, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates. Agenda items included:

Items from September 23, 2003 Meeting: Caltrans document review process and signatory input; Update on Sutter County CEQA co-lead agency status; Update on Resources Agency consultation; Status of Sunset Boulevard PSR re: Placer Parkway; Inclusion of other groups in Advisory Committee process; Additional input re: Master EIR, Tier 1 guidance, and scope of technical studies.

Purpose and Need

PSR Alternatives Screening: Transportation Model results; Environmental screening results; Schedule for draft report.

Key decisions included:

- Additional followup needed re: FEMA grant programs involving levee improvements, which could prohibit new floodplain impediments on fill; inquiries to date have not identified such a program.
- Decision to move ahead with a modified NEPA/404 process; determined that it would likely cause some delay in the overall project schedule but would be beneficial to the project in the long term.
- Caltrans and the consultant team will meet in early 2004 to obtain general agreement on the scope and content of technical work supporting the Tier 1 EIS/EIR.
- Caltrans to obtain internal feedback on future plans for widening SF 70/99

PDT MEETING #3 – January 30, 2004

Meeting participants included representatives from FHWA, Caltrans, Sutter County, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates. Agenda items included:

Carry-Over Items from Previous PDT Meetings: Co-Lead Agency status; Consultation/coordination update; State highway system effects and direction; Port of Sacramento origin/destination data

Purpose and Need

TAC #5 Meeting Input re: Adjustments to PSR Alternatives; Goals and Policy Issues

Next Steps for Corridor Alternatives Identification

Key decisions included:

- Confirmed that Caltrans will not be a signatory to the Tier 1 EIS/EIR.
- No record of FEMA funding could be found for areas within the study area; this topic was retired with the caveat that the project team continues to be aware of the concern in later project phases.
- Include EPA in notices for PDT meeting agendas and meeting summaries.
- The traffic report will include some origin/destination information; the select link analysis should include "with" and "without" Watt Avenue scenarios.
- The Technical Memorandum would include more information on effects to SR 65 and SR 70/99
- S. Propst and D. Azevedo (Caltrans) would meet with Caltrans staff to identify/recommend SR 70/99 improvements for the next MTP update.
- Revised internal draft of Purpose and Need Statement approved for sending to EPA.

- Based on review of TAC comments on Technical Memorandum, there was no PDT action identified except:

  – Potential Modification #1 re: rerouting central and southern PSR alignments to the north to avoid vernal pools and proposed West Roseville Specific Plan Area - Placer Parkway/Fiddyment Boulevard interchange creates a conflict with local roads. Placer County has indicated that there were three choices to solve this problem: (1) relocate Fiddyment Road (not preferred by Placer County); (2) leave Fiddyment as is (preferred by Placer County, or (3) realign other local roads to reduce the roadway's geometric problem. Project team to meet with Placer County staff to discuss.

  – Project team to consider developing a process to identify mitigation land and an early acquisition process.

  – Project team to get more information on and address the Sutter County suggestion to consider a more northerly corridor alignment – north of Sunset Boulevard West/Howsley Road.

  – Project team to contact Caltrans project manager of I-5/Arena Boulevard interchange for background of that project.

- Confirmed that TAC's no-development buffer would be flexible, especially for areas where potential urban development is being considered.

PDT MEETING #4 – March 11, 2004

Meeting participants included representatives from FHWA, Caltrans, Sutter County, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates. Agenda items included:

Carry-Over Items from Previous PDT Meetings: Co-lead agency status; Consultation/ coordination update; Port of Sacramento origin/destination study; Redrafted Purpose and Need Statement

Changes to Corridor Alignment Alternatives: Review status of alignments; Parkway/Fiddyment/ Sunset alignment; Parkway/Whitney/SR 65 Interchange; SR 70/99 Interchange; Process to identify mitigation land and an early acquisition process; Sutter County issues regarding relieving traffic from Marysville/Plumas Lakes area; Growth inducement issues

Goals/Policy Issues and Input: "No Access"; "No-Development Buffer"; Watt Avenue connection

Right of Entry Letters.

Key decisions included:

- Confirmed SPRTA would be sole CEQA lead agency; Sutter County would be responsible agency.

- S. Propst (Caltrans) met with Sutter County staff, and reported that a more northerly Parkway alignment would not meet the project's Purpose and Need.

- Agreed to study the geometrics and environmental impacts of shifting the Parkway farther onto the proposed Placer Ranch Specific Plan area.

- Placer Parkway project should show ultimate right-of-way required at Parkway/Whitney Boulevard interchange, and coordinate with Rocklin and the County.

- Plan for the largest interchanges with SR 70/99 and through local roads.

- Continue efforts to move forward with early mitigation acquisition strategy.

- Include information regarding new growth areas in the Marysville/Plumas Lakes areas in the traffic report.

- S. Propst reported that wherever the Parkway connects to SR 70/99, six traffic lanes would most likely be needed from that point south to I-5.

- Include definition of growth inducement in Technical Memorandum.

- The right-of-entry letter task was deleted from the work program as not required.

PDT MEETING #5 – April 27, 2004

Meeting participants included representatives from FHWA, Caltrans, Sutter County, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates. Agenda items included:

Carry-Over Items from Previous PDT Meetings: Consultation/coordination update; Port of Sacramento origin/destination data; Regional aboveground water storage facility; Identification of mitigation land and an early acquisition process; Traffic information re: SR 70/99 needed by Caltrans; Plumas Lakes EIR traffic information; Definition of growth inducement; Analysis of water-ski park

U.S. Army COE/EPA Modified NEPA/404 Process

Interchange Geometrics

Transportation Systems Management (TSM) Alternative

Corridor Alignment Alternatives

Key decisions included:

- Agreed to definition of growth inducement prepared by M. Feeney (Mara Feeney & Associates), to be added to the Technical Memorandum

- Agreed to accept the Modified NEPA/404 proposal as drafted by EPA, and that the discussion at the NEPA/404 meeting on April 12, 2004 clarifying the proposal would be recorded as a mutually agreed meeting summary, which would be part of the implementing guidance.

- Based on Caltrans HQ geometricians, preliminary concept drawings of the Parkway interchanges with the state routes were prepared. The interchange with SR 70/99 must be a high-speed connection. To accomplish this and provide a more direct route in Sutter

County, a new location for an interchange with SR 70/99 was identified; there would be no direct connection from Riego Road to Placer Parkway

- Sutter County indicated that they wanted two interchanges in Sutter County in addition to the Placer Parkway/SR 70/99 interchange.

- A new concept was identified for the Placer Parkway/SR 65 interchange. This would be a combined freeway-to-freeway connection for the southbound connections to SR 65, and a local interchange connection for the northbound connections to SR 65. It includes braided ramps to avoid conflicts with SR 65. It was agreed that this concept needed more discussion with Caltrans HQ before taking a final concept to Placer County and the City of Rocklin for discussion.

- J. Long (DKS) to develop traditional TSM alternative and additional alternative scenario based on improving existing roadways, and adding other components such as transit, for review.

PDT MEETING #6 – June 7, 2004

Meeting participants included representatives from FHWA, Caltrans, Sutter County, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates. Agenda items included:

Carry-Over Items from Previous PDT Meetings: Consultation and coordination update; Interchange geometrics; Port of Sacramento origin/destination study

U.S. Army COE/EPA – Modified NEPA/404 Process

TAC/SAC Feedback on Corridor Alternatives

Land Use Assumptions for Future Analysis

TSM Alternative

Key decisions included:

- In response to SAC input, the project team agreed to prepare potential interchange options for SR 70/99 at/near Riego Road prior to August 2004 public meetings.

- The project team will meet with Placer County and SACOG to ensure the project's goals are clear and that economic growth assumptions are consistent between the Parkway and the Blueprint process.

- The project team will meet with Placer County staff regarding alternatives crossing the proposed Regional University and Community Plan and agricultural impacts associated with corridor alignment alternatives.

- There was general discussion regarding the need to update the land use forecasts used in the traffic study, but no conclusions.

- Draft TSM Alternative information was provided to the group, who suggested various additional improvements, including six lanes on SR 65. The numbers were to be rerun. It was noted that future land use in the region remains a major issue; it will be important to sort out what are reasonable assumptions for the travel demand modeling based on the

RTP, the MTP, and Department of Finance assumptions and numbers. Coordination with SACOG was suggested.

PDT MEETING #7 – July 6, 2004

Meeting participants included representatives from Caltrans, Sutter County, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates. Agenda items included:

Carry-Over Items from Previous PDT Meetings: Consultation and coordination
Report on U.S. Army COE/EPA – Modified NEPA/404 Meeting
Status of South Sutter County Specific Plan
Status of State Route Interchanges with Placer Parkway
Public Meetings

Key decisions included:

- All Parkway traffic modeling needs to be based on SACOG's MTP. Cumulative traffic modeling will be based on 2040 projections; Placer County has engaged a consultant to develop its own projections.

PDT MEETING #8 – September 21, 2004

Meeting participants included representatives from FHWA, Caltrans, Sutter County, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates. Agenda items included:

Carry-Over Items from Previous PDT Meetings: Consultation/Coordination update; South Sutter Plans and Ballot Initiative; State route interchanges with Placer Parkway; Watt Avenue interchange locations for Tier 1 EIS/EIR analysis

Update on U.S. Army COE/EPA – Modified NEPA/404 Meeting

Report on Policy Advisory Committee Meeting – September 14, 2004

Moving Forward to Tier 1 EIS/EIR: Cost and schedule risk; Items needing input from TAC/SAC; Project description, Coordination with Caltrans and FHWA

Report on Public Meetings 2004

Key decisions included:

- The project team provided comments on a revised Purpose and Need statement, with direction to forward to EPA.

- In response to concerns that the "diagonal" alignment alternative would impact the proposed Regional University Specific Plan, FHWA advised that if it were viable, it should be left in the analysis.

- Input from the TAC and the SAC is required regarding the interchange concepts, the recommended Watt Avenue interchanges to be studied in the Tier 1 EIS/EIR, and the expanded TSM scenario, a revised transportation scenario, and generic roadway cross sections prepared for environmental analysis.

PDT MEETING #9 – November 17, 2004

Meeting participants included representatives from FHWA, Caltrans, Sutter County, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates. Agenda items included:

Carry-Over Items: Consultation/Coordination update; South Sutter County Plans/Initiative; Caltrans/URS team meeting re: technical reports; TAC Meeting #7

Update on U.S. Army COE/EPA – Modified NEPA/404 Process

Mitigation Strategy Planning

Projections for Travel Forecast Modeling

Project Description Items: Country Acres residential impacts; Interchange concepts; Typical roadway cross sections; Visual aspects; Operations and maintenance; SPRTA Board meeting December 1, 2004

Key decisions included:

- Detailed maps should not be produced during the Tier 1 process as it makes it appear that the Parkway alignments are already determined.
- If MEPLAN is used to assess future development and mitigation lands, EPA approval of this methodology should be obtained.
- The project description should generally identify in a conceptual way what is expected regarding buffer zones and median – landscaping, planting, etc.
- The potential corridor alignment alternatives will be taken to the next SPRTA Board meeting, while noting that they could be altered by the Modified NEPA/404 process.

PDT MEETING #10 – November 14, 2005

Meeting participants included representatives from FHWA, Caltrans, Sutter County, Placer County, the City of Roseville, PCTPA, URS Corporation, and DKS Associates. Agenda items included:

Project Update and Schedule: Addition of a fifth build alternative; Update on U.S. Army COE/ EPA – Modified NEPA/404 process; Initiation of technical studies; Travel forecast model

Project Description Items: Interchange concepts; Sankey Road relocation; Sunset Boulevard West relocation; Typical roadway cross sections; Fire/emergency access; Visual aspects; Operations and maintenance

Other Items: Coordination with New Development Projects; Toll Road Study; Mitigation Strategy; Standard Day/Time for Future Meetings

Key decisions included:

- The project team would find out more about MEPLAN and its potential use to measure growth inducement concerns and report back at the next meeting.
- P. McAchren (Caltrans) will check with Caltrans HQ regarding toxic air contaminants guidance.

- Because $PM_{2.5}$ guidance was expected from EPA in April 2006, this would need to be evaluated in the Parkway's environmental document.

- John Long (DKS) to attend meeting with local jurisdictions regarding cumulative scenarios, and then develop a draft cumulative roadway network for Placer County review.

- Placer County representative T. Brinkman indicated concurrence with the relocation of Sunset Boulevard West to allow access to Fiddyment Road once the Parkway/Fiddyment interchange was constructed.

- Advised Placer County to address the inconsistency between the Parkway corridor width in the vicinity of the Placer Ranch Specific Plan and the Placer Ranch applicant's proposal for an approximately 200-foot right-of-way.

- Work with Caltrans landscape architects to develop a landscaping plan that would not create prime habitat, and would allow for good aesthetics, drainage, safety, and ease of maintenance.

- Disclose information regarding the Toll Road Feasibility Study in the Tier 1 EIS/EIR.

PDT MEETING #11 – January 19, 2006

Meeting participants included representatives from FHWA, Caltrans, Placer County, the City of Roseville, City of Lincoln, PCTPA, SACOG (by phone for MEPLAN item), URS Corporation, and DKS Associates (by phone for MEPLAN item). Agenda items included:

Use of MEPLAN for Growth Inducement Analysis

Carry-Over Items: Travel forecast model – roadway assumptions; Sankey Road realignment – Sutter County input; Landscaping concepts for project description; Placer Ranch Specific Plan roadway; Air toxics

SPRTA PCCP Participation

Logical Termini

Key decisions included:

- MEPLAN was approved for use in developing the growth inducement analysis, if the project team can use the version of the model used by the Blueprint project, and customize it as necessary for the project's purposes. The process would be initiated, and FHWA will contact our NEPA/404 partners to present this approach and receive their feedback.

- The revised 2040 traffic forecast model will use the revised scenario being used for Placer Vineyard, with minor tweaks as suggested by Placer County.

- A. Sawyer (Sutter County) confirmed (by e-mail) that Sutter County is agreeable to the five corridor alignment alternatives, including the realignment of Sankey Road that extends over SR 70/99.

- G. Horton (URS) to check on whether auxiliary lanes would be required from the Placer Parkway/SR 65 interchange at Whitney Boulevard to the SR 65/Twelve Bridges interchange.

- Draft landscaping concepts presented to the PDT were approved.

- Placer County is asking that the proposed Placer Ranch project construct a four-lane roadway to serve their project, from SR 65 to Fiddyment Boulevard, and to reserve right-of-way for a Placer Parkway as indicated on the Parkway's alternatives map. They will evaluate an interchange at SR 65 at a project level based on the existing PSR for the eastern portion of that interchange, and evaluate the western part (including ramps and needed auxiliary lanes) at a program level based on the Placer Parkway alternatives map. The areas of impact are to be identified by G. Horton. Placer Ranch has been asked to do their best to ensure that the lanes are not "throw-away" lanes. In the event Placer Parkway is approved and constructed, Placer County would like to have done their best effort that the road would likely be within a future Parkway LEDPA alignment. It was emphasized that the Placer Ranch roadway is needed for their project, and it has independent utility without a Parkway, but that Placer County was taking account of the current Parkway planning process and wanted to be as efficient as possible.

- Include a qualitative discussion of potential toxic impacts by examining distances between the alignments and the closest sensitive receptors. Those distances will be compared with the buffers recommended in California Air Resources Board's "Air Quality and Land Use Handbook: A Community Health Perspective" dated April 2005.

- Include $PM_{2.5}$ in the scope of the Air Quality Technical Report.

- Reaffirmed that the logical termini are at the interchanges of the Parkway with the state routes, including needed ramps and auxiliary lanes.

PDT MEETING #12 – February 16, 2006

Meeting participants included representatives from FHWA, Caltrans, Sutter County, Placer County, the Cities of Roseville and Rocklin, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates. Agenda items included:

Carry-Over Items: Auxiliary lane north on SR 65, Air quality memo approval; South Sutter County local roadway assumptions

MEPLAN Meeting with SACOG – February 15, 2006

Modified NEPA/404 Process

Potential for Use of Context Sensitive Solutions (CSS)

Status of Technical Studies

Funding Deadline

Key decisions included:

- G. Horton (URS) reported that auxiliary lanes would be required between the Placer Parkway/SR 65 interchange at Whitney Boulevard and the SR 65/Twelve Bridges

interchange. The improvements were likely to be a pat of the SR 65/Twelve Bridges project. S. Propst (Caltrans) agreed unless SR 65 traffic generated by the Parkway greatly increased.

- In response to questions from the City of Rocklin, and several developers who have asked for information regarding the right-of-way requirements at SR/65 and Whitney Boulevard, G. Horton will provide an updated interchange concept drawing with a tentative "exclusion zone" (for parking areas and building setbacks) to be used for planning purposes. This drawing will be forwarded to L. Wing (City of Rocklin).

- It was reported that J. Gil (Caltrans) approved the scope of work for the Air Quality Technical Report, as amended by URS to include the approach to air toxic contaminants.

- Due to the lack of information regarding projected local roadway connections in Sutter County, J. Long (DKS) will develop reasonable assumptions, and proceed to use them in analyses with appropriate qualifications.

- After a report on the MEPLAN meeting with SACOG on February 15, 2006, the PDT directed that:

  – A "purpose/need" statement will be prepared to outline why MEPLAN is being used. It will include background that growth inducement is a very controversial environmental issue, and that there is no standard way to measure it. Because growth inducement discussions are typically qualitative, they are considered subjective. The use of MEPLAN would add a quantitative layer, which has been vetted by SACOG and local interests and is widely accepted as reasonable. In addition, EPA seems to be comfortable with its use. The use of MEPLAN will strengthen the Tier 1 growth inducement discussion via model output.

  – It is likely that the traffic model in MEPLAN would not produce results identical to the Transportation/Traffic Study that is being undertaken by J. Long for this project, as his model is more detailed and includes updated assumptions. MEPLAN's traffic model assumptions will be evaluated to be sure there are no significant differences on a regional level. This will be explained in the write-up of the process. The MEPLAN modeling exercise will focus on growth inducement, not traffic. Traffic will be addressed comprehensively in a separate technical report.

  – The work will be presented in a "stand-alone" technical report or in an appendix to the growth inducement discussion.

  – Initially, only the land use differences between the northern (#5) and southern (#1) corridor alternatives will be analyzed. This assumes that any growth inducement differences would be bracketed. However, if significant changes result between the two alternative corridors, then the middle ones would be analyzed.

- Direction was provided to include "Eco-Logical" concepts.

- Several steps were agreed upon regarding incorporating Context Sensitive Solutions: including a description in the Tier 1 EIS/EIR's project description, prepare a SPRTA Board memo describing this concept in the context of Placer Parkway, S. Propst will circulate information on a U.C. Berkeley-sponsored Caltrans workshop on CSS in March.

- S. Propst will check on funding deadline and use of any remaining funds.

PDT MEETING #13 – March 16, 2006

Meeting participants included representatives from Caltrans, Placer County, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates. Agenda items included:

Carry-Over Items from Previous PDT Meetings: MEPLAN Coordination with SACOG; Context Sensitive Solutions; Funding extension for Parkway Tier 1 EIS/EIR

Modified NEPA/404 Process

Technical Studies – Cultural Resources Update

Analysis Scenarios

Key decisions included:

- Confirmed that funding for this phase of the Tier 1 EIS/EIR could not be extended beyond February 2007.

- Direction was received from Caltrans to identify historic architectural direct impacts only under Criterion C, and to proceed with cultural resources investigations without SHPO concurrence on approach and methodology. SHPO will not be the approving agency during Tier 1.

- It was agreed that opening day conditions will be analyzed for 2020 for traffic, air, and noise, consistent with the memorandum of March 13, 2006 from J. Long, and that 2040 will be the future analysis year for cumulative impacts (all studies). The EIS/EIR will acknowledge that 2025 has been used as a future cumulative impact analysis year by other jurisdictions/projects in the six-county area. Its use is not appropriate for Placer Parkway due to (1) the atypical timeframe during which actual construction will begin, relative to those other projects; and (2) number of developments in that scenario that have not been approved. The Placer Parkway strategy is to bracket the range of conditions analyzed by including a scenario with only planned development in 2020 on the one hand, and the broader proposed development scenario for 2040. The 2020 land use scenario will only include approved projects. Placer Vineyards will be included for the first phase of 7,200 units. The 2040 scenario will include all proposed projects. This reflects the unpredictability of potential future development over a 35-year time frame and the Tier 1 analysis level.

- The Tier 1 EIS/EIR will analyze one additional year, 2027, for air quality only; this reflects the Air Quality Conformity analysis year.

- For the potential future Watt Avenue connection (not a part of the Placer Parkway project), this connection would not be included in the "No-Build" scenario. There was not agreement as to whether or not the analysis should include the presence of a Watt Avenue extension and Watt Avenue interchanges. This issue will be referred to the project's legal team. The 2040 analysis will analyze conditions both with and without the Watt Avenue connection.

- Reaffirmed the conceptual locations for interchanges along the Parkway in Sutter County.

PDT MEETING #14 – April 26, 2006

Meeting participants included representatives from Caltrans, Sutter County, Placer County, the Cities of Roseville and Rocklin, PCTPA, URS Corporation, and DKS Associates. Agenda items included:

Carry-Over Items: MEPLAN update; Context Sensitive Solutions; Watt Avenue connection/ Extension analysis; Mitigation strategy; Placer Ranch Specific Plan alignment
U.S. Fish & Wildlife Service Consultation
Traffic Analysis and Impacts
1st Administrative Draft Tier 1 EIS/EIR

Key decisions include:

- Based on input from the project's legal team, the Watt Avenue interchange and extension option would be included in the 2040 cumulative scenario as well as in the 2020 scenario, including the No Build Alternative.

- Endorsed the idea of continuing to explore feasible early mitigation options.

- Placer County staff will follow up with Placer Ranch Specific Plan representatives regarding their moving a portion of their roadway to SR 65 outside of the corridor alignment identified for Placer Parkway, as well as their proposed 50-foot medium and maximum 250-foot right-of way, all in conflict with proposed Parkway features.

- Meeting attendees to provide comment on the draft significance criteria for transportation, given that each jurisdiction evaluates traffic impacts by differing criteria. Also the draft traffic impacts and mitigation strategies.

- J. Long (DKS) to rerun traffic for Alternatives 1 and 5 with HOV lanes on SR 70/99, to bracket differences between the southernmost and northernmost alternatives.

PDT MEETING #15 – May 9, 2006

Meeting participants included representatives from FHWA, Caltrans, the City of Roseville, PCTPA, URS Corporation, and DKS Associates. Agenda items included:

Context Sensitive Solutions
Transportation/Traffic
Other Items: Secondary and Indirect Impacts; Schedule

Key decisions include:

- Caltrans and FHWA to work together to document Context Sensitive Solutions applications for Placer Parkway. C. Perez (FHWA) to ask for FHWA funding.

- Three potential mitigation strategies for SR 70/99 were identified: (1) adding two additional HOV lanes (eight lanes total); (2) adding parallel north-south facilities to serve shorter trips between Sacramento County's "northwest territories" and Sutter County's Measure M area. It was recognized that the proposed 'buffer' area between Sacramento and Sutter counties might complicate this potential mitigation strategy; and (3) transit. Transit would only work in addition to one or another of the potential strategies identified above.

- Caltrans requires that secondary and indirect impacts be treated in each technical report, not deferred to Tier 1 EIS/EIR.

PDT MEETING #16 – September 16, 2006

Meeting participants included representatives from FHWA, Caltrans, Sutter County, Placer County, the Cities of Roseville and Rocklin, PCTPA, URS Corporation, and DKS Associates. Agenda items included:

Carry-Over Items: Funding Deadline; Mitigation Strategy; Placer County Coordination

Schedule

Technical Report Status: Status of submittals/review comments; Transportation Technical Report comments and responses; MEPLAN update; Federal partner review

Key decisions included:

- Ways to extend the funding allocation have been exhausted. The project team will look at ways to implement appropriate early-action items.

- Local jurisdictions will perform a broad level review of technical studies, concurrent with Caltrans/PCTPA's more detailed review.

- Placer County asked if the Tier 1 EIS/EIR could provide information regarding the Placer Ranch Specific Plan (PRSP) roadway alignment lying outside the Placer Parkway corridor alignment in the eastern segment. Placer County would cooperate to identify the LEDPA location for their roadway and that Placer County staff would not support any alignment that was preferable with respect to right-of-way but which would not qualify as the LEDPA. The PDT agreed that it was possible that the PSRP's proposed roadway could become a component of the future Placer Parkway, if approved and permitted. The PDT provided direction to evaluate the proposed PSRP alignment as a separate discussion in the Tier 1 EIS/EIR, similar to the Watt Avenue interchange discussion, since it is not proposed by Placer Parkway. This will require work in all the technical reports and cause a project delay and increase in costs. The PDT also directed that the resources agencies by apprised of this situation in a timely manner.

- Placer County reported that Placer Ranch would be responsible for constructing a partial interchange at SR 65 in the same location as the conceptual Parkway interchange. At this time it is not planned to be built initially as a full freeway-to-freeway interchange. It would be built based on Caltrans traffic requirements and funding availability. At Foothills Boulevard and at Fiddyment Road, the Placer Ranch road would include temporary signalized intersections.

- The PDT supported the Placer County requirement that the PRSP develop an alternative land plan showing the Placer Parkway corridor alignment alternative including the required 500-foot and 1,000-foot corridor width requirements; the support was tempered by a concern to ensure the alternative would not be loaded with "fatal flaws" so that it could be easily dismissed. FHWA cautioned that reducing the corridor width would be a big issue with the resource agencies.

- The project team will offer the resources agencies the opportunity to review the technical studies prior to completion of the Tier 1 EIS/EIR.

Appendix D
Summary of Modified NEPA/404 Consultation for Placer Parkway Corridor Preservation Tier 1 EIS/Program EIR through Concurrence Point #3

APPENDIX D
MODIFIED NEPA/404 PROCESS FOR PLACER PARKWAY

TABLE OF CONTENTS

Section **Page**

LIST OF ATTACHMENTS

MODIFIED NEPA/404 PROCESS FOR PLACER PARKWAY

1.0 INTRODUCTION

As part of the planning process for the Placer Parkway Corridor Preservation Tier 1 EIS/EIR, the Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the Placer County Transportation Planning Agency (PCTPA) acting on behalf of the South Placer Regional Transportation Authority (SPRTA) have agreed to participate with the U.S. Army Corps of Engineers (U.S. Army COE) and the U.S. Environmental Protection Agency (EPA) in a *modified* National Environmental Policy Act/Clean Water Act Section 404 Integration Process (modified NEPA/404) process.[2] A formal process is usually initiated by the submittal of an application for a Section 404 permit under the Clean Water Act to the U.S. Army COE. It focuses on identification of a Least Environmentally Damaging Practicable Alternative (LEDPA). This process ensures federal agency agreement that the preferred alternative is the LEDPA necessary to obtain permits prior to project construction.

The Tier 1 EIS/EIR process for the Placer Parkway Corridor Preservation project does not require a Section 404 permit or any permits from any federal agency. Therefore, a LEDPA determination is not necessary in the current process, although the associated Tier 2 project will require a Section 404 Permit. To provide early direction to FHWA and PCTPA so that Tier 1 decisions reflect careful consideration of the Section 404(b)(1) Guidelines, and to accommodate future regulatory requirements, the usual NEPA/404 process has been modified for the Tier 1 EIS/EIR phase of the Placer Parkway project, the purpose of which is to identify and preserve a corridor for a future Placer Parkway. The modified process reflects the broad nature of Tier 1 environmental review while also anticipating the permit application requirements of Tier 2. The modified process is intended to ensure the following:

- Tier 1 decisions closely reflect 404 Guidelines;
- There is ongoing agency concurrence with Tier 1 decisions throughout the environmental review process;
- Decision making provides sufficient certainty that alternatives eliminated in Tier 1 are unlikely to need revisiting in Tier 2, although it is recognized among all parties that additional assessment of alternatives evaluated in Tier 1 may be necessary in Tier 2, depending on the outcome of the environmental review process;
- The corridor alignment identified as the preferred alternative in the Final EIS/EIR will most likely contain the LEDPA. This will help to address significant LEDPA issues during the Tier 2 process, and should result in an ultimate project that will receive a Section 404 permit; and
- The initial additional time required for agency review under this modified NEPA/404 process will ultimately result in a more streamlined environmental review process for the project overall, and one which is appropriate to a Tier 1 process.

This process has been memorialized in a Memorandum of Understanding (MOU) for the Placer Parkway Corridor Preservation Project (Attachment 1). The modified NEPA/404 MOU integrates requirements of the Clean Water Act into the NEPA environmental review, and facilitates the preparation of the Section 404 Permit at the end of the NEPA process (Tier 2).

[2] National Environmental Policy Act/Clean Water Act Section 404 Integration Process for Surface Transportation Projects Memorandum of Understanding" signed by Federal Highway Administration, Federal Transit Administration, U.S. Environmental Protection Agency, U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, National Marine Fisheries Service, California Department of Transportation, Arizona Department of Transportation, and Nevada Department of Transportation, 1993.

The modified NEPA/404 Process MOU for Placer Parkway Corridor Preservation Project identifies five sequential Concurrence Points at which formal agency approval (U.S. Army COE and EPA) would be sought and obtained before the environmental review process proceeds to the next step. USFWS would not provide formal approval but would track this process.

The five Concurrence Points are:

1. Purpose and Need
2. Criteria for Selecting the Range of Alternatives
3. Range of Alternatives
4. Alternative(s) most likely to contain the LEDPA
5. Mitigation Framework

Concurrence Points 1 to 3 occur prior to completion of the Tier 1 Draft EIS. Concurrence Points 4 and 5 occur prior to completion of the Tier 1 Final EIS.

This report presents a summary to date of consultation under the modified NEPA/404 process. Meeting minutes are on file at PCTPA's offices in Auburn, California.

2.0 SUMMARY OF THE CONSULTATION PROCESS

On August 21, 2003, the Placer Parkway team participated in a meeting with the following agencies:

- U.S. Environmental Protection Agency (EPA)
- US. Army Corps of Engineers (U.S. Army COE)
- Central Valley Water Resources Control Board (CVWRCB)
- Federal Highway Administration (FHWA)
- California Department of Transportation (Caltrans)
- Placer County Transportation Planning Agency (PCTPA)

This meeting was intended as an introduction to the Placer Parkway Tier 1 EIS/EIR project, as early consultation. Since the Tier 1 process and subsequent land acquisition would not require a Section 404 permit, the team did not initially envision a formal NEPA/404 consultation process. Agencies, however, in particular U.S. Army COE and EPA, encouraged development of a modified NEPA/404 process, notwithstanding the lack of a permit application at Tier 1. General discussion among agencies at this and a subsequent meeting in October led to the development and circulation by EPA of a proposed modified NEPA/404 process in April 2004. A final modified NEPA/404 Process MOU was accepted at a meeting on April 12, 2004, the meeting notes for which elaborate on the process for NEPA/404 integration (see Attachment 1).

As of the date of this summary, agency concurrence has been obtained on Concurrence Points 1, 2, and 3 (see Attachment 2). The consultation process currently reflects the phase of the process between Concurrence Points 3 and 4; during which time the Draft Tier 1 EIS/Draft Program EIR is under preparation. As agreed, USFWS has not provided formal approval but has not voiced objections to the Concurrence decisions.

3.0 MEETING OBJECTIVES AND SUMMARIES

A series of subsequent meetings were held as part of the modified NEPA/404 process for the project. A summary of these meetings and major items discussed are presented below.

COORDINATION MEETING #1 – August 21, 2003

Meeting participants included representatives from Central Valley Water Resources Control Board, U.S. Army COE, California Department of Fish and Game, EPA, FHWA, Caltrans, PCTPA, and URS Corporation.

The meeting objective was to generally introduce the Placer Parkway Tier 1 EIS/EIR project to federal and state agencies, and receive information, input, and guidance. Agenda items included:

Introduction and Project Background
Study Goals
Tier 1 Process
Work Plan Approach
Review of GIS-Level Mapping
Questions and Comments

This initial meeting was convened to give an overview of and introduction to the project. The Tier 1 concept was presented. Federal resource agencies, in particular the U.S. Army COE and the EPA, encouraged PCTPA to consider how a modified NEPA/404 process could be implemented in the absence of any permit application.

General information regarding the *Conceptual Plan* (DKS, 2000) and *Project Study Report* (DKS, 2001) were provided. These documents are available on the PCTPA website. Information about the three project advisory committees (Technical Advisory Committee, Study Advisory Committee, and Policy Advisory Committee) was provided. Information was provided to the group regarding study goals, baseline information collected (maps), the project's work program and schedule. A conceptual alignment map from the *Project Study Report* and a project fact sheet were provided to attendees.

Key issues raised by participants included:

- The purpose and need of the project
- Multi modal transit options
- Project design, including options for access limitation
- Potential impacts on natural/biological resources
- Cumulative and indirect impacts are key components
- Need to factor into ROW acquisition high value resources such as vernal pools, as avoidance or mitigation
- EPA's expectation of a "Placer Legacy vision" to protect west Placer riparian corridors and to make this project a lever for conservation
- Implementation of a parallel "404-like" process

It was agreed that Erin Foresman (EPA) and Mike Jewell (U.S. Army COE) would coordinate with PCTPA to set up a meeting regarding LEDPA and the NEPA/404 process.

COORDINATION MEETING #2 – OCTOBER 23, 2003

Meeting participants included representatives from U.S. Army COE, EPA, FHWA, Caltrans, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates.

The meeting objective was to identify a clear process to apply the NEPA/404 integration to the Placer Parkway Corridor Preservation Tier 1 EIS/EIR, and to provide more information regarding the purpose and need for the project and planned and projected growth in the project study area. Agenda items included:

Introductions
Process for NEPA/404 Integration
Purpose and Need
Planned and Projected Growth
Data Availability Needs: types of information available; level of information required
Conclusions and Next Steps

This meeting was convened with the intention of identifying the details of the proposed process for NEPA/404 Integration within the Tier 1 EIS/EIR (with the objectives of ensuring that the ultimate corridor alignment includes the LEDPA, obtaining ongoing agency concurrence with environmental decision-making, and ensuring the likely success of the Tier 2 404 permit application). Additional information was also provided regarding the purpose and need for the project and planned and projected growth in the project study area. Environmental resource maps detailing the location of the conceptual alternative corridors from the *Project Study Report* (DKS, 2001) in relation to wetlands, vernal pool complexes, riparian and upland habitat, flood zones, and residential and commercial buildings were distributed. An October 23, 2003 Placer County Board of Supervisors' action was also reported. The Board directed the County staff to proceed with concurrent processing of two "university" proposals (Placer Ranch/California State University – Sacramento branch campus and the De La Salle University and Community) as well as the proposed Placer County HCP/HCCP in coordination with the proposed Placer Parkway.

The meeting participants agreed to the following:

- A modified NEPA/404 Integration Process MOU prepared by EPA/U.S. Army COE would be used for the Tier 1 evaluation of the project, subject to meeting participant comments and subsequent revision.

- Resource agencies will describe expectations for development of project purpose and need, alternatives selection criteria, and range of alternatives, and the level of information required to make a formal preliminary LEDPA determination.

COORDINATION MEETING #3 – APRIL 12, 2004

Meeting participants included representatives from U.S. Army COE, EPA, FHWA, Caltrans, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates.

The meeting objective was to review and finalize the process and timeline for a modified NEPA/404 process prepared by U.S. Army COE and EPA, including clearly identifying steps, data requirements, and schedule. Agenda items included:

Introductions
Brief Overview of Project Status
Review Draft Modified NEPA/404 Process
Identify Schedule and Data Needed for Each Step
Other Items: draft Purpose and Need Statement, EPA Notice of Intent (NOI) comment letter, PSR northern corridor alignment alternative (proposed to be dropped), workshop to provide and review environmental data
Conclusions and Next Steps

A draft process proposal for a modified NEPA/404 process (prepared by U.S. Army COE and EPA) was the primary focus of this meeting. The meeting reviewed and finalized the Memorandum of Understanding regarding the modified NEPA/404 process. The timeline was not finalized, pending further discussion.

The project team gave a brief project status update. A Draft Purpose and Need statement was distributed to the meeting for review and comment and preliminary questions regarding purpose and need were discussed.

Key issues raised by participants included:

- Identifying that Placer County is considering a new community plan area – south of Pleasant Grove Creek to the Placer/Sutter County line
- Clarifying the definition of "free-flowing" traffic
- Determining how a Watt Avenue interchange would be studied and what other access points would be considered in the 7-mile central segment
- Determining how much information is needed for a Tier 1 determination

COORDINATION MEETING #4 – MAY 3, 2004

Meeting participants included representatives from U.S. Army COE, EPA, FHWA, Caltrans, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates.

The meeting objective was to progress towards obtaining concurrence regarding the project's Purpose and Need. Agenda items included:

> Information Related to the Draft Purpose and Need Statement: project development background, traffic forecast data
> Response to Questions and Comments from U.S. Army COE and EPA
> Provide Clarification as Needed to U.S. Army COE and EPA
> Develop an Understanding of What Additional Information is Needed to Reach Concurrent on Purpose and Need

Steve Propst (Caltrans) provided a summary of the project history. John Long (DKS) provided additional traffic and Level of Service (LOS) information to support the project Purpose and Need. Tom Cavanaugh (U.S. Army COE) stated that the U.S. Army COE guidance under Section 404 is to presume there is a need, and defers to project's need, focusing more on the project purpose.

The meeting participants also discussed future development forecasts for the six-county SACOG region. Current development proposals, if approved, would have substantially more development in the study area than that included in SACOG's 2025 Metropolitan Transportation Plan (MTP). DKS provided four large-scale maps which graphically illustrated the projected Level of Service under a range of future Development Scenarios: (1) No Project – using SACOG's 2025 MTP forecasts based on development forecasts for the six-County SAOG region as of 2001; (2) Two Expanded Development Scenarios with additional development not included in SACOG's 2025 MTP. This would include approved and reasonably foreseeable additional land uses beyond the 2025 horizon. The two scenarios (Expanded Scenarios A and B) would reflect a different distribution of commercial/industrial development. Both scenarios assume buildout of all additional residential development, plus nonresidential development in an amount equal to the current jobs/housing ratio, which is relatively balanced. The two scenarios would reflect a different distribution of commercial/industrial development. It was noted that other factors come in to play when projecting future development, such as the ability of available mitigation and the ability to secure federal permits.

The need for the project, based on the traffic forecasting model as illustrated by the map, was identified. The following features on the maps were identified:

- The maps show that conditions will be much worse in the future than today

- The difference between SACOG 2025 and Expanded Development Scenario A is pronounced, with conditions much worse under the Expanded Development Scenario A.
- Local roadways will experience LOS F conditions for more than 1 hour.
- LOS conditions have a ripple effect, which will back up freeways extending for miles and multiple hours.

The model shows that a lot of that benefit occurs on the local roadway system. It was pointed out that the traffic forecasting model accounts for latent demand. This is why the improvement on I-80 is not as pronounced as would be seen if the traffic model did not include feedback loops to account for travel that would be redirected to I-80 because Placer Parkway would reduce the existing congestion.

Key issues raised by participants included:

- Study area boundary development.
- Likelihood that additional development identified in the Expanded Development Scenario would be approved.
- Clarification about how the employment outside of the study area was spread.
- Assumptions about the jobs/housing balance.
- Improvements included in SACOG's regional projects
- Difficulty of finding vernal pool mitigation sites within Placer County.
- Options for a multi-modal facility.
- Placer County planning processes, especially Curry Creek Community Plan.
- Time horizon, congestion over time, levels of service.
- I-80 effects.
- Goods movement.
- Economic development.
- Growth inducement.

This discussion was followed by more specific discussion related to the Purpose and Need Statement, with direction provided by U.S. Army COE and EPA and a schedule for agency review.

COORDINATION MEETING #5 – July 6, 2004

Meeting participants included representatives from EPA, FHWA, Caltrans, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates.

The meeting objective was to review prior comments and fine-tune the project's Purpose and Need Statement based on EPA comments on the draft received by the project team on May 17, 2004, and to discuss the potential Watt Avenue interchange. Agenda items included:

Purpose and Need for the Project
Watt Avenue Interchange
DKS Memorandum on TSM Alternatives

The meeting objective was to review and finalize the project Purpose and Need. A revised Purpose and Need Statement was sent to EPA and U.S. Army COE on June 4, 2004. Materials circulated for discussion included the following documents:

- EPA Comments on Draft Purpose and Need Statement

- Memorandum from Caltrans, June 4, 2004, responding to EPA comments and questions regarding project benefits, current and future congestion information, and further explanation with respect to SACOG's future growth projections

- A revised Draft Purpose and Need Statement (with comment-number annotation linking the revisions to the memorandum)

- Memorandum from John Long (DKS), June 21, 2004, explaining the analysis of a potential TSM alternative

- A map of the potential corridor alignment alternatives

A smaller group of meeting participants agreed to participate in a conference call (August 16, 2004) to finalize the Purpose and Need. [Note that EPA did not attend this call due to scheduling conflicts. During a subsequent call to URS from EPA on August 18, 2004, the conclusion was that the team would be in a position to request concurrence shortly, pending any additional input from Tom Cavanaugh. EPA would provide a bullet list of outstanding items for discussion at a future meeting.]

Key issues raised by participants included:

- Provide more information on project benefits and how long they would last
- Provide LOS information and more specific information on congestion relief, including on Interstate 80
- Basis of jobs numbers
- Sutter County industrial reserve area
- Geographic area of influence and traffic analysis study boundary, including relationship to employment projections
- Need to identify a "basic" purpose versus an "overall project purpose"
- SACOG Blueprint process and how Placer County relates to it
- Sufficiency of available mitigation

It was cautioned that given the continuing work on modeling and the evolving work by SACOG and others on growth numbers, any numbers in the Purpose and Need would be "place holders" for now. However, there should be little difference from the final numbers. Variation would depend on the Technical Advisory Committee direction, and SACOG Blueprint, Placer County Planning Department, and State of California Department of Finance numbers. Things seem to be pointing to 2040 as the future date to use for analysis. For screening, the project team needed to keep the approach reasonable and cannot wait for new numbers to emerge in the future.

The meeting participants discussed a potential future Watt Avenue Interchange with the Parkway. This potential future interchange is not a part of the Placer Parkway project, but very conceptual locations will be analyzed in the Tier 1 EIS/EIR for informational purposes, as set forth in the projects goals and policies. Both a future Watt Avenue extension and a potential connection to the Parkway would be separate projects, proposed by others. The conceptual potential connection would be analyzed for the range of Parkway corridor alignment alternatives.

The meeting participants discussed the opportunity for including a TSM alternative in the analyses. As set out in the memo circulated at the meeting (John Long, June 21, 2004), the Placer Parkway would provide a substantial benefit in travel times while a TSM alternative by itself would not offer any substantial improvement. Key issues raised by the participants included:

- Baseline Road improvements and whether it could be an expressway

- Other approaches to solve the traffic problem without a new facility
- Congestion pricing

COORDINATION MEETING #6 – August 24, 2004

Meeting participants included representatives from U.S. Army COE, EPA, FHWA, Caltrans, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates.

The meeting objective was to review and obtain feedback on screening criteria, environmental resource data used for Tier 1 screening, the screening process, and start a discussion on potential corridor alignment alternatives for evaluation in the Tier 1 EIS/EIR. Agenda items included:

Introductions
Reschedule Purpose and Need Conference Call
Screening Criteria
Environmental Resource Data and Screening Process
Potential Corridor Alignment Alternatives

EPA expressed concern that the Purpose and Need could prematurely narrow the range of alternatives, eliminating any TSM-like alternative (i.e., use of existing infrastructure). This was based on a concern regarding potential impacts to wetlands. U.S. Army COE was concerned that the potential alternatives maps appeared to "pancake" the alternatives into one general area.

The meeting participants reviewed screening criteria used in the screening evaluation conducted with the advisory committees (URS, 2004). Screening was used to distinguish among the PSR alternatives and to identify areas where they needed to be adjusted or avoided. The U.S. Army COE noted the importance of the LEDPA was emphasized over other screening parameters.

The environmental resource data and the screening process were reviewed in the context of project alternatives, utilizing an excel table showing the calculations of potential impacts on affected resources (waterfowl and other upland habitat; potential special-status species habitat; riparian, wetland, and conservation areas; vernal pool critical habitat and vernal pool complexes; socioeconomic resources; cultural resources; floodplains; hazardous waste; farmland designations; working farm units, and power lines). A map showing potential future development in and around the study area was also presented. Potential alternatives were discussed based on screening to date. The project team requested early input from agencies with respect to the suitability of the proposed screening criteria.

Key issues raised by participants included:

- Vernal pool data
- Evaluation and calculation of impacts
- Concern with eliminating a corridor alignment that might have more impacts overall but would have a roadway alignment with less impacts
- Emphasis on avoiding or minimizing impacts
- West Roseville Specific Plan area and vernal pools
- Concern to not prematurely eliminate a LEDPA
- Growth inducement – specifically related to interchange locations and alignment location
- Limiting Central Segment access (interchanges) and no-development buffer zone
- Screening criteria documentation
- USFWS attendance/participation

U.S. Army COE and EPA expressed concern that screening of alternatives was occurring prior to concurrence on the Purpose and Need, and agreed-upon screening criteria. This should be documented, as should the screening process.

EPA agreed to provide final comments on the Purpose and Need. The project team agreed to compile information fully explaining the process by which alternatives had been considered and either rejected or identified as appropriate for further evaluation.

EPA expressed concern that a new facility is assumed to be required. Other potential solutions to the transportation need were discussed, including building a shorter Parkway or widening Baseline Road.

COORDINATION MEETING #7 – October 21, 2004

Meeting participants included representatives from EPA, FHWA, Caltrans, PCTPA, URS Corporation, and DKS Associates.

The meeting objective was to discuss remaining issues on the draft Purpose and Need Statement and discuss the information EPA needs regarding the range of corridor alignment alternatives for evaluation in the Tier 1 EIS/EIR. Agenda items included:

Introduction
Purpose and Need Concurrence Process
EPA Input and Discussion: Assessment, Placer County vernal pools; SACOG Blueprint, and Range of Alternatives

Information provided to participants prior to the meeting included information regarding the broad range of alternatives that were initially considered during early project planning contained in the Study Area Definition for Placer Parkway Alternatives and an Analysis of a Shorter Parkway.

EPA staff provided an assessment of the project and its progress via the modified NEPA/404 process. This discussion focused on the importance of vernal pools in western Placer County, avoiding/minimizing impacts, and the project's indirect impacts. As part of this discussion, the project team reinforced key project provisions including limited access for the 7-mile segment between Fiddyment Road and Pleasant Grove Road along with the no-development buffer area within the corridor along the future roadway. Potential Watt Avenue connections (via a future extension of Watt Avenue) to the Parkway would be analyzed in the Tier 1 EIS/EIR. It was emphasized that the potential extension and/or interchange were not a part of the proposed project.

The list of outstanding issues on the draft Purpose and Need Statement was reduced to two related to Sacramento County references and the desired level of service. Minutes of this meeting were not prepared.

COORDINATION MEETING (Not Numbered) – January 25, 2005

Meeting participants included representatives from U.S. Army COE, EPA, FHWA, Caltrans, Placer County, and PCTPA.

The meeting purpose was to make agencies' management aware of concerns with the modified NEPA/404 process, to establish a framework to resolve issues, and to advance the project. Agenda items included:

Introductions
Background

Meeting Objectives – Framework to Advance the Project Collaboratively, Identify Agencies Objectives and Issues, and Identify Critical Issues
Summary and Action Items

For background, the Mare Island Accord (2002) was outlined. This is a partnership agreement among FHWA, Caltrans, and EPA to support collaboration in transportation and environmental planning processes. The Mare Island Accord group recognized that there are unresolved issues on the Placer Parkway project. Because the parties were "stuck," it was decided to convene a meeting.

Issues/concerns focused on the need for more efficient communications (identifying decision makers and the level of information required); Purpose and Need (clarifying "free-flowing traffic"); land use/conservation plan for southwest Placer County; project delay, and mitigation concerns (limited amount of available land).

Ideas/opportunities included investigating multi-modal opportunities, innovative planning (integrating resource avoidance/mitigation into land use and transportation planning processes), using a facilitator to track tasks, questions, and action items.

Understandings/agreements concluded that the current means of communications is not working well. The Purpose and Need Statement would be revised to include agreed-upon language concerning free flowing traffic. The group would be convened as needed.

Actions Items were:

- Placer County would prepare a presentation on Placer County Land Use and Conservation Planning in March.
- PCTPA would circulate a new draft version of the Purpose and Need Statement for review.
- FHWA, if there are no further concerns, would send a formal request for concurrence on this version of the Purpose and Need Statement.
- Caltrans would identify a facilitator for regular modified NEPA/404 meetings.

COORDINATION MEETING #8 – March 10, 2005

Morning Session

Meeting participants included representatives from U.S. Army COE, EPA, U.S. Fish and Wildlife Service, FHWA, California Department of Fish and Game, Caltrans, Placer County, PCTPA, Resources Law Group, URS Corporation, and DKS Associates.

The morning session of this two-part meeting focused on land use and conservation planning in Western Placer County. Agenda topics included:

Introductions
Land Use
Conservation
Input and Discussion

Loren Clark (Placer County) gave an overview of the Placer County Habitat Conservation Plan and Natural Communities Conservation Plan, collectively called the Placer County Conservation Plan

(PCCP). The PCCP would apply to Placer Parkway and would require mitigation for direct, indirect, and cumulative impacts from the Parkway with respect to Section 404 and Endangered Species Act impacts.

There was general discussion and questions regarding the PCCP. U.S. Army COE stated that the vernal pool complexes identified in the PCCP's GIS database is not a definitive identification of all vernal pools. It was noted that the "green" area shown as a conservation area in the PCCP map set is not intended to be a hard line, but a generalized area where development would be precluded/discouraged. EPA strongly encouraged the purchase of conservation lands now.

Placer Parkway is intended to be a covered activity under the PCCP, providing mitigation for direct and indirect take. California Department of Fish and Game expressed strong disagreement with adding alternatives north of Pleasant Grove Creek. He stated that a highway within the "green" conservation area would be a huge blockage to the conservation area, and a serious impediment to going forward with the HCP.

Afternoon Session

Meeting participants included representatives from U.S. Army COE, EPA, U.S. Fish and Wildlife Service, FHWA, Caltrans, Placer County, PCTPA, URS Corporation, and DKS Associates.

The objective of the afternoon session of this two-part meeting was to recapitulate the Purpose and Need Concurrence status as well as to review/discuss corridor alternatives screening criteria and the range of corridor alignment alternatives for evaluation in the Tier 1 EIS/EIR. A Caltrans facilitator provided guidance for this session. Agenda topics included:

Introductions
NEPA/404 Process Recap: Purpose and Need Concurrence; Next Steps: Criteria for Selecting Range of Alternatives, Range of Alternatives, Alternatives Most Likely to Contain LEDPA, and Mitigation Framework; Schedule
Discussion of Screening Criteria: Overview; Suggested Screening Criteria
Wrap Up
Future Meetings

Key decisions and/or issues raised by participants included:

EPA confirmed concurrence with the project Purpose and Need (March 7, 2005, see Attachment 2). U.S. Army COE confirmed they were in agreement and would provide a similar concurrence letter to this effect, pending any further comments following their final review of the Purpose and Need.

The meeting participants discussed the alternatives screening criteria, as included in the *Technical Memorandum, Screening Evaluation of PSR Alternatives (February 2005);* there was general agreement that these were valid. Potential additional screening criteria were identified; it was agreed that these would be integrated into the first set of screening criteria, and routed for review and comment. The meeting participants agreed that the screening criteria should not assume a roadway; to be consistent with the Purpose and Need, criteria should not preclude non-roadway alternatives. EPA wants to be sure that the screening criteria do not eliminate alternatives using existing roadways (in whole or in part) because a new roadway would be the most damaging. EPA is interested in working with local agencies to change densities, etc., to reduce vehicle miles traveled so that the Placer Parkway will not be needed. John Long (DKS) mentioned that *current* entitlements show the need for this project, without considering all the proposed and potential new growth beyond current general plans.

Caltrans summarized the public involvement process to date:

- *Placer Parkway Interconnect Study/Conceptual Plan* (DKS, 2000) was a policy document. This process included extensive public meetings, a newsletter and input from three advisory committees:

  – Policy Advisory Committee – made up of elected officials from affected jurisdictions and representatives from Caltrans, etc.
  – Study Advisory Committee – made up of a range of stakeholders
  – Technical Advisory Committee – made up of staff from affected jurisdictions, FHWA, Caltrans, SACOG, etc.

- *Placer Parkway Project Study Report* (DKS, 2001) identified eleven potential roadway configurations for Placer Parkway, based on earlier work and input from the three advisory committees.

- *Tier 1 EIS/EIR* process to date has also included the above committees, four public meetings, two newsletters, website, and numerous meetings with interested groups and individuals. Screening criteria identified in the *Technical Memorandum* were developed with input from all of these groups.

COORDINATION MEETING #9 – April 18, 2005

Meeting participants included representatives from U.S. Army COE, EPA, U.S. Fish and Wildlife Service, FHWA, Caltrans, PCTPA, URS Corporation, DKS Associates, and Koegel & Associates (meeting facilitator).

The meeting objective was to recap Purpose and Need concurrence status, complete discussion on corridor alternatives screening criteria, and begin discussion on the range of corridor alignment alternatives for evaluation in the Tier 1 EIS/EIR. Agenda items included:

Introductions
March 10 Meeting Recap and discussion: Purpose and Need; Criteria for Electing Range of Alternatives
Future Meetings

Information provided to participants prior to the meeting included Screening Criteria Information (annotated based on March 10 meeting input), Potential Screening Criteria Identified at the March 10 meeting, April 8 EPA comments, and Suggested Screening Criteria for non-Parkway Alternatives.

EPA and U.S. Army COE concurred with the Purpose and Need; the U.S. Army COE concurrent letter is still outstanding. U.S. Fish and Wildlife will stay involved in the process because Placer Parkway is a covered activity under the PCCP. A meeting to update USFWS was held on April 13, 2005.

EPA provided comments on the screening criteria and suggested that criteria should first be focused on determining the reasonable range of alternatives to advance to the Tier 1 DEIS/EIR for full analysis, with a separate, longer list (subject to input but not formal concurrence) for evaluating the alternatives in the Tier 1 DEIS/EIR. This is because EPA criteria are narrowly focused on Section 404, and the intent of the criteria should be to broaden the range of alternatives within this context. U.S. Army COE agreed.

It was explained that FHWA has to consider other aspects in addition to water. FHWA needs to make decisions in the overall context of a project, and needs to be sure that there are no fatal flaws in areas other than water. Caltrans agreed, and thought additional criteria should be added to EPA's suggested list. PCTPA is also responsible to their Board and as a regional transportation planning agency must be responsive to local planning policy and direction.

EPA's suggested list was discussed and a draft revision was identified:

The following criteria will determine the reasonable range of alternatives to advance to the DEIS/EIR. The range of alternatives can include both new roadway and non-roadway transportation solutions, e.g., expanding existing roads, a non-freeway facility, a Transportation System Management (TSM) alternative, a shorter Parkway alternative, or a combination of the aforementioned. Alternatives that are not consistent with this list of criteria should not be advanced to the DEIS/EIR for evaluation.

1. Meets the Project Purpose
2. Has no known irrefutable Clean Water Act Section 404 permitting obstacle[3]
3. Avoids or minimizes growth inducement in environmentally sensitive areas
4. Avoids or minimizes impacts to jurisdictional waters of the U.S., including wetlands
5. Avoids or minimizes effects to Section 4(f) resources
6. Is consistent with the intent of the objectives of the Placer County Conservation Plan
7. Has no conditions that would render the project infeasible, for the following reasons:[4]

    - It would not meet the purpose and need for the project;
    - It would not reasonably achieve the goals and policies adopted for the project;
    - It could not be permitted in subsequent Tier 2 processes; or,
    - It would not likely be supported by the project's Policy Advisory Committee (PAC) or the lead agencies.

    or

    - Two types of screening criteria that can be effective for Tier 1 decision-making are "project purpose"[5] and "fatal flaw" analyses. Under the Clean Water Act Section 404(b)(1) Guidelines, an alternative may be eliminated from consideration in the draft EIS if it does not meet the project purpose. Fatal flaws are unavoidable or unmitigatable impacts associated with an alternative that are so great that the project could never go forward.

It was agreed that Item 7 could be considered as an *option* in lieu of some of the other criteria listed above (some items are redundant). EPA has outstanding concerns about Item 5 concerning Section 4(f) and about the specific language of the last bullet under Item 7 (but not the general idea of the fatal flaw approach). This draft will need to be circulated within EPA for review and comment.

U.S. Army COE was not able to participate in the development of the final list. All other participants agreed with the items on the list, with the caveats described herein.

There was also discussion and confirmation that practicability of an alternative is considered in the decision of whether or not to advance an alternative to evaluation in the DEIS/EIR.

COORDINATION MEETING #10 – May 18, 2005

Meeting participants included representatives from U.S. Army COE, EPA, U.S. Fish and Wildlife Service, FHWA, Caltrans, PCTPA, URS Corporation, DKS Associates, and Koegel & Associates.

[3] Suggestion was made to change this to a more proactive statement.
[4] *Technical Memorandum, Screening Evaluation of PSR Alternatives* (February 2005)
[5] Modification of the National Environmental Policy Act/Clean Water Act Section 404 Integration Process for Surface Transportation Projects memorandum of Understanding (NEPA/404 MOU) for application to the Placer parkway Corridor Preservation Project (April 12, 2004)

The meeting objective was to complete discussion on screening criteria for selecting the range of alternatives, and identify how to proceed on identifying the range of alternatives for evaluation in the Tier 1 EIS/EIR. Agenda items included:

Introductions
Group Decision-Making Process and Schedule
Approval of Meeting Notes of April 18 Meeting
Action Items from April 18 Meeting
Screening Criteria for Selecting Range of Alternatives
Range of Alternatives
Next Steps and Next Meeting Dates

The group's purpose was affirmed:

Group's Purpose: Achieve concurrence on Concurrence Points 1 through 5 identified in the modified NEPA/404 process for Placer Parkway Corridor Preservation Tier 1 EIS/EIR, so that decisions made at Tier 1 will be consistent with requirements of the Clean Water Act Section 404. The five Concurrence Points were reiterated:

1. Purpose and Need
2. Criteria for Selecting the Range of Alternatives
3. Range of Alternatives
4. Alternative(s) Most Likely to Contain the LEDPA
5. Mitigation Framework

It was noted that there will be a time break between Concurrence Points 3 and 4 while the Draft EIS is being completed and circulated for public comment.

The current process requires formal letters of concurrence ("hard" concurrence) from USACE and EPA. USFWS wants to take a back seat but be involved in the process. USFWS will research if some written agreement on concurrence points (as opposed to formal concurrence) is feasible and report at the next meeting. EPA stated that there were no "red flags" in the Purpose and Need Concurrence Point.

Screening criteria were discussed. The meeting participants agreed that the following criteria should be used to determine a reasonable range of alternatives to advance to the Draft Tier 1 EIS/Program EIR:

1. Meets the Project Purpose
2. Avoids or minimizes direct, indirect and cumulative impacts to jurisdictional waters of the U.S., including wetlands
3. Avoids or minimizes growth inducement in environmentally sensitive areas
4. Avoids or minimizes effects to Section 4(f) resources
5. Is consistent with the intent of the objectives of the Placer County Conservation Plan

FHWA would formally ask U.S. Army COE and EPA to provide concurrence letters based on this list.

The meeting participants undertook a preliminary discussion of the range of alternatives to be evaluated. The meeting agreed to consider the corridor alignment alternatives already identified by PCTPA, as well as any new alternatives proposed by stakeholders, the public and/or agencies. This includes four alternatives already identified by a stakeholder.

EPA has a presumption that at least one avoidance alternative can be identified that meets the project's Purpose and Need and that would reduce the impacts of alternatives that represent a full freeway across the study area. This alternative could be a TSM, shorter Parkway, or combination of modes. DKS noted

that some work in analyzing such potential alternatives has been conducted and provided to the meeting participants, but this work needs discussion with the whole group in order to determine what such an alternative (or alternatives) would look like and if it (they) would meet Purpose and Need.

COORDINATION MEETING #11 – June 28, 2005

Meeting participants included representatives from U.S. Army COE, EPA, FHWA, Caltrans, PCTPA, URS Corporation, DKS Associates, and Koegel & Associates.

The meeting objective was to commence discussion on the range of alternatives. Agenda items included:

Introductions
Approval of Minutes of May 18 Meeting
Consultation Process Status
Action Items from May 18 Meeting
Range of Alternatives
PowerPoint Presentation of PCTPA's Four Potential Corridor Alignment Alternatives

Concurrence letters regarding screening criteria will be forthcoming from EPA and U.S. Army COE; a concurrence letter regarding purpose and need will be forthcoming from U.S. Army COE.

The meeting focused on discussion of the range of alternatives that could be evaluated during screening. There was a discussion of potential avoidance alternatives. EPA recommended concepts to apply to an avoidance alternative. These were as follows:

1. The focus in defining alternatives should be on habitat connectivity and aquatic connectivity.

2. The land use assumptions' cumulative development scenario should be as reasonable as possible, and should reflect where the region is going relative to the Blueprint project. EPA suggests that the cumulative development scenario be modified to apply Blueprint concepts and to better reflect the Section 404 perspective, i.e., change the land use assumptions to reflect more dense development and smaller project footprints.

3. EPA would like to see an array of ways to maximize the use of existing infrastructure, which they believe would be the best avoidance alternative.

EPA described four potential avoidance alternatives, as follows:

1. Combine the concepts for the TSM alternative and the "shorter parkway" alternative developed by PCTPA.

2. Expand the project's right-of-way to bring resources into conservation easements. These easements would be designed to protect aquatic resources.

3. Develop a multi-modal transportation corridor near Baseline Road. Put all transportation facilities in a narrow corridor to minimize the area of impact and to reduce growth-inducing effects.

4. Combine the TSM alternative with changed land use assumptions in the Baseline Road area. These land uses would be more intense than those identified to date, and would be more intense than identified in the Blueprint scenario – "a step beyond the Blueprint."

Key issues raised by participants included:

- Changing the land use assumptions in the future scenario was a concern to Caltrans and FHWA, particularly with respect to CEQA requirements. Concerns were raised about legal issues, local land use authority, speculation, and implementation. The land use assumptions used for screening were developed through the advisory committees and with input from all jurisdictions and SACOG. Changing these assumptions without buy-in from these groups may not be considered reasonably foreseeable. Also, for air quality conformity reasons, the project is required to use the same assumptions as SACOG for the 2025 analysis. It was agreed to think more about this, and get some legal input from FHWA and from Caltrans.

- DKS described the assumptions behind the TSM and "shorter parkway" alternatives, focusing on the limited capacity of Baseline Road using the future land use assumptions approved by the advisory committees.

- DKS described the assumptions in the No Project Alternative, which currently includes all projects in the 2025 MTP, plus new or expanded roadways that are reasonably foreseeable as a condition of future development. John Long asked what beyond that should be considered for the 2040 scenario to respond to EPA's input.

- The reasons for moving the PCTPA's proposed southern alternative one mile away from Baseline Road were identified: fewer impacts to aquatic resources, fewer impacts to communities, expressed desire by the advisory committees to place the parkway so that an adequate planning area along Baseline Road could be achieved, not precluding development along Baseline Road.

Meeting participants agreed to further discussion on these alternatives and concepts.

PCTPA presented a brief PowerPoint presentation that summarized the process through which the four potential corridor alignment alternatives were developed. This was illustrated through comparison of their impacts on aquatic resources, as compared to the concept alignments identified in the *Project Study* Report (DKS, 2004).

COORDINATION MEETING #12 – August 8, 2005

Meeting participants included representatives from U.S. Army COE, EPA, FHWA, Caltrans, PCTPA, URS Corporation, DKS Associates, and Koegel & Associates.

The meeting objective was to continue discussion on the range of alternatives. Agenda items included:

Introductions
Approval of Minutes of June 28, 2005 Meeting
Consultation Process Status
Action Items from May 18 and June 28 Meetings
Range of Alternatives

The meeting focused on ongoing discussion on the range of alternatives. The meeting participants agreed that the previous identification of a reasonable range of alternatives should be documented, with these alternatives then being screened against the screening criteria to demonstrate the generation of the list of alternatives identified to date. Both EPA and the U.S. Army COE agreed that the four potential corridor alignment alternatives already identified by PCPTA would be carried forward into the Draft EIS/R.

It was agreed that the development of avoidance alternatives should also be documented. Avoidance alternatives would be screened against the screening criteria, and would not necessarily be eliminated if

they did not meet the entire project Purpose and Need. EPA emphasized that all alternatives should include avoidance elements as reflected in the screening criteria.

The potential avoidance alternatives identified by EPA at the last meeting were discussed:

1. *Shorter Parkway with Transportation System Management (TSM)* – EPA emphasized that it should include the BRT Feasibility Study for South Placer County. There was considerable discussion about what could be done so that this alternative meets Purpose and Need. DKS said that the amount of traffic projected along Baseline/Riego would require adding new frontage roads to carry local traffic, or expanding new no-project rights-of-ways beyond the improvements identified in the earlier Shorter Parkway analysis. It was agreed that DKS would screen this alternative from a traffic perspective to see if it would meet Purpose and Need.

   There was some discussion about how a roadway with no access for 7 miles, with conservation easements to reduce the likelihood that this no-access feature would be retained, would induce growth.

2. *Corridor close to Baseline with expanded ROW (buffer) for conservation easements* – EPA said that the concept for this alternative was to provide the least amount of induced development to the west and north, with an expanded right-of-way for conservation easement to protect sensitive aquatic resources. When developing this alternative, PCPTA should look for opportunities to link up resources.

   It was noted that the West Roseville Specific Plan has included "preserves" and that they should be added to the map showing preserves within the study area. This Plan has a "buffer area" along its western boundary and this should be included in the "preserves" category. It was agreed that a separate meeting to include PCCP staff, CDFG, U.S. Army COE, EPA and USFWS should be held. This could help define conservation/linkage/connectivity opportunities. PCTPA noted that the project is time-limited and resource-limited, and that "the sky is not the limit" with respect to land acquisition. It was agreed that the concept of an expanded right-of-way for conservation easement to protect sensitive aquatic resources should be applied to all build alternatives, not just the one closest to Baseline/Riego Roads.

3. *Land use change alternative with TSM* – The concept for this alternative was to test whether denser land uses or more compact development could reduce the need for a new structure. It was understood that the transportation agencies cannot change land use. DKS suggested looking at the "super-cumulative" development scenario in development by Placer County, which is trending in a more "Blueprint-like" concept. EPA reiterated that they want to see this concept analyzed, focusing on high density, increased transit, and urban growth boundaries, to attempt to answer the question of what levels of these elements would be needed to meet the Purpose and Need without the Parkway. EPA said that they were not stuck on this being a formal alternative that could be considered a LEDPA candidate, but there must be some analysis and some discussion in the Draft Tier 1 EIS/Program EIR. The analysis should look at changed land use assumptions beyond what is planned or proposed by Blueprint or other processes.

   It was suggested that a sensitivity analysis could focus on density as the mechanism to get transit to work. It was agreed that such an analysis, using the same amount of development assumptions as Blueprint, but pushed closer together, would be undertaken, with the results presented in the Draft Tier 1 EIS/Program EIR.

COORDINATION MEETING #13 – October 6, 2005

Meeting participants included representatives from EPA, FHWA, Caltrans, PCTPA, URS Corporation, DKS Associates, and Koegel & Associates.

The meeting objective was to continue discussion on the range of alternatives. Agenda items included:

Introductions
Approval of August 8, 2005 Meeting Minutes
Action Items
Continue Discussion on Range of Alternatives
Avoidance Alternative Concept – Shorter Parkway and TSM
General Discussion

The concurrence letters from U.S. Army COE on Purpose and Need and Screening Criteria were still outstanding. Gary Sweeten will call USFWS and ask for their input regarding concurrence.

PCTPA reported that the SPRTA Board accepted the recommendation of the Policy Advisory Committee to include a fifth corridor alignment alternative, which was one of four brought forward by a stakeholder. The meeting participants agreed to include this corridor alignment as an alternative to be studied in the Draft Tier 1 EIS/EIR. This corridor alignment alternative would connect to SR 70/99 at Sankey, located between corridor alignment Alternative 4 and the City of Roseville Retention Basin. It would use the common alignment on the western portion of the study area.

The meeting participants discussed details of potential connections and alignments of the proposed alternatives, including the avoidance alternatives. EPA is committed to ensuring a broad range of alternatives is evaluated in the EIS to ensure that the LEDPA is included. Protections of water resources and habitat, and maintenance of habitat connectivity, were considered to be key issues.

Avoidance Alternative Concept – Expanded Corridor Areas: Nancy Levin (EPA) summarized EPA's idea behind this concept. EPA wants to be sure we have a broad enough range of alternatives to include the LEPDA. If there is not a broad enough range, potentially down the line the U.S. Army COE could identify an avoidance alternative that should have been looked at but was not. This concept builds on the PCTPA vision of the Parkway as a broad corridor with few interchanges. There may be certain areas where the corridor lines could be adjusted to protect habitat or provide better habitat connectivity. The idea is to look at where this might be possible and to adjust the alignments by including more areas where this occurs, and tighten up the corridor width in other areas where this opportunity did not exist, so that the result was the same total area preserved.

Project team representatives met with representatives of the Placer County Conservation Plan, to examine a map displaying the five potential corridor alignment alternatives superimposed on aquatic resources and preserve areas, for the purpose of identifying potential areas that would be good to include within the Parkway's potential corridors. Placer County staff felt that the team had done a good job of avoidance, and that there was little habitat value in preserving small, isolated wetland areas adjacent to the corridor alignments, especially given the likelihood of development in this area. The project team's biologist explained how there didn't seem to be other opportunities to make this avoidance concept workable, given the location of the corridors and the resources in the study area near them. He noted that the best resource in the study area proximate to the corridors is Pleasant Grove Creek. The Parkway would span the creek and thereby avoid habitat fragmentation. He also noted that the retention basin already is a preserve concept, so that areas immediately adjacent to the Parkway in this location are already protected. Potential habitat areas near the Parkway corridors were discussed. EPA noted that the idea of avoidance was related to indirect as well as direct impacts, and introduced the concept of potentially looking at downstream areas and protecting them against growth that would be induced by the project. FHWA

agreed to see if the concept of protecting a resource not directly impacted by the project, as an alternative, has ever been incorporated in a project, if it seems viable from FHWA's perspective, and if FHWA believes it meets purpose and need. EPA will also discuss it further internally. It was noted that it would be helpful to hear from the U.S. Army COE on this issue as well.

Avoidance Alternative Concept – Shorter Parkway: DKS Associates explained assumptions behind the analysis. The approach included:

- In the eastern portion of the study area, the roadway would be a new freeway, from SR 65 to Baseline Road;
- In the central and western portion of the study area, traffic would use Baseline/Riego Roads, under either an expressway or a full freeway concept.

Three 2040 scenarios were evaluated using a very robust multimodal model that can predict the worst 1-hour and also the worst 3-hour periods of congestion. Transit was the key component in all scenarios.

1. The No-Build scenario did not include a new roadway; it included PCTPA's Funding-Constrained Transit Alternative, and the Caltrans concept for SR 70/99 as a six-lane roadway with auxiliary lanes, with bus miles growing proportion to population. This scenario led to severe congestion on I-80 and local roads, including Baseline/Riego Roads. This scenario did not meet the Purpose and Need.

2. The expressway scenario for Baseline/Riego Roads assumed a new freeway between SR 65 and Baseline Road, some additional improvements on Baseline/Riego roads, and more Transportation Systems management features as compared to the No-Build scenario. This concept included the PCTPA Transit Emphases Alternative including light rail or high-grade BRT systems coming up Watt Avenue and into Placer County; walk to transit concepts; park and ride access, I-80 express bus service, more commuter rail, express bus service along Baseline/Riego Roads, and more transit bus miles. The analysis showed higher volumes without enough capacity. This concept identified up to 98,000 vehicles on key portions of Baseline Road. DKS noted that the freeway portion of this alternative concept puts more pressure on this segment. This alternative concept clearly did not work.

3. The freeway or freeway-equivalent scenario along the Baseline/Riego Road portion of this concept included a six-lane freeway with two- to four-lane frontage roads to the north and south, three additional interchanges (or an additional four- to six-lane arterials for short to mid-range traffic). This scenario violates the Parkway concept with limited access. The analysis indicated that there would be more volume on SR 70/99 with this concept than with any of the other Placer Parkway alternatives or the concepts identified above, with projected 113,000 ADT in the roadway segment between the potential Curry Creek development and potential development in Sutter County. This concept got good transit ridership (±1 percent), but not enough to offset increased traffic volumes. The interchange volumes at the Riego Road/SR 70/99 interchange would be problematic. It was noted that this concept takes up more right-of-way and includes more interchanges that any of the build alternatives for the Parkway. It would be very expensive (existing homes, an electric substation, vernal pools in the right-of-way) and the local jurisdictions would be adamantly opposed to it. Caltrans and FHWA do not believe that this alternative meets the purpose and need. For this reason, they recommended that this alternative not be carried forward. EPA noted that the purpose for evaluating this alternative was to try to identify an alternative that would reduce growth-inducing

impacts and minimize habitat fragmentation; i.e., keep the development envelope packed in and reduce development sprawl.

There were questions and discussion. Agencies agreed to review the information presented in the analysis, discuss alternatives internally and present their recommendations at the next meeting.

COORDINATION MEETING #14 – November 3, 2005

Meeting participants included representatives from EPA, FHWA, Caltrans, PCTPA, URS Corporation, DKS Associates, and Koegel & Associates.

The meeting objective was to complete discussion on the range of alternatives. Agenda items included:

Introductions
Approval of October 6, 2005 Meeting Minutes
Consultation Process Status
Action Items from previous Meetings
Range of Alternatives
Avoidance Alternative Concept – Shorter Parkway and TSM
General Discussion

U.S. Army COE concurrence letter on the Purpose and Need was received. There was no response from USFWS to FHWA phone calls regarding their agreement.

EPA noted that PCTPA had adequately explored the potential of non-freeway or non-full-freeway alternatives, and was in agreement that no viable such alternatives exist. The meeting discussed the importance of incorporating impact avoidance and minimization measures into the five alternatives that would be analyzed. In looking at avoidance and minimization, three components are important:

1. Direct impacts such as crossing Pleasant Grove Creek, other fill in wetlands;
2. Secondary impacts such as downstream segmentation of habitat, runoff affecting water quality, etc.; and
3. Indirect impacts, which tend to be associated with growth inducement.

All three areas should be considered in avoidance and minimization strategies. EPA wants to end up with clear understanding of alternatives with as much specificity as possible about how resources will be avoided. Strategies for protecting resources were discussed.

The avoidance alternative scenario and Pleasant Grove Creek projection discussion from the prior meeting was discussed. EPA agreed that this concept is not an avoidance alternative. It is a potential mitigation concept or avoidance concept. It is not a transportation alternative. FHWA reiterated that FHWA cannot fund an alternative that is not a transportation alternative. All participants agreed to drop the Shorter Parkway Plus TSM alternative.

EPA now believes that PCTPA has done a really good job of looking to see if there are other viable non-freeway or non-full-freeway alternatives. It does not seem that there are. EPA feels pretty satisfied that PCTPA has demonstrated that. The conclusion was that no avoidance alternatives will be carried forward for further evaluation in the Draft Tier 1 EIS/EIR.

Concurrence Point 3 was agreed to by participants and contained the following components:

1. The range of alternatives to be studied in the Draft EIS/EIR include the five build alternatives approved by the SPRTA Board plus the No-Build Alternative.

2. Build alternatives will include the following concepts to avoid and minimize direct and indirect impacts to aquatic resources and other natural resources

   - Quote buffer policy statement in Concept Plan/PSR
     - 500- and 1,000-foot corridors
     - access restrictions in the Central Segment
     - others
   - Project proponents will be working toward implementing the buffer policy, including such potential concepts as land use controls, land leases, general plans, zoning/overlay zoning, covenants/deed restrictions, conservation easements, urban growth boundaries.
   - Span Pleasant Grove Creek
   - BMPs

The project team also agreed to include an evaluation of alternate ways to meet the transportation need through land use changes and other mechanisms (Blueprint and beyond, tools identified in the Mineta Report, etc.). This was not a request for another alternative. The evaluation should reference the Mineta report, describe the range of tools, note that these tools are being used elsewhere, and identify what tools are incorporated into the proposed project. This will allow for this project to be put in perspective, and take credit for tools that are incorporated. EPA stated that the most value in performing this evaluation is to look at possible alternative futures in an unconventional way – looking at unconventional solutions to reducing VMTs. The goal of the evaluation is to describe what would need to happen to lower VMTs enough so that a freeway would not be needed. EPA stated that it is important to have a meaningful analysis in the EIS/EIR because it would provide additional disclosure and fulfill NEPA requirements to look at ways to meet the project Need even if the project sponsors do not have control over the tools.

COORDINATION MEETING #15 – March 1, 2006

Meeting participants included representatives from U.S. Army COE, EPA, FHWA, Caltrans, SACOG, PCTPA, URS Corporation, DKS Associates, and Mara Feeney & Associates.

The meeting objective was to provide background on the project team's approach to use MEPLAN to help measure potential growth inducing impacts and to get resource agency input. Agenda items included:

Introductions
MEPLAN

The project team's interest in using MEPLAN, an integrated land use and transportation program with an imbedded traffic model, was described. MEPLAN would be used to identify the potential for growth with and without the project, and to differentiate the potential for growth inducement among Placer Parkway Corridor Alternatives (with and without Watt Avenue interchange).

DKS provided information regarding MEPLAN. It is a program that is familiar to the Sacramento region. It was used in the Mineta Foundation Report prepared by U.C. Davis. Its primary purpose is to allocate development around the region in specific time increments via economic-based inputs. He said there is a concern whether there would be a difference in development by 2020 with or without the Placer Parkway. The MEPLAN work is to determine whether there would be a significant difference in growth and, if so,

where. Initially, the northernmost and southernmost corridor alternatives will be evaluated. If a significant change results between the two – the corridor alternatives between them will then be reviewed.

SACOG said MEPLAN is a decision-making model based on the competitive nature of builders (developers), land supply and growth policies. DKS explained that some MEPLAN adjustments have to be completed. However, the project team did not want to "constrain" the model to force a particular outcome.

EPA asked whether the model allows "available land" for any type of development and if areas identified for development were restricted to certain uses. DKS replied that SACOG's Base Case for the Blueprint used the MEPLAN model, in which there were no limits on growth and sprawl. The Parkway team will not constrain the types of land uses since the projects identified in the 2040 scenario propose all types of land uses. And, since the Base Case was developed, SACOG has received updated land availability information from local jurisdictions, and these data would be incorporated into the model.

Preliminary feedback from the federal resource agencies was very positive. Many questions were raised, including how inputs would be developed, how the model worked, how land prices were arrived at, allocation of growth and land supply information, if the model would capture isolated developments, and how the local roadway network would take account of new development over time.

COORDINATION MEETING #16 – October 23, 2006

Meeting participants included representatives from U.S. Army COE, EPA, USFWS (by phone), FHWA, National Marine Fisheries Service, California Department of Fish and Game, Caltrans, SACOG, Placer County, PCTPA, URS Corporation, and DKS Associates.

The meeting objective was to receive feedback from the resource agencies on two coordination issues. Resource agencies attendance will help to share: (1) concerns (and possible solutions) related to processing the proposed Placer Ranch Specific Plan and (2) ways to improve the environmental review process via early input by the resources agencies. Agenda topics included:

Introductions
Approval of March 2006 Meeting Minutes
Consultation Process Status and March 1 Meeting Action Items
Project Update
Placer County Coordination
Information Sharing and Early Input

All letters confirming EPA and U.S. Army COE concurrence on the first three Concurrence Points have been received. PCTPA provided an update on project progress.

PCTPA described a potential conflict between the Placer Parkway's proposed corridor alignment alternative in the Eastern Segment and a roadway from SR 65 to Fiddyment Road proposed by the Placer Ranch Specific Plan (PSRP) applicant. At an October 2003 Placer County Board of Supervisors' meeting, direction was given to staff to process both the Placer Parkway project and the PRSP concurrently. County staff preferred to identify the Placer Parkway corridor first and then process the PRSP. However, the Board was adamant about the concurrent process direction. One common Placer Parkway corridor alternative crosses over the proposed PRSP area. The PRSP needs a connection from SR 65, west to their site that would connect to Fiddyment Road, which runs north-south through the central portion of the PRSP site. Two Placer Parkway corridor issues are related to this potential PRSP roadway:

1. Roadway Alignment – East of Fiddyment Road

   The PRSP applicant is working with a proposed roadway alignment from SR 65 to Fiddyment Road that differs slightly from the Placer Parkway corridor alignment alternative. The PRSP alignment moves slightly south of the Parkway corridor alignment alternative in some areas in order to get as much of the roadway on to land they control, and to avoid the Rio Bravo (Ultra Power) site as much as possible. In order to move both projects forward, Placer County has asked if PCTPA could separately provide information about the PRSP roadway alignment areas that lie outside of the Placer Parkway corridor alignment alternative.

   Placer County explained that part of the condition of approval for the PRSP would be that it includes a roadway that may be integrated into the future Parkway, should the Parkway be approved. The PRSP schedule is to certify a Final EIR in 2007, while the Parkway's schedule reflects a Record of Decision in 2008. PRSP will be seeking approvals before the completion of the Tier 1 process for the Placer Parkway Corridor Preservation project. Phasing could be a key. There is to be no Placer Parkway construction as a result of the Tier 1 process. Placer County hoped the Tier 2 review for this critical segment (during which a LEDPA would be identified) could be completed for Placer Parkway before PRSP had to build the roadway.

   A possible solution (for the eastern roadway alignment issue) would be for the Placer Parkway Tier 1 EIS/EIR (possibly in an appendix) - to have information on potential impacts associated with the PRSP roadway alignment. Placer County does not want the Parkway and PRSP environmental documents to contain different or confusing information. Placer County's message to the PSRP applicant is they need to find a LEDPA alignment for their roadway. According to Placer County, PRSP would cooperate to identify the LEDPA. Placer County staff would not support any alignment that was preferable with respect to right-of-way acquisition but which would not qualify as the LEDPA.

   Concern was expressed regarding impacts, the narrow width of the PSRP right-of-way reservation, lack of existing information about impacts related to the proposed PSRP right-of-way, the potential to undermine the Parkway process.

2. Roadway Width – West of Fiddyment Road

   The PRSP applicants are proposing a reduced corridor width and buffer areas. Placer County said the PRSP applicant has indicated that it is quite a financial burden to reserve a 1,000-foot-wide area. The PRSP proposes to dedicate right-of-way for a future Placer Parkway, if approved, west of Fiddyment Road. PRSP has prepared two land plans:

   a. a "proposed" land plan with an approximate 250-foot-wide right-of-way for the road and land uses in the remainder of what would be the 1,000-foot-wide corridor, and

   b. a second land plan with a 1,000-foot-wide corridor as proposed by Placer Parkway, which would be studied as an alternative in the PSRP EIR.

   Placer County is trying to find a solution that respects the need to preserve open space and which also is more acceptable for development. U.S. Army COE cautioned that concurrence on the 1000-foot-wide corridor had already been achieved. Placer County acknowledged this; the staff was trying to make both projects better in the end, given the

Placer County Board of Supervisors' direction to proceed with both projects in a similar time frame.

The possibility of PRSP acquiring land off-site to the north to provide more buffer was discussed. U.S. Army COE again cited concurrence concerns. One option would use the existing corridor alignment area plus land outside of it.

U.S. Army COE stated that a potential solution for all the western Placer County development proposals was the Placer County conservation plan. However, this cannot be assumed, and the time frame is not consistent with PSRP time frame.

It is important to preserve the integrity of the Parkway's environmental review process through to the Tier 1 Record of Decision. Caltrans said that because of the concurrence process, it would be clearer to keep the PRSP analysis separate. Meeting participants agreed that information regarding the PRSP alignment that falls outside of the proposed Placer Parkway alignment should be of similar type and level of detail completed to date for the Tier 1 project. This would be presented in a separate section of the Draft Tier 1 EIS/EIR, as information.

PCTPA offered to share technical studies supporting the Draft Tier 1 EIS/EIR with the agencies. Resources agency representatives did not appear interested in providing early input based on existing workloads. The EPA representative said she would check in-house with EPA staff.

[Note: Subsequent to this meeting, the PRSP team completed their review of LEDPA issues within the proposed Parkway corridor and their proposed corridor, east of Fiddyment where the two diverged, and concluded that they would withdraw their proposed alignment, and work toward identifying a LEDPA alignment within the proposed Parkway corridor. They have still not agreed to reserve the full width identified by the proposed Parkway alignment through their Plan Area.]

Appendix E
Meeting Notices

PLACER PARKWAY
CORRIDOR PRESERVATION PROJECT

Public Scoping Meetings Scheduled for Placer Parkway Corridor Preservation Project

The project will identify a corridor and allow for the acquisition or preservation of right-of-way for a future Parkway connecting State Route 65 in Placer County, California and State Route 70/99 in Sutter County, California. This Parkway is identified in the Sacramento Council of Government's (SACOG) 2025 Metropolitan Transportation Plan (MTP) and the 2022 Placer County Regional Transportation Plan. Three corridor concepts connecting these routes were identified in a Project Study Report prepared in 2001: a northerly connection, a central connection and a southerly connection within the study area. These concepts, together with other feasible corridors that may be identified during the scoping process, will be evaluated to determine the alternatives that will be analyzed in a Tier 1 Environmental Impact Statement/ Environmental Impact Report (EIS/EIR).

The South Placer Regional Transportation Authority (SPRTA) is the lead California Agency for this project. Sutter County is in the process of formalizing an agreement to associate with SPRTA as a co-lead agency for the project. SPRTA has authorized the Placer County Transportation Planning Agency (PCTPA) to prepare the Tier 1 EIS/EIR. The Federal Highway Administration (FHWA) will be the federal lead agency, working in conjunction with the California Department of Transportation (Caltrans).

The formal comment period regarding the scope and content of the Tier 1 EIS/EIR ends on October 31, 2003. You may provide your comments in writing to Celia McAdam at the address on the back, provide comments in writing at one or both of the scoping meetings, and/or provide oral comments at the scoping meeting. If for some reason you can't attend and want more information, please contact us.

High-Priority Project

The Parkway is a high-priority regional transportation project. Employment, population growth, and traffic have become major issues for many people who live and work in the area. The amount of time and productivity lost has a real impact on the regional economy and our quality of life. At the same time, preserving agricultural open space and habitat is also critical.

[DATELINE]

PLACER PARKWAY CORRIDOR PRESERVATION PROJECT
SCOPING MEETINGS

October 6 and October 9, 2003, are the dates set by the Placer County Transportation Planning Agency for public meetings to help define corridor alternatives for the Placer Parkway Corridor Preservation project. The Parkway is a high priority regional transportation corridor that will eventually connect rapidly growing western Placer County with Sutter County industrial development areas, and the airport to the west. A previous Project Study Report recommended preservation of a 15-mile long, east-west transportation corridor linking State Highway 65 with State Highway 70/99.

"It is critical to preserve our ability to address our growing transportation needs. We are planning this future transportation corridor to reduce traffic congestion, improve access to Sacramento International Airport, and provide an alternative to Interstate 80 while promoting and preserving agricultural open space," said Celia McAdam, Executive Director of PCTPA.

To streamline the environmental review process, PCTPA will prepare a Tier 1 Environmental Impact Statement/Environmental Impact Report (EIS/EIR), which will identify and preserve the land needed for the future transportation corridor. It will address federal and state environmental guidelines and provide

information to the public so that community members can play a part in selecting a corridor.

Three distinct advisory groups are reviewing the project, providing vital discussions of technical data, jurisdictional issues, preferences, community-specific elements and policy-related matters. The Technical and Policy Advisory Committees includes elected officials and staff. The Study Advisory Committee fosters communication between the community; environmental, agricultural, development, and other interest groups; public agencies; and local jurisdictions. .

The public can participate in the project by attending the public scooping meeting on October 6, at the Maidu Community Center, in Roseville and October 9, at the Pleasant Grove School in Pleasant Grove. There will be a dedicated project website for questions and comments from the public. Celia McAdam added, “PCTPA encourages the public to get involved and provide their input to ensure we incorporate the best ideas available.”

For more information regarding the Placer Parkway Corridor Preservation project please contact: Stan Tidman, Project Manager, PCTPA, (530) 823-4033.

The Parkway Concept

The Placer Parkway Corridor Preservation Project is in the process of identifying a 500-foot to 1,000-foot-wide corridor for future Parkway construction. The Placer Parkway is envisioned as an 15-mile long high-speed transportation facility connecting State Route (SR) 65 in Placer County and SR 70/99 in Sutter County. It will link existing and planned development in the two counties. It will also improve access to downtown Sacramento and to Sacramento International Airport. Other potential transportation modes, such as bus rapid transit, may be developed in the corridor.

The aim of the current project is to preserve a corridor for right-of-way acquisition in this rapidly growing area. Work to identify a corridor is underway now. However, funding for Parkway construction is not anticipated until approximately 2015.

Corridor Preservation Project

The Corridor Preservation project has two phases. Phase 1, currently underway, is to identify feasible corridor alignment alternatives (alternatives). Input has been collected from a wide range of sources. See *Corridor Alternatives Identification Process, inside*. Contributors to this process include standing technical, study, and policy advisory committees; local jurisdictions; landowners and the public; and federal, state and local agencies. The alternatives identified during Phase 1 will be evaluated in Phase 2.

Phase 2 is to complete a Tier 1 Environmental Impact Statement/ Environmental Impact Report (Tier 1 EIS/EIR) that will evaluate the alternatives and will lead to the selection of one corridor for right-of-way preservation. The Tier 1 EIS/EIR is a combined Federal/State environmental review document. There will be opportunities for the public to review and comment on it. The Tier 1 EIS/EIR will emphasize the relative differences among corridor alternatives with regard to potential impacts to allow for an informed choice among alternatives. It will focus on broad topics, such as general location, mode choice, area-wide air quality and land use, and other environmental issues. The Tier 1 EIS/EIR will also identify mitigation strategies to be used in later construction-related (Tier 2) environmental reviews. The Tier 2 review, relying on the work from the Tier 1 document, will provide a more detailed analysis of environmental impacts for specific alignments within the selected corridor.

Right-of-way acquisition for the corridor can begin only after the Tier 1 EIS/EIR process is completed.

CONTINUED INSIDE

modified

NEPA/404 process

PCTPA is committed to identifying and addressing environmental issues, including ones that could affect future federal permits required to construct the Parkway. So that these issues can be identified and satisfactorily dealt with, the Federal Highway Administration, Caltrans, and PCTPA are coordinating with the U.S. Army Corps of Engineers (USACOE) and the U.S. Environmental Protection Agency (USEPA). These agencies have agreed to modify the "NEPA/404 process." This process streamlines the review of projects subject to the National Environmental Policy Act (NEPA) that also require Section 404 permits under the Clean Water Act. The focus of the NEPA/404 process is wetlands and other "Waters of the U.S."

Normally, the process is initiated only when a permit application is made to the USACOE. The process was modified because there is no permit required for the Corridor Preservation Project. The parties have agreed to early consultation to identify environmental issues that could affect future construction permit approvals. The process will seek to reach concurrence on the Least Environmentally Damaging Practicable Alternative (the "LEDPA"), and to identify appropriate mitigation strategies. This effort will assist PCTPA to identify corridor alignment alternatives that will satisfy USACOE and USEPA environmental concerns.

CONTINUED FROM COVER

Future construction can start only after the Tier 2 construction-related environmental review is done.

Planning History

The concept of the Placer Parkway has been considered for over a decade. Placer County's 1994 General Plan depicts a 'plan line' for it. More detailed planning began in the late 1990s with a Conceptual Plan, published in 2000. Next, several conceptual corridor alternatives were identified in a 2001 Project Study Report (PSR). PCTPA and Sacramento Area Council of Governments (SACOG) Boards adopted the project goals and policies contained in these planning documents. The Placer Parkway is now an important component of SACOG's 2025 Metropolitan Transportation Plan.

Corridor Alignment Alternatives Identification for Tier 1 EIS/EIR Evaluation

Since 2003, PCTPA and its consultant team have worked with agencies, organizations, and individuals to identify potential issues and to collect and evaluate engineering, environmental, and transportation information for the study area. See *Technical Memorandum-Screening Evaluation of PSR Alternatives (www.pctpa.org)*. A number of environmental issues were identified while screening the PSR's conceptual alternatives. Consequently, a number of modifications to the corridors were recommended to reduce environmental impacts while remaining consistent with the project's adopted goals and policies.

The project's three advisory committees, local jurisdictions, and federal resource agencies reviewed these recommended modifications. They also provided additional direction and requested more information on specific issues. Advisory committee direction included:

- **Modify** each PSR corridor alignment alternative to avoid or minimize effects on resources such as vernal pools, existing communities, and agricultural lands.

Residents, community leaders and business repre

stay involved!

second round of pub

The Placer Parkway Corridor Preservation Project has recently completed identifying potential corridor alignment alternatives for analysis in a Tier 1 Environmental Impact Statement/Environmental Impact Report (Tier 1 EIS/EIR). Public meetings are scheduled on August 23 (Placer County) and August 26 (Sutter County), 2004 to

- **Eliminate** (1) the central and western segments of the PSR's northern corridor alignment alternative, (2) a potential Parkway connection with SR 65 at Sunset Boulevard, (3) a potential Parkway connection with SR 70/99 north of Sankey Road, and (4) a potential Parkway connection with SR 70/99 south of Riego Road, with concurrence of the City of Sacramento and Sacramento County.
- **Identify** and evaluate more direct corridor alignment alternatives across the study area.
- **Evaluate** two Baseline Road-vicinity scenarios (1) a corridor alignment immediately to the north, and (2) one approximately one mile farther north.

These recommendations resulted in 11 modified or new corridor alignment alternatives. They were evaluated and adjusted to further avoid or reduce impacts to environmental and other resources, and presented to the project's Technical Advisory Committee (May) and Study Advisory Committee (June). As a result of these meetings, four potential corridor alignment alternatives were identified for analysis in the Tier 1 EIS/EIR. Each would connect to SR 65 at Whitney Boulevard. Each alternative would extend westward, differing as shown on the map at right:

- **Connecting to SR 70/99 at Sankey Road**
- **Extending south along Locust Road, to connect to SR 70/99 north of Riego Road**
- **Extending diagonally to the southwest, to connect to SR 70/99 north of Riego Road**
- **Extending south, then west parallel to Baseline Road, to connect to SR 70/99 north of Riego Road**

Also, in the central segment of the study area, one potential connection with a future Watt Avenue extension will be evaluated in the Tier 1 EIS/EIR. The project's goals and policies limit access between Fiddyment Road and Pleasant Grove Road to this potential interchange. A future Watt Avenue extension is not a part of the Placer Parkway project.

Next Steps

These four potential corridor alignment alternatives to be considered for Tier 1 EIS/EIR analysis and subject to additional adjustments will be presented at public meetings on August 23 in Roseville and August 26 in Pleasant Grove. The purpose of these meetings is to review the alternatives and gather public comments. The project team is also working with the U.S. Army Corps of Engineers and the U.S. Environmental Protection Agency to address Clean Water Act requirements. (Please see sidebar describing the "*Modified NEPA/404 Process*.")

The final set of corridor alignment alternatives to be evaluated in the Tier 1 EIS/EIR will be determined with direction from the project's Policy Advisory Committee, South Placer Regional Transportation Authority (SPRTA), Sutter County, and the Federal Highway Administration, as well as public input.

sentatives are now discussing where to preserve a corridor for the future.

blic meetings has been scheduled

present this information to the community. This is the second in a series of public meetings to present information regarding project progress and to obtain community feedback. The meetings will include a presentation by project staff at 6:30 p.m., followed by an opportunity to ask questions and provide comments.

The first public meetings for the project were held in fall 2003 in Roseville and Pleasant Grove. The PSR corridor alignment alternative concepts identified in earlier studies were reviewed. The process to develop alternatives for study in the Tier 1 EIS/EIR was also described.

Community members, local groups, agency representatives and other interested stakeholders offered their comments and ideas about the proposed Placer Parkway Corridor Preservation Project. Areas of concern identified at the 2003 meetings included: alignment routes, impacts on residents/farming operations/ businesses, impacts to the environment, and the need for coordination among planning agencies.

Placer Parkway
Corridor Preservation

Additional Potential Alternatives

The Placer Parkway is envisioned as a 15-mile-long high-speed transportation facility, which will connect State Route (SR) 65 in Placer County and SR 70/99 in Sutter County. The facility will be constructed within a 500-foot- to 1,000-foot-wide corridor. It will reduce pressure on the existing transportation network, address anticipated future congestion on the local roadway system in southwestern Placer County and south Sutter County, and will improve regional accessibility for businesses and jobs. Other potential transportation modes, including bus rapid transit, may be developed in the corridor.

Placer Parkway Corridor Preservation Update

The South Placer Regional Transportation Authority (SPRTA), through the Placer County Transportation Planning Agency (PCTPA), recently evaluated corridor alternatives based on environmental, transportation and engineering criteria. PCTPA collected input through scoping meetings and the project's Advisory Committees. In August 2004, PCTPA also hosted two public meetings in Roseville and Pleasant Grove to present information regarding potential corridor alignment alternatives. These four corridors are shown graphically on the map in this newsletter, in gold.

PCTPA and Caltrans are also coordinating with federal agencies to identify potential alternatives that will satisfy the Parkway's purpose while reducing the need for new facilities (e.g., Transportation Systems Management, a shorter Parkway, etc.). This modified NEPA/404 process is ongoing.

Additional Potential Alternatives Identified

In December 2004, Foothill Associates, on behalf of a local developer, KT Communities, identified two additional corridor alignments with SR 70/99 connections at Sankey Road or north of Riego Road. These additional potential corridor alignments are outlined in green on the map (reverse side).

In March 2005, SPRTA directed PCTPA staff to screen these alignments for potential inclusion in the reasonable range of alternatives for the Tier 1 environmental document (EIS/EIR).

PCTPA evaluated these alignments for data consistency and then screened them using a process similar to that used for the four PCTPA potential corridor alternatives. This screening identified benefits and drawbacks for each alignment. The results were presented to the Technical Advisory and Study Advisory Committees for their input and recommendations. The Policy Advisory Committee will evaluate this information at a meeting on August 31, 2005 in Lincoln. Information about the meeting is available on PCTPA's web site (www.pctpa.org/PlacerParkway).

Next Steps

Input provided through the Advisory Committees will be presented to the SPRTA Board on September 28, 2005. The Board is expected to provide direction on which alternatives will be evaluated in the Tier 1 EIS/EIR. The Board will decide only which potential alternatives merit further study – it will not determine the location of the preferred alignment. Following this decision, preparation of the Tier 1 EIS/EIR will commence. According to the revised schedule, a public review draft will be published in fall 2006.

Fact Sheet

PLACER PARKWAY
CORRIDOR PRESERVATION

LAND TO BE PRESERVED FOR FUTURE PLACER PARKWAY

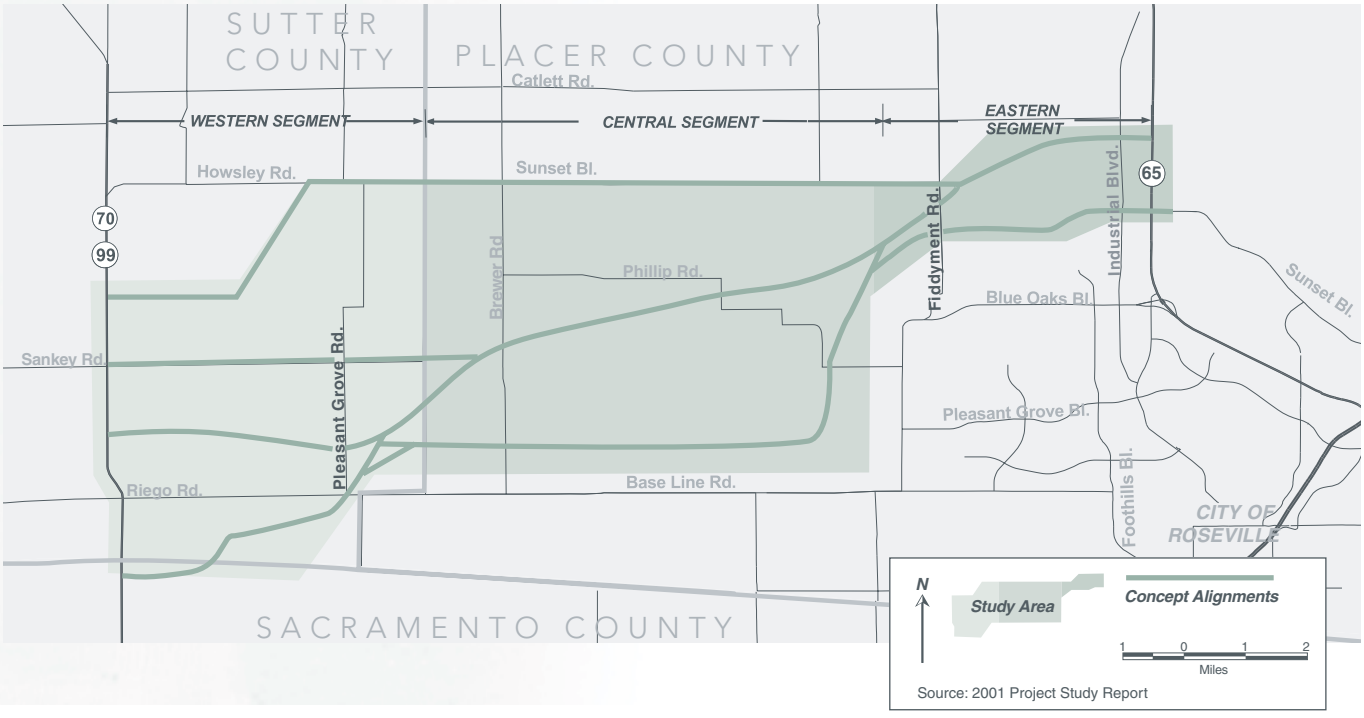
Placer Parkway is a proposed 15-mile long, east-west transportation corridor that will connect rapidly growing western Placer County with Sutter County industrial development and the airport to the west—linking State Highway 65 with State Highway 70/99 (see map). Residents, community leaders and business representatives are now discussing where to preserve a corridor for the future Parkway.

High-Priority Project

The Parkway is a high-priority regional transportation project. Employment, population growth, and traffic have become major issues for many people who live and work in the area. The amount of time and productivity lost has a real impact on the regional economy and our quality of life. At the same time, preserving agricultural open space and habitat is also critical.

The Placer Parkway Corridor Preservation will identify and preserve land for a future transportation corridor that will offer several key benefits:

- **Ease traffic and enhance the flow of people and goods**
- **Link rapidly growing areas of western Placer County and planned industrial development in south Sutter County**
- **Improve access to the I-5 corridor and the Sacramento International Airport**
- **Provide an alternative to heavily traveled Interstate 80**



PCTPA | 550 High St., Suite 107 | Auburn, CA 95603 | tel 530-823-4030 | fax 530-823-4036 | web www.pctpa.org

PLACER PARKWAY
CORRIDOR PRESERVATION

- **Promote agricultural open space to preserve and enhance natural resources**
- **Restrict access along an approximately 7-mile central segment between Fiddyment Road in Placer County and Pleasant Grove Road in Sutter County**

Preserving the Corridor

A key objective of the project is to preserve enough land for a 1,000-foot-wide central segment corridor and 500-foot-wide eastern and western segment corridors. Several concept corridors were identified via a previous study (see map).

Within the corridor, Placer Parkway would be divided into three segments:

- **Western: Highway 70/99 to the Sutter/Placer County line**
- **Central: Sutter/Placer County line to Fiddyment Road, with no access (preserving a 1,000-foot-wide, 7-mile-long corridor from Pleasant Grove Road to Fiddyment Road).**
- **Eastern: Fiddyment Road to Highway 65**

The Placer County Transportation Planning Agency (PCTPA) is administering the project for the South Placer Regional Transportation Authority (SPRTA) and Sutter County. PCTPA is the regional transportation planning agency for Placer County and its six cities. SPRTA consists of several PCTPA member jurisdictions in western Placer County.

Environmental Process

PCTPA will be preparing a Tier 1 Environmental Impact Statement/ Environmental Impact Report (EIS/EIR). A Tier 1 document is used for long-term projects and to streamline environmental review. This will help to ensure that the land needed for a future transportation corridor can be preserved now. The Tier 1 EIS/EIR will address state and federal environmental requirements and will outline public concerns in enough detail to make an informed choice about selecting a corridor alignment. A future Tier 2 environmental review would address design and construction issues for the specific alignment within the corridor.

SPRTA and Sutter County are co-lead agencies for California Environmental Quality Act compliance. Caltrans is acting on behalf of the Federal Highways Administration, lead agency for National Environmental Policy Act compliance.

Funding

PCTPA has programmed about $4.7 million to complete the required federal and State environmental review. SPRTA oversees a regional fee program that is expected to collect about $50 million for acquiring a corridor. Actual construction funding for the transportation facility is not anticipated until after 2015.

Public Involvement

There will be many opportunities for the public to provide input into this environmental review. For more information about the project and upcoming meetings, go to:

PLACER PARKWAY
CORRIDOR PRESERVATION

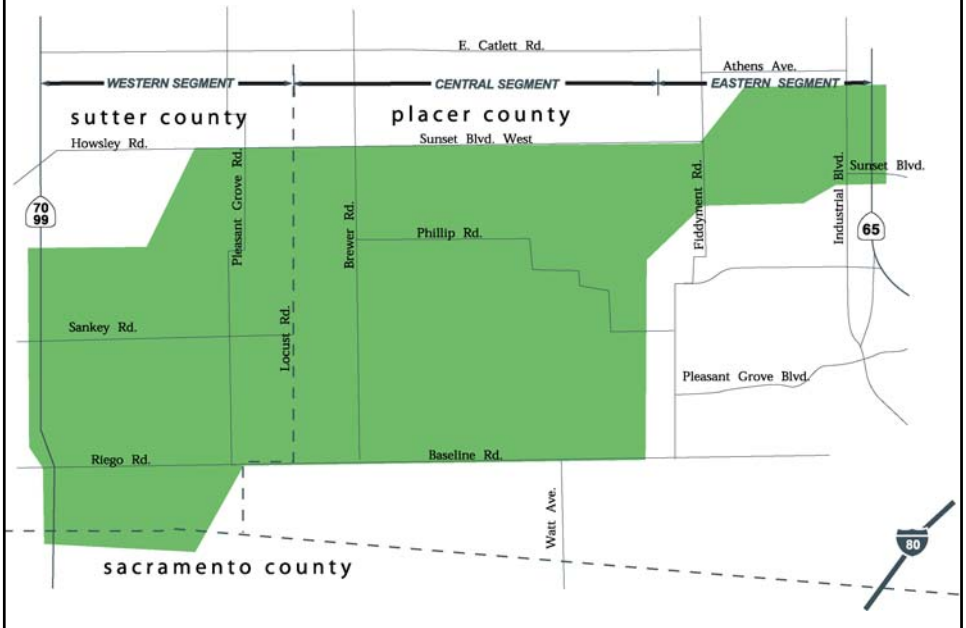
AGENDA

- Introductions
- Project Background
- Potential Corridor Alignment Alternatives
- What's Next
- Public Discussion

Public Meeting August 2004

Project Study Area



PLACER PARKWAY
CORRIDOR PRESERVATION

PLACER PARKWAY

(The Concept)

- **Regional Transportation Facility**
  - Connector – SR 65 & SR 70/99 between Sunset Blvd. W/Howsley and Baseline/Riego

Public Meeting August 2004

PLACER PARKWAY
CORRIDOR PRESERVATION

PLACER PARKWAY

(The Concept)

- **Regional Transportation Facility**
- **Parkway Goals (via 2000 Conceptual Plan & PSR)**
  - Controlled access highway
  - Maximize mobility and accommodate planned growth
  - Avoid growth inducement/protect rural character
  - Minimize environmental impacts
  - Improve safety/minimize hazards
  - Feasible and equitable funding

Public Meeting August 2004

PLACER PARKWAY
CORRIDOR PRESERVATION

PLACER PARKWAY

(The Concept)

- Regional Transportation Facility
- Parkway Goals (via 2000 Conceptual Plan & PSR)
- Design and Construction
  - $200 to $300 million
  - Construction funding – after 2015

Public Meeting August 2004

CORRIDOR PRESERVATION

SCREENING PROCESS

- Focus on Early Identification of Fatal Flaws

Public Meeting August 2004

PLACER PARKWAY
CORRIDOR PRESERVATION

SCREENING PROCESS

- Focus on Early Identification of Fatal Flaws
- Environmental Screening
  - Existing/Planned Land Uses
  - Williamson Act Contracts/Important Farmlands
  - Community Disruption/Displacement /Relocation
  - Recreation Lands
  - Noise
  - Cultural/Native American Resources
  - Biological/Wetland Resources
  - Hazardous Materials/Waste
  - Floodplain/Hydrology
  - Soils
  - Growth Inducement

Public Meeting August 2004

PLACER PARKWAY
CORRIDOR PRESERVATION

SCREENING PROCESS

- Focus on Early Identification of Fatal Flaws
- Environmental Screening
- Transportation Screening
  - Need and Purpose
  - Connections
  - Traffic Volumes

Public Meeting August 2004

PLACER PARKWAY
CORRIDOR PRESERVATION

SCREENING PROCESS

- Focus on Early Identification of Fatal Flaws
- Environmental Screening
- Transportation Screening
- Identify Impacts to Avoid or Minimize

Public Meeting August 2004

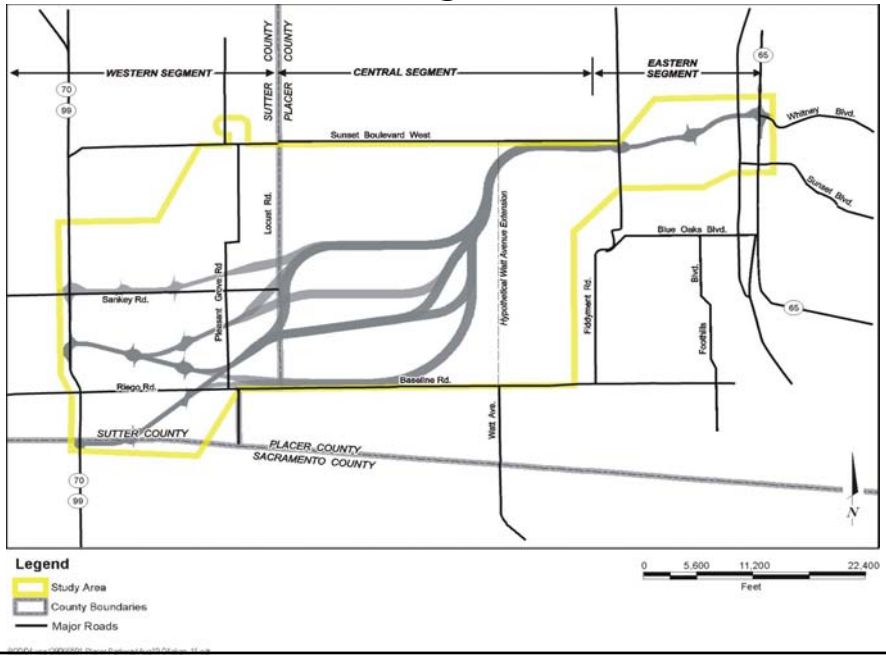
PLACER PARKWAY
CORRIDOR PRESERVATION

ALTERNATIVES REFINEMENT

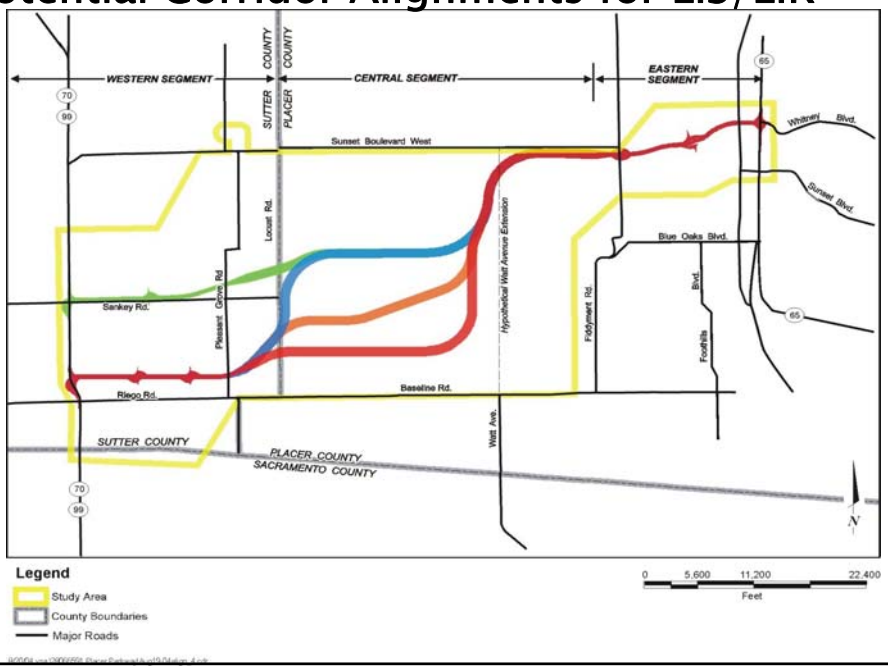
- Public Outreach
- NOI/NOP Comments
- Transportation Screening
- Environmental Screening
- NEPA/404 Process

Public Meeting **August 2004**

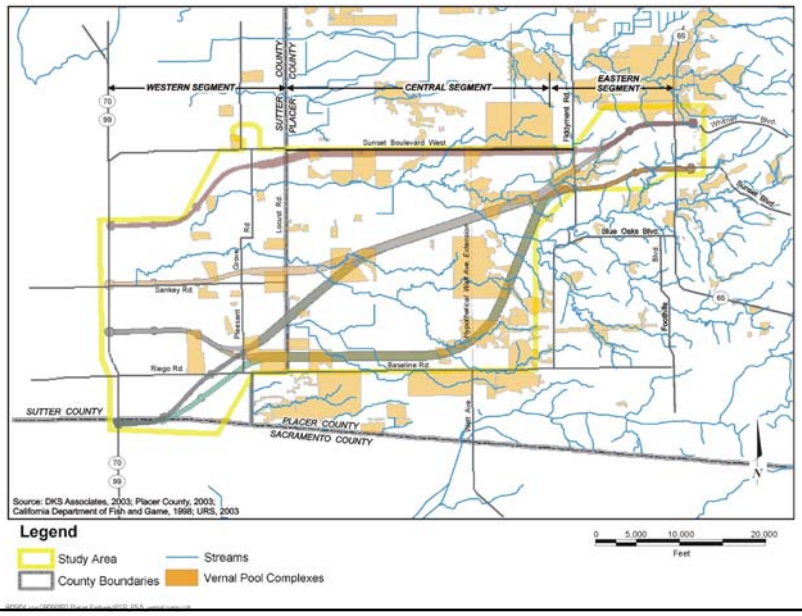
Additional Corridor Alignments Evaluated



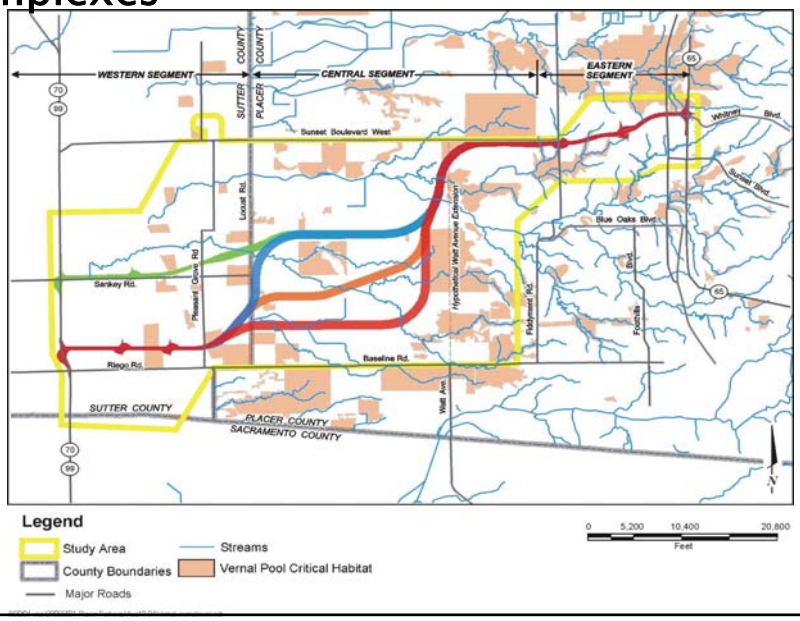
Potential Corridor Alignments for EIS/EIR



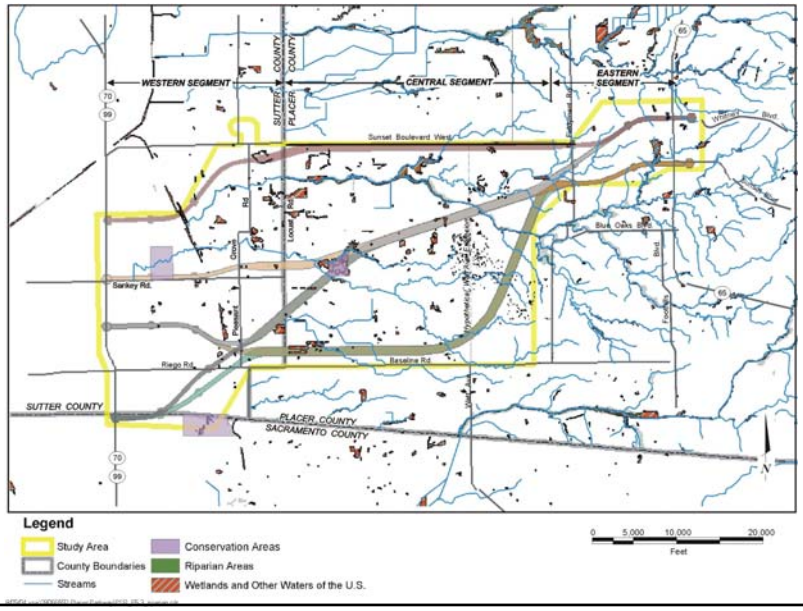
PSR: Vernal Pool Complexes



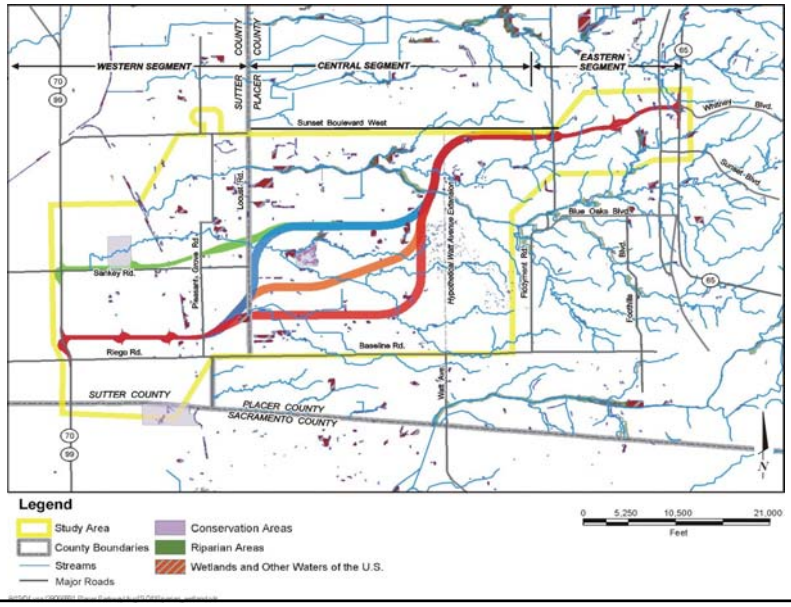
Potential Corridor Alternatives: Vernal Pool Complexes



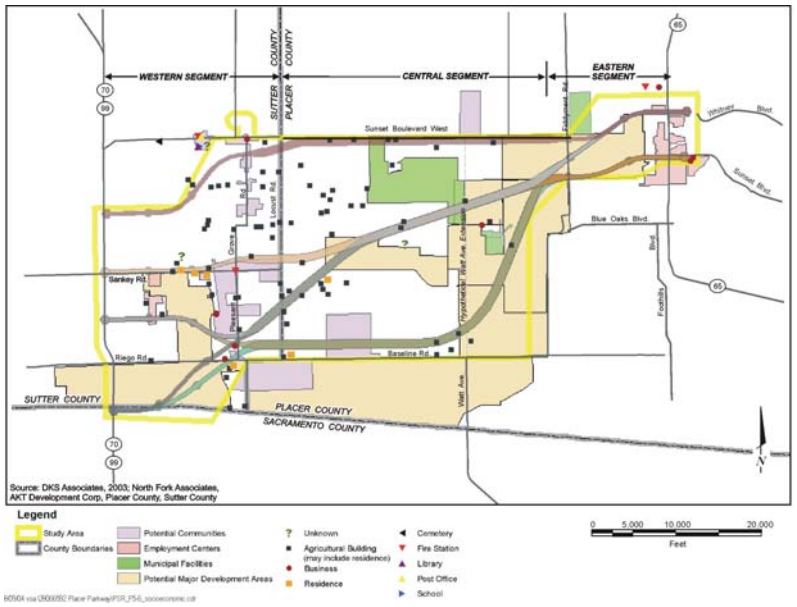
PSR: Riparian, Wetland, and Conservation Areas



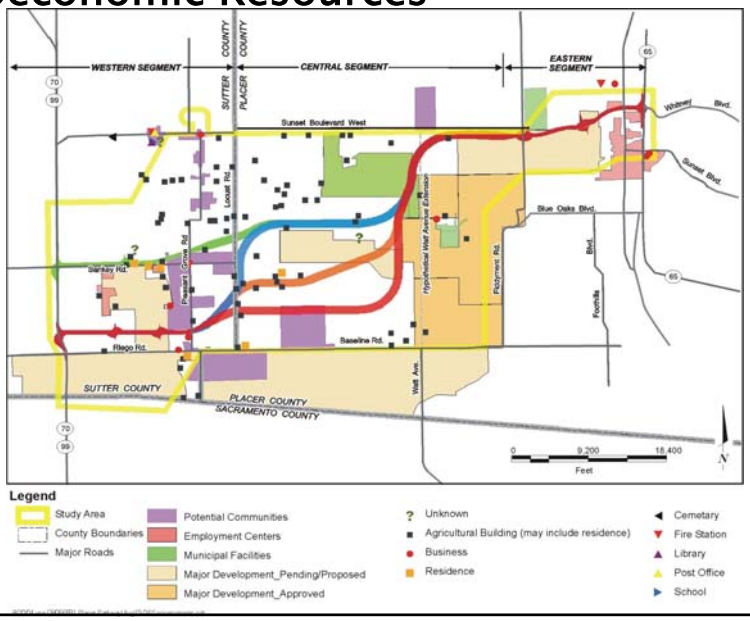
Potential Corridor Alternatives: Riparian, Wetland, and Conservation Areas



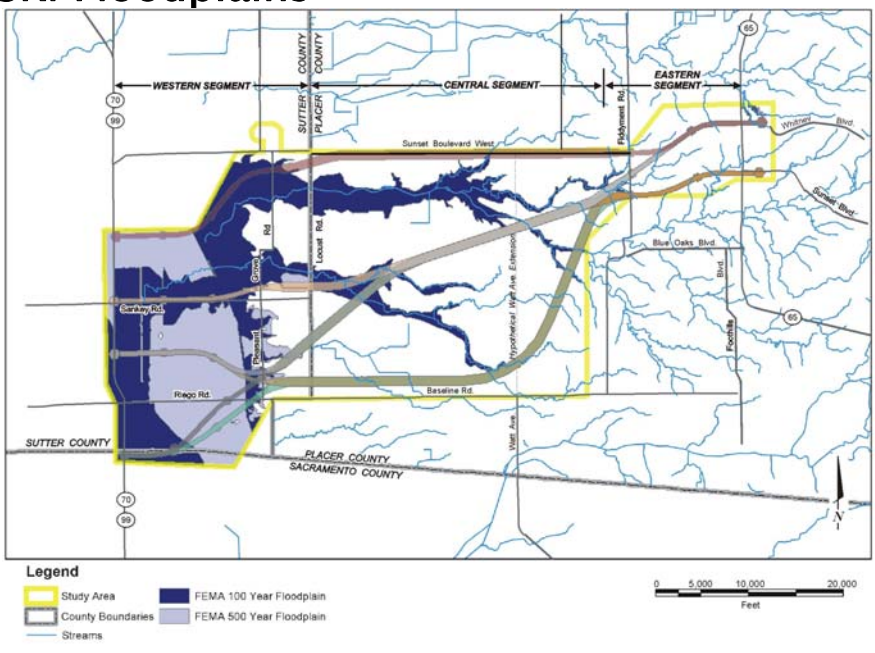
PSR: Socioeconomic Resources



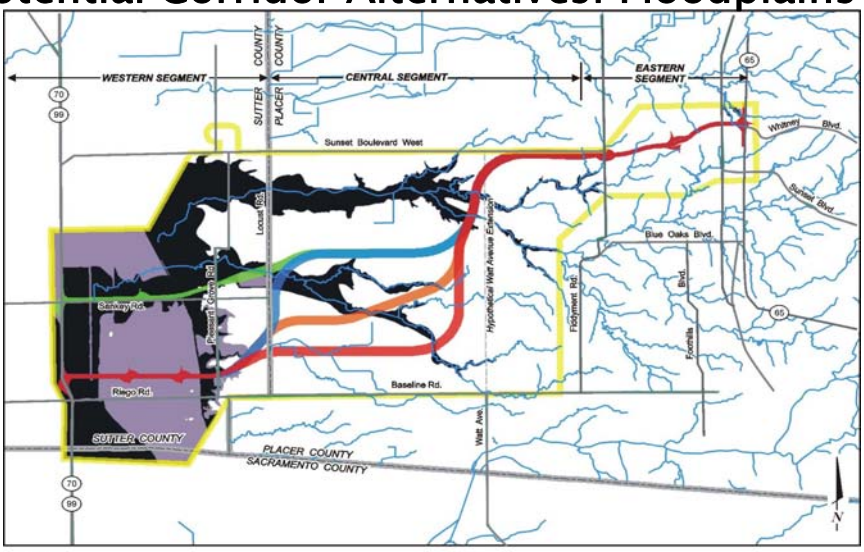
Potential Corridor Alternatives: Socioeconomic Resources



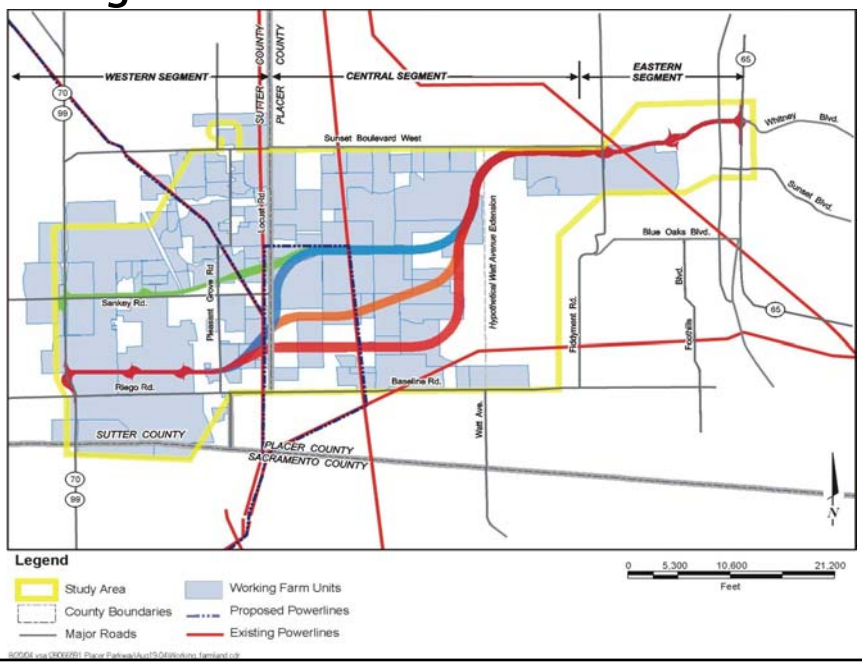
PSR: Floodplains



Potential Corridor Alternatives: Floodplains



Working Farm Units and Powerlines



PLACER PARKWAY
CORRIDOR PRESERVATION

NEXT STEPS

- Continue NEPA/404 Process
- Continue Public Outreach Process
- Identify Alternatives for Study in Tier 1 EIS/EIR
- Prepare Tier 1 EIS/EIR
- Start Preserving the Corridor!

Public Meeting August 2004

PLACER PARKWAY
CORRIDOR PRESERVATION

DISCUSSION

- Project and Planning Process
- New or Additional Information about the Project Study Area
- Comments on the 4 Potential Corridor Alignment Alternatives Presented
- Other Comments

Public Meeting August 2004

PLACER PARKWAY
CORRIDOR PRESERVATION

Thank You for Participating!

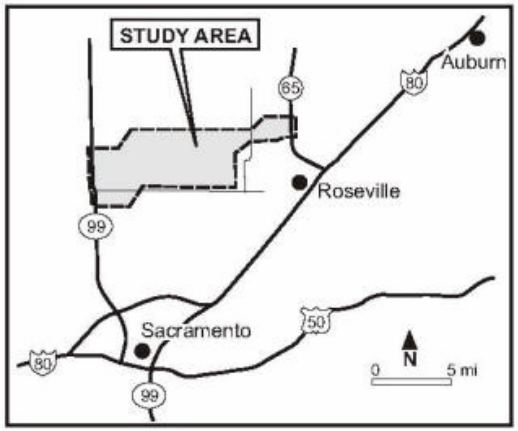
- Who to Contact

Welcome to the Placer Parkway Corridor Preservation Project!

The Placer Parkway is to be an approximate 15-mile long, high-speed transportation facility, which will connect State Route (SR) 65 in western Placer County to SR 70/99 in south Sutter County. It will link existing and planned development near some of the region's fastest growing communities while improving access to the I-5 corridor, downtown Sacramento, and the Sacramento International Airport.



Work, via two phases, is underway to identify and preserve a corridor for right-of-way acquisition.

Phase 1: Identify Corridor Alternatives
Completed – September 2005
» 5 Recommended Corridor Alternatives *(September 2005)*

UPCOMING MEETINGS
There are no public meetings scheduled at this time.
Future public meeting will be noticed as work on the Draft Tier 1 EIS/ EIR continues. Periodic updates to this page will provide when and where meetings will take place.
Please Note: There will be an opportunity to review and comment on the Draft Tier 1 EIS/EIR. The public review draft document is expected to be available by spring 2007. Notice of the draft's availability for review and comment will be made through the Federal Register, public notice, newsletter, web site posting, etc.
The Placer Parkway Corridor Preservation Project and its Tier 1 EIS/EIR will require several more years to complete. Continuing public input and agency coordination are keys to ensure the completion of a comprehensive planning and environmental review process.
CORRIDOR ALTERNATIVES AND ENVIRONMENTAL SCOPING
The public outreach and agency coordination process to identify the reasonable range of alternatives and to start the proposed project's environmental review included:
Community stakeholder interviews
Interviews with Community Stakeholders Summary Report
(September 2003)
18 advisory committee meetings
Technical Advisory Committee (TAC), Study Advisory Committee (SAC), and Policy Advisory Committee (PAC) meeting agendas, materials, and minutes are available - contact PCTPA.
Public scoping meetings in Roseville (October 6, 2003) and Pleasant Grove (October 9, 2003)
Scoping Meetings & Scoping Process Summary Report
Public Meetings in Roseville (August 23, 2004) and Pleasant Grove (August 26, 2004)

List of Meetings with Individuals, Agencies, and Community Members

LIST OF MEETINGS
WITH INDIVIDUALS, AGENCIES, AND COMMUNITY MEMBERS

MEETINGS WITH INDIVIDUAL, AGENCIES, AND COMMUNITY MEMBERS	
DATE	**MEETING**
2002	
10.15.2002	TAC Meeting – *Overview and Alternative Alignments* Roseville Corporation Yard, 2005 Hilltop Circle, Roseville
11.26.2002	Placer Co. Staff Meeting – *Coordination (see 12.26 summary letter)* Placer Co. Public Works, DeWitt Center 11444 B Ave., Auburn
12.6.2002	Sutter Co. Staff Meeting – *Orientation (see 12.20 summary letter)* 1160 Civic Center Blvd., Yuba City
2003	
2.10.2003	Sun City – Roseville Community Assn. – *Project Overview* Roseville
3.10.2003	Placer County Agricultural Commission – *Update* Placer County Planning Commission Room, DeWitt Center, Auburn
4.10.2003	Placer Legacy and County GIS Coordination Meeting Placer Co. Planning, 11414 B Ave., DeWitt Center, Auburn
4.30.2003	Sutter Co. Staff Meeting – *Update* Sutter County Board of Supervisors Office, 1160 Civic Center Blvd, Yuba City
5.1.2003	FHWA/Caltrans/PCTPA/SACOG Meeting – *Traffic Analysis and Modeling* URS, 2520 Venture Oaks Dr., Sacramento
8.21.2003	Federal Resource Interagency Meeting #1 – *Study Goals, Work Plan Approach, and GIS Data for Alternatives Screening* U.S. Army Corps of Engineers, 1325 J St., Sacramento
9.19.2003	Placer Legacy HCP Interagency Resources Group Meeting Placer Co. Planning Commission Room, DeWitt Center, Auburn
9.22.2003	City of Roseville Staff Meeting – *Non-PSR Alternatives* Civic Center, 311 Vernon, Roseville
10.6.2003	Sutter Co. Agricultural Commissioner Meeting – *Orientation* 142 Garden Highway, Yuba City
10.6.2003	Sutter Co. Staff Meeting – Non-PSR Alternatives Sutter County Board of Supervisors Office, 1160 Civic Center Blvd, Yuba City
10.20.2003	Placer Co. Board of Supervisors – *West Placer Co. Land Use Workshop* Placer Co. Board of Supervisors – "The Domes," 175 Fulweiler Rd., Auburn

MEETINGS WITH INDIVIDUAL, AGENCIES, AND COMMUNITY MEMBERS	
DATE	**MEETING**
10.23.2003	Federal Resource Interagency Meeting #2 – *NEPA/404 Integration, Purpose and Need, and Planned and Projected Growth* U.S. Army Corps of Engineers, 1325 J St., Sacramento
11.5.2003	Placer Co. Staff Meeting – *Placer Ranch Specific Plan and De LaSalle University Proposals* Public Works, DeWitt Center 11444 B Ave., Auburn
11.17.2003	City of Roseville Staff Meeting – *WRSP and DEIR Comments* Civic Center, 311 Vernon St., Roseville
11.25.2003	Sutter Co. Staff Meeting – *CEQA Issues* Sutter County Board of Supervisors Office, 1160 Civic Center Blvd, Yuba City
12.2.2003	Placer Co. Agricultural Commissioner Meeting – *Ag. Issues* 11477 E Ave., DeWitt Center, Auburn
12.2.2003	Pleasant Grove/Curry Creeks Watershed Group Meeting – *Orientation* Civic Center, 311 Vernon St., Roseville
12.9.2003	PAC Member – P. Hill Meeting – Access and No-Development Buffer Policies PCTPA, 550 High St., Auburn
2004	
1.9.2004	United Auburn Indian Community of the Auburn Rancheria Meeting – Project Overview, Tier 1 EIS/EIR Process, Relevant Cultural Resources in the Study Area, Traditional Cultural Properties in the Study Area, Input or Concerns, and Casino/Parking Lot Issues Analytical Environmental Services -- 2021 N St., Sacramento
1.23.2004	Natomas Basin Conservancy Meeting – *Project Update, HCP Status Report, and HCP Resources Information* Sutter County Board of Supervisors Office, 1160 Civic Center Blvd, Yuba City
2.3.2004	Placer County Bicycle Advisory Committee – *Project Overview* Auburn City Hall, 1225 Lincoln Way, Auburn
2.4.2004	Roseville Staff Meeting -- *PSR Alternatives Screening Follow-up* Civic Center, 311 Vernon St., Roseville
2.19.2004	Placer County Staff Meeting – *PSR Alternatives Screening Follow-up* Public Works, DeWitt Center 11444 B Ave., Auburn
2.19.2004	Brookfield and Blue Oaks Developer Meeting PCTPA, 249 Nevada St., Auburn
2.24.2004	Loomis Staff Meeting – *PSR Alternatives Screening Follow-up* Town Hall, 6140 Horseshoe Bar Rd., Loomis

MEETINGS WITH INDIVIDUAL, AGENCIES, AND COMMUNITY MEMBERS	
DATE	**MEETING**
2.24.2004	Rocklin Staff Meeting – *PSR Alternatives Screening Follow-up* City Council Chambers, 3970 Rocklin Rd., Rocklin
3.9.2004	Lincoln City Staff Meeting – PSR Alternatives Screening Follow-up City Hall, 640 Fifth St., Lincoln
3.9.2004	Sutter Co. Staff Meeting – PSR Alternatives Screening Follow-up 1160 Civic Center Blvd., Yuba City
4.12.2004	Federal Resource Interagency Meeting #3 – *Project Status, Draft Modified NEPA/404 Process, Schedule/Data for Each Step, Draft Purpose and Need, EPA NOI comment Letter* U.S. Army Corps of Engineers, 1325 J St., Sacramento
4.12.2004	Placer Co. Agricultural Commission – *Project Update* Placer Co. Planning Commission Hearing Room, DeWitt Center, Auburn
5.3.2004	Federal Resource Interagency Meeting #4 – *Draft Purpose and Need, Project Development Background, Traffic Forecast Data, and Draft Modified NEPA/404 Process Agreement* U.S. Army Corps of Engineers, 1325 J St., Sacramento
5.5.2004	City of Sacramento and Sacramento County Staff Meeting – PSR *Alternatives Screening follow-up* 1231 I St., Sacramento
5.10.2004	Sutter Co. Staff Meeting – *SR 70/99 Interchanges* Sutter County Board of Supervisors Office, 1160 Civic Center Blvd, Yuba City
5.12.2004	City of Roseville Staff Meeting – *Watt Ave. and Local Roadway Network* Civic Center, 311 Vernon St., Roseville
5.18.2004	Brookfield (University Park) Developer Meeting *PCTPA, 249 Nevada St., Auburn*
6.9.2004	City of Roseville and Placer Co. Staff Meeting – *Watt Ave. and Local Roadway Network* Placer Co. Public Works, DeWitt Center 11444 B Ave., Auburn
6.18.2004	Placer Co. Planning and Public Works Staff Meeting – *Update* Placer Co. Public Works, DeWitt Center 11444 B Ave., Auburn
7.6.2004	Federal Resource Interagency Meeting #5 – *EPA Responses to Draft Purpose and Need, Watt Ave. Interchange, TSM Alternatives, Alternatives Input,* FHWA, 650 Capitol Mall, Sacramento
7.15.2004	SACOG Staff Meeting – *Update and Coordination* 1415 L St., Sacramento

MEETINGS WITH INDIVIDUAL, AGENCIES, AND COMMUNITY MEMBERS	
DATE	**MEETING**
8.9.2004	Sutter Co. Staff Meeting – *SR 70/99 Interchange Concepts and Local Roadway Assumptions* Sutter County Public Works, 1130 Civic Center Blvd, Yuba City
8.10.2004	Placer Co. Building Industry Association Meeting – *Update* 1536 Eureka Rd., Roseville
8.19.2004	Placer Co. Agricultural Commissioner Meeting – *Update* Placer Co. Public Works, DeWitt Center 11444 B Ave., Auburn
8.19.2004	Placer Co. Staff and De LaSalle University Developer Meeting – *Update* Placer Co. Public Works, DeWitt Center 11444 B Ave., Auburn
8.24.2004	Federal Resource Interagency Meeting #6 – *Purpose and Need, Screening Criteria, Environmental Resource Data and Screening Process, and Potential Corridor Alignment Alternatives* FHWA, 650 Capitol Mall, Sacramento
8.25.2004	Placer Architects, Geologists, Engineers and Surveyors (PAGES) – *Background, Issues, Potential Corridor Alignment Alternatives* Mary Belle's Restaurant, Auburn
8.26.2004	Sierra Club – SAC Member Meeting – *Update* URS, 1380 Lead Hill Blvd., Roseville
9.13.2004	Audubon Society/ECOS SAC Member Meeting – *Update* URS, 1380 Lead Hill Blvd., Roseville
9.13.2004	Public Meeting Follow-up – *Sankey Rd. Property Owner* URS, 1380 Lead Hill Blvd., Roseville
9.13.2004	Public Meeting Follow-up – *Country Acres' Property Owners* URS, 1380 Lead Hill Blvd., Roseville
9.16.2004	Placer Co. Planning Staff Meeting – *Placer County Conservation Plan* Placer Co. Planning, DeWitt Center 11414 B Ave., Auburn
10.1.2004	Sutter Co. Public Works Staff Meeting – *SR 70/99 and Local Roadway Assumptions* Sutter County Public Works, 1130 Civic Center Blvd, Yuba City
10.5.2004	De LaSalle University Developer Meeting – *Potential Corridor Alignment Alternatives* PCTPA, 249 Nevada St., Auburn
10.13.2004	City of Roseville – Visioning Committee Meeting – *Update* Roseville Corporation Yard, 2005 Hilltop Circle, Roseville
10.21.2004	Federal Resource Interagency Meeting #7 – *Purpose and Need, Screening Criteria/Process, EPA Input and Discussion* FHWA, 650 Capitol Mall, Sacramento

MEETINGS WITH INDIVIDUAL, AGENCIES, AND COMMUNITY MEMBERS	
DATE	**MEETING**
11.16.2004	Highway 49 Business Assn. Meeting – *Background, Issues, and Potential Corridor Alignment Alternatives* 21456 Grass Valley Highway, Auburn
11.17.2004	De LaSalle University Developers Meeting – Potential Corridor Alignment Alternatives URS, 2530 Venture Oaks Way, Sacramento
11.22.2004	Placer Co. Staff and Resources Law Group Meeting – *Mitigation Strategies* Placer Co. Public Works, DeWitt Center 11444 B Ave., Auburn
11.30.2004	Sutter Co. Board of Supervisors Study Session – *Potential Corridor Alignment Alternatives* *466 Second Street, Yuba City*
12.14.2004	Sierra Club – SAC Member (Alan Green) Meeting – *Bus Rapid Transit* PCTPA, 249 Nevada Street, Auburn
12.18.2004	FHWA, Caltrans, and Placer Ranch Specific Plan Meeting -- *Fiddyment Interchange* PCTPA, 249 Nevada Street, Auburn
12.28.2004	Sierra Club – SAC Member (Alan Green) Meeting – *Bus Rapid Transit and Specific Plan Coordination* PCTPA, 249 Nevada Street, Auburn
2005	
1.10.2005	Lincoln Rural Municipal Advisory Council – *Project Update* 3333 Mt. Pleasant Rd., Lincoln
1.11.2005	Placer County Building Industry Association (BIA) – *Project Update* 1536 Eureka Rd., Roseville
1.12.2005	Sheridan Municipal Advisory Council – *Project Update* 6005 Camp Far West Road, Sheridan
1.25.2005	Federal Resource Interagency Meeting #8 – *Background, Framework to Advance Project, Identify Agencies and Objectives, Summary of Agreements, and Action Items* FHWA, 650 Capitol Mall, Sacramento
3.10.2005	Federal Resource Interagency Meeting #9 – *Western Placer County – Land Use and Conservation Planning , Purpose and Need, Screening Criteria, Range of Alternatives, Alternatives Most Likely to Contain LEDPA, and Mitigation Framework* FHWA, 650 Capitol Mall, Sacramento
3.24.2005	Placer County Conservation Plan (PCCP) – *Interagency Working Group Meeting* Placer County Planning, 11414 B Ave., Auburn

MEETINGS WITH INDIVIDUAL, AGENCIES, AND COMMUNITY MEMBERS	
DATE	**MEETING**
3.24.2005	KT Communities – *Two Alignments Screening Work Plan, Schedule, and Cost Estimate Meeting* PCTPA, Auburn
4.6.2005	Placer County Conservation Plan (PCCP) – *Interagency Working Group Meeting* Placer County Planning, 11414 B Ave., Auburn
4.12.2005	Placer County Conservation Plan (PCCP) – *Interagency Working Group Meeting* Placer County Planning, 11414 B Ave., Auburn
4.13.2005	U.S. Fish and Wildlife Service Orientation Meeting – *Project Background, Modified NEPA/404 Process, Purpose and Need, and Phase 1 Screening and Alternatives Identification Process* U.S. Fish and Wildlife Service, 2800 Cottage Way, Sacramento
4.18.2005	Modified NEPA/404 Process (Federal Resource Interagency) Meeting #10 – Alternatives *Screening Criteria* FHWA, 650 Capitol Mall, Sacramento
4.26.2005	Placer County Conservation Plan (PCCP) – *SPRTA/Parkway Issues* Placer County Planning, 11414 B Ave., Auburn
5.18.2005	Modified NEPA/404 Process (Federal Resource Interagency) Meeting #11 – *Group Decision-making Process and Schedule, Action Items Review, Screening Criteria for Selecting the Range of Alternatives, and Range of Alternatives* FHWA, 650 Capitol Mall, Sacramento
6.8.2005	Placer County Conservation Plan (PCCP) – *SPRTA/Parkway Issues Meeting* U.S. Fish and Wildlife Service, 2800 Cottage Way, Sacramento
6.28.2005	Modified NEPA/404 Process (Federal Resource Interagency) Meeting #12 – *Consultation Process Status, Action Items Review, and Range of Feasible Alternatives* FHWA, 650 Capitol Mall, Sacramento
7.20.2005	New Alignments Screening Meeting – Placer County/City of Roseville Civic Center, 311 Vernon St., Roseville
8.2.2005	Construction Materials Association of California – *Background, Issues, and Corridor Alternatives Identification* Rusty Duck – 500 Bercut Drive, Sacramento
8.8.2005	Modified NEPA/404 Process (Federal Resource Interagency) Meeting #13 – *Consultation Process Status, Action Items Review, and Continue Discussion on the Range of Feasible Alternatives* FHWA, 650 Capitol Mall, Sacramento
8.22.2005	Sierra Club and Environmental Council of Sacramento -- *Project Update* 1414 K St. – Ste. 500, Sacramento

MEETINGS WITH INDIVIDUAL, AGENCIES, AND COMMUNITY MEMBERS	
DATE	**MEETING**
9.19.2005	Sutter County Coordination – *Local Roadway Access, SR 70/99 Interchanges and Measure "M" Land Uses/Circulation* Sutter County Board of Supervisors Office, 1160 Civic Center Blvd, Yuba City
9.27.2005	Expanded Corridor Alternative and Resource Opportunities Meeting Placer County Planning Dept., 11414 B Ave., Auburn
9.28.2005	Federal and State Resource Agencies Coordination Meeting – *Regional Conservation and Development Strategy* U.S. Army Corps of Engineers, 1325 J St., Sacramento
10.6.2005	Modified NEPA/404 Process (Federal Resource Interagency) Meeting #14 – *Consultation Process Status, Action Items Review, and Range of Feasible Alternatives Continuation* FHWA, 650 Capitol Mall, Sacramento
10.06.2005	Placer County Conservation Plan (PCCP) – *Landowner Meeting* U.S. Fish and Wildlife Service, 2800 Cottage Way, Sacramento
10.27.2005	Placer County Conservation Plan (PCCP) – *Policy Group Meeting -- PCCP Update, Participating Agencies, and Relationship of 404 LEDPA to PCCP Reserve Design* U.S. Fish and Wildlife Service, 2800 Cottage Way, Sacramento
10.31.2005	Placer County Conservation Plan (PCCP) – *SPRTA Participation and Costs* Placer County Planning Dept., 11414 B Ave., Auburn
11.3.2005	Placer County and Sutter County Fire Dept. – *Project Update and Emergency Access* Placer County Fire Station, 1300 Athens Ave., Lincoln
11.3.2005	Modified NEPA/404 Process (Federal Resource Interagency) Meeting #15 – *Consultation Process Status, Action Items Review, and Complete Range of Feasible Alternatives* FHWA, 650 Capitol Mall, Sacramento
11.4.2005	Placer Ranch Specific Plan and EIR Conference Call – *Placer County, Placer Ranch and PCTPA Coordination*
11.8.2005	SACOG Meeting – *MEPLAN Program Feasibility – Growth-Inducement* 1415 L St., Sacramento
11.19.2005	Placer County Conservation Plan (PCCP) – *Landowners Meeting* U.S. Fish and Wildlife Service, 2800 Cottage Way, Sacramento
11.21.2005	Lincoln Rural Municipal Advisory Council – *Update* 3333 Mt. Pleasant Rd., Lincoln
2006	
2.15.2006	Law Enforcement Agencies Coordination Meeting (Rocklin, Roseville, Placer and Sutter County Sheriffs Office) – *Project Overview and Emergency/Local Access Issues* Rocklin EOC – 4080 Rocklin Rd., Rocklin

MEETINGS WITH INDIVIDUAL, AGENCIES, AND COMMUNITY MEMBERS	
DATE	**MEETING**
2.15.2006	SACOG and MEPLAN Meeting – *Project Overview, MEPLAN and Scope of Work, Data Input Identification, and Schedule/Cost Estimates* SACOG – 1415 L Street, Sacramento
3.1.2006	Modified NEPA/404 Process (Federal Resource Interagency) Meeting #16 – *MEPLAN and growth Assessment Tool, Discussion/Feedback, and Range of Feasible Alternatives -- Concurrence* FHWA, 650 Capitol Mall, Sacramento
3.22.2006	PCCP Update Meeting – PCCP Status Placer County Planning Dept., 11414 B Ave., Auburn

TRAFFIC NOISE ANALYSIS TECHNICAL MEMORANDUM PLACER PARKWAY CORRIDOR PRESERVATION TIER 1 EIS/PROGRAM EIR

1.0 INTRODUCTION

1.1 TIER 1 EIS/PROGRAM EIR

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

1.2 CORRIDOR SELECTION AND PRESERVATION

The concept for the Placer Parkway is over a decade old. Placer County's 1994 General Plan depicts a "plan line" for it. Two planning studies helped to refine the concept:

- DKS Associates, 2000, Placer Parkway Interconnect Study/Conceptual Plan
- DKS Associates, 2001, Project Study Report (Project Development Support) for Placer Parkway

Placer Parkway is cited as a high priority regional transportation project by the Sacramento Area Council of Governments (SACOG) 2025 Metropolitan Transportation Plan and the 2027 Placer County Regional Transportation Plan. The project vicinity and surrounding area include some of the fastest growing communities in the Sacramento region. A number of large urban development proposals are being considered by Sutter and Placer Counties. New development is expected to add a significant amount of residential, commercial, industrial, and educational uses.

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included

representatives from planning and public works departments of all affected cities and counties, environmental, business, agricultural, development, and homeowner interests (the Study Advisory Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report will analyze these five corridor alternatives along with a No-Build Alternative.

Other potential transportation modes such as bus rapid transit may be developed in the corridor in the future, although they are not proposed as part of the current project. The corridor for the Placer Parkway is to vary from approximately 500 feet wide in the Eastern and Western segments to approximately 1,000 feet wide in the Central Segment. Depending upon the alternative, the corridor's length ranges from a minimum of 14.2 miles to a maximum of 16.2 miles. The selected corridor would contain the roadway, including the median, travel lanes, shoulder, associated access ramps and a no-development buffer zone.

Corridor acquisition may not be completed until after Tier 2, as funding becomes available. Portions of the selected corridor will be preserved as a no-development buffer zone. The buffer would be maintained as a zone where development is either not permitted or is severely restricted. This is intended to restrict access to the proposed interchanges, protect the rural character of agriculturally designated areas in the vicinity of the Parkway as far as possible subject to future development, and to maximize opportunities to incorporate adjacent sensitive areas. It is intended that the buffer would be owned and managed in the future to achieve these objectives. For subsequent Tier 2 (project-level) environmental reviews, the size of this buffer zone could be considered flexible for agriculturally-designated land undergoing urban development. In the Tier 2 environmental review, the specific buffer size and location would be determined. This determination would be based on performance standards on a case-by-case basis, depending on the land use needs of future approved development, and taking into account the primary objective of restricting future access to the Parkway.

Project proponents are considering employment of several land management and control mechanisms in order to ensure that the buffer would be effectively maintained as an area where development would either not be permitted, and where construction of any additional access onto the Parkway would not be allowed. These mechanisms could include land use controls, land purchase/leases, general plan amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, urban growth boundaries, etc. "Layering" or using several of these methods would provide more assurance the buffers would be permanent, or at least more difficult to undo.

1.3 TECHNICAL STUDY OBJECTIVE

This Noise Technical Memorandum has been prepared to support the Tier 1 Environmental Impact Statement/Program Environmental Impact Report. It presents a Tier 1/Program level assessment of potential impacts related to noise for five corridor alternatives and the No-Build Alternative as described in Chapter 2.

The scope of work performed for this report is based on the Caltrans Local Assistance Procedures Manual (Caltrans, 2006), as modified for purposes of Tier 1/Program analysis by agreement of Caltrans; the Caltrans Highway Design Manual (HDM) (Caltrans, 2001) and the Caltrans Environmental Handbook guidance (Caltrans, 2005) on preparing a noise technical memorandum. In addition, the evaluation considered guidance from the FHWA, Environmental Checklists for Draft and Final Environmental Documents (FHWA, 1998a; FHWA, 1998b).

This report is organized as follows:

Chapter 2: The Proposed Action

Chapter 3: Regulatory and Technical Framework
Chapter 4: Affected Environment
Chapter 5: Potential Direct Impacts
Chapter 6: Secondary and Indirect Impacts
Chapter 7: Cumulative Impacts
Chapter 8: Watt Avenue Interchange
Chapter 9: Avoidance, Minimization and/or Mitigation Strategies
Chapter 10: Analyses to be Undertaken in Tier 2
Chapter 11: References

This report also includes figures and tables, which show the project location, each action alternative, and pertinent technical information prepared to evaluate the action alternatives.

Throughout this document, the Placer Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

2.0 THE PROPOSED ACTION

The Proposed Action for the Placer Parkway Corridor Preservation Project is to select and preserve a 500- to 1,000-foot-wide corridor in the project study area, within which the future four- or six-lane Placer Parkway may be constructed. The ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction, and operation of the Parkway. Although the action taken at Tier 1 on the Placer Parkway Corridor Preservation Project is limited, the underlying project whose effects are studied in this document is the Placer Parkway. To the extent feasible at this early stage, the Tier 1 EIS/EIR addresses the potential effects of construction and operation of the future roadway.

2.1 THE PROJECT STUDY AREA

The project study area is an area of approximately 33,460 acres located in Placer and Sutter Counties, with a small section located in Sacramento County (see Figures 1-1 and 2-1). The portion of the study area in Sacramento County is located in the extreme southwest corner of the study area and does not include any of the proposed corridor alignment alternatives. It extends from SR 70/SR 99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego Roads.

For the purposes of the analysis the study area is divided into three segments

- Western Segment: the Western Segment extends from SR 70/99 to Pleasant Grove Road in Sutter County.
- Central Segment: the Central Segment extends from Pleasant Grove Road in Sutter County to approximately 2,300 feet north of Pleasant Grove Creek in Placer County.
- Eastern Segment: the Eastern Segment extends from approximately 2,300 feet north of Pleasant Grove Creek to SR 65 in Placer County.

2.2 CORRIDOR ALTERNATIVES

The following subsections describe the corridor alternatives, which are depicted on Figure 2-1, and are numbered according to location from south to north in the study area.

2.2.1 The No-Build Alternative

In this alternative, the project would not be implemented. A Placer Parkway corridor would not be selected/preserved, and the future Placer Parkway would not be constructed.

2.2.2 Alternative 1 – the Red Alternative

Alternative 1 would extend from SR 70/99 approximately ½ mile north of Riego Road, eastward approximately 1 mile north of Baseline Road to approximately Watt Avenue, proceeding north and transitioning in an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment alternative is 16.2 miles long. This alternative would include six interchanges.

2.2.3 Alternative 2 – the Orange Alternative

Alternative 2 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed northeast, then in a northerly direction south of Pleasant Grove Creek, transitioning to an easterly direction before it reaches Sunset Boulevard

West, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.4 miles long. This alternative would include six interchanges.

2.2.4 Alternative 3 – the Blue Alternative

Alternative 3 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed north along the Sutter/Placer County Line, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.6 miles long. This alternative would include six interchanges.

2.2.5 Alternative 4 – the Yellow Alternative

Alternative 4 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.3 miles long. This alternative would include five interchanges.

2.2.6 Alternative 5 – the Green Alternative

Alternative 5 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 4,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.2 miles long. This alternative would include five interchanges.

2.3 PARKWAY DESIGN ASSUMPTIONS

Although the Parkway would be designed and construction-level impacts analyzed during Tier 2, for the purpose of this report and the Tier 1 EIS/Program EIR, several assumptions have been made about potential design and configuration concepts. These assumptions would be subject to further development and refinement, and specific decisions about design of the roadway would be made during the Tier 2 process. For example, the number, location, and design of over-crossings would be determined at the time of final Parkway design, in consultation with local jurisdictions. The following sections outline assumptions for the future roadway.

Preliminary costs estimates for the Parkway range from $600 to $650 million (2005 dollars). This includes costs for right-of-way, design, construction, and environmental mitigation for the four- to six-lane facility. The funding situation has spurred interest in exploring other more creative funding options. These include a county-wide sales tax, more developer contributions, and tolling facilities. The Technical Report and Tier 1 EIS/Program EIR do not make any assumptions about funding sources.

2.3.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally –

in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane facility. A preliminary conceptual cross section (see Figure 2-2) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/ Program EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

2.3.2 Conceptual Roadway Elevation

As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on either side of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways or trails.

Throughout the project study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These over-crossings would not connect to the Parkway. Parkway access would be via the interchanges described below.

2.3.3 Interchange Concepts

The analysis assumes that the location of interchanges (see Figure 2-1) is as follows.

- SR 70/99 (at ½ mile north of Riego Road or at Sankey Road)
- One or two locations to be determined in southern Sutter County
- Fiddyment Road
- Foothills Boulevard

- SR 65 at Whitney Ranch Parkway

The following discussion outlines concepts and assumptions for the six interchanges that could potentially serve the Placer Parkway.

2.3.3.1 Western Segment

Within the Western Segment of the Parkway, a high-speed, freeway-to-freeway type interchange would connect the Parkway with SR 70/99 at one of following potential locations depending on the project alternative (see Section 2.4). Placer Parkway would terminate at SR 70/99.

- **Placer Parkway/SR 70/99 Interchange at North of Riego Road.** This alternative concept uses "braided" ramps to eliminate weaving problems or conflicts with the future SR 70/99 at Riego Road interchange being developed by Sutter County and Caltrans.

- **Placer Parkway/SR 70/99 Interchange at Sankey Road.** Under this alternative concept, the existing two-lane Sankey Road would be realigned to the south of Placer Parkway and the proposed freeway-to-freeway interchange, extending from approximately ¼ mile west of SR 70/99 to approximately ¼ mile east of the Union Pacific railroad tracks. There would be no direct access to SR 70/99 or Placer Parkway from the realigned Sankey Road.

Depending on the final alignment selected, one or two additional arterial interchanges would also be located in south Sutter County. Conceptual locations are identified for purposes of this Tier 1/Program analysis (see Figure 2-1). The actual location of these interchanges would be developed in the Tier 2 phase, based on Sutter County requirements.

2.3.3.2 Central Segment

Within the Central Segment of the Parkway, there would not be any access proposed as part of the project in the 7-mile segment between Fiddyment Road and Pleasant Grove Road. Please see Section 2.8 regarding a potential interchange with a future extension of Watt Avenue (Figure 2-3) which could be proposed and constructed by others in the Central Segment; such an interchange is not part of the Placer Parkway.

2.3.3.3 Eastern Segment

Within the Eastern Segment of the Parkway, a signalized high-speed freeway-to-freeway and local access interchange would connect the Parkway to SR 65 at Whitney Ranch Parkway (Figure 2-1). From SR 65 eastward Placer Parkway would terminate and become Whitney Ranch Parkway east of the SR 65 exit ramp intersection. Traffic signals would be provided at the exit ramp terminals. This interchange would be approximately 1 mile north of a planned SR 65/Sunset Boulevard interchange and 1.2 miles south of the existing Twelve Bridges interchange.

As part of this interchange, auxiliary lanes would be required on SR 65 in both directions to enhance traffic operations on the north side of the future SR 65/Sunset Boulevard interchange. The southbound SR 65 exit-ramp at Sunset Boulevard is being designed to accommodate an additional auxiliary lane required for the future Placer Parkway/Whitney Ranch Parkway interchange to minimize the reconstruction of this ramp in the future. Within the Eastern Segment of the Parkway, from SR 65 westward, two interchanges with local roadways would be constructed, one at Foothills Boulevard and one at Fiddyment Road, as depicted on Figure 2-1.

The future interchange on Placer Parkway at Fiddyment Road would be located near the existing intersection of Fiddyment Road and Sunset Boulevard West. To provide acceptable traffic operations, additional distance needs to be provided between the Fiddyment Road/Sunset Boulevard West intersection and the Fiddyment Road/Placer Parkway westbound off-ramp intersection. Therefore, Sunset Boulevard West will need to be realigned to the north as it nears Fiddyment Road.

2.3.4 Landscaping Concept

For the purposes of this environmental analysis, preliminary landscaping concepts have been developed for Placer Parkway. These are entirely conceptual and would be subject to further refinement during the Tier 2 environmental process. It is anticipated that landscaping would be used to reflect local topography and vistas in the study area and complement the varying character of land adjacent to the Parkway corridor. Landscape design would vary within the Parkway's three segments depending on corridor width and type and density of surrounding land uses. Landscaping would be used within the median and the Parkway buffer zone to enhance the aesthetics of the Parkway, and would be used to provide screening and enhance local and long distance views. Where appropriate, more concentrated plantings would be considered to buffer the Parkway from future adjacent land uses that may be incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Landscape design would likely include a mix of compatible native and non-native plants that may require some irrigation. Wherever possible, native plant species would be used in line with Caltrans policy. Where possible and depending on availability, feasibility and cost, recycled water would be used for irrigation.

During a future design phase, lighting elements would be designed for safety and would consider the proposed landscaping plan in order to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower-voltage lighting, and proposing lighting fixtures that conform with the visual character of the area).

2.4 POTENTIAL WATT AVENUE INTERCHANGE

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 2-3). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/Program EIR. However, the connection of Placer Parkway to a potential Watt Avenue extension could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/Program EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges with Placer Parkway.

2.5 AGENCY PERMITS AND APPROVALS

The Proposed Action would preserve a preferred corridor for a future transportation facility. In the future, permits and approvals would be obtained from appropriate agencies prior to construction of the Parkway. These permits and approvals may include specific design or mitigation requirements that would be incorporated into the project.

2.6 SUBSEQUENT TIER 2 INFORMATION

As noted earlier, the design and construction of Placer Parkway—including its interchanges and over-crossings, and ancillary features such as stream crossings, safety devices, stormwater management structures, and similar improvements—would be evaluated in a subsequent Tier 2 environmental review process once a corridor has been identified. Chapter 10, Analyses to Be Undertaken in Tier 2, provides more detailed information regarding Tier 2 studies.

3.0 REGULATORY AND TECHNICAL SETTING

3.1 ACOUSTICS BACKGROUND

3.1.1 Sound and Noise Definitions

Sound is a perturbation in a medium: gas, liquid, or solid, sensed by hearing organs. Noise is a class of sound generally defined as loud, unpleasant, unexpected, or undesired sound typically associated with human activity that interferes with or disrupts normal activities. Although exposure to high noise levels has been demonstrated to cause hearing loss, the principal human response to environmental noise is annoyance. The response of individuals to similar noise events is diverse and influenced by the type of noise, perceived importance of the noise, its appropriateness in the setting, time of day, and type of activity during which the noise occurs, and sensitivity of the individual. Acoustics is defined as the generation, transmission, and reception of energy as vibrational waves in matter (Kinsler et al., 1982).

3.1.2 Frequency and Hertz

Sound waves are characterized by several parameters, including frequency (pitch) and amplitude (loudness). Like the notes on a piano or other musical instrument, a low frequency is low in pitch and a high frequency is high in pitch. Cycles per second or oscillations are used to quantify frequency and are referred to as Hertz (Hz). In the case of the piano, frequency relates to the oscillations of the vibrating wires struck by the hammers connected to the keys. Oscillations also characterize periodic systems with rotating components (e.g., multi-bladed fans) where a specified duration defines the return of a system to its original state and the associated creation of a fluid pressure perturbation or sound wave cycling from a state of high pressure, to a state of low pressure, and back to the state of high pressure (one cycle). For higher frequencies, a prefix is commonly attached to Hertz. Thus, 1 kilo-Hertz (kHz) is equivalent to 1,000 Hz, and 24 kHz equals 24,000 Hz. The human ear is sensitive to the frequency range from 20 Hz to 20 kHz, with variations based on age, genetics, and environment.

3.1.3 Amplitude and Decibels

Amplitude describes how loud a sound is. Sound is transmitted via a pressure wave. The peak-to-peak amplitude of a pressure wave corresponds to the difference between the crest (state of high pressure) and trough (state of low pressure) of the wave. Pressure is typically reported in micro-Pascals (µPa); however, the human ear's sensitivity to differences in µPa is minute. For example, the minimum perceptible *increase* in sound noticeable to the average human ear corresponds to a doubling of the pressure amplitude (e.g., from 400 to 800 µPa). The lowest sound perceptible to the human ear is approximately 20 µPa, while a very loud sound may be 200 million µPa.

Because the variance between sound amplitudes is so large, the use of µPa becomes impractical; therefore, sound pressure, measured in units of µPa, is rarely used. Instead, Sound Pressure Level (SPL), measured in units of decibels (dB), is the standard sound amplitude metric. A *level* is the logarithm of the ratio of a given quantity to a reference quantity of the same kind, so SPL is the logarithm of the given pressure referenced to 20×10^{-6} µPa (for air). SPL compresses the amplitude range into quantities that are manageable, as shown in Table 3-1.

Increasing any sound amplitude 3 dB on the logarithmic scale corresponds to an approximate doubling of pressure. So increasing from 70 dB to 73 dB is equivalent to increasing from 200 µPa to 400 µPa.

Table 3-1
Noise Levels from Common Sources

Noise Environment at a Given Distance	A-Weighted Noise Level (decibels)	Subjective Impression
Military Jet takeoff with after-burner (50 feet)	140	
Civil defense siren (100 feet)	130	
Jet takeoff (200 feet)	120	Threshold of pain
Loud rock music	110	
Pile driver (50 feet)	100	Very loud
Diesel truck (150 feet)	90	
Garbage disposal (3 feet)	80	
Vacuum cleaner (10 feet)	70	Moderately loud
Normal conversation (3 feet)	60	
Light traffic (100 feet); rainfall	50	
Bird calls (distant)	40	Quiet
Soft whisper (5 feet); rustling leaves	30	
Library	20	
Normal breathing	10	
	0-1	Threshold of hearing

3.1.4 Decibel Addition

Because the pressure amplitude range has been compressed by conversion from a linear scale to a logarithmic scale, normal arithmetic operations no longer apply. For example, suppose a speaker in a room produces 70 dB as measured from a distance of 5 feet. Adding another 70 dB speaker to the room also at 5 feet from the measurement point would result in an aggregate level of 73 dB from the following equation:

$10*Log_{10}(10^{(0.1*A)} + 10^{(0.1*B)})$, where A and B are each 70 dB.

But if speaker A is 70 dB and speaker B is 80 dB, the equation above indicates that the logarithmic sum is 80 dB. Hence, two commonly understood rules result:

A. Adding two sound sources with equivalent Sound Pressure Levels corresponds to an increase in sound level of 3 dB.

B. Adding two sound sources with Sound Pressure Levels differing by 10 dB means that the Sound Pressure Level equals the loudest sound source.

3.1.5 A-Weighted Scale

Loudness as perceived by the human ear is not only dependent upon noise amplitude, but also the frequency at which the noise occurs. The physical geometry of the human ear mimics a system capable of filtering out frequencies below 20 Hz and above 20 kHz. Also, this geometry provides frequency-

dependent sound attenuation within the range of human hearing. Unsurprisingly, the human ear best distinguishes sound in the range associated with speech: 1,000 to 5,000 Hz. The perception of sound outside of this range will be less than reality or as measured and quantified by an instrument. An amplitude weighting system called the "A-weighted scale" accounts for this sensitivity of the average normal human ear and thereby describes sound in a manner that relates well to human perception. The scale is a set of frequency-dependent constants that are algebraically applied to "flat" or "unweighted" sound levels, resulting in a closer approximation of perceived sound and the potential for annoyance. The A-weighted scale is expressed in A-weighted decibels (dBA). Because A-weighting only algebraically modifies sound levels, both dB and dBA values follow the same previously described rules of logarithmic decibel addition.

3.1.6 Human Response to Noise

Human response to SPL increases differs, but the widely accepted standard is that a 3 dBA increase in noise level is the lower threshold of sensitivity, representing the minimum perceptible increase in noise level to the average human. An increase of 5 dBA is a readily perceptible increase in noise level, and a 10 dBA increase is generally perceived as a doubling of the noise level.

3.1.7 Noise Descriptors

The following noise descriptors are typically used in quantifying noise for traffic analysis:

- Equivalent Sound Level (L_{eq}): The level of a sound, which, in a stated time period and at a stated location, has the same A-weighted sound energy as the time-varying sound.
- Maximum/Minimum A-weighted Sound Level (L_{min}/L_{max}): The maximum/minimum sound level measured using fast time-averaging and A-weighting.
- Percentile Sound Level (L_{xx}): For a stated duration of a total measurement period, the sound level that is exceeded for xx percent of the total measurement period using fast time-averaging and A-weighting. An L_{90} of 66 dBA implies that 90 percent of the time, the sound level exceeded 66 dBA.
- Day-Night Level (L_{dn}): L_{dn} is an L_{eq} averaged over 24 hours, with a 10 dBA penalty added between the hours of 10 p.m. and 7 a.m.
- Community Noise Equivalent Level (CNEL): CNEL is identical to L_{dn}, except 5 dBA is also added to the evening sound level, from 7 p.m. to 10 p.m. L_{dn} and CNEL introduce penalties to account for times when people are typically home and sleeping.

3.2 FEDERAL REGULATIONS

3.2.1 National Environmental Protection Act

The National Environmental Protection Act (NEPA) of 1969 instituted policies to "foster and promote the general welfare, to create and maintain conditions under which man and nature can exist in productive harmony, and fulfill the social, economic, and other requirements of present and future generations of Americans." NEPA promotes environmentally conscious efforts aimed at improving the health and welfare of Americans by empowering federal, state, and local agencies authorized to develop and enforce environmental standards.

3.2.2 Title 23, Part 772 of the Code of Federal Regulations

The criteria for evaluating traffic noise effects in this report are contained in Title 23 of the Code of Federal Regulations Part 772 (23 CFR 772), "Procedures for Abatement of Highway Traffic Noise and Construction Noise," and Caltrans' "Traffic Noise Analysis Protocol," dated October 1998. The Category B criterion in these documents applies to residences, churches, schools, recreation areas, and other similar uses that are susceptible to noise, and is an hourly sound level that approaches or exceeds 67 dBA L_{eq}.

Other developed land with uses such as commercial or industrial uses is included in Category C, for which an hourly sound level criterion that approaches or exceeds 72 dBA L_{eq} has been established. There are no criteria for undeveloped land or construction noise. These criterion sound levels are determined at the exterior of structures during peak hour noise conditions.

Table 3-2 shows the FHWA noise criteria used for determining effects to specific land uses (for example, residential and commercial).

Table 3-2
Federal Highway Administration Noise Abatement Criteria

Activity Category	Design Noise Levels L_{eq} hourly (dBA)	Description of Land Use Activity Category
A	57 (exterior)	Serene or quiet lands that serve an important public need where the preservation of those qualities is essential if the lands are to continue to serve their intended purpose. Such areas could include amphitheaters, parks, open spaces, or historic districts that are dedicated or recognized by local officials for activities requiring serenity and quiet.
B	67 (exterior)	Picnic areas, recreation areas, playgrounds, active sports areas, and parks not included in category A, and residences, motels, hotels, public meeting rooms, schools, churches, libraries, and hospitals.
C	72 (exterior)	Developed lands, properties, or activities not included in categories A and B.
D	--	Undeveloped lands.
E	52 (interior)	Residences, motels, hotels, public meeting rooms, schools, churches, libraries, hospitals, and auditoriums.
Source: 23 CFR 772, Federal Highway Administration, 1982.		

FHWA and Caltrans consider a traffic noise effect to occur if predicted loudest-hour traffic noise levels approach or exceed the noise levels contained within the FHWA noise abatement criteria. Caltrans defines "approach or exceed" as noise levels within 1 dBA of the noise criterion, meaning 66 dBA for activity category B (also referred to as an "absolute" noise impact). In addition to these criteria sound levels, the FHWA and Caltrans consider a traffic noise effect as occurring if predicted sound levels "substantially" exceed existing noise levels. Caltrans defines "substantial" as an increase of 12 dBA over existing peak-hour noise levels (also referred to as a "relative" noise impact). The FHWA and Caltrans policies dictate that noise abatement measures must be considered when noise effects are identified.

3.3 STATE OF CALIFORNIA

3.3.1 California Environmental Quality Act

The California Environmental Quality Act (CEQA) provides California law and procedure relative to analysis of projects that might result in significant impacts to the environment. CEQA discloses to decision-makers and the public the significant environmental effects of proposed activities and identifies ways to avoid or reduce those effects by requiring implementation of feasible alternatives or mitigation measures. Under CEQA, an agency may find that a substantial noise increase may result in a significant adverse environmental effect; if so, the noise increase must be mitigated or identified as a noise impact for which it is likely that only partial (or no) mitigation measures are available. Specific economic, social, environmental, legal, and technological conditions may make noise mitigation measures infeasible; if such conditions occur, a decision-making body must adopt a statement of those overriding considerations and an explanation of the benefits of the project that outweigh the impacts.

3.3.2 California Streets and Highways Code Section 216

Section 216 of the California Streets and Highways Code relates to the noise level produced by the traffic on, or by the construction of, a state freeway measured in the classrooms, libraries, multi-purpose rooms, and spaces used for pupil personnel services of a public or private elementary or secondary school. The code states that if the interior noise level produced by freeway traffic or the construction of a freeway exceeds 52 dBA-L_{eq}, the department shall undertake a noise abatement program in any such classroom, library, multi-purpose room, or space used for pupil personnel services to reduce the freeway traffic noise level therein to 52 dBA-L_{eq} or less by measures including, but not limited to, installing acoustical materials, eliminating windows, installing air conditioning, or constructing sound baffle structures.

3.3.3 Traffic Noise Analysis Protocol for New Highway Construction and Reconstruction Projects

The Protocol (Caltrans, 1998a) specifies the policies, procedures, and practices to be used by agencies that sponsor new construction or reconstruction projects. Noise abatement criteria specified in the Protocol are the same as those specified in 23 CFR 772 (Table 3-2 above). This report defines a noise increase as substantial when the predicted noise levels with project implementation exceed existing noise levels by 12 dBA-L_{eq}(h). The Protocol also states that a sound level is considered to approach a Noise Abatement Criteria (NAC) level when the sound level is within 1 dBA of the NAC identified in 23 CFR 772. For example, a sound level of 66 dBA is considered to approach the NAC of 67 dBA, but 65 dBA does not.

3.3.4 Technical Noise Supplement

The Caltrans Technical Noise Supplement (a.k.a. "TeNS") provides general technical background information on noise related to transportation, with specific attention to highway traffic noise (Caltrans, 1998b). Although not official policy, the procedures recommended in TeNS are in conformance with industry standards and serve to elaborate—for informational purposes—concepts and procedures referred to by the Caltrans Traffic Noise Analysis Protocol.

3.4 COUNTY

3.4.1 Sutter County General Plan

Policy 8.A-5 of the Sutter County Noise Element of the General Plan pertains to transportation noise, stating "noise created by new transportation noise sources, including roadway improvement projects, should be mitigated…." so as not to exceed the levels specified in Table 3-3.

Table 3-3
Placer County Maximum Allowable Noise Exposure
(Transportation Noise Sources)

Land Use	Outdoor Activity Areas[1]	Interior Spaces

Notes:

[1] Where the location of outdoor activity areas is unknown, the exterior noise level standard shall be applied to the property line of the receiving land use.

[2] As determined for a typical worst-case hour during periods of use.

[3] Where it is not possible to reduce noise in the outdoor activity areas to 60 dB L_{dn}/CNEL or less using a practical application of the best available noise reduction measures, an exterior noise level of up to 65 dB L_{dn}/CNEL may be allowed provided that available exterior noise reduction measures have been implemented and interior noise levels are in compliance with this table.

3.4.2 Placer County General Plan

Placer County's General Plan contains policies governing noise related to development within Placer County (1994). The maximum allowable noise exposure limits for transportation noise sources are summarized in Table 3-4. The Placer County Noise Ordinance is in Article 9.36 of the County Code (updated February 12, 2005). Under the Noise Ordinance, any person generating noise must keep that noise below 55 dB during the day and 45 dB at night. If a complaint is reported, noise measurements may be taken to assess the sound levels. Exceptions to this rule include daytime construction activities and vehicle operation on public roads and driveways. In addition, the Placer County Board of Supervisors has issued a Minute Order that controls construction noise by limiting the hours of operation to the daytime hours of 6 a.m. to 8 p.m. Monday through Friday, and 8 a.m. to 6 p.m. Saturday. This order also requires proper maintenance of equipment mufflers and the indication of the staging area on the improvement plans.

Table 3-4
Sutter County Maximum Allowable Noise Exposure
(Transportation Noise Sources)

Land Use	Outdoor Activity Areas[1]	Interior Spaces	
	L_{dn}/CNEL, dB	L_{dn}/CNEL, dB	L_{eq}, dB[2]

Notes:

[1] Where the location of outdoor activity areas is unknown, the exterior noise level standard shall be applied to the property line of the receiving land use.

[2] As determined for a typical worst-case hour during periods of use.

[3] Where it is not possible to reduce noise in the outdoor activity areas to 60 dB L_{dn}/CNEL or less using a practical application of the best available noise reduction measures, an exterior noise level of up to 62.5 dB L_{dn}/CNEL may be allowed provided that available exterior noise reduction measures have been implemented and interior noise levels are in compliance with this table.

4.0 AFFECTED ENVIRONMENT

This chapter describes the existing conditions in the study area. It characterizes existing ambient sound and identifies contributory sources such as traffic noise.

4.1 SITE SURVEY

A site reconnaissance and ambient noise measurement survey was conducted in January 2006 in the study area. Ten noise-sensitive receptors and proposed residential developments were selected as representative locations of existing noise conditions within the study area. One 15-minute, short-term attended measurement was conducted at each of the ten measurement locations.

4.1.1 Instrumentation and Setups

Short-term (ST) data were gathered using two Larson Davis Model 820 American National Standards Institute (ANSI) Type 1 integrating sound level meter (Serial Number 1324). A field calibration check was conducted for each meter before and after each measurement period with a Larson Davis Model CAL150B acoustic calibrator (Serial Number 2233). Each sound level meter was also within its manufacturer's recommended laboratory calibration period. For each measurement the meter was mounted on a tripod 5 feet above the ground to simulate the average height of the human ear. All sound level measurements were conducted in accordance with ISO (1996).

4.1.2 Meteorology

Information on wind speed, direction, atmospheric pressure, approximate cloud cover percentage, and ambient temperature appear in the raw data sheets contained in Appendix A. All the recorded meteorological data were within normally acceptable levels for environmental noise measurements.

4.1.3 Study Area Description

The existing topography of the study area is relatively flat with a gentle slope from east to west. Under these conditions, noise modeling for predicting future noise impacts will—unless otherwise noted—assume a flat, sound-reflective ground surface offering negligible attenuation.

Because Placer Parkway would have an impact on travel patterns in a fairly large area, a Transportation Analysis Study Area (TASA) was defined for the project's traffic study (DKS Associates, 2007). The TASA was the basis for this Traffic Noise Analysis Technical Memorandum. It extends from Nicolaus Road on the north to I-80 on the south, and from Sierra College Boulevard on the east to west of SR 70/99. The Transportation Analysis Study Area covers portions of eight jurisdictions: Placer County, Sutter County, Sacramento County, the Cities of Roseville, Rocklin, Lincoln and Sacramento, and the Town of Loomis.

4.1.4 Noise Measurements

Existing noise measurements were taken at a variety of locations throughout the study area (Figure 4-1). Actual noise measurement locations were selected according to a number of criteria, including, representation of the overall noise study area, proximity to identified project alternatives, proximity to actual noise sensitive land uses, and available access during the noise measurement period. Results of the short-term measurements appear in Table 4-1. The list below characterizes existing land use, the measurement period and perceived contributions to the aural environment.

Table 4-1
Short-Term Sound Level Measurement Summary

Location Tag	Location Description	Level, dBA-L_{eq}
ST1	5550 West Sunset Boulevard	48.6
ST2	Approximately 1.25 miles west of Industrial Boulevard on Sunset Boulevard West	58.7
ST3	6990 Country Acres Lane	38.3
ST4	4315 Brewer Road	45.7
ST5	The southwestern corner of Sankey and Pleasant Grove Road	63.1
ST6	Vacant land west of 3990 Sankey Road	52.0
ST7	7967 Pleasant Grove Road	54.9
ST8	Access road for agricultural land near Brewer Road	46.3
ST9	6382 Phillips Road	36.9
ST10	Approximately 2,500 feet south of the industrial park on the east side of Pacific Avenue	60.4

ST1. Land uses around this monitoring location are single-family residential to the north, west, and east, with vacant land to the south. Between 9:14 a.m. and 9:29 a.m. on January 25, the 15-minute L_{eq} captured lamb bleats, helicopter overflights, birdsongs, vehicle backup alert beeps, dog barks, jet aircraft overflights, and apparent industrial noise to the south.

ST2. Land uses around this monitoring location are agricultural to the north, with undeveloped land to the south and pastoral land to the west. Beyond this land use is residential, with agricultural land to the east and the Western Regional Sanitary Landfill farther away. The 15-minute L_{eq} for measurement between 9:44 a.m. and 9:59 a.m. on January 25 was 58.7 dBA and included birdsongs, apparent landfill operation processes, helicopter overflights, and vehicular traffic on Sunset Boulevard West and Industrial Boulevard.

ST3. Land uses around this monitoring location comprise single-family residential to the north and east, with areas of undeveloped land to the west. Between 11:11 a.m. and 11:26 a.m. on January 25, the 15-minute L_{eq} was 38.3 dBA and reflected birdsongs, vehicular traffic on Baseline Road, and jet aircraft overflights.

ST4. Land uses around this monitoring location comprise single-family residential to the south, east, and north, with areas of undeveloped land to the west. A 15-minute L_{eq} of 45.7 dBA was measured between 11:51 a.m. and 12:06 p.m. on January 25 and included vocalizing birds, vehicular traffic on Brewer Road, and propeller-equipped aircraft overflights.

ST5. Land uses around this monitoring location comprise single-family residential to the north, south, west, and northeast, with areas of agricultural land to the southeast. The measurements were conducted between 2:36 p.m. and 2:51 p.m. on January 25, recording a 15-minute L_{eq} of 63.1 dBA and including rooster calls, mooing cows, birdsongs, a pinging flagpole, vehicular traffic on Pleasant Grove and Sankey Road, and aircraft overflights.

ST6. Land uses around this monitoring location comprise single-family residential to the south, west, and east, with vacant land to the south and a single-family residential land use approximately 1 mile away. The 15-minute L_{eq} between 3:18 p.m. and 3:33 p.m. on January 25 was 52.0 dBA and captured dog barks, birdsongs, vehicular traffic on Sankey Road and Locust Road, and propeller-equipped aircraft overflights.

ST7. Land uses around this monitoring location comprise agricultural land to the south, with areas of undeveloped land to the east and west. A wood fabrication plant is located 2,000 feet to the east of the monitoring location, with commercial and single-family residential land uses to the north. Between 9:37 a.m. and 9:52 a.m. on January 26, jet aircraft overflights, birdsongs, frog croaks, childplay, helicopter overflights, dog barks and rooster calls contributed to a measured 15-minute L_{eq} of 54.9 dBA.

ST8. Land uses around this monitoring location comprise agricultural land to the east, west, and south, with single-family residential to the north. Noise measurements were conducted between 10:22 a.m. and 10:37 a.m. on January 26, with train whistles, dog barks, vehicular traffic on Brewer Road, frog croaks, and birdsongs influencing the 15-minute L_{eq} measurement of 46.3 dBA.

ST9. Land uses around this monitoring location comprise undeveloped or agricultural to the east, agricultural land to the south and west, and a retention basin to the north. Noise sources during the measurement included jet overflights, vocalizing birds, humming low-voltage overhead power lines, croaking frogs, and propeller-equipped aircraft overflights. The 15-minute L_{eq} between 10:55 a.m. and 11:10 a.m. on January 26 was 36.9 dBA.

ST10. Land uses around this monitoring location comprise industrial land to the north, agricultural land and Riego Road to the south, and agricultural land to the east and west, with SR 70/99 also located to the west. The measurements were conducted between 11:47 a.m. and 12:02 p.m. on January 26. Noise sources during the measurement included birdsongs and vehicular traffic on Pacific Avenue and Riego Road. The 15-minute L_{eq} was 60.4 dBA.

4.2 EXISTING TRAFFIC FLOWS

The Transportation Technical Report for this project includes a list of 107 existing roadway segments and/or locations within the Placer Parkway study area (DKS Associates, 2007). This noise analysis does not include detailed noise measurements or predictions for the majority of these locations in the TASA as they are removed from the locations of the corridor alignment alternatives and therefore are not relevant to the noise analysis as they are too far away from any of the locations of the Parkway alternatives to be substantially affected by Parkway noise. The noise analysis comprised noise measurements taken within the study area and close to the proposed corridor alignment alternatives. Estimated 2005 daily traffic volumes have been used to prepare a qualitative discussion of existing conditions with and without the Parkway, as required by both NEPA and CEQA, and will serve as the basis for comparison with years 2020 and 2040 to help determine potential relative direct and cumulative impacts, respectively.

5.0 POTENTIAL DIRECT IMPACTS

5.1 IMPACT CATEGORIES

In this chapter, two different types of potential noise impacts are discussed: "absolute" noise impacts, where a specific noise level (66 dBA-L_{eq}, for the loudest hour) is expected to be exceeded at noise-sensitive receptors for a particular alternative and design year, and "relative" noise impacts, where noise levels for a specific alternative and design year are expected to increase by a specific amount (12 dBA or more) relative to existing or projected noise conditions in each of the analysis years (i.e., 2004, 2020, and 2040).

In addition to the Caltrans and FHWA loudest-hour absolute impact threshold of 66 dBA, L_{eq}, both Placer and Sutter counties have land use compatibility noise guidelines within their respective general plans (typically 60 dBA, CNEL, for outdoor areas in residential land uses). It is assumed that these guidelines will be taken into consideration during the more detailed Tier 2 analysis as well as the detailed planning/design phase of any future residential developments in the study area.

In accordance with FHWA noise guidelines (FHWA, 1995) and the requirements of CEQA and NEPA, the analysis of potential noise impacts has been conducted within the following framework:

- 2004 existing conditions plus the project.
- 2020 conditions (projected Parkway opening year) compared to existing (2005) conditions for the No-Build Alternative and the build alternatives. This reflects 2020 development levels based on current general plans. Additional details of the development assumptions upon which the 2020 scenario is based are provided in the Transportation Technical Report (DKS Associates, 2007).
- 2040 conditions evaluating the contribution of the Parkway build alternatives to cumulative impacts. This scenario goes beyond SACOG's 2027 development levels to include foreseeable development based on input from local jurisdictions and SACOG's Preferred Blueprint Scenario.

5.1.1 Absolute Impacts

The study area contains existing noise-sensitive receptors that will potentially be directly affected by the completion and subsequent usage of Placer Parkway. Identification of these impacted receptors involves projecting future noise levels from projected traffic volumes on the Parkway using an appropriate model in the context of potential exceedance of regulatory noise thresholds.

5.1.1.1 Model Description

Section 3.1, Acoustics Background, provides a background of common acoustic terms and descriptions. The following subsections specifically discuss the phenomenon of outdoor noise propagation, its application to traffic noise, and the creation of a model suitable for a Tier 1 noise analysis for this project.

Propagation Factors

From the source to the receiver, noise changes both in level and frequency spectrum. The most obvious change is the decrease in noise as the distance from the source increases. The manner in which noise reduces with distance depends on the following factors:

- Geometric spreading from point and line sources
- Ground absorption
- Atmospheric effects and refraction
- Shielding by natural and manmade features, noise barriers, diffraction, and reflection

Sound from a small localized source (approximating a "point" source) radiates uniformly outwards as it travels away from the source in a spherical pattern. The noise level decreases or drops off at a rate of 6 dBA for each doubling of the distance (DD) due to spherical spreading.

However, highway traffic noise is not a single, stationary point source of sound. Vehicle movement makes the source of the sound appear to emanate from a line (line source) rather than a point when viewed over a time interval. Generally, noise levels from a highway decrease at rates of 3 dBA to 4.5 dBA for each doubling of distance from the highway, depending on the type of terrain between the highway and receivers. Terrain located between a noise source and a receiver is assessed as one of two site types in traffic noise models, as follows:

- **Hard Sites**. These are sites with a reflective surface between the source and the receiver, such as parking lots or smooth bodies of water. No excess ground attenuation is assumed in the model for these sites and the changes in noise levels with distance (drop-off rate) are simply 6 dB or 3 dB per DD for point and line sources, respectively.

- **Soft Sites**. These sites have an absorptive ground surface, such as soft dirt, grass, or scattered brushes and trees. An excess ground attenuation value of 1.5 dBA is normally assumed and hence added to the aforementioned "hard" drop-off rates.

Research by the California Department of Transportation and others (Caltrans, 1998b) has shown that atmospheric conditions can have a profound effect on noise levels within 200 feet of a highway. Wind has been shown to be the single most important meteorological factor within approximately 500 feet, and vertical air temperature gradients are more important over longer distances. Other factors such as humidity and turbulence also have significant effects.

Traffic Data Assumptions and Site Geometry

To develop appropriate noise contour predictions for the Parkway alternatives, the analysis employed the following steps:

A. A set of traffic noise propagation cases was defined by dividing each corridor alignment alternative into distinguishable links between proposed interchanges, bridges, and ROW widths.

B. Each link was modeled as a straight section of highway, with features and dimensions corresponding to the conceptual project corridor alignment alternatives.

C. The level of service (LOS) and hourly traffic volumes, percentage of heavy trucks, percentage of buses/medium duty trucks, percentage of remaining vehicles (assumed to autos); posted speeds for each class, and number/configuration of lanes were determined for each analysis year.

D. The flow of traffic was assumed to be half of the total (i.e., half for each direction) and consolidated on the outermost lane of the travel direction.

E. The analysis used the FHWA Traffic Noise Model (TNM) 2.5 to estimate the distance from the centerline of the highway facility to the 66 dBA L_{eq} peak-noise-hour contour assuming the following analysis parameters:

- Flat topography
- No shielding from sound walls or structures
- No roadway gradient
- Highway either at-grade with surroundings with no elevated or depressed segments or at 10-foot or 30-foot elevations depending on water or railroad crossings, respectively.
- "Hard" ground characteristics between the highway and the receptor location.

F. Representative distances were applied to all roadway links with similar characteristics to obtain the distance to the 66 and 60 dBA contour for each link.

G. A Geographic Information System (GIS) was used to create 66 dBA contour maps for 2020 and 2040. These contours were extended on both sides of each corridor alignment alternative to define a "potential noise impact area."

H. The estimated total number of receptors within the noise contours (single-family dwellings, multi-family dwelling units, parks, and schools) was calculated. Receptors that would likely be acquired and removed as a result of the Parkway were excluded from the analysis.

It was assumed that the traffic volumes that would be associated with the interchange ramps for the Parkway alternatives (on-ramps and off-ramps) would not make a significant contribution to the noise contours in the vicinity of the interchanges. This assumption reflects the lower traffic volumes and speeds of ramp traffic generally, which generate much less noise than the mainline highway traffic. As a result, interchange ramps were not taken into account for this Tier 1 study. However, during the subsequent Tier 2 study, interchange ramps will be modeled separately.

5.1.1.2 Predicted Noise Contours

The tables in Appendix B present the input data that TNM used to model future Parkway traffic noise and calculate both the 60 dBA 1-hour L_{eq} and the 66 dBA peak-hour L_{eq} distances from the conceptual median centerline. The generation of graphical contour maps appearing on the figures in this report applied an additional buffer to these distances that allows for flexibility in the ultimate location of the roadway outer boundaries with respect to the ROW boundaries. In other words, the median centerline and ROW centerline may or may not be collinear. These 66 dBA contours, which were superimposed on the study area, provided the following:

1. Counts of existing single-family residences that could experience 66 dBA or greater highway traffic noise (a.k.a., an "absolute" impact, which does not consider the contribution of the existing ambient background sound environment).

2. Identification of "overlap" where planned and/or proposed residential developments will have some portion of their acreage experiencing 66 dBA or higher traffic noise from the Parkway. These impacts are considered in the 2020 impact analysis and the cumulative impacts chapter of this report (see Chapter 7). The degree and extent of this traffic noise impact on future residential developments will be addressed more fully in the Tier 2 study, which will include consideration of Placer Parkway traffic sound mitigation techniques (see Chapter 10, Analyses to be Undertaken in Tier 2).

In addition to the impacts of the Parkway traffic and its associated noise on existing and future residential receptors in the study area, potential noise impacts associated with increased traffic on roads that link to the Parkway are also discussed at a Tier 1 level in the subsequent section.

5.1.2 Relative Impacts

The Parkway traffic analysis estimates existing (2004) daily traffic volumes for 107 road segments in and around the study area (DKS Associates, 2007). As traffic volumes on Placer Parkway and other area roadways increase with the passing years, the associated sound levels will also increase.

Although the construction of the Parkway within one of the five corridor alternatives may reduce these future traffic volumes on many study area roadways when compared to the No-Build Alternative, the future traffic volumes on the majority of these 107 road segments are still going to be greater than 2005 levels. In many cases, the traffic volume at least doubles. By treating traffic flow as a collection of individual sources having, on average, the same sound contribution, acoustic theory tells us that a doubling of identical sources causes a logarithmic increase of 3 dB—considered, as industry-accepted research tells us, a perceptible change to the human ear (Bolt et al., 1973). The same studies indicate that a healthy human ear perceives a 10 dB change as a "doubling" of loudness. Furthermore, as already noted in Chapter 3, a difference of 12 dB or more is considered significant by Caltrans policy (Caltrans, 1998a).

Therefore, in addition to reporting the receptor-specific (i.e., existing residences) and non-specific (i.e., development land overlap) absolute impacts, the following noise impact presentations for the No-Build Alternative and the five build alternatives also discuss relative impacts based on a comparison of estimates for 2004 traffic flows and projected daily traffic volumes for 2020 as they appear in the project's transportation analysis report (DKS Associates, 2007).

5.2 2004 EXISTING PLUS PROJECT CONDITIONS

The Caltrans Traffic Noise Analysis Protocol (2006) requires the evaluation of noise impacts in the context of existing noise levels. As appropriate for a Tier 1 EIS/EIR, and the conditions in the study area, it was determined that "existing plus" project conditions would be evaluated at a qualitative level based on the findings of the Parkway transportation analysis.

- The study area is expected to experience substantial growth in the next 20 to 40 years. This growth will change much of the area from its present rural condition to a developed area. Along with that growth, additional roadways will be constructed to serve future traffic.

- The Parkway is not expected to be operational until 2020. Because of the 15 or so years between 2004 and project operation, current conditions do not reflect the 2020 conditions.

Sections 5.4, Comparison of Alternatives, and Chapter 7, Cumulative Impacts provide a quantitative noise analysis of the project alternatives under 2020 (Opening Year) and 2040 (cumulative) conditions, respectively. As shown in these sections, the future Placer Parkway would affect noise levels near existing roadways in a broad area covering south and west Placer County, south Sutter County, and north Sacramento County. Although some roadway segments near the proposed interchanges along the proposed project would experience increases in traffic volumes and noise levels due to Placer Parkway, a larger number of roadway segments would experience decreases in traffic volumes and noise levels with the Parkway in place.

The project's traffic report concluded that under existing plus project conditions, the project alternatives would result in similar changes in travel patterns in the TASA as those identified for 2020 conditions (described in the following section). While similar, the magnitude of change in travel patterns is less than the 2020 scenario, if the project were added to existing conditions. With respect to noise impacts, therefore, the project alternatives would:

- Increase noise levels for some roadway segments near proposed interchanges along the proposed project. These increases would likely be less than those under 2020 conditions.
- Result in decreases in noise levels near a larger number of local roadway segments in south Sutter County and southwestern Placer County. These decreases would likely be less than those under 2020 conditions.

5.3 2020 IMPACT ANALYSIS

The 66 dBA contour maps illustrate the potential absolute impacts, while Table 5-1 shows the existing and projected future roadway segments in the TASA that are anticipated to experience relative impacts of 3 dB or more. The relative impacts would be considered potentially significant if they exceed existing noise levels by 12 L_{eq} hourly (dBA) in the vicinity of sensitive receptors.

Table 5-1
Relative Impacts for Existing/Future Roadways (2020)

DKS Tag	Roadway	Segment	2005 Daily Traffic Vol.	Estimated 2020 Daily Traffic Volumes						Projected Relative Decibel (dBA) Increases in Traffic Noise from 2005 to 2020					
				No Build	Alt. 1	Alt. 2	Alt. 3	Alt. 4	Alt. 5	No Build	Alt. 1	Alt. 2	Alt. 3	Alt. 4	Alt. 5

5.3.1 No-Build Alternative

Under the No-Build Alternative, land for the construction of Placer Parkway would not be acquired and the Parkway would not be constructed. There would not be any noise impacts under the No-Build Alternative.

5.3.1.1 No-Build Alternative – Western Segment

Number of Existing Roadways Experiencing Relative Noise Increases. The other area roadways identified in the project's traffic report within the Western Segment of the study area that, by 2020, would experience a 3 dB or greater increase in noise relative to existing levels attributable to higher traffic volume are as follows (identified by the DKS tag number on Table 5-1): 34, 45, 70, 71, 75, and 76. None of these is expected to experience a relative noise increase equal to or greater than 12 dB.

5.3.1.2 No-Build Alternative – Central Segment

Number of Existing Roadways Experiencing Relative Noise Increases. The other area roadways within the Central Segment of the study area that, by 2020, would experience a 3 dB or greater increase in noise relative to existing levels attributable to higher traffic volume are as follows: 22, 31, 35, 46 through 52, 65, 84, 86, 90, and 107 (as defined in Table 5-1). Of these, #107 (18th Street, north of Elverta Road) is expected to experience a relative noise increase greater than 12 dBA.

5.3.1.3 No-Build Alternative – Eastern Segment

Number of Existing Roadways Experiencing Relative Noise Increases. The list of other area roadways within the Eastern Segment of the study area that, by 2020, would experience a 3 dB or greater increase in noise relative to existing levels attributed to higher traffic volume are as follows: 6 through 8, 25, 29, 53, 54, 58, 59, 63, 67, 77 through 79, 81 through 83, 87, 88 and 104 (as defined in Table 5-1). None of these is expected to experience a relative noise increase equal to or greater than 12 dB.

5.3.2 Alternative 1 – the Red Alternative

Figure 5-1 presents the projected 66 dBA noise contour under Alternative 1.

5.3.2.1 Western Segment

The Western Segment of Alternative 1 is located entirely within Sutter County. The total length of this segment is approximately 15,300 feet along the centerline of the corridor. Two or three interchanges would be included along this segment, as shown on Figure 2-1.

Number of Absolute Noise Impacts at Existing Noise Sensitive Receptors. The estimated quantity of noise-impacted existing (2004) single-family residences associated with this segment is zero (from data in Table 5-2). If new sensitive receptors are constructed within the 66 dBA contour lines identified on Figure 5-1, they would be affected by the Parkway under Alternative 1.

Number of Existing Roadways Experiencing Relative Noise Increases. The other area roadways within the Western Segment of the study area that, by 2020, would experience a 3 dB or greater increase in noise relative to existing levels attributed to higher traffic volume are as follows: 4, 34, 45, 70, 71, 75, and 76 (as defined in Table 5-1). None of these is expected to experience a relative noise increase equal to or greater than 12 dB.

Table 5-2
Placer Parkway Absolute Noise Impact Summary (2020)

Alternative	Homes Within Proposed ROW[1]				Impacted Residential Units by Segment (2020)			
	Western	Central	Eastern	Total	Western	Central	Eastern	Total
1	0	5	1	6	0	0	0	0
2	0	5	1	6	0	2	0	2
3	0	3	1	4	0	2	0	2
4	2	3	1	6	0	0	0	0
5	2	5	1	8	0	1	0	1

Note:

1. Homes within proposed ROW are units that are currently within the identified right-of-way for the given proposed alternative/segment. Impacted units for given year 2020 are for existing units that are within the 66 dBA loudest hour contour for that alternative/segment but outside of the identified right-of-way for the given alternative/segment.

5.3.2.2 Alternative 1 – Central Segment

The Central Segment for Alternative 1 is located in Sutter and Placer counties. The total length of this segment is approximately 40,600 feet along the centerline of the corridor. No interchanges are proposed along this segment.

Number of Absolute Noise Impacts at Existing Noise Sensitive Receptors. The estimated quantity of noise-impacted existing (2004) single-family residences associated with this segment is zero (see Table 5-2). If new sensitive receptors are constructed within the 66 dBA contour lines identified on Figure 5-1, they would be affected by the Parkway under Alternative 1.

Number of Existing Roadways Experiencing Relative Noise Increases. The other area roadways within the Central Segment of the study area that, by 2020, would experience a 3 dB or greater increase in noise attributed to higher traffic volume are as follows: 22, 32, 35, 37, 38, 46 through 52, 65, 90, and 107 (as defined in Table 5-1). Of these, the last (18th Street, north of Elverta Road) is expected to experience a relative noise increase greater than 12 dB.

5.3.2.3 Alternative 1 – Eastern Segment

All of the Eastern Segment of Alternative 1 is within Placer County. The total length of this segment is approximately 29,600 feet measured along the centerline of the corridor. Three interchanges would be included along this segment as shown on Figure 2-1.

Number of Absolute Noise Impacts at Existing Noise Sensitive Receptors. The estimated quantity of noise-impacted existing single-family residences associated with this segment is zero (see Table 5-2). If new sensitive receptors are constructed within the 66 dBA contour lines identified on Figure 5-1, they would be affected by the Parkway under Alternative 1.

Number of Existing Roadways Experiencing Relative Noise Increases. The other area roadways within the Eastern Segment of the study area that, by 2020, would experience a 3 dB or greater increase in noise attributed to higher traffic volume are as follows: 6 through 8, 25, 29, 53, 54, 58, 59, 63, 67, 77 through 79, 81 through 83, 92, and 93 (as defined in Table 5-1). None of these is expected to experience a relative noise increase equal to or greater than 12 dB.

5.3.3 Alternative 2 – the Orange Alternative

Figure 5-2 presents the projected 66 dBA noise contour under Alternative 2.

5.3.3.1 Alternative 2 – Western Segment

The Western Segment of Alternative 2 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.3.3.2 Alternative 2 – Central Segment

The Central Segment for Alternative 2 is located in Sutter and Placer counties. The total length of this segment is approximately 36,400 feet along the centerline of the corridor. There are no interchanges along this segment.

Number of Absolute Noise Impacts at Existing Noise Sensitive Receptors. The estimated quantity of noise-impacted existing single-family residences associated with this segment is two (from data in Table 5-2). If new sensitive receptors are constructed within the 66 dBA contour lines identified on Figure 5-2, they would be impacted by the Parkway under Alternative 2.

Number of Existing Roadways Experiencing Relative Noise Increases. The other area roadways within the Central Segment of the study area that, by 2020, would experience a 3 dB or greater increase in noise attributed to higher traffic volume are as follows: 22, 32, 35, 37, 38, 46 through 52, 65, 90, and 107 (as defined in Table 5-1). Of these, the last (18th Street, north of Elverta Road) is expected to experience a relative noise increase greater than 12 dB.

5.3.3.3 Alternative 2 – Eastern Segment

The Eastern Segment of Alternative 2 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.3.4 Alternative 3 – the Blue Alternative

Figure 5-3 presents the projected 66 dBA noise contour under Alternative 3.

5.3.4.1 Alternative 3 – Western Segment

The Western Segment of Alternative 3 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.3.4.2 Alternative 3 – Central Segment

The Central Segment for Alternative 3 is located in Sutter and Placer counties. The total length of this segment is approximately 38,000 feet along the centerline of the corridor. No interchanges are planned along this segment.

Number of Absolute Noise Impacts at Existing Noise Sensitive Receptors. The estimated quantity of noise-impacted existing single-family residences associated with this segment is two (see Table 5-2). If new sensitive receptors are constructed within the 66 dBA contour lines identified on Figure 5-3, they would be affected by the Parkway under Alternative 3.

Number of Existing Roadways Experiencing Relative Noise Increases. The other area roadways within the Central Segment of the study area that, by 2020, would experience a 3 dB or greater increase in

noise attributed to higher traffic volume are as follows: 22, 32, 35, 37, 38, 46 through 52, 65, 90, and 107 (as defined in Table 5-1). Of these, the last (18th Street, north of Elverta Road) is expected to experience a relative noise increase greater than 12 dB.

5.3.4.3 Alternative 3 – Eastern Segment

The Eastern Segment of Alternative 3 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.3.5 Alternative 4 – the Yellow Alternative

Figure 5-4 presents the projected 66 dBA noise contour under Alternative 4.

5.3.5.1 Alternative 4 – Western Segment

The total length of this segment is approximately 15,300 feet along the centerline of the corridor. Two interchanges would be included along this segment, as shown on Figure 2-1. In addition, this segment includes the realignment of Sankey Road.

Number of Absolute Noise Impacts at Existing Noise Sensitive Receptors. The estimated quantity of noise-impacted existing single-family residences associated with this segment is zero (see Table 5-2). If new sensitive receptors are constructed within the 66 dBA contour lines identified on Figure 5-4, they would be affected by the Parkway under Alternative 4.

Number of Existing Roadways Experiencing Relative Noise Increases. The other area roadways within the Western Segment of the study area that, by 2020, would experience a 3 dB or greater increase in noise attributed to higher traffic volume are as follows: 4, 34, 45, 70, 71, and 76 (as defined in Table 5-1). None of these is expected to experience a relative noise increase equal to or greater than 12 dB.

5.3.5.2 Alternative 4 – Central Segment

The Central Segment for Alternative 4 is located in Sutter and Placer counties. The total length of this segment is approximately 30,600 feet along the centerline of the corridor. There are no interchanges along this segment.

Number of Absolute Noise Impacts at Existing Noise Sensitive Receptors. The estimated quantity of noise-impacted existing single-family residences associated with this segment is zero (see Table 5-2). If new sensitive receptors are constructed within the 66 dBA contour lines identified on Figure 5-4, they would be affected by the Parkway under Alternative 4.

Number of Existing Roadways Experiencing Relative Noise Increases. The other area roadways within the Central Segment of the study area that, by 2020, would experience a 3 dB or greater increase in noise attributed to higher traffic volume are as follows: 22, 32, 35, 38, 46 through 52, 65, 90, and 107 (as defined in Table 5-1). Of these, the last (18th Street, north of Elverta Road) is expected to experience a relative noise increase greater than 12 dB.

5.3.5.3 Alternative 4 – Eastern Segment

The Eastern Segment of Alternative 4 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.3.6 Alternative 5 – the Green Alternative

Figure 5-5 presents the projected 66 dBA noise contour under Alternative 5.

5.3.6.1 Alternative 5 – Western Segment

The Western Segment of Alternative 5 is the same as that for Alternative 4. Therefore, the potential impacts for this segment are the same as discussed for Alternative 4.

5.3.6.2 Alternative 5 – Central Segment

The Central Segment for Alternative 5 is located within Sutter and Placer counties. The total length of this segment is approximately 30,500 feet along the centerline of the corridor. There are no interchanges along this segment.

Number of Absolute Noise Impacts at Existing Noise Sensitive Receptors. The estimated quantity of noise-impacted existing single-family residences associated with this segment is one (see Table 5-2). If new sensitive receptors are constructed within the 66 dBA contour lines identified on Figure 5-5, they would be affected by the Parkway under Alternative 5.

Number of Existing Roadways Experiencing Relative Noise Increases. The list of other area roadways within the Central Segment of the study area that, by 2020, would experience a 3 dB or greater increase in noise attributed to higher traffic volume are as follows: 22, 32, 35, 38, 46 through 52, 65, 90, and 107 (as defined in Table 5-1). Of these, the last (18th Street, north of Elverta Road) is expected to experience a relative noise increase greater than 12 dB.

5.3.6.3 Alternative 5 – Eastern Segment

The Eastern Segment of Alternative 5 is the same as that for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.4 COMPARISON OF ALTERNATIVES

Absolute impacts for the five build alternatives are summarized in Table 5-2. The No-Build Alternative is not shown in Table 5-2 because no absolute impacts would be associated with this alternative.

Figures 5-1 through 5-5 illustrate the overlaps of 66 dBA contours for all build alternatives with respect to planned developments (see Section 5.1) within the TASA expected to be partially or fully built-out by 2020. In 2020, residential land uses within the approved West Roseville Specific Plan area are expected to be built-out. There is an open space buffer within the western edge of this Plan area, and absolute noise impacts are therefore not expected under any of the build alternatives. No sensitive receptors are planned within the City of Roseville Retention Basin, except for potential users of a trail that could pass under the Parkway overcrossing of Pleasant Grove Creek. Therefore, under the 2020 condition, no additional absolute noise impacts are anticipated.

Relative impacts related to the existing roadways in the study area are summarized in Table 5-1. In this case, the No-Build Alternative is shown for comparison purposes. For the same reason as for absolute impacts, under the 2020 condition, no additional relative impacts are anticipated.

Table 5-3 shows a comparison of all five alternatives for both absolute and relative noise impacts for design year 2020. Also shown is a combined ranking for each alternative with respect to combined noise impacts.

Table 5-3
Noise Impact Ranking by Alternative (2020)

Alternative	Absolute Impacts[a]	Relative Impacts[b]	Ranking[c]
No Build	0	1	1
1	0	1	1
2	2	1	5
3	2	1	5
4	0	1	1
5	1	1	4

Notes:

a. Number of residences.
b. Number of roadways with projected increases in traffic noise > 12 dBA.
c. A ranking of 1 indicates that an alternative has the fewest projected combined impacts; A ranking of 5 — the most.

6.0 SECONDARY AND INDIRECT IMPACTS

Recent FHWA, U.S. EPA, and Caltrans guidance on growth inducement (Mare Island Accord, 2006) advises that analysis of potential impacts associated with growth should include an evaluation of the effects of growth on resources of concern. The following discussion presents a qualitative evaluation of potential secondary and indirect impacts of Anticipated Growth (see below for definition) on human and environmental resources in the study area.

The Council on Environmental Quality (CEQ) provided clarification of the terminology "indirect impacts" when it issued its NEPA regulation in 1978. Secondary and indirect impacts are defined as impacts "caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable." Moreover, indirect effects ". . . may include growth-inducing effects and other effects related to induce changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems."

A key term used in this section is "Anticipated Growth." This is defined as the growth that is anticipated in the study area as described in the relevant General Plans and adopted regional forecasts, such as the SACOG Blueprint scenario (as detailed in the Community Impact Assessment [Mara Feeney & Associates and North Fork Associates, 2006]), including additional growth that may occur as a result of major new development proposals that have not yet been formally approved. It is possible that this additional growth may accelerate the rate of buildout in the study area, but it is not ultimately expected to result in any greater levels of development than are presented in adopted regional forecasts.

The following secondary and indirect discussion considers impacts that may occur as a result of anticipated growth, leading to additional increases in traffic volumes and associated noise. The study area for the analysis of secondary and indirect impacts for noise is shown on Figure 6-1.

6.1 GROWTH INDUCEMENT SCENARIO

NEPA and CEQA both require environmental analyses to consider the effects of a project on growth. Caltrans defines growth inducement as the relationship between a proposed project and growth. This section summarizes the relationship between the Placer Parkway Corridor Preservation project and regional growth, and discusses potential secondary and indirect effects of the project related to growth inducement.

While the study area is predominantly undeveloped at this time, parts of the study area are within local General Plan designations allowing urban growth. In addition, numerous proposals for major new development projects in and around the study area are depicted on Figure 6-2 that are currently in various stages of the approval and entitlement process. Portions of the surrounding area (especially northern Sacramento County and southwestern Placer County) have developed very rapidly over the past several decades. This has occurred as a result of many factors, including continuing net population growth statewide, strong employment growth in the Sacramento region, relative housing affordability, and location amenities.

Population and employment growth projections for California and the Sacramento Region in general, and for southwestern Placer County and south Sutter County in particular (described in detail in the Tier 1 EIS/EIR Community Impact Assessment), indicate that that development pressures in the project vicinity will remain relatively intense, irrespective of the Placer Parkway project. Between 1950 and 2000, the California population more than tripled. During the same period, population in the six-county SACOG region increased by more than 800 percent (DOF, 2006). Projections and established goals and policies from a wide range of sources, including SACOG, Placer, Sacramento and Sutter counties, and the Cities

of Roseville, Rocklin and Lincoln, confirm that relatively high rates of population and employment growth and housing and commercial development are anticipated in the six-county region by 2050. Between 2000 and 2050, California's population is expected to increase from approximately 34 million to 55 million. During the same time period, SACOG projects that the region's growth will double, from 1.9 million in 2000 to 3.95 million in 2050, with the Roseville-Rocklin-Lincoln area remaining one of the fastest growing areas in the region (Levy and Doche-Boulos, 2005; SACOG, 2006).

Placer Parkway would be growth inducing because it would help support changes in the amount of growth beyond current general plan levels, and could influence the pace and location of some development. It is likely that Placer Parkway could help to implement the various specific development proposals in the study area, since it would serve to relieve traffic congestion associated with these proposals. Furthermore, the Parkway could affect the timing of development in the vicinity of the proposed interchange locations, particularly those proposed near vacant land adjacent to rapidly developing areas or areas now proposed for urban development. It could result in different land uses, or more intensive land uses, in the vicinity of interchanges where land use plans are still being developed and have not yet been approved. Also, it could hasten the buildout of planned commercial and industrial uses, especially in the Sunset Industrial Area and proposed Placer Ranch Specific Plan area, as well as in the Sutter County Sutter Pointe Specific Plan.

In the longer term, improved access provided to lands in the Western and Eastern segments could be a factor in stimulating additional growth and development in areas west of SR 70/99 not protected by the Natomas Basin Habitat Conservation Plan, or north of the Sutter Pointe Specific Plan area or north of Sunset Boulevard West in Placer County. Although growth is anticipated in these areas over time (as reflected in SACOG's preferred Blueprint scenario, the Sutter County General Plan, and the City of Lincoln General Plan), such development is not reflected in general plans at present and has not been formally proposed by landowners. By providing improved access to adjacent areas, Placer Parkway could be one of many factors that would encourage growth in these areas sooner than this might otherwise occur.

The factors influencing growth in the region are complex. The Parkway is one of several major urban development proposals in the region. While Placer Parkway would contribute to regional growth, including growth beyond the level identified in current general plans, it is not feasible to quantify the amount of its contribution. A single new transportation facility such as the Parkway is only one of the many factors contributing to regional growth, and it is speculative to assign a particular quantity of growth to any one factor.

Furthermore, several factors serve to limit the likely effect of the Parkway on growth, including the following:

- No interchanges are proposed for any areas that are not already approved or proposed for development;
- All approved and proposed residential development that has not already been built is projected to be built out prior to 2020, when the Parkway is proposed to open; and
- Real estate market pressures in the area have been and continue to be intense without the Parkway, and local government jurisdictions have been supportive of processing development applications in spite of anticipated regional transportation challenges.

It is unlikely that the choice of one Placer Parkway alternative over another would substantially change expected patterns of growth and development in the project study area and the surrounding region. In the Western Segment, all corridor alignment alternatives would provide new access to an area that is currently undeveloped farmland, but that is proposed for mixed use urban development. The three more southerly alignments (Alternatives 1, 2, and 3) would provide two interchanges in the South Sutter Pointe Specific

Plan area, while the more northerly alignments (Alternatives 4 and 5) would provide only one interchange in this area, approximately one mile farther north of the more southerly alignments in the Western Segment. Since none of the alternative alignments would include any intersections in the Central Segment, there would be little difference in growth inducement effects among the alternatives in this segment. In the Eastern Segment, two interchanges are proposed within the existing Sunset Industrial Area Plan area, in an area proposed for the Placer Ranch Specific Plan. While these interchanges would provide new access to a currently undeveloped area, this area is planned for growth. In the Eastern Segment all alternatives would follow an identical alignment, so there would be no differences in growth inducement effects among the alternatives.

A future interchange at Watt Avenue could be growth inducing, because it would provide major new regional access to a portion of the project study area that is currently rural and undeveloped, although both conceptual interchange locations are now surrounded by formal development proposals or land controlled by development interests. A Watt Avenue interchange is not proposed as part of the project.

6.2 SECONDARY AND INDIRECT EFFECT EVALUATION

6.2.1 No-Build Alternative

Under the No-Build Alternative, land would not be acquired for the Parkway and the Parkway would not be constructed. There would not be any secondary or indirect impacts with respect to noise under the No-Build Alternative.

6.2.2 Build Alternatives

Upon completion, Placer Parkway would potentially serve as a major thoroughfare for the proposed developments in the area such as Placer Ranch Specific Plan, Brookfield Property, Creekview Specific Plan, City of Roseville Retention Basin, Curry Creek Community Plan, Regional University Specific Plan, West Roseville Specific Plan, Sierra Vista Specific Plan, Placer Vineyards Specific Plan, and Sutter Pointe Specific Plan. The operation of Placer Parkway may expedite the aforementioned proposed developments and potentially create a trend to develop other nearby vacant parcels of land to supplement the current proposed developments (e.g., storage facility, shipping and distribution facilities, automobile dealership) including changing existing businesses to better fit the needs of the area. The additional growth would have to be analyzed for air quality impacts and a determination made whether the growth is consistent with Placer and Sutter Counties' General Plan and is feasible with the proposed developments.

The anticipated growth that would be expected to occur as a result of Placer Parkway could result in secondary and indirect impacts associated with noise. Anticipated growth would be expected to generate additional traffic in the study area that would most likely not have occurred in the absence of such growth. Increased traffic volumes could adversely affect noise, particularly if this results in traffic traveling at higher speeds within the study area. Although precise impacts on future receptors cannot be predicted, it is reasonable to assume that new developments that would be present in the study area in the future could be affected by noise. Secondary and indirect impacts could include the following:

- Increase in overall ambient noise such that any increase in noise might be significant (resulting in a reduction in available increment for future projects in the area);
- Increased risk of reduced quality of life, and associated adverse health effects on residences, business and facilities located in areas affected by increased noise levels; and

- Impacts on noise-sensitive wildlife, such as birds, mammals, and reptiles. Impacts are also possible on species that are sensitive to noise, and noise-related disturbance, at particular stages of their life cycle, such as during nesting and other breeding activities.

Further analysis of potential secondary and indirect impacts on noise will be performed during the Tier 2 EIS/EIR for Placer Parkway.

7.0 CUMULATIVE IMPACTS

7.1 CUMULATIVE IMPACT SCENARIO

Analysis of cumulative impacts is required under NEPA and CEQA. Cumulative impacts result when the effects of an action are added to or interact with other effects in a particular place and within a particular time. It is the combination of these effects, and any resulting environmental degradation, that should be the focus of cumulative impact analysis. The CEQ's regulations (CEQ, 1987) explicitly state that cumulative impacts must be evaluated along with the direct and indirect effects of each alternative.

FHWA has requested that cumulative conditions for the analysis of project alternatives in the EIS/EIR for Placer Parkway be based on development levels that are 20 years beyond the projected opening of the Parkway. For planning purposes, Placer County Transportation Planning Agency has identified 2020 as the opening year of the Parkway. Cumulative impacts are therefore being evaluated for the year 2040. This 2040 scenario includes the following projects (see Figure 6-2).

- Full build-out of all residential land in Placer County west of Sierra College Boulevard, including current general plan areas and the following major development proposals in West Placer County:
  - The Creekview and Sierra Vista Specific Plan areas in Roseville's Memorandum of Understanding (MOU) Remainder area
  - The Sphere of Influence expansion areas of Lincoln
  - The Placer Vineyards, the Regional University, Placer Ranch Specific Plan areas in unincorporated Placer County
  - The Curry Creek Community Plan area
- Growth in retail employment in Placer County that balances the growth in residential development by matching SACOG's countywide estimate of about 0.32 employee per dwelling unit from their 2025 forecasts.
- Growth in total employment levels in Placer County that balances the growth in residential development by matching SACOG's 1.3 employees per dwelling unit from their 2025 forecasts.
- Full build-out of the residential development in the proposed South Sutter Pointe Specific Plan along with a non-residential development level that balances the residential development in that area.
- Estimated 2040 developments in all other portions of SACOG's six-county region based on assuming a constant rate for the development growth between 2005 levels and the 2050 Preferred Blueprint scenario for each of SACOG's traffic analysis zones (TAZs).

Cumulative impacts are described below.

7.2 CUMULATIVE IMPACT EVALUATION

7.2.1 2040 Noise-Sensitive Receptors

The predicted 66 dBA noise contours in 2040 for Alternatives 1 through 5 are shown on Figures 7-1 through 7-5, respectively. There would not be absolute noise impacts for the No-Build Alternative because the Parkway would not be constructed under the No-Build Alternative.

Table 7-1 summarizes absolute impacts on residential units existing as of 2005 for the build alternatives with respect to 2040. Homes within the proposed ROW are similar to 2020, because the land use changes associated with most of the proposed development are not known. The number of impacted residential units in 2040 will be greater than in 2020 because, as traffic volumes increase, the 66 dBA contour expands relative to the 2020 contour. Residential units built after 2005 may also be affected. This issue is addressed in Section 7.2.2.

Table 7-1
Cumulative Absolute Noise Impact Summary (2040)

	Homes Within Proposed ROW[a]				Impacted Residential Units by Segment (2040)			
Alternative	Western	Central	Eastern	Total	Western	Central	Eastern	Total
1	0	5	1	6	0	4	0	4
2	0	5	1	6	0	4	0	4
3	0	3	1	4	0	5	0	5
4	2	3	1	6	5	3	0	8
5	2	5	1	8	5	2	0	7

Note:

a. Homes within proposed ROW are units that are currently within the identified right-of-way for the given proposed alternative/segment. Impacted units for given year 2040 are for existing units that are within the 66 dBA loudest hour contour for that alternative/segment but outside of the identified right-of-way for the given alternative/segment.

7.2.2 Future Residential Developments

Figures 7-1 through 7-5 illustrate the overlaps of 66 dBA contours for all build alternatives with respect to planned developments within the TASA expected to be partially or fully built-out by 2040. As discussed in Section 5.1.1.2, these 66 dBA noise contours based on a TNM model of future traffic volumes create geographical zones for each alternative that overlap acreage planned for development. Although a review of Figures 7-1 through 7-5 might suggest that one corridor alignment alternative may demonstrate less absolute noise impact than the others, it is not possible to make such comparisons until specific detailed plans in these future developments are known. The specific detailed plans would identify the locations of residences and other noise-sensitive receptors and would count them, as was done for Table 7-1. Design details for land use plans for proposed development are not yet finalized and will have a significant influence over the type and amount of future noise impacts in these areas. Therefore, this analysis is general in nature.

Coordination with jurisdictions which are processing the applications for proposed development has provided some idea of the location where such potential impacts may occur for some developments. Sutter Pointe Specific Plan applicants and Sutter County are planning residential land uses in the south and predominantly industrial/commercial land uses in the north. There are no land use plans for the Curry Creek Community Plan as yet. The Sierra Vista and Creekview Specific Plans have not finalized their roadway network or their land use plans. The Regional University Specific Plan is underway; residential development is planned in the eastern portion of the Plan area. There is an open space buffer within the western edge of the West Roseville Specific Plan area, and absolute noise impacts are therefore not expected under any of the build alternatives. No sensitive receptors are planned within the City of Roseville Retention Basin. No land use plan has been identified for the Brookfield property. Placer County and the Placer Ranch Specific Plan applicant have been working cooperatively to reserve ROW for a future Parkway within the proposed Placer Ranch Specific Plan area, since all Parkway alternatives cross through the Placer Ranch Specific Plan area in the same location. Although it is not certain that currently proposed land uses will be approved, this is the best current information upon which to base a projected evaluation of potential absolute noise impacts of the Parkway's build alternatives in 2040.

The following narrative addresses each alternative, identifying which planned and/or proposed developments experience some degree of overlap with the projected 2040 66 dBA contour.

7.2.2.1 Alternative 1

The Alternative 1 66 dBA contour in 2040 would overlap with areas of the Sutter Pointe Specific Plan, the Curry Creek Community Plan (both northern and southern regions), the Sierra Vista Specific Plan area, the Regional University Specific Plan, the West Roseville Specific Plan, the Creekview Specific Plan, the Brookfield property and the Placer Ranch Specific Plan. Based on current information, Alternative 1 would potentially result in absolute noise impacts on the Sutter Pointe Specific Plan area and the Regional University Specific Plan area. Impacts to other development areas are unknown.

7.2.2.2 Alternative 2

The Alternative 2 66 dBA contour in 2040 would overlap with areas of the Sutter Pointe Specific Plan, the Curry Creek Community Plan (both northern and southern regions), the Regional University Specific Plan, the West Roseville Specific Plan, the Creekview Specific Plan, the Brookfield property and the Placer Ranch Specific Plan. Based on current information, Alternative 2 would potentially result in absolute noise impacts on the Sutter Pointe Specific Plan area and the Regional University Specific Plan area. Potential impacts on the Regional University Specific Plan area would be more severe than that under Alternative 1 or any other alternative. There would be no potential impacts on the Sierra Vista Specific Plan area. Impacts to other development areas are unknown.

7.2.2.3 Alternative 3

The Alternative 3 66 dBA contour in 2040 would overlap with areas of the Sutter Pointe Specific Plan, the Curry Creek Community Plan (only northern region), the Regional University Specific Plan, the Creekview Specific Plan, the Brookfield property and the Placer Ranch Specific Plan. Based on current information, Alternative 3 would potentially result in absolute noise impacts on the Sutter Pointe Specific Plan area and the Regional University Specific Plan area. Potential impacts on the Regional University Specific Plan area would be limited to a small area on the northern Plan Area boundary. There would be no potential impacts on the West Roseville Specific Plan area or the Sierra Vista Specific Plan area. Impacts to other development areas are unknown.

7.2.2.4 Alternative 4

The Alternative 4 66 dBA contour in 2040 would overlap with areas of the Sutter Pointe Specific Plan, the Curry Creek Community Plan (only northern region), the Regional University Specific Plan, the Creekview Specific Plan, the Brookfield property, and the Placer Ranch Specific Plan. Based on current information, Alternative 4 would not likely result in impacts to the Sutter Pointe Specific Plan area since industrial and commercial uses are planned in the area of overlap with this alternative. Alternative 4 would result in the same potentially limited impacts to the Regional University Specific Plan area as under Alternative 3. There would be no potential impacts on the West Roseville Specific Plan area or the Sierra Vista Specific Plan area. Impacts to other development areas are unknown.

7.2.2.5 Alternative 5

The Alternative 4 66 dBA contour in 2040 would overlap with areas of the Sutter Pointe Specific Plan, the Creekview Specific Plan, the Brookfield property, and the Placer Ranch Specific Plan. Based on current information, Alternative 5 would not likely result in impacts to the Sutter Pointe Specific Plan since industrial and commercial uses are planned in the area of overlap with this alternative. There would be no potential impacts on the Curry Creek Community Plan area, the Regional University Specific Plan area, the West Roseville Specific Plan area or the Sierra Vista Specific Plan area. Impacts to other development areas are unknown.

Sutter Pointe Specific Plan

Good planning within future development could involve location of noise-sensitive receptors (e.g., residences) far enough away from the overlap zones depicted on Figures 7-1 through 7-5 and listed in Table 7-1. This potential strategy is discussed in Chapter 9.

7.2.3 Relative Impacts on Future Roadways

Relative impacts related to the existing and projected future roadways in the study area are summarized in Table 7-2. In this case, the No-Build Alternative is shown for comparison purposes.

It appears from Table 7-2 that, similar to 2020, Alternatives 4 and 5 would generate the same number of roadway segments experiencing relative impacts. Although each has a slightly larger quantity of noticeable impacts than the totals for Alternatives 1, 2, and 3, Alternatives 4 and 5 each have one less impact of 12 dBA or greater. Since these significant relative impacts invite closer scrutiny, one might conclude that—on the basis of counts—Alternatives 4 and 5 are quieter or will need less mitigation.

As for absolute impacts, actual relative impacts would also depend on the nature of the land uses ultimately approved for the various planned and proposed developments.

Table 7-2
Cumulative Relative Impact for Existing Roadways (2040)

DKS Tag	Roadway	Segment	2005 Daily Traffic Vol.	Estimated 2040 Daily Traffic Volumes						Projected Relative Decibel (dBA) Increases in Traffic Noise from 2005 to 2040					
				No Build	Alt. 1	Alt. 2	Alt. 3	Alt. 4	Alt. 5	No Build	Alt. 1	Alt. 2	Alt. 3	Alt. 4	Alt. 5

8.0 WATT AVENUE INTERCHANGE

An extension of Watt Avenue to Placer Parkway is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto Placer Parkway via a new interchange. A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this technical report. However, the connection of Placer Parkway to a potential Watt Avenue interchange could affect future travel patterns in the area, including use of the Parkway.

As shown on Figure 2-3, two general locations for a future Watt Avenue interchange were identified through a planning process involving local jurisdictions. Each of these locations was identified for purposes of evaluating potential impacts of such an interchange on a general basis; the actual location of a Watt Avenue interchange could be different, when proposed. Each of the two interchange options influences projected traffic volumes for both the Placer Parkway alternatives and the existing roads in the study area. In both the TNM 2.5 model used to predict absolute impacts and in the logarithmic expression used to derive a relative noise increase for the study area's existing roadways, the physical location of these interchanges and their design or layout is—for this Tier 1 level study—not nearly as acoustically important as the traffic volumes. Hence, although the following discussion will largely resemble that of the "without Watt" study, the reader should note differences in both absolute and relative impacts resulting from the inclusion of the Watt Avenue interchange.

8.1 2020 IMPACT ANALYSIS WITH WATT AVENUE INTERCHANGE

The predicted 66 dBA noise contours in 2020 for Alternatives 1 (Options One and Two) through Alternative 5 with the Watt Avenue interchange are shown on Figures 8-1 through 8-6, respectively.

Absolute impacts with respect to residential units existing as of 2005 for the five build alternatives are summarized in Table 8-1. Residential units built after 2005 may also be affected in a manner similar to that described in Chapter 7. The No-Build Alternative is not shown in Table 8-1 because no impacts would be associated with this alternative.

Table 8-1
Placer Parkway Absolute Noise Impact Summary,
with Watt Avenue Interchange (2020)

	Homes Within Proposed ROW[a]				Impacted Residential Units by Segment (2020)			
Alternative	**Western**	**Central**	**Eastern**	**Total**	**Western**	**Central**	**Eastern**	**Total**
1, Option One	0	5	1	6	0	2	0	2
1, Option Two	0	5	1	6	0	3	0	3
2	0	5	1	6	0	3	0	3
3	0	3	1	4	0	3	0	3
4	2	3	1	6	2	1	0	3
5	2	5	1	8	0	2	0	7

Note:

a. Homes within proposed ROW are units that are currently within the identified right-of-way for the given proposed alternative/segment. Impacted units for given year 2020 are for existing units that are within the 66 dBA loudest hour contour for that alternative/segment but outside of the identified right-of-way for the given alternative/segment.

Unless appropriate mitigation is in place, new residential units in the overlap zones could therefore experience absolute impacts and be quantified in a manner similar to that shown in Table 8-1.

Relative impacts related to the existing roadways in the study area are summarized in Table 8-2. In this case, the No-Build Alternative is shown for comparison purposes.

Table 8-2
Relative Impacts for Existing Roadways, with Watt Avenue Interchange (2020)

DKS Tag	Roadway	Segment	2005 Daily Traffic Vol.	Estimated 2020 Daily Traffic Volumes (with potential Watt Interchange)							Projected Relative Decibel (dBA) Increases in Traffic Noise from 2005 to 2020

Based on counts of roadway segments expected to experience relative impacts, Alternative 4 narrowly bests Alternative 5 by just one noticeable difference. Aside from that, Alternatives 4 and 5 would appear to create less relative acoustical impact on the study area's existing roadways than the remaining three build alternatives or the No-Build Alternative.

8.2 2040 IMPACT ANALYSIS WITH WATT AVENUE INTERCHANGE

8.2.1 Existing Noise-Sensitive Receptors

An evaluation of cumulative impacts for noise considers again both absolute and relative impacts that correspond to the Placer Parkway 66 dBA contours and arterial roadway traffic volume increases, respectively.

The predicted 66 dBA noise contours for Alternatives 1 (Options One and Two) through Alternative 5 with the Watt Avenue connection, 2040 are shown on Figures 8-7 through 8-12.

Table 8-3 summarizes absolute impacts on existing (2005) residential units for the five build alternatives with respect to 2040. Homes within the proposed ROW are similar to 2020, because the land use changes associated with most of the proposed development are not known. The number of affected residential units with a Watt Avenue interchange in 2040 will be greater than in 2020 because, as traffic volumes increase, the 66 dBA contour expands relative to the 2020 contour. Residential units built after 2005 may also be affected in a manner similar to that described in Chapter 7. The No-Build Alternative is not shown in Table 8-3 because no impacts would be associated with this alternative.

Table 8-3
Placer Parkway Absolute Noise Impact Summary,
with Watt Avenue Interchange (2040)

Alternative	Homes Within Proposed ROW[a]				Impacted Residential Units by Segment (2020)			
	Western	Central	Eastern	Total	Western	Central	Eastern	Total
1, Option One	0	5	1	6	0	5	0	5
1, Option Two	0	5	1	6	0	6	0	6
2	0	5	1	6	0	5	0	5
3	0	3	1	4	0	5	0	5
4	2	3	1	6	6	3	0	9
5	2	5	1	8	6	2	0	8

Note:

a. Homes within proposed ROW are units that are currently within the identified right-of-way for the given proposed alternative/segment. Impacted units for given year 2040 are for existing units that are within the 66 dBA loudest hour contour for that alternative/segment but outside of the identified right-of-way for the given alternative/segment.

Unless appropriate mitigation is in place (such as discussed in Section 9), new residential units in the overlap zones could therefore experience absolute impacts and be quantified in a manner similar to that shown in Table 8-3.

8.2.2 Relative Impacts on Future Roadways

Relative impacts related to the existing roadways in the study area are summarized in Table 8-4. In this case, the No-Build Alternative is shown for comparison purposes.

Table 8-4 shows that the inclusion of a Watt Avenue interchange creates relative affected roadway segment count totals that indicate that Alternative 5 would have the least overall impact. This conclusion is largely based on Alternative 5 having both the least "significant" (i.e., greater than or equal to 12 dB) and least "substantial" impacts.

Table 8-4
Relative Impact for Existing Roadways, with Watt Avenue Interchange (2040)

DKS Tag	Roadway	Segment	2005 Daily Traffic Vol.	Estimated 2040 Daily Traffic Volumes (with potential Watt Interchange)							Projected Relative Decibel (dBA) Increases in Traffic Noise from 2005 to 2040

Table 8-5 shows a comparison of all five alternatives for both absolute and relative noise impacts for design year 2040 with a Watt Avenue interchange. Also shown is a combined ranking for each alternative with respect to combined noise impacts.

Table 8-5
Noise Impact Rating by Alternative, with Watt Avenue Interchange (2040)

Alternative	Absolute Impacts[a]	Relative Impacts[b]	Ranking[c]
No Build	0	15	7
1, Option One	5	8	2
1, Option Two	6	7	4
2	5	6	1
3	5	8	2
4	9	7	6
5	8	7	5

Notes:

a. Number of residences.
b. Number of roadways with projected increases in traffic noise > 12 dBA.
c. A ranking of 1 indicates that an alternative has the fewest projected combined impacts; A ranking of 7 — the most

9.0 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION STRATEGIES

9.1 OPERATIONAL NOISE ABATEMENT STRATEGIES

Per Caltrans policy, noise abatement is only considered where noise impacts are predicted, where frequent human use occurs, and where a lowered noise level would be of benefit. As a matter of practice, abatement is only considered for places where people are exposed to highway noise for at least 1 hour on a regular basis. Potential noise abatement measures identified in the Caltrans policy (Caltrans, 1998a) include the following:

- avoiding the project impact by using design alternatives, such as altering the horizontal and vertical alignment of the project;
- constructing noise barriers;
- acquiring property to serve as a buffer zone;
- using traffic management measures to regulate types of vehicles and speeds; and
- acoustically insulating public use or nonprofit institutional structures.

Given the amount of proposed and planned development that could potentially be affected by the proposed project, avoidance practiced by jurisdictions with land use control over the development proposals would be the most effective and least costly noise abatement measure. To the extent practicable, this mitigation strategy should be considered as the primary mitigation for noise impacts resulting from Placer Parkway. Until a corridor is identified at the end of the Tier 1 EIS/Program EIR process, this can only be implemented with certainty in the common alignment, which occurs primarily in the Western Segment. Once a corridor has been selected, this mitigation measure can be more fully implemented.

Jurisdictions should require that applicants for development proposals perform a noise impact study as part of their environmental review process, using the projected traffic volumes in the project's traffic report (DKS Associates, 2007), to assess the potential for exceedances of the land use compatibility noise thresholds identified in their General Plans. Jurisdictions should work to avoid such exceedances in their planning processes so as to avoid costly mitigation in the future.

Application of these mitigation strategies will follow a phased approach. Once the corridor is selected at the end of Tier 1, the jurisdictions will be able to account for this corridor in CEQA review and land use decisions. Once Tier 2 is completed, the specific location of the Parkway within the corridor will be determined, and can be accounted for accordingly in CEQA and land use review.

Based on this study and the configuration and location of the project, noise abatement in the form of noise barriers would be considered at the impacted residential locations. The reasonableness of this noise mitigation strategy and the criteria for determining it would be guided by Caltrans policy and would also be discussed in the Tier 2 noise study.

9.2 CONVENTIONAL CONSTRUCTION NOISE MITIGATION STRATEGIES

Noise produced by construction equipment required to build this project would occur with varying intensity and duration during the various phases of construction. Typically, construction activities would occur on weekdays between the hours of 7:00 a.m. and 7:00 p.m.

To avoid unnecessary annoyance from construction noise, the following construction noise control strategies should be implemented:

- Minimize nighttime and weekend work;

- Use portable noise screens to provide shielding for jack hammering or other similar activities when work is close to the hotels; and

- Comply with Caltrans' Standard Specifications 7-1.011 (July 1999) "*Sound Control Requirements"*: The contractor should comply with all local sound control and noise level rules, regulations and ordinances which apply to any work performed pursuant to the contract. Each internal combustion engine, used for any purpose on the job or related to the job, should be equipped with a muffler of a type recommended by the manufacturer. No internal combustion engine should be operated on the project without said muffler.

10.0 ANALYSES TO BE UNDERTAKEN IN TIER 2

Once a preferred alternative is selected, the purposes of a Tier 2 noise study would be to determine the following:

- A depiction of the noise contours associated with Placer Parkway that would have finer resolution with respect to specific identified noise-sensitive receiver locations and that would include modeled features resulting from a more complex TNM model which accounts for such factors as intervening topography, actual roadway alignment, ramp designs, locations, expected traffic volumes, level of service, vehicle speeds, and category composition.

- Guidance regarding the location and design of noise mitigation means along the chosen alternative route where absolute impacts are expected.

This information would allow estimation of costs for one or more mitigation options with respect to existing and future noise-sensitive receptors.

To undertake this Tier 2 level model creation and the development of mitigation guidance, input parameters would be required as follows:

- Detailed road segment designs and locations for the selected Placer Parkway alternative. This would include landscaping features that could offer some level of noise abatement.

- To the extent that such plans and details are available, locations of single- or multiple-story residential dwellings in currently understood future developments.

- Additional site measurements, similar to those covered in Chapter 4, Affected Environment, chosen to generate a database of existing ambient sound levels that would help calibrate and thereby enhance the accuracy of noise impact predictions made possible with a Tier 2 TNM model.

As a result of a more detailed noise receiver identification effort and more detailed noise modeling, specific noise mitigation elements would be considered for locations where noise impacts are determined to exist.

Project Name: Placer Pkwy | Page 5 of

Project #: | Day / Date: 1-25 | My Name: WC

Sound Level Meter	Calibrator	Weather Meter
Model # LD 820	Model # 150B	Model # Serial #
Serial # 1324	Serial # 2233	
Weighting: A / C / Flat	Pre-Test: 114.2 dBA SPL	Terrain: Hard / Soft / Mixed
Response: Slow / Fast / Impl	Post-Test: 114.1 dBA SPL	Topo: Flat / Hilly (describe)
Windscreen: Yes / No		Wind: Steady / Gusty

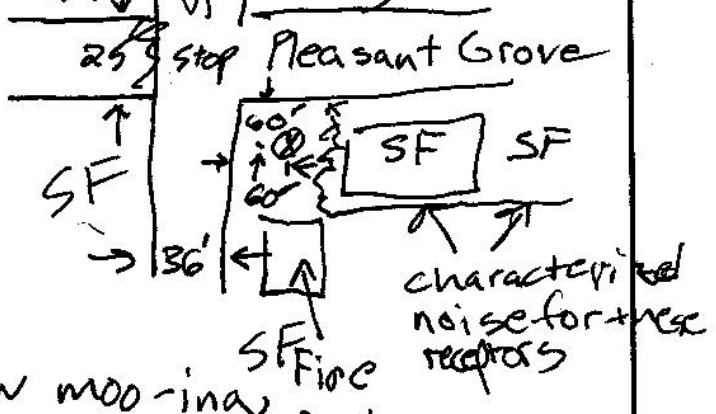
ID	Time Start	Time Stop	Leq	Lmin	Lmax	L10	L50	L90	Wind Spd/ Dir (mph)	Temp (°F)	RH (%)	Bar Psr (in Hg)	Cloud Cover (%)
	14:36	14:51	63.1	34.0	84.1	65.7	49.7	40.0	1-4/N	74.0		30.51	20

Roadway Name	Sankey WB/EB	Pleasant Grove SB/NB	
Speed (post/obs)	55	55	
Number of Lanes			
Width (pave/row)			
1- or 2- way			
Grade			
Bus Stops			
Stop Sign/Signal	yes	yes	
Street Parking			
Automobiles	5/6	9/10	
Medium Trucks	0/0	0/0	
Heavy Trucks	2/3	3/4	

Location(s) / GPS Reading(s):

N: 38.78007

W: 121.48885



Noise Sources: Rooster crowing, cow mooing, birds vocalizing, flagpole pinging, vehicular traffic on Pleasant Grove & Sankey, aircraft over flights. Dept. No. 2

Adj. Land Uses: SF Res (N, S, W, NE), Ag (SE)

Other Noise Sources: distant: aircraft / roadway traffic / trains / landscaping / rustling leaves / children playing / dogs barking / birds vocalizing

Notes and Sketches on Reverse

Notes:
1. "Trans" = transition from 500 to 1000 feet of ROW corridor width.
2. Level of Service input from DKS Table 12 or 21 as follows: 2020, four lanes of travel; 2040, six lanes of travel. All Average Daily Volumes from DKS tables and assume six travel lanes for 2020 and 2040.
3. Zero elevation crossings are considered traverses over Placer Parkway.
4. Non-zero elevation crossings are described in Feb. 2006 draft project description and on April 5th 2006 URS Figure 1 (Tier 1 EIS/EIR).
5. Truck compositions based on "median" percentages shown on DKS Associates "truckdata.xls" found on their FTP site.
6. Peak hourly volume assumed to be 10% of half of the total Average Daily Volume.
7. Unless specifically indicated in DKS tables, "East of Foothills" shall mean "West of SR 65" for volumes and LoS.

2020

Notes:
1. "Trans" = transition from 500 to 1000 feet of ROW corridor width.
2. Level of Service input from DKS Table 12 or 21 as follows: 2020, four lanes of travel; 2040, six lanes of travel. All Average Daily Volumes from DKS tables and assume six travel lanes for 2020 and 2040.
3. Zero elevation crossings are considered traverses over Placer Parkway.
4. Non-zero elevation crossings are described in Feb. 2006 draft project description and on April 5th 2006 URS Figure 1 (Tier 1 EIS/EIR).
5. Truck compositions based on "median" percentages shown on DKS Associates "truckdata.xls" found on their FTP site.
6. Peak hourly volume assumed to be 10% of half of the total Average Daily Volume.
7. Unless specifically indicated in DKS tables, "East of Foothills" shall mean "West of SR 65" for volumes and LoS.

Notes:
1. "Trans" = transition from 500 to 1000 feet of ROW corridor width.
2. Level of Service input from DKS Table 12 or 21 as follows: 2020, four lanes of travel; 2040, six lanes of travel. All Average Daily Volumes from DKS tables and assume six travel lanes for 2020 and 2040.
3. Zero elevation crossings are considered traverses over Placer Parkway.
4. Non-zero elevation crossings are described in Feb. 2006 draft project description and on April 5th 2006 URS Figure 1 (Tier 1 EIS/EIR).
5. Truck compositions based on "median" percentages shown on DKS Associates "truckdata.xls" found on their FTP site.
6. Peak hourly volume assumed to be 10% of half of the total Average Daily Volume.
7. Unless specifically indicated in DKS tables, "East of Foothills" shall mean "West of SR 65" for volumes and LoS.

1.0 INTRODUCTION

1.1 TIER 1 EIS/PROGRAM EIR

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

1.2 CORRIDOR SELECTION AND PRESERVATION

The concept for the Placer Parkway is over a decade old. Placer County's 1994 General Plan depicts a "plan line" for it. Two planning studies (DKS Associates, 2000 and 2001) helped to refine the concept:

- DKS Associates, 2000, Placer Parkway Interconnect Study/Conceptual Plan
- DKS Associates, 2001, Project Study Report (Project Development Support) for Placer Parkway

Placer Parkway is cited as a high-priority regional transportation project by the Sacramento Area Council of Governments (SACOG) 2025 Metropolitan Transportation Plan and the 2027 Placer County Regional Transportation Plan. The project vicinity and surrounding area include some of the fastest growing communities in the Sacramento region. A number of large urban development proposals are being considered by Placer and Sutter counties. New development is expected to add a significant amount of residential, commercial, industrial, and educational uses.

CORRIDOR PRESERVATION

Tier 1 EIS/EIR Transportation Technical Report	Project Location Map	***Figure 1***
		June 2007

6/12/07 ..\vsal\hkT:\Placer Parkway 2007\Tech Studies June07\Traffic\Fig_1_Project_Location.pdf

URS Corporation L:\Projects\PlacerParkway2006_28066593\MXD\Current Working Documents\Archaeological_Survey_Report\Fig_1_Project_Location.mxd Date: 6/29/2006 4:11:03 PM Name: akkeele0

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included representatives from planning and public works departments of all affected cities and counties, environmental, business, agricultural, development, and homeowner interests (the Study Advisory Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report will analyze these five corridor alternatives along with a No-Build Alternative (Figure 2).

Other potential transportation modes such as bus rapid transit may be developed in the corridor in the future, although they are not proposed as part of the current project. The width of the corridor for the Placer Parkway is to vary from approximately 500 feet in the Eastern and Western segments to approximately 1,000 feet in the Central Segment. Depending upon the alternative, the corridor's length ranges from a minimum of 14.2 miles to a maximum of 16.2 miles. The selected corridor would contain the roadway, including the median, travel lanes, shoulder, associated access ramps and a no-development buffer zone.

Corridor acquisition may not be completed until after Tier 2, as funding becomes available. Portions of the selected corridor would be preserved as a no-development buffer zone. The buffer would be maintained as a zone where development is either not permitted or is severely restricted. This is intended to restrict access to the proposed interchanges, protect the rural character of agriculturally designated areas in the vicinity of the Parkway as far as possible subject to future development, and to maximize opportunities to incorporate adjacent sensitive areas. It is intended that the buffer would be owned and managed in the future to achieve these objectives. For subsequent Tier 2 (project-level) environmental reviews, the size of this buffer zone could be considered flexible for agriculturally designated land undergoing urban development. In the Tier 2 environmental review, the specific buffer size and location would be determined. This determination would be based on performance standards on a case-by-case basis, depending on the land use needs of future approved development, and taking into account the primary objective of restricting future access to the Parkway.

Project proponents are considering employment of several land management and control mechanisms in order to ensure that the buffer would be effectively maintained as an area where development would either not be permitted, and where construction of any additional access onto the Parkway would not be allowed. These mechanisms could include land use controls, land purchase/leases, general plan amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, urban growth boundaries, etc. "Layering" or using several of these methods would provide more assurance that the buffers would be permanent, or at least more difficult to undo.

1.3 TECHNICAL STUDY OBJECTIVE

This Transportation Technical Report has been prepared to support the Tier 1 EIS/Program EIR. It presents a Tier 1/Program level assessment of potential impacts related to transportation for five corridor alternatives and the No-Build Alternative as described in Chapter 2.

The scope of work performed for this report is based on the Caltrans Local Assistance Procedures Manual (Caltrans, 2006), as modified for purposes of Tier 1/Program analysis by agreement of Caltrans, the Caltrans Highway Design Manual (HDM) (Caltrans, 2001b) and the Caltrans Environmental Handbook guidance (Caltrans, 2005) on preparing a Transportation Technical Report. In addition, the evaluation considered guidance from the Federal Highway Administration (FHWA), Environmental Checklists for Draft and Final Environmental Documents (FHWA, 1998a; FHWA, 1998b).

The Transportation Technical Report provides an analysis of the transportation and circulation impacts associated with development of the Placer Parkway Corridor Preservation alternatives including impacts on roadways, transit services and bicycle facilities and pedestrians. The traffic analysis of the build alternatives is conducted under the projected opening year (2020) and cumulative (2040) conditions, and also includes an evaluation of circulation scenarios with and without a Placer Parkway interchange at a potential future extension of Watt Avenue.

The potential extension of Watt Avenue and an interchange with Placer Parkway are not part of the project. This potential work would be a distinct project(s) with a separate environmental review. The direction to analyze each build alternative with and without a Watt Avenue connection is based on input from the Policy Advisory Committee during the preparation of the Concept Plan and Project Study Report (PSR) (DKS Associates, 2001) for Placer Parkway.

This report is organized as follows:

Chapter 2 The Proposed Action
Chapter 3 Environmental Setting
Chapter 4 Analysis Methodology
Chapter 5 Impacts and Mitigation Strategies
Chapter 6 Analyses to be Undertaken in Tier 2
Chapter 7 References

This report also includes figures and tables, which show the project location, each action alternative, and pertinent technical information prepared to evaluate the action alternatives.

Throughout this document, the Placer Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

2.0 THE PROPOSED ACTION

The Proposed Action for the Placer Parkway Corridor Preservation Project is to select and preserve a 500- to 1,000-foot-wide corridor in the project study area, within which the future four or six-lane Placer Parkway may be constructed. The ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. Although the action taken at Tier 1 on the Placer Parkway Corridor Preservation Project is limited, the underlying project whose effects are studied in this document is the Placer Parkway. To the extent feasible at this early stage, the Tier 1 EIS/EIR addresses the potential effects of construction and operation of the future roadway.

2.1 THE PROJECT STUDY AREA

The project study area is an area of approximately 33,460 acres located in Placer and Sutter counties, with a small section located in Sacramento County (Figures 1 and 2). The portion of the study area that is located in Sacramento County is in the extreme southwest corner of the study area and does not include any of the proposed corridor alignment alternatives. It extends from SR 70/SR 99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego Roads. The study area as defined for transportation analysis includes the project study area and is described in Section 3.1.

The study area is divided into three segments:

- Western Segment: the Western Segment extends from SR 70/99 to Pleasant Grove Road in Sutter County.
- Central Segment: the Central Segment extends from Pleasant Grove Road in Sutter County to approximately 2,300 feet north of Pleasant Grove Creek in Placer County.
- Eastern Segment: the Eastern Segment extends from approximately 2,300 feet north of Pleasant Grove Creek to SR 65 in Placer County.

2.2 CORRIDOR ALTERNATIVES

The following subsections describe the corridor alternatives, which are depicted on Figure 2, and are numbered according to location from south to north in the study area.

2.2.1 The No-Build Alternative

Under the No-Build Alternative, the project would not be implemented. A Placer Parkway corridor would not be selected/preserved, and the future Placer Parkway would not be constructed.

2.2.2 Alternative 1 – the Red Alternative

Alternative 1 would extend from SR 70/99 approximately ½ mile north of Riego Road, eastward approximately 1 mile north of Baseline Road to approximately Watt Avenue, proceeding north and transitioning in an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment alternative is 16.2 miles long. This alternative includes six interchanges, as described in Section 2.3.3.

2.2.3 Alternative 2 – the Orange Alternative

Alternative 2 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed northeast, then in a northerly direction south of Pleasant Grove Creek, transitioning to an easterly direction before it reaches Sunset Boulevard West, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.4 miles long. This alternative would include six interchanges, as described in Section 2.3.3 below.

2.2.4 Alternative 3 – the Blue Alternative

Alternative 3 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed north along the Sutter/Placer County Line, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.6 miles long. This alternative would include six interchanges, as described in Section 2.3.3 below.

2.2.5 Alternative 4 – the Yellow Alternative

Alternative 4 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.3 miles long. This alternative would include five interchanges, as described in Section 2.3.3 below.

2.2.6 Alternative 5 – the Green Alternative

Alternative 5 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 4,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.2 miles long. This alternative would include five interchanges, as described in Section 2.3.3 below.

2.3 PARKWAY DESIGN ASSUMPTIONS

Although the Parkway would be designed and construction-level impacts analyzed during Tier 2, for the purpose of this report and the Tier 1 EIS/Program EIR, several assumptions have been made about potential design and configuration concepts. These assumptions would be subject to further development and refinement, and specific decisions about design of the roadway would be made during the Tier 2 process. For example, the number, location, and design of over-crossings would be determined at the time of final Parkway design, in consultation with local jurisdictions. The following sections outline assumptions for the future roadway.

Preliminary costs estimates for the Parkway range from $600 to $650 million (2005 dollars). This includes costs for right-of-way, design, construction and environmental mitigation for the four- to six-lane facility. The funding situation has spurred interest in exploring other more creative funding options.

These include a county-wide sales tax, more developer contributions, and tolling facilities. The Technical Report and Tier 1 EIS/Program EIR do not make any assumptions about funding sources.

2.3.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane facility. A preliminary conceptual cross section (see Figure 3) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/Program EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

2.3.2 Conceptual Roadway Elevation

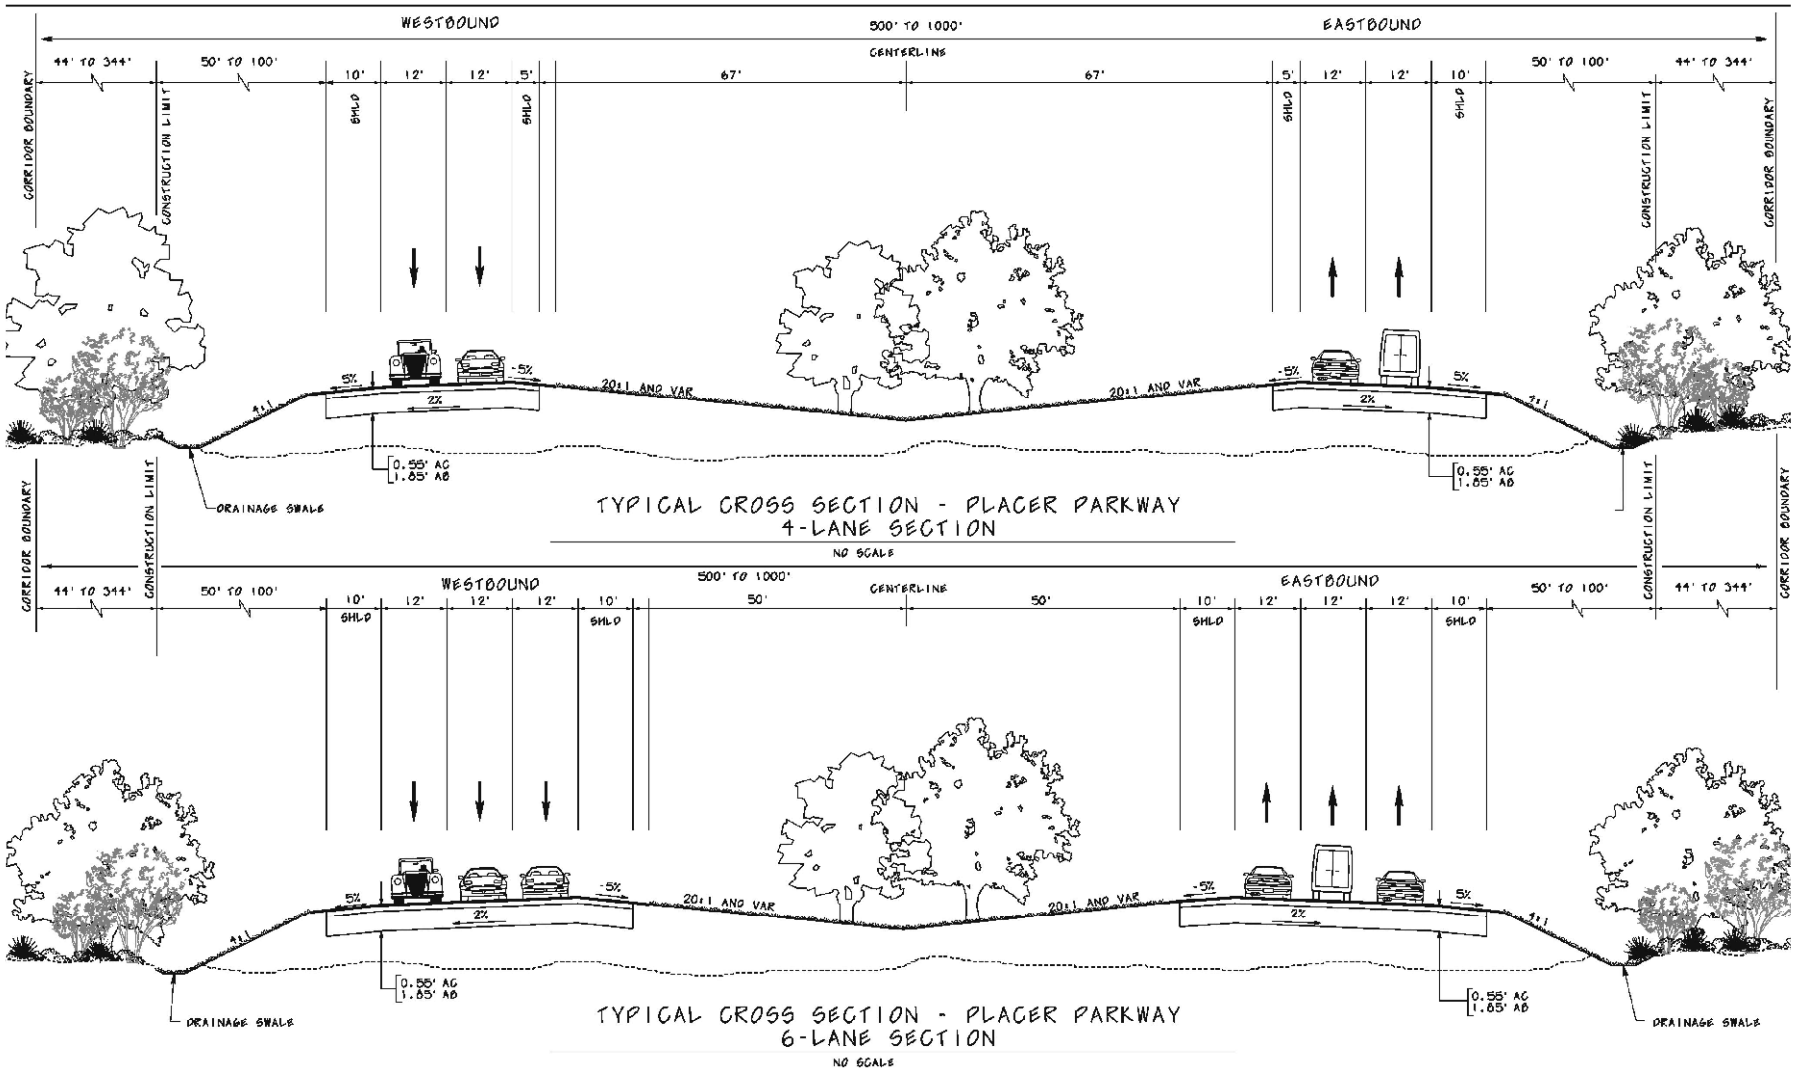
As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on either side of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways or trails.

Throughout the project study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These over-crossings would not connect to the Parkway. Parkway access would be via the interchanges described below.



PLACER PARKWAY CORRIDOR PRESERVATION	Tier 1 EIS/EIR Transportation Technical Report	Typical Cross Section (Conceptual)	***Figure 3*** ***June 2007***

6/12/07 ..\vsa\hkT:\Placer Parkway 2007\Tech Studies June07\Traffic\Fig_3_Typical_CrossSection.pdf

URS Corporation L:\Projects\PlacerParkway2006_28066583\MXD\Current Working Documents\HydrologyTechMemo\Fig_2-2_Typical_CrossSection.mxd Date: 5/23/2006 2:14:19 PM Name: akkeele0

2.3.3 Interchange Concepts

The analysis assumes that the location of interchanges (see Figure 2) is as follows.

- SR 70/99 (at ½ mile north of Riego Road or at Sankey Road)
- One or two locations to be determined in southern Sutter County
- Fiddyment Road
- Foothills Boulevard
- SR 65 at Whitney Ranch Parkway

The following discussion outlines concepts and assumptions for the six interchanges that could potentially serve Placer Parkway.

2.3.3.1. Western Segment

Within the Western Segment of the Parkway, a high-speed, freeway-to-freeway type interchange would connect the Parkway with SR 70/99 at one of following potential locations depending on the project alternative (see Section 2.2). Placer Parkway would terminate at SR 70/99.

- **Placer Parkway/SR 70/99 Interchange at North of Riego Road.** This alternative concept uses "braided" ramps to eliminate weaving problems or conflicts with the future SR 70/99 at Riego Road interchange being developed by Sutter County and Caltrans.

- **Placer Parkway/SR 70/99 Interchange at Sankey Road.** Under this alternative concept, the existing two-lane Sankey Road would be realigned to the south of Placer Parkway and the proposed freeway-to-freeway interchange, extending from approximately ¼ mile west of SR 70/99 to approximately ¼ mile east of the Union Pacific railroad tracks. There would be no direct access to SR 70/99 or Placer Parkway from the realigned Sankey Road.

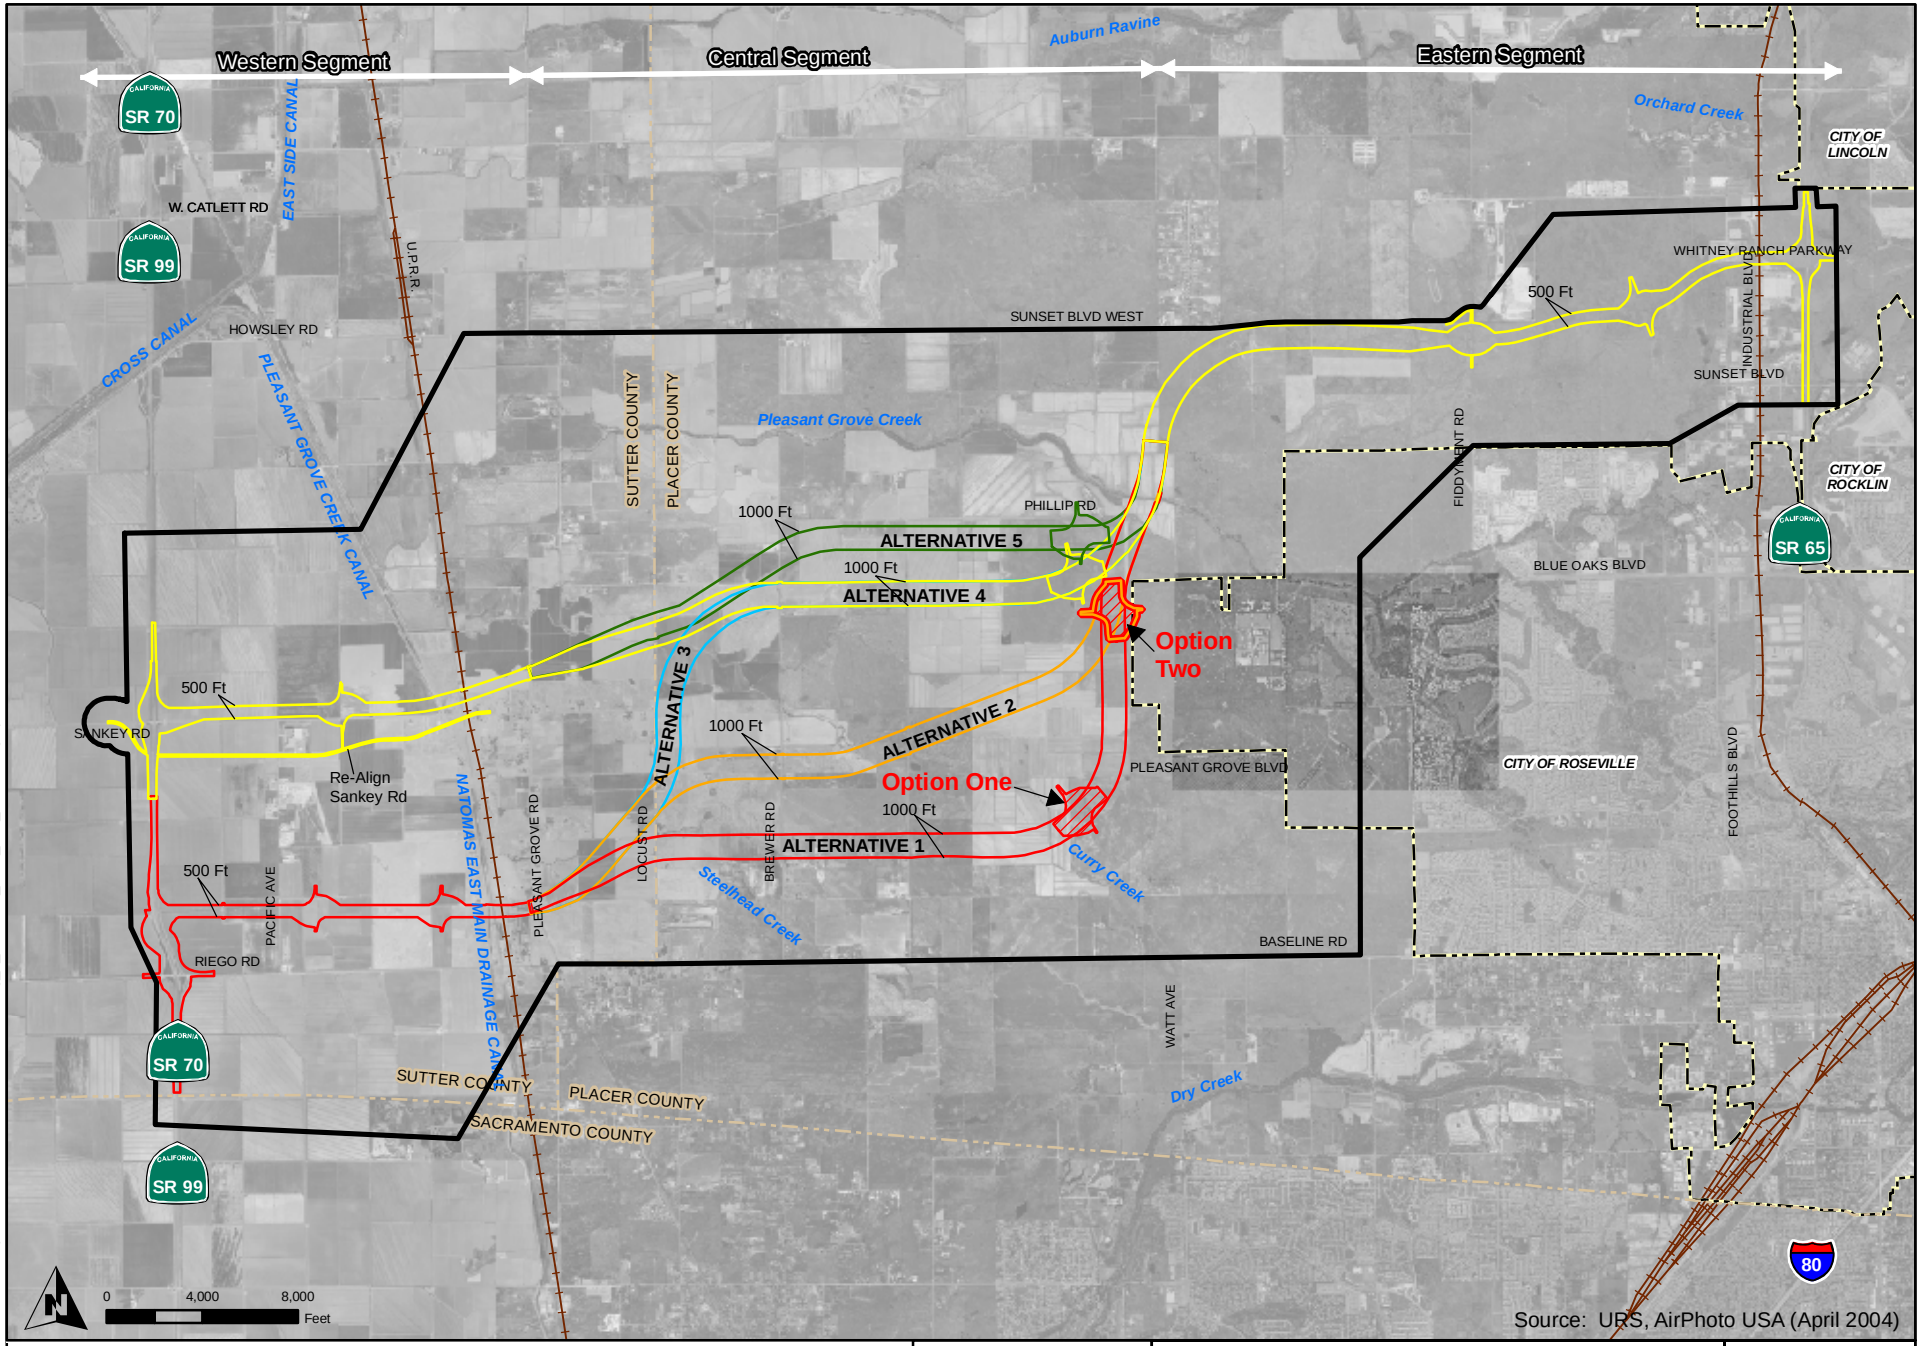
Depending on the final alignment selected, one or two additional arterial interchanges would also be located in south Sutter County. Conceptual locations are identified for purposes of this Tier 1/Program analysis (see Figure 2). The actual location of these interchanges would be developed in the Tier 2 phase, based on Sutter County requirements.

2.3.3.2. Central Segment

Within the Central Segment of the Parkway, there would not be any access proposed as part of the project in the 7-mile segment between Fiddyment Road and Pleasant Grove Road. Please see Section 2.4 regarding a potential connection to a future extension of Watt Avenue (Figure 4) which could be proposed and constructed by others in the Central Segment; such an interchange is not part of the Placer Parkway.

2.3.3.3. Eastern Segment

Within the Eastern Segment of the Parkway, a signalized high-speed freeway-to-freeway and local access interchange would connect the Parkway to SR 65 at Whitney Ranch Parkway (Figure 2). From SR 65 eastward Placer Parkway would terminate and become Whitney Ranch Parkway east of the SR 65 exit ramp intersection. Traffic signals would be provided at the exit ramp terminals. This interchange would be approximately 1 mile north of a planned SR 65/Sunset Boulevard interchange and 1.2 miles south of the existing Twelve Bridges interchange.



Tier 1 EIS/EIR
Transportation
Technical Report

Potential Watt Avenue Interchange

Figure 4

June 2007

As part of this interchange, auxiliary lanes would be required on SR 65 in both directions to enhance traffic operations on the north side of the future SR 65/Sunset Boulevard interchange. The southbound SR 65 exit-ramp at Sunset Boulevard is being designed to accommodate an additional auxiliary lane required for the future Placer Parkway/Whitney Ranch Parkway interchange to minimize the reconstruction of this ramp in the future. Within the Eastern Segment of the Parkway, from SR 65 westward, two interchanges with local roadways would be constructed, one at Foothills Boulevard and one at Fiddyment Road, as depicted on Figure 2.

The future interchange on Placer Parkway at Fiddyment Road would be located near the existing intersection of Fiddyment Road and Sunset Boulevard West. To provide acceptable traffic operations additional distance needs to be provided between the Fiddyment Road/Sunset Boulevard West intersection and the Fiddyment Road/Placer Parkway westbound off-ramp intersection. Therefore, Sunset Boulevard West will need to be realigned to the north as it nears Fiddyment Road.

2.3.4 Landscaping Concept

For the purposes of this environmental analysis, preliminary landscaping concepts have been developed for Placer Parkway. These are entirely conceptual and would be subject to further refinement during the Tier 2 environmental process. It is anticipated that landscaping would be used to reflect local topography and vistas in the study area and complement the varying character of land adjacent to the Parkway corridor. Landscape design would vary within the Parkway's three segments depending on corridor width and type and density of surrounding land uses. Landscaping would be used within the median and the Parkway buffer zone to enhance the aesthetics of the Parkway, and would be used to provide screening and enhance local and long-distance views. Where appropriate, more concentrated plantings would be considered to buffer the Parkway from future adjacent land uses that may be incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Landscape design would likely include a mix of compatible native and non-native plants that may require some irrigation. Wherever possible, native plant species would be used in line with Caltrans policy. Where possible and depending on availability, feasibility and cost, recycled water would be used for irrigation.

During a future design phase, lighting elements would be designed for safety and would consider the proposed landscaping plan in order to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower-voltage lighting, and proposing lighting fixtures that conform with the visual character of the area).

2.4 POTENTIAL WATT AVENUE INTERCHANGE

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 4). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/Program EIR. However, the connection of Placer Parkway to a potential Watt Avenue extension could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/Program EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges with Placer Parkway.

2.5 AGENCY PERMITS AND APPROVALS

The Proposed Action would preserve a preferred corridor for a future transportation facility. In the future, permits and approvals would be obtained from appropriate agencies prior to construction of the Parkway. These permits and approvals may include specific design or mitigation requirements that would be incorporated into the project.

2.6 SUBSEQUENT TIER 2 INFORMATION

As noted earlier, the design and construction of Placer Parkway—including its interchanges and over-crossings, and ancillary features such as stream crossings, safety devices, stormwater management structures, and similar improvements—would be evaluated in a subsequent Tier 2 environmental review process once a corridor has been identified. Chapter 6, Analyses to Be Undertaken in Tier 2, provides more detailed information regarding Tier 2 studies.

3.0 ENVIRONMENTAL SETTING

The initial task of defining transportation impacts for the project's alternatives was to evaluate the operating characteristics of the circulation system in the vicinity of the project. The following sections discuss existing roadway functions, traffic volumes, and traffic levels of service, as well as transit services and bicycle facilities.

3.1 EXISTING ROADWAY SYSTEM

Placer Parkway would have an impact on travel patterns in a fairly wide (large) area. Based on an evaluation of the changes in traffic volumes, a Transportation Analysis Study Area (TASA) was defined. It covers the area where the travel model shows "significant" changes in traffic volumes, although the percentage of roadways that would be affected by Placer Parkway decreases on the fringes of that area. The TASA extends from Nicolaus Road on the north to I-80 on the south, and from Sierra College Boulevard on the east to west of SR 70/99. The TASA (shown in Figure 5) covers portions of eight jurisdictions: Placer County, Sutter County, Sacramento County, the cities of Roseville, Rocklin, Lincoln and Sacramento, and the Town of Loomis.

For some system-wide analysis measures, two analysis areas were used: (1) the TASA, as described above; and (2) an Analysis Focus Area (AFA), also shown in Figure 5. The AFA is the portion of the TASA that is close to the build alternatives. Its boundaries were selected to define the area where most of the transportation benefits of constructing Placer Parkway would occur.

The existing roadway network in the TASA consists of state highways, arterials, collectors, and local roadways. The key existing highways, arterials, and collector roadways shown in Figure 5 that are in the vicinity of the project, or may have a measurable change in traffic volume due to Placer Parkway are described below.

- **State Route 65 (SR 65)** is a north–south state highway that begins at I-80 in Roseville and extends north through Rocklin and Lincoln to SR 70 near Marysville. SR 65 is a four-lane freeway between I-80 and Industrial Avenue and a two-lane to four-lane conventional highway from Industrial Avenue to SR 70.

- **State Route 70/99 (SR 70/99)** is a north–south state highway that extends from I-5 in Sacramento County northward into Sutter County. North of Catlett Road the route splits into SR 70 (which extends northward through Yuba and Butte counties to Marysville and Oroville), and SR 99 (which extends northward through Sutter and Butte counties to Yuba City and Chico).

- **Interstate 80 (I-80)** is the primary east–west state highway that provides a regional link between Placer County and Sacramento County, as well as an interregional link to the Bay Area. Interstate 80 is the only trans-Sierra Interstate route in northern California. This highway serves both local travel, such as commuter traffic, as well as interstate travel, including goods movement.

- **Interstate 5 (I-5)** is the primary north–south highway that provides a regional link between Yolo County and Sacramento County, as well as an interregional link within the Central Valley of California. I-5 provides access to Downtown Sacramento and the Sacramento International Airport. I-5 is also a key route for interstate travel, especially goods movement along the west coast of the U.S.

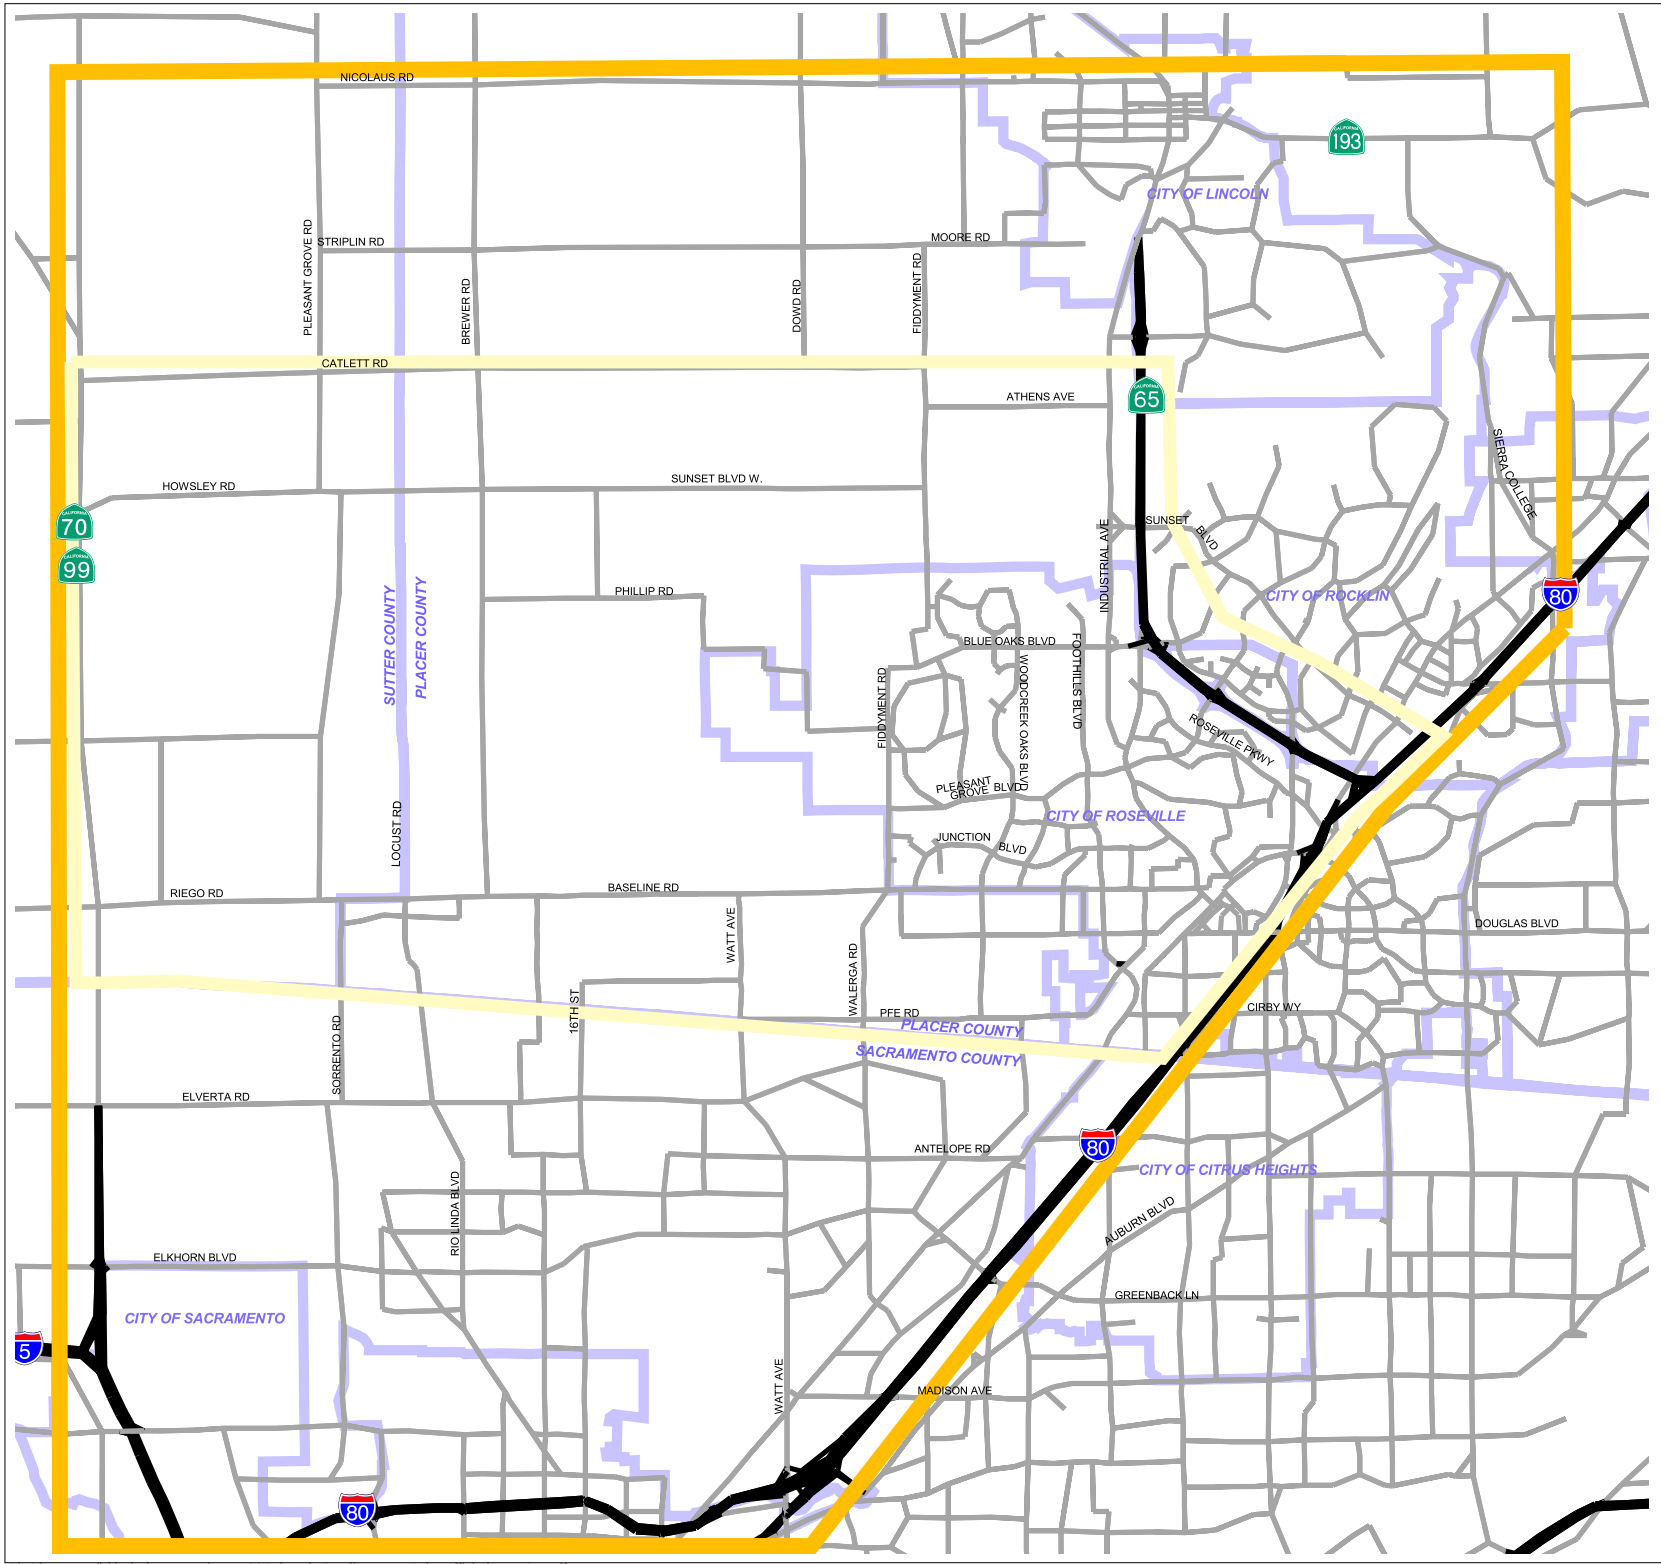


FIGURE 5
Existing Roadway Network and Transportation Analysis Study Area

Transportation Analysis Study Area

Analysis Focus Area

Tier 1 EIS/EIR
Transportation
Technical Report

June 2007

- **State Route 193 (SR 193)** is an east–west two-lane conventional state highway that extends from SR 65 in Downtown Lincoln east to Interstate 80 at Newcastle.

- **Baseline Road/Riego Road** is an east–west rural arterial that extends through the study area. Baseline Road extends from Foothills Boulevard in the City of Roseville to the Sutter County line. East of Foothills Boulevard this roadway becomes Main Street. Within Sutter County, this roadway becomes Riego Road, which extends across SR 70/99 to the Garden Highway. Baseline Road and Riego Road connect Roseville, west Placer County, and south Sutter County with each other and with SR 70/99.

- **Watt Avenue** is a north–south arterial that runs from Baseline Road south to Florin Road in Sacramento County. Watt Avenue connects west Placer County with Interstate 80, and extends across the American River to provide access to U.S. 50. The roadway becomes South Watt Avenue at Jackson Road (SR 16), and becomes Elk Grove-Florin Road at Florin Road. Elk Grove-Florin Road continues south to Stockton Boulevard at State Route 99 in the community of Elk Grove.

- **Fiddyment Road** is a two- to four-lane north–south rural arterial that extends north from Baseline Road to Moore Road, southwest of the City of Lincoln.

- **Brewer Road** is a two-lane north–south rural collector that extends from Baseline Road north across west Placer County. It terminates just south of the Bear River, which is the Yuba County line.

- **Locust Road** is a two-lane north–south rural collector that extends from the Sacramento County line north to Sunset Boulevard West. In Sacramento County this roadway becomes Elwyn Avenue.

- **Pleasant Grove Road** is a two-lane north–south rural arterial that runs along the Placer County/Sutter County line from Baseline Road south to the Sacramento County line, where it becomes Sorrento Road. Pleasant Grove Road also extends north of Riego Road, beginning about one-quarter mile west of its southern section, and runs north to the Yuba County line where it becomes Forty Mile Road.

- **Sankey Road** is a two-lane east–west rural roadway in Sutter County that runs from the Garden Highway across SR 70/99 to Locust Road.

- **Howsley Road/Sunset Boulevard West** is a two-lane east–west roadway that extends from the Garden Highway across SR 70/99 to Placer County line. In Placer County, this roadway becomes Sunset Boulevard West, which extends east to Fiddyment Road.

- **Pacific Avenue** is a two-lane north–south roadway parallel to SR 70/99 in Sutter County that extends from Riego Road to Sankey Road, as well as from Howsley Road north to Bear River Drive.

- **Nicolaus Road** is an east–west two-lane arterial roadway that extends from H Street (just west of SR 65 and the Union Pacific Rail Road (UPRR) tracks) in the City of Lincoln west to Joiner Parkway. Between Joiner Parkway and Aviation Road it is a four-lane arterial roadway. West of Aviation Road, it returns to a two-lane arterial roadway west to the Sutter County Line, where it becomes Marcum Road.

- **Athens Road** is an east–west two-lane rural arterial roadway that extends from Fiddyment Road to Industrial Avenue.

- **Dowd Road** is a north–south two-lane rural collector roadway that runs from Moore Road north to SR 65.

- **Catlett Road** is an east–west two-lane roadway that extends from SR 70/99 in Sutter County east to Fiddyment Road in Placer County.

- **Walerga Road** is a two-lane rural arterial that extends from Baseline Road south to Roseville Road in Sacramento County. It provides access between western Placer County and the Antelope area of Sacramento County.

- **Blue Oaks Boulevard** is an east–west arterial that links the cities of Roseville and Rocklin to each other and to SR 65. Between SR 65 and Woodcreek Oaks Boulevard it has four lanes.

- **Foothills Boulevard** is a north–south arterial in Roseville west of I-80. It extends as far south as Cirby Way, where it becomes Roseville Road and continues south into Sacramento. North of Cirby Way it traverses portions of the City's Infill Area, Northwest Specific Plan, and North Industrial Area, and currently ends at Duluth Avenue at the northern city limits.

- **Junction Boulevard** is an east–west arterial in west Roseville that has four lanes from Washington Boulevard to Baseline Road.

- **Pleasant Grove Boulevard** is an east–west arterial that extends from Fiddyment Road to the City of Rocklin where it becomes Park Drive and connects the Del Webb Specific, Plan, the Northwest Roseville Specific Plan, the North Central Roseville Specific Plan, and the Highland Reserve Specific Plan to each other and to SR 65. It is a two-lane facility between Fiddyment Road and Woodcreek Oaks Boulevard, a four-lane roadway from Woodcreek Oaks Boulevard to Foothills Boulevard, and a six-lane facility between Foothills Boulevard and SR 65.

- **Roseville Parkway** is a four- to six-lane arterial that links the North Central, Stoneridge, Northeast and Southeast Specific Plan areas of the City of Roseville to Placer County east of Sierra College Boulevard.

- **Washington Boulevard** is a major north–south arterial that connects SR 65 and Blue Oaks Boulevard on the north to Oak Street in downtown Roseville. Most of Washington Boulevard has four lanes, except a two-lane segment north and south of where it crosses under the UPRR north–south tracks. Along with Foothills Boulevard and SR 65, it provides one of three grade-separated crossings of the UPRR east–west mainline tracks.

- **Woodcreek Oaks Boulevard** is a north–south arterial that extends from Baseline Road to Blue Oaks Boulevard. Most of this arterial currently has only two lanes, but its wide median is designed for widening to four lanes.

- **Industrial Avenue** is a two-lane north–south arterial that extends from Washington Boulevard in Roseville north through the Sunset Industrial Area to connect with SR 65.

- **Sunset Boulevard** is an arterial that extends in a northwest direction from Pacific Street in the City of Rocklin to west of SR 65 in the Sunset Industrial Plan Area in unincorporated Placer County. Sunset Boulevard has two lanes west of SR 65 and four to six lanes east of SR 65.

- **Sierra College Boulevard** is a major north–south two- to six-lane arterial connecting Placer County with Sacramento County. The roadway starts at SR 193 east of Central Lincoln and extends south through unincorporated Placer County, Rocklin, Loomis, and Roseville to the Sacramento County line. In Sacramento County it becomes Hazel Avenue and continues south to U.S. 50.

- **Elverta Road** is an east–west arterial in northern Sacramento County that extends from the Garden Highway to east of Walerga Road. From the Garden Highway to just west of Watt Avenue this roadway has two travel lanes, while there are four to six lanes on its Eastern Segments.

- **Elkhorn Boulevard** is an east–west arterial in Sacramento County that extends from the Sacramento International Airport east to I-80 where it becomes Greenback Lane. From the Sacramento International Airport to just west of Rio Linda Boulevard, this roadway has two travel lanes, while there are four on its Eastern Segments.

3.2 EXISTING TRAFFIC LEVELS OF SERVICE

Determination of traffic impacts of the project is based upon projected roadway volumes and comparisons to roadway capacities. Roadway operating conditions are described using the concept of "level of service."

Level of Service (LOS) is a qualitative measure of the effect of a number of factors that include speed, travel time, traffic interruptions, freedom to maneuver, safety, driving comfort/convenience, and operation costs. LOSs are designated "A" through "F," from the best to worst, which covers the entire range of traffic operations that might occur. Level of Service "E" describes conditions approaching or at maximum capacity.

As shown in Table 1, the LOS standards and the analysis methodologies for calculating LOS differ for the jurisdictions and agencies in the study area. Most jurisdictions use both a roadway segment analysis (based on daily capacities by roadway type) and an intersection analysis (based on critical movements during peak hours), while the cities of Roseville and Lincoln do not use a roadway segment analysis. The LOS standards on state highways are based on Caltrans' Transportation Concept Reports for each route. Typical Concept LOS standards in District 3 are LOS D in rural areas and LOS E in urban areas. However, some heavily congested route segments now have a concept LOS F because improvements required to bring the LOS to E are not considered feasible.

For the Tier 1 EIS/EIR, the LOS analysis is based on comparing average weekday traffic volumes on a roadway segment to a planning level daily capacity for that roadway segment. Table 2 summarizes the LOS criteria used for this analysis.

The daily segment-based analysis criteria in Table 2 are consistent with the methodologies used in the *Placer County General Plan EIR* and the *Sacramento County General Plan EIR*, as well as by other jurisdictions in the area. Arterial roadways were evaluated using the criteria for "moderate access control arterials," while the criteria for "low access control" arterials were used for collector roadways.

Table 1:
Summary of Level of Service Standards and Methodologies for Local Jurisdictions

Jurisdiction/ Agency	Level of Service Standard	Methodology for LOS Calculations	
		Roadway Segment Analysis	Peak hour Intersection Analysis
Placer County	C (D within ½ mile of state highway)	Based on daily volumes	Circular 212
Sutter County	D	Based on daily volumes	Circular 212
Sacramento County	E	Based on daily volumes	Circular 212 with modified capacities
City of Roseville	C (up to 30 percent of signalized intersections can exceed LOS C at buildout of City's entitled land)	NA	Circular 212 with modified capacities
City of Lincoln	C (LOS D along state highways)	NA	Circular 212 with modified capacities
City of Rocklin	C (LOS D within ½ mile of freeway interchange)	Based on daily volumes	Circular 212
Town of Loomis	C	Based on daily volumes	Circular 212
Caltrans	Based on Transportation Concept Report (TCR) for each facility	Highway Capacity Manual (HCM) based on peak hour volumes	HCM

Table 2:
Level of Service Definitions – Daily Segment Based Analysis

Roadway Capacity Class	Maximum Daily Traffic Volume Per Lane for Each Level of Service Designation				
	A	B	C	D	E
1) Arterial – High Access Control	6,000	7,000	8,000	9,000	10,000
2) Arterial – Moderate Access Control	5,400	6,300	7,200	8,100	9,000
3) Arterial and Collector – Low Access Control	4,500	5,250	6,000	6,870	7,500
4) Expressway – Level Terrain	4,050	6,620	9,450	12,150	13,500
5) Freeway – Level Terrain	6,300	10,620	13,680	16,740	18,000
6) Rural Roadway	1,500	2,950	4,800	7,750	12,500

Sources: Placer County General Plan EIR and Sacramento County General Plan EIR

Table 3 shows the existing daily traffic volumes and the daily segment-based LOS on a number of key roadways in the study area. Most of the traffic counts on local roadways were taken in 2005, while the counts on state highways are from 2004. The counts on local roadways were collected by local jurisdictions as part of regular count programs, by consultants as part of recent traffic impact studies or by DKS for this technical report.

Notes:
Shaded cells reflect roadway segments that do not meet LOS policies of jurisdiction or agency.
[1] +2 = Plus two HOV lanes
[2] Traffic volumes on state highways are 2004. Counts on some local roadways were taken prior to 2005
Source: DKS Associates, 2006

Table 3 shows that some roadway segments in the TASA currently do not meet the LOS standards of the jurisdictions and agencies that control them, including the following:

- I-80 from SR 65 to Antelope Road and between Northgate Boulevard and Norwood Avenue
- SR 65 from I-80 to Pleasant Grove Boulevard
- Baseline Road from the Sutter County Line to Watt Avenue, and from Walerga Road to Woodcreek Oaks Boulevard
- Blue Oaks Boulevard from SR 65 to Foothill Boulevard
- Cirby Way from Foothill Boulevard to Riverside Avenue
- Elverta Road from 28th Street to Watt Avenue
- Fiddyment Road from Baseline Road to Pleasant Grove Boulevard
- Foothill Boulevard from Baseline Road to Cirby Way
- Walerga Road from Baseline Road to Elverta Road
- Watt Avenue from Antelope Road to Elkhorn Boulevard, and from Airbase Drive to I-80

Table 3 indicates that Riego Road and Baseline Road operate at LOS D, conditions, while observations indicate that portions of these roadways currently operate at LOS F conditions. The LOS for Riego Road and Baseline Road in Table 3 are based on capacities for an urban arterial, which would typically have

signalized intersections at major cross streets instead of the four-way or three-way stop-sign control that exists along Riego Road and Baseline Road. If these intersections were signalized, these roadways would operate at LOS D conditions.

The analysis of I-80 in this Technical Report covers segments between Rocklin Road and Antelope Road, and well as between Northgate Boulevard and Norwood Road. This latter section of I-80 was selected because it is a current bottleneck, especially during the p.m. peak period due to a decrease in travel lanes between Truxel Avenue and Norwood Road.

3.3 EXISTING TRANSIT SERVICE

Local transit service in the TASA is currently provided by local governments and social service agencies. Fixed-route bus service providers in south/west Placer County include Placer County Transit, Lincoln Transit, Roseville Fixed Route, and Roseville Commuter Service. In south Sutter County, Yuba-Sutter Transit provides fixed-route bus services. In Sacramento County, Sacramento RT operates fixed-route bus and light-rail services.

The existing transit services in the TASA are summarized in Table 4. While there are a number of transit routes and services within the urbanized portion of this area, only a few transit routes travel near the proposed build alternatives, and those are located along SR 65, SR 70/99, or in the western portion of the City of Roseville. As discussed in Section 4.5, local transit operators intend to extend transit services into western Placer County as it urbanizes.

Table 4:
Existing Transit Routes in the TASA

		Existing Service		
			Approximate Frequency	
Operator	**Line**	**Route Description**	**Peak Period**	**Off-peak**
Auburn Transit	Blue	Local Blue	2 runs	hourly

	101	Don Julio (North Highlands – Watt/I-80)	2 a.m./p.m.	
	102	Hillsdale Express (Hillsdale – Watt/I-80)	30 min	

Sources: Schedules from local transit providers

The urbanized portions of the TASA are also served by "dial-a-ride" transit services, but not the rural area around the build alternatives. Consolidated Transportation Services Agency, an independent provider of demand responsive transportation services to the elderly and disabled, provides services in portions of Placer County, but they do not serve the area near the Parkway alternatives. Dial-a-ride services would be extended into western Placer County as it urbanizes.

3.4 EXISTING BICYCLE FACILITIES

Bicycle facilities in Placer County and Sutter County are classified as follows:

- **Class I:** Off-street bike trails or paths that are physically separated from streets or roads used by motorized vehicles.
- **Class II:** On-street bike lanes with signs, striped lane markings, and pavement legends.
- **Class III:** On-street bike routes marked by signs and shared with motor vehicles and pedestrians. Optional 4-inch edge lines painted on the pavement.

There is a very limited bikeway system in the vicinity of the Parkway Alternatives.

Placer County adopted a *Regional Bikeway Plan* in 2002. That plan covered much of Placer County, but not areas west of Watt Avenue. Sacramento County and the cities of Roseville and Lincoln have also developed Bikeway Master Plans. Sutter County has worked to establish bikeways in urban areas. There are no existing bikeways in the rural portion of Sutter County near the corridor alignment alternatives.

4.0 TRAVEL FORECASTING AND ANALYSIS METHODOLOGY

4.1 ANALYSIS SCENARIOS

Table 5 outlines the 24 scenarios (corridor alternatives, Watt Avenue options, and development conditions) that were defined and evaluated in this Technical Report. Comparing traffic conditions based on the above conditions and scenarios provides a comprehensive basis for determining the traffic impacts of the proposed Parkway alternatives. To determine the traffic impacts, the traffic associated with each alternative was compared to a No-Build scenario for the same time frame, as follows:

Table 5:
Analysis Scenarios for Transportation Technical Report

#	Development Level	Placer Parkway Alternative	Watt Avenue Interchange
1	Opening Year (2020)	No-Build	
2		1	Without interchange
3			With north interchange
4			With south interchange
5		2	Without interchange
6			With interchange
7		3	Without interchange
8			With interchange
9		4	Without interchange
10			With interchange
11		5	Without interchange
12			With interchange
13	Cumulative (2040)	No-Build	
14		1	Without interchange
15			With north interchange
16			With south interchange
17		2	Without interchange
18			With interchange
19		3	Without interchange
20			With interchange
21		4	Without interchange
22			With interchange
23		5	Without interchange
24			With interchange

- The traffic impacts under the Opening Year (2020) Plus Project scenario were determined by comparing its traffic operations to the Opening Year (2020) No-Build scenario.

- The traffic impacts under the Cumulative (2040) Plus Project scenario were determined by comparing its traffic operations to the Cumulative (2040) No-Build scenario.

4.2 SACMET MODEL

The primary travel forecasting tool to be used for the Parkway Tier 1 EIS/EIR is the Sacramento Metropolitan Travel Demand Model, or "SACMET" model. This model was used for development of SACOG's 2006 Metropolitan Transportation Plan (MTP), and for regional air quality conformity analyses. It has provided the basis for other recent regional studies, corridor analyses, and environmental documents. SACOG maintains SACMET over time, updating base year and forecast year demographic data and networks, and working with a technical advisory committee to periodically update and enhance the model. Finally, many local jurisdictions use the model as the basis for general plans and environmental studies. For all of these reasons, this model provides the best starting point for travel forecasts for this project.

Documentation on this model is provided in *"Sacramento Regional Travel Demand Model Version 2001 – SACMET 01 (SACOG and DKS Associates, March 2002).*

The Parkway would affect traffic patterns and volumes on arterial and collector roadways in a broad area covering south/west Placer County, south Sutter County, and north Sacramento County. SACMET does not include some of the arterial roadways or most of the major collector roadways in that sub-regional area. To adequately evaluate the impact of the Parkway on that roadway system, modifications to SACMET were needed. Modifying a regional model to provide additional detail in the model's transportation system for a corridor or sub-regional transportation analysis is a common practice.

Through discussions with the Placer Parkway Technical Advisory Committee (TAC) and SACOG, the following enhancements were made to the SACMET model for the purposes of preparing travel forecasts for the project's Tier 1 EIS/EIR alternatives:

- The traffic analysis zones (TAZs) and roadway network in the Placer County Travel Demand Model were substituted for the SACMET zone system and roadway network in Placer County.

- Additional TAZs were also added to SACMET in south Sutter County to allow a more detailed analysis in that area.

It is important to test the model's accuracy and make appropriate adjustments to its equations, parameters, and assumptions through a validation process. Validation refers to the systematic comparison of the model outputs for a base year (i.e., 2005) to observed travel behavior. The validation of the enhanced SACMET model for the project's Tier 1 EIS/EIR focused on vehicle volume counts on roadway segments (or links in the model networks). The performance of the model in predicting traffic volumes by functional class, volume class, and "screenlines" was evaluated.

The results of the validation process, shown in Appendix A of this report, were presented to the TAC. The validation produced results that were within acceptable tolerances for sub-regional travel models following best practices in travel demand forecasting. The TAC concurred that the travel model was acceptable for use in this Tier 1 EIS/EIR.

4.3 INDUCED TRAVEL DEMAND

When a major new transportation facility such as Placer Parkway is introduced into a heavily congested travel corridor, it would not only impact people's route choice, but potentially the mode and origin/destination of trips in that corridor. A new or widened regional transportation facility could "induce" travel and increase vehicle-miles of travel (VMT) in the corridor by allowing people to travel further in the same amount of time.

In general terms, induced travel can come from the following sources:

- A change in trip generation – either an increase in the number of total person trips related to development or an increase in motorized person trips *per development unit*
- A change in trip distribution – an increase in average motorized person trip distance
- A change in mode choice – an increase in the share of person travel by private motorized vehicles
- A change in route choice – a shift in vehicle travel to new or improved facilities from unimproved facilities within a corridor, or to an improved corridor due to diversion of traffic from other corridors.

It is important that the model used for the Tier 1 EIS/EIR follows nationally accepted "best practices" in the engineering profession. Under "best practices," the model should be capable of forecasting differences in trip distribution, mode choice, and route choice (traffic assignment) between all alternatives.

The "feedback loop" in the SACMET model to both the trip distribution and mode choice models is being used in the forecasting for the Tier 1 EIS/EIR. This model feature ensures that the model adequately predicts how the project would change trip distribution and mode choice (and resulting traffic volumes and vehicle-miles of travel) compared to the No-Build Alternative.

4.4 DEVELOPMENT PROJECTIONS (2005 TO 2040)

Travel demand in the vicinity of the project area will be influenced by growth in population and employment in the six-county Sacramento region, and especially growth in south/west Placer County, south Sutter County, and north Sacramento County.

FHWA and Caltrans have requested that cumulative conditions for the transportation analysis of build alternatives be based on development levels that are 20 years beyond the projected opening of the Parkway. For planning purposes, Placer County Transportation Planning Agency (PCTPA) has identified 2020 as the opening year of this facility.

SACOG's current MTP has a 2027 horizon year. In 2004, the SACOG Board adopted the Preferred Blueprint Scenario, which outlines land use and development levels for a 2050 horizon year. Based on discussions with the TAC, the transportation analysis of build alternatives was conducted for the following two future development scenarios:

- A 2020 "Opening Year" scenario reflecting 2020 development levels based on current general plans.
- A Cumulative (2040) Development Scenario that reflects a 2040 horizon. This scenario goes beyond SACOG's 2027 development levels to include foreseeable development based on input from local jurisdictions and SACOG's Preferred Blueprint Scenario.

The PDT concluded that these two scenarios would "bracket" regional development levels from a low (2020) level to a high (2040) level.

The development assumptions for a 2020 "Opening Year" scenario were based on discussions with the TAC and reflect the following assumptions:

- Residential buildout of current general plans within Placer County (see Figure 6).
- No development in the following major projects that would require General Plan amendments:
  - The Creekview and Sierra Vista Specific Plans in Roseville's Annexation Area
  - The SOI expansion areas of Lincoln
  - The Regional University, Placer Ranch Specific Plan areas, and Curry Creek Community Plan area in unincorporated Placer County
  - Sutter Pointe area in Sutter County.
- Development of the initial phase of Placer Vineyards (7,261 dwelling units out of 14,132 total). Placer Vineyards was included in the 2020 "Opening Year" scenario since urban development in that area was envisioned in Placer County General Plan.
- Growth in retail employment in the current General Plan areas of Placer County that "balances" the growth in residential development by matching SACOG's countywide estimate of about 0.32 employee per dwelling unit from their 2025 forecasts.
- Growth in total employment levels in the current General Plan areas of Placer County that "balances" the growth in residential development by matching SACOG's 1.3 employees per dwelling unit from their 2025 forecasts
- A straight-line growth rate between SACOG's estimates of 2005 development levels and their draft 2032 forecasts in each travel model zone outside Placer County and south Sutter County.

The Cumulative (2040) Development Scenario is based on the "Super-Cumulative" development scenario that was developed for the evaluation of traffic impacts in several pending EIRs for major developments in Placer County. It was prepared through discussions with the staffs of Placer County and the cities of Roseville, Rocklin, and Lincoln. The Cumulative (2040) Development Scenario for this Tier 1 EIS/EIR is based on the following:

- Full build out of all residential land in Placer County west of Sierra College Boulevard, including: current general plan areas and the following major development proposals in west Placer County (see Figures 7 and 7a):
  - The Creekview and Sierra Vista Specific Plans in Roseville's Sphere of Influence Annexation area
  - The Sphere of Influence expansion areas of Lincoln
  - The Placer Vineyards, the Regional University, Placer Ranch Specific Plans in unincorporated Placer County
  - The Curry Creek Community Plan area.

- Growth in retail employment in Placer County that "balances" the growth in residential development by matching SACOG's countywide estimate of about 0.32 employee per dwelling unit from their 2025 forecasts.

- Growth in total employment levels in Placer County that "balances" the growth in residential development by matching SACOG's 1.3 employees per dwelling unit from their 2025 forecasts.

- Full build-out of the residential development in the proposed Sutter Pointe Specific Plan area along with a non-residential development level that "balances" the residential development in that area.

- Estimated 2040 developments in all other portions of SACOG's six-county region based on a straight-line for the development growth between 2005 levels, and the 2050 Preferred Blueprint scenario for each of SACOG's TAZs.

As shown on Table 6, the 2020 "Opening Year" scenario has the same average yearly growth rate in each land use category as the Cumulative (2040) Development scenario, and the same yearly growth rate in residential units as SACOG's draft 2032 MTP forecasts for Placer County. This shows that the development rates used in this Tier 1 EIS/EIR are generally consistent with growth rates used in SACOG's regional forecasts for the MTP.

Table 6:
Summary of Placer County Growth

Land Use	Forecast Year	Estimate of Growth Rate		
		Period	Development (dwelling units [DU] or square feet [sq. ft.])	Growth per Year
Residential (Dwelling Units)	2004		109,810 DU	
	2020	2004 to 2020	181,437 DU	4,477 DU
	2032 (SACOG)[1]	2004 to 2032	216,962 DU	4,121 DU
	2040	2004 to 2040	261,980 DU	4,227 DU
Retail (KSF)	2004		17,008,000 sq. ft.	
	2020	2004 to 2020	28,575,000 sq. ft.	723,000 sq. ft.
	2040	2004 to 2040	43,015,000 sq. ft.	722,000 sq. ft.
Office (KSF)	2004		9,904,000 sq. ft.	
	2020	2004 to 2020	24,681,000 sq. ft.	924,000 sq. ft.
	2040	2004 to 2040	43,268,000 sq. ft.	927,000 sq. ft.
Industrial (KSF)	2004		21,906,000 sq. ft.	
	2020	2004 to 2020	34,640,000 sq. ft.	796,000 sq. ft.
	2040	2004 to 2040	50,565,000 sq. ft.	796,000 sq. ft.

[1] Based on March 2006 draft development forecasts from SACOG
All growth estimates do not include Placer County's High Country east of Colfax

Table 7 summarizes the development assumptions that were used for the 2020 and Cumulative (2040) travel demand forecasts. The location of the assumed development areas in 2020 and 2040 are shown in Figures 6 and 7, respectively.

Table 7:
Summary of Development Assumptions – 2020 and 2040 Scenarios for Placer Parkway Tier 1 EIS/EIR

Jurisdiction	Residential (DU)			(KSF) Retail			Office			Industrial

4.5 FUTURE TRANSPORTATION SYSTEM

The 2020 No-Build roadway system (shown in Figure 6) includes the following elements:

- The roadway improvements in the MTP that would be implemented by 2020, which includes the funded Capital Improvement Programs (CIPs) of local jurisdictions.
- The proposed new roadways and roadway widening projects that would be part of Phase 1 of the proposed Placer Vineyards development that was assumed in the 2020 development scenario

The assumed 2040 No-Build roadway system (shown in Figure 7) was based on the "Super-Cumulative" scenario that was developed for the evaluation of traffic impacts in several recent EIR's for major developments in Placer County and was prepared through discussions with the staffs of Placer County and the cities of Roseville, Rocklin and Lincoln. The 2040 No-Build roadway system includes the following elements:

- The roadway improvements in SACOG's 2027 MTP that includes the funded Capital Improvement Programs (CIPs) of local jurisdictions. The MTP also includes the addition of HOV lanes and auxiliary lanes on I-80 between Riverside Avenue and SR 65.
- The proposed new roadway and roadway widening projects that would be part of the new developments assumed in the Cumulative (2040) Development Scenario, including the following:
  - New roadways in the Placer Vineyards, Regional University, Placer Ranch, Curry Creek, Creekview, and Sierra Vista developments
  - Widening Baseline Road to six lanes west of Watt Avenue and widening of Watt Avenue to six lanes between Baseline Road and the Sacramento County line that will be required as part of the proposed Placer Vineyards development.
  - The new and widened roadways identified as part of the proposed Lincoln SOI expansion area.
- Widening of SR 65 to six lanes from I-80 to Nelson Road.
- Widening of SR 70/99 to six lanes from I-5 to Riego Road.

The transit system assumptions for the No-Build Alternative were based on the "Funded Constrained Alternative" that was recently developed by PCTPA with the assistance of local transit providers as part of the Placer County Long-range Transit Plan update. This represents the most likely future transit system unless new sources for transit operating subsidies are established.

The Funded Constrained Alternative assumed that operating funds (in particular TDA funds) would increase at the same rate as population in Placer County. The 2040 development scenario represented about a 140 percent increase in population between 2005 and 2040. Based on this, a transit system was defined that represented about a 140 percent increase in bus-miles from the 2005 system. The assumed increase in bus service between 2005 and 2040 is summarized in Table 8, and was defined by the following:

Table 8:
Assumed Transit Service Changes for 2040 Funded Constrained Scenario

Line Name	Existing Service			Funded Constrained Scenario – Assumed Modified or New Service			
		Frequency		Route Description		Assumed Frequency	
	Route Description	Peak Period	Off-peak	Short Range Transit Plan Changes	Other Additional Services	Peak Period	Off-peak
0084 X	RT Watt Avenue	hourly	hourly		Extend to Placer Vineyards	hourly	hourly
BRT1	Placer Ranch/Galleria/I-80

Source: DKS Associates, 2006

- First, the 2005 to 2012 bus service improvements in the Short Range Transit Plans for each of the transit providers in Placer County were assumed.

- Second, other "potential future services" that were discussed in each of Short Range Transit Plans were assumed.

- Third, additional bus service was added to new growth areas that would develop after the 2012 horizon year of the Short-Range Transit Plans.

The 2020 "Opening Year" scenario represents about a 65 percent increase in population in Placer County between 2005 and 2020, and a transit system was defined that represented about a 65 percent increase in bus-miles from the 2005 system. The 2020 No-Build transit system is similar to the "Funded Constrained" transit system that was used for the 2040 transportation analysis. It excludes a number of transit lines that would serve new development areas that were not included in the 2020 development scenario. That is, it excludes transit service to proposed Creekview, Sierra Vista, Placer Ranch, and Regional University Specific Plan areas, the proposed SOI expansion areas of Lincoln, and the Curry Creek Community Plan area in unincorporated Placer County.

4.6 STANDARDS OF SIGNIFICANCE

Transportation impacts were evaluated in the TASA (shown in Figure 1) that covers portions of Sutter County, Placer County, Sacramento County, the cities of Roseville and Rocklin, and the town of Loomis. Potential significant transportation impacts have been evaluated using the following specific criteria:

- In the City of Lincoln, the project would cause the operations on a roadway segment operating at LOS C or better conditions to deteriorate to LOS D or worse conditions. If a roadway segment already operates below the LOS standard, the project would cause roadway operations to deteriorate by one grade, or its volume-to-capacity ratio[1] increases by at least 0.05.

- In unincorporated Placer County, the project would cause a roadway segment operating at LOS C or better conditions to deteriorate to LOS D or worse conditions; or, for a roadway segment within one-half mile of state highways, the project would cause a roadway segment operating at LOS D or better conditions to deteriorate to LOS E or worse conditions. If a roadway segment already operates below the LOS standard, the project would cause roadway operations to deteriorate by one grade, or it causes the volume-to-capacity ratio to increase by at least 0.05.

- In unincorporated Sutter County, the project would cause a roadway segment operating at LOS D or better conditions to deteriorate to LOS E or worse conditions. If a roadway segment already operates below the LOS standard, the project would cause roadway operations to deteriorate by one grade, or it causes the volume-to-capacity ratio to increase by at least 0.05.

- In the City of Roseville, the project would cause a roadway segment operating at LOS C or better conditions to deteriorate to LOS D or worse conditions. If a roadway segment

[1] Volume-to-capacity (V/C) ratio equals the roadway volume divided by its capacity. A volume-to-capacity (v/c) ratio of 0.50 means that vehicles use only ½ of the road or intersection capacity and traffic moves freely. A v/c ratio of 1.0 indicates the volume of vehicles has completely used all the road's capacity and the roadway is congested.

already operates below the LOS standard, the project would cause roadway operations to deteriorate by one grade.

- In the City of Rocklin, the project would cause a roadway segment operating at LOS C or better conditions to deteriorate to LOS D or worse conditions; or, for a roadway segment within one-half mile of access to an interstate freeway, the project would cause a roadway segment operating at LOS D or better conditions to deteriorate to LOS E or worse conditions. If a roadway segment already operates below the LOS standard, the project would cause roadway operations to deteriorate by one grade, or it causes the volume-to-capacity ratio to increase by at least 0.05.

- The project would cause operations on a state highway to deteriorate to levels below the "concept LOS" identified in Caltrans' Transportation Concept Report (TCR). The TCRs for I-80, SR 65, and SR 70/99 indicate that these state highways have a concept LOS "E."

- The project would 1) directly remove or obstruct existing and planned transit facilities, routes, or services; or 2) substantially impact travel times on existing or planned transit routes.

- The project would directly remove or obstruct existing and planned bicycle facilities.

The above criteria focus on impacts to individual transportation facilities and reflect adopted policies of local jurisdictions and agencies. PCTPA and SACOG also have policies related to improving regional access and mobility. To assess the impact of the project on these policies, the following system-wide criteria were defined:

- The project would increase the percentage of vehicle-miles of travel on congested roadways in the TASA.

- The project would increase total vehicle delay in the TASA.

5.0 TRANSPORTATION IMPACT ANALYSIS

5.1 EXISTING PLUS PROJECT CONDITIONS

A qualitative evaluation of Existing Plus Project conditions was conducted for the Tier 1 EIS/EIR for the following reasons:

- The project is not needed to accommodate existing traffic demand. It is intended to reduce expected future traffic congestion levels on the local roadway system in south Sutter County and southwestern Placer County stemming from future development in those areas.
- Construction of the Parkway is not expected to commence until 2020.
- A full evaluation of Existing Plus Project Conditions will be conducted in a Tier 2 EIS/EIR, which will cover the design and construction of this transportation facility.

Sections 5.2 and 5.3 below provide a quantitative analysis of the build alternatives under 2020 (Opening Year) and 2040 (cumulative) conditions. As shown in these sections, the Parkway would affect traffic patterns and volumes on arterial and collector roadways in a broad area covering south/west Placer County, south Sutter County, and north Sacramento County. While some roadway segments near proposed interchanges along the project would have increases in traffic volumes due to Placer Parkway, a larger number of roadway segments would have decreases in traffic volumes.

The 2020 travel demand forecasts assume continued development in areas covered by current general plans within Placer County. None of the following major projects that would require general plan amendments were assumed to be developed by 2020:

- The Creekview and Sierra Vista specific plans in Roseville's Annexation Area.
- The SOI expansion areas of Lincoln.
- The Regional University and Placer Ranch Specific Plans and Curry Creek Community Plan area in unincorporated Placer County.
- Sutter Pointe Specific Plan area. in Sutter County

It was concluded that under Existing Plus Project conditions, the build alternatives would result in similar but smaller changes in travel patterns in the TASA under Existing Plus Project conditions than the under 2020 conditions (described in the following section). That is, the build alternatives would:

- Increase traffic volumes on some roadway segments near proposed interchanges along the Parkway. These increases would likely be less than those under 2020 conditions.
- Result in decreases in traffic volumes on a larger number of local roadway segments in south Sutter County and southwestern Placer County. These decreases would likely be less than those under 2020 conditions.
- Have a lower traffic volume on Placer Parkway than 2020 conditions.

5.2 ANALYSIS OF 2020 CONDITIONS

5.2.1 Changes in Traffic Volumes

Table 9 summarizes the projected 2020 daily traffic volumes on segments of the Parkway under each build alternative. For Alternatives 1 through 5, traffic forecasts were made both with and without a potential interchange at the future extension of Watt Avenue. For Alternative 1, two general locations for this potential interchange—a north and a south location—were sited through discussions with the TAC. See Figure 4 for assumed interchange locations along the Placer Parkway corridor alternatives. Table 10 shows the 2020 projected daily volumes on each of the assumed on- and off-ramps to Placer Parkway under each alternative.

Table 11 compares estimated 2020 daily traffic volumes on study area roadways under each build alternative to each other and to 2005 traffic volumes. The change in traffic volumes on study area roadways for Alternatives 1 through 5 compared to the No-Build Alternative are shown in Table 12. The locations of the volumes provided in Tables 11 and 12 are shown on Figure 8.

To help illustrate how the Parkway would affect traffic patterns and volumes, a set of "difference plots" were prepared that show which roadways would have increases and which would have decreases in volumes due to a corridor alternative when compared to the No-Build Alternative. On Figure 9 through Figure 19, these differences are shown for each alternative with red colors on roadways that would receive increases in volumes (compared to the No-Build Alternative) and green colors on roadways with decreases in volume. The width of the red or green bands on each roadway provides an indication of the magnitude of the change in traffic volumes (compared to the No-Build Alternative with larger changes having the widest band widths).

These figures show that compared to the No-Build Alternative, Alternatives 1 through 5 would decrease traffic on many arterial/collector roadway segments in western Roseville, unincorporated portions of west Placer County, and unincorporated portions of south Sutter County. While all of these alternatives would decrease traffic volumes on many roadway segments, they would all cause increases in traffic volumes on the following segments:

- SR 70/99 south of where the Parkway would connect to this state highway
- SR 65 north of where the Parkway would connect to this state highway
- Rocklin's Whitney Ranch Parkway and the future Valley View Parkway
- Some roadways near future Placer Parkway interchanges.

5.2.2 Changes in Traffic Levels of Service

The Purpose and Need Statement for the Parkway indicates that it would be designed to "improve travel times between the SR 65 corridor and SR 70/99 by maintaining a travel speed at or near the free flow speed of the Parkway, which on a freeway reflects LOS C to D conditions." Table 13 shows the estimated 2020 LOS on segments of the Parkway based on four travel lanes with and without a Watt Avenue interchange. This table shows that under all alternatives, all segments would operate at LOS A or B conditions in 2020 if four lanes are provided.

Table 14 shows the estimated volume/capacity ratio in 2020 on key roadway segments under each project alternative. Table 15 provides the resulting LOS on these roadway segments.

Table 9:
Projected 2020 Daily Traffic Volumes on Placer Parkway Mainline

Number	Segment	Lanes	Average Daily Volume

Notes
[1] +2 = Plus two HOV lanes
[2] Traffic volumes on state highways are from 2004. Counts on some local roadways were taken prior to 2005
[3] Two general locations for a potential interchange on Placer Parkway at the future extension of Watt Avenue were identified with Alternative 1 – a north and a south location (see Figure 4 for assumed interchange locations)

Notes
[1] +2 = Plus two HOV lanes
[2] Traffic volumes on state highways are from 2004. Counts on some local roadways were taken prior to 2005
[3] Two general locations for a potential interchange on Placer Parkway at the future extension of Watt Avenue were identified with Alternative 1 – a north and a south location (see Figure 4 for assumed interchange locations)

- 20,000-40,000
- >40,000

Change in Volume on Non-Project Roadways[2]
- <-10,000
- 5,000-10,000 Decrease
- 1,000-5,000 Decrease
- 100-1,000 Decrease
- 1-100 Decrease
- No Change
- 1-100 Increase
- 100-1,000 Increase
- 1,000-5,000 Increase
- 5,000-10,000 Increase
- >10,000 Increase

Cities and Specific Plan Areas

Notes:

[1] Project Roadways are Placer Parkway and its Interchanges. See Tables 9 & 10 for Daily Volumes on Placer Parkway.

[2] See Table 12 for Change in Daily Volumes for Non-Project Roadways.

Tier 1 EIS/EIR
Transportation
Technical Report

June 2007

Table 13:
Projected 2020 Level of Service on Placer Parkway with 4 Travel Lanes

		Average Daily Volume										
		Alternative 1			Alternative 2		Alternative 3		Alternative 4		Alternative 5	
	Segment	With Watt South	With Watt North	With Watt	With Watt	Without Watt	With Watt	Without Watt	With Watt	Without Watt	With Watt	Without Watt

[1] +2H = Plus two HOV lanes
[2] Levels of service on state highways are from 2004
[3] Two general locations for a potential interchange on Placer Parkway at the future extension of Watt Avenue were identified with Alternative 1 – a north and a south location (see Figure 4 for assumed interchange locations)

Source: DKS Associates, 2006

The comparison between the No-Build Alternative and the build alternatives under 2020 conditions indicates that there would be significant LOS impacts on some roadway segments. These impacts are discussed in Section 5.3.

5.2.3 Changes in System-Wide Congestion and Delay

The Parkway would have an impact on travel patterns in a fairly wide area. While some roadway segments would have increases in traffic volumes due to Placer Parkway, a larger number of roadway segments would have decreases in traffic volumes. In addition to measuring changes in traffic volumes and LOS on individual roadway segments (discussed in the previous sections), the following systemwide measures were defined to show the impacts and benefits to the roadway system as a whole:

- Vehicle-miles of travel on congested roadways
- Vehicle delay.

These two system-wide measures were estimated using the travel demand model for the following two areas:

- **The TASA,** shown with the assumed 2020 roadway network in Figure 6, covers the area where the travel model shows "significant" changes in traffic volumes, although the percentage of roadways that would be affected by Placer Parkway decreases on the fringes of that area. The TASA extends from Nicolaus Road on the north to I-80 on the south, and from Sierra College Boulevard on the east to west of SR 70/99. This area covers portions of eight jurisdictions: Placer County, Sutter County, Sacramento County, the cities of Roseville, Rocklin, Lincoln, and Sacramento, and the Town of Loomis.

- **The Analysis Focus Area,** also shown in Figure 6, is the area close to the build alternatives and represents the area where most of the transportation benefits of constructing Placer Parkway would occur.

Tables 16 and 17 show the projected VMT on congested roadways during commute periods under the 2020 and 2040 conditions, respectively, for the full TASA (shown in Figure 6). Tables 18 and 19 show this same information, but as percentages of the total VMT in the full TASA.

Tables 20 and 21 show the projected VMT on congested roadways during commute periods under the 2020 and 2040 conditions, respectively, for the Analysis Focus Area (also shown in Figure 6). Tables 22 and 23 show this same information, but as percentages of the total VMT in the Analysis Focus Area.

VMT was summarized in those tables separately for roadways that would operate at LOS F for 1 hour, 2 hours, and for 3 or more hours. Key conclusions are:

- Compared to the No-Build Alternative, all build alternatives would increase the total VMT in the TASA.

- Compared to the No-Build Alternative, all build alternatives would reduce the amount of VMT on congested roadways, especially in the Analysis Focus Area. For each alternative, the scenarios with a Watt Avenue interchange would provide a larger reduction in VMT on congested roadways than without this interchange.

Vehicle delay can be measured in a number of ways. For this analysis, vehicle delay was defined as the additional travel time that vehicles would take to travel on a roadway segment beyond the time that it would take under a given LOS threshold. The added travel time was measured system-wide for three LOS thresholds:

- > LOS D – the added travel time for vehicles faced with LOS E and F conditions
- > LOS E – the added travel time for vehicles faced with LOS F conditions
- > LOS F2 – the added travel time for vehicles faced with LOS F3+ conditions.

Table 24 shows the projected vehicle delay during the 3-hour a.m. and 3-hour p.m. peak commute periods combined under the 2020 conditions for the full TASA (shown in Figure 6). Table 25 shows this same information for the Analysis Focus Area (also shown in Figure 6). These tables indicate that Placer Parkway would significantly reduce vehicle hours of delay, especially in the Analysis Focus Area. Vehicle delay would be lower for scenarios with a Watt Avenue interchange than without that interchange.

5.2.4 Traffic Effects of Potential Interchange at Watt Avenue

As discussed in Section 2.4, an extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 4). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. However, the connection of Placer Parkway to a potential Watt Avenue could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/EIR evaluate each corridor alternative with and without a Watt Avenue interchange.

The changes in traffic volumes due to each build alternative with and without a potential Watt Avenue interchange are described in Tables 9 through 12 and Figures 9 through 19. A review of these tables and figures indicates that a Watt Avenue interchange would increase volumes on some roadway segments and decrease volumes on others. The effects of a Watt Avenue interchange are summarized below.

An interchange between Placer Parkway to a potential Watt Avenue extension would result in higher traffic volumes on some roadways in the TASA than without that interchange. The roadway segments that would have the most substantial increase in traffic volume due to a Watt Avenue interchange are as follows:

- Placer Parkway
- Watt Avenue north of Elverta Road
- SR 70/99 south of Placer Parkway
- Blue Oaks Boulevard west of Foothills Boulevard.

A limited number of other roadway segments would also have higher traffic volumes with a Watt Avenue interchange than without that interchange, primarily in the vicinity of this potential interchange.

While north of Elverta Road Watt Avenue would have higher volumes with the Watt Avenue interchange than without that interchange, south of Elkhorn Boulevard the interchange would result in small decreases in traffic volumes, except for Alternative 1. Under all build alternatives, a Watt Avenue interchange would result in very small changes in traffic volumes on the Watt Avenue/I-80 interchange ramps and overpass. At the request of Caltrans, projected traffic volumes on the ramps to the I-80/SR 51/Watt Avenue interchange have been provided for each alternative. These estimates (see Table 26) show that traffic volumes will increase on some of the Watt Avenue/I-80 interchange ramps between 2005 and 2020, but the 2020 volumes on these ramps would only change marginally as a result of any of the build alternatives.

[1] Two general locations for a potential interchange on Placer Parkway at the future extension of Watt Avenue were identified with Alternative 1 – a north and a south location (see Figure 4 for assumed interchange locations)
Note: SR 51 is commonly called the Capitol City Freeway

Source: DKS Associates, 2006

An interchange between Placer Parkway and a potential Watt Avenue extension would result in lower traffic volumes on a number of roadways in the TASA than without that interchange. The roadway segments that would have the most substantial reduction in traffic volume due to a Watt Avenue interchange are as follows:

- Portions of SR 65 near Placer Parkway
- Portions of I-80
- Baseline Road
- Riego Road
- Fiddyment Road south of Placer Parkway
- Walerga Road

A number of other roadway segments would also have lower volumes with a Watt Avenue interchange than without that interchange, including:

- Portions of Foothill Boulevard, Woodcreek Oaks Boulevard, Washington Boulevard, Industrial Avenue, and Pleasant Grove Boulevard in the City of Roseville
- Portions of Catlett Road/East Catlett Road, Sierra College Boulevard
- Portions of Elkhorn Boulevard, Elverta Road, and Walerga Road in north Sacramento County

5.3 ANALYSIS OF CUMULATIVE (2040) CONDITIONS

5.3.1 Changes in Traffic Volumes

Table 27 summarizes the projected 2040 daily traffic volumes on segments of the Parkway under each alternative. For Alternatives 1 through 5, traffic forecasts were made both with and without a potential interchange at the future extension of Watt Avenue. For Alternative 1, two general locations for this potential interchange – a north and a south location – were sited. See Figure 4 for assumed interchange locations along the Placer Parkway corridor alternatives. Table 28 shows the 2040 projected daily volumes on each of the assumed on- and off-ramps to Placer Parkway under each alternative.

Table 29 compares estimated 2040 daily traffic volumes on study area roadways under each Placer Parkway alternative to each other and to 2005 traffic volumes. The change in traffic volumes on study area roadways for Alternatives 1 through 5 compared to the No-Build Alternative are also shown in Table 30. The locations of the volume changes provided in Tables 29 and 30 are shown on Figure 20.

To help show how the Parkway would affect traffic patterns and volumes, a set of "difference plots" were prepared that show which roadways would have increases and which would have decreases in volumes due to a build alternative when compared to the No-Build Alternative. On Figure 21 through Figure 31, these differences are shown for each alternative with red colors on roadways that would receive increases in volumes (compared to the No-Build Alternative), and green colors on roadways with decreases in volume. The width of the red or green bands on each roadway provides an indication of the magnitude of the change in traffic volumes (compared to the No-Build Alternative with larger changes having the widest band widths).

These figures show that compared to the No-Build Alternative, Alternatives 1 through 5 would decrease traffic on many arterial/collector roadway segments in western Roseville, unincorporated portions of west Placer County, and unincorporated portions of south Sutter County. While all of the build alternatives would decrease traffic volumes on many roadway segments, they would all cause increases in traffic volumes on the following:

Notes
[1] +2 = Plus two HOV lanes
[2] Traffic volumes on state highways are from 2004. Counts on some local roadways were taken prior to 2005
[3] Two general locations for a potential interchange on Placer Parkway at the future extension of Watt Avenue were identified with Alternative 1 – a north and a south location (see Figure 4 for assumed interchange locations)

Notes
[1] +2 = Plus two HOV lanes
[2] Traffic volumes on state highways are from 2004. Counts on some local roadways were taken prior to 2005
[3] Two general locations for a potential interchange on Placer Parkway at the future extension of Watt Avenue were identified with Alternative 1 – a north and a south location (see Figure 4 for assumed interchange locations)

Tier 1 EIS/EIR
Transportation
Technical Report

June 2007

- SR 70/99 south of where Placer Parkway would connect to this state highway
- SR 65 north of where Placer Parkway would connect to this state highway
- Rocklin's Whitney Ranch Parkway and the future Valley View Parkway
- Some roadways near future Placer Parkway interchanges.

5.3.2 Changes in Traffic Levels of Service

The Purpose and Need Statement for the Parkway indicates that the roadway would be designed to "improve travel times between the SR 65 corridor and SR 70/99 by maintaining a travel speed at or near the free flow speed of the Parkway, which on a freeway reflects LOS C to D conditions." Table 31 shows the estimated 2040 LOS on segments of Placer Parkway based on four- or six-lane configurations with and without a Watt Avenue interchange. This table shows that in 2040:

- All Parkway segments would operate at LOS C or better conditions with any of the build alternatives if six lanes are provided.

- Some Parkway segments would operate at LOS E or F conditions with some of the build alternatives if four lanes are provided.

Table 32 shows the estimated volume/capacity ratio in 2040 on key roadway segments under each project alternative. Table 33 provides the resulting LOS on these roadway segments.

The comparison between the No-Build Alternative and the other alternatives under 2040 conditions indicates that there would be significant LOS impacts on some roadway segments. These impacts are discussed Section 5.3.4.

5.3.3 Changes in System-Wide Congestion and Delay

Placer Parkway would have an impact on travel patterns in a fairly wide area. While some roadway segments would have increases in traffic volumes due to the Parkway, a larger number of roadway segments would have decreases in traffic volumes. In addition to measuring changes in traffic volumes and levels of service on individual roadway segments (discussed in the previous sections), the following system-wide measures were defined to show the impacts and benefits to the roadway system as a whole:

- Vehicle-miles of travel on congested roadways
- Vehicle delay.

These two system-wide measures were estimated for using the travel demand model for the following two areas:

- **The TASA,** shown with the assumed 2040 roadway network in Figure 7, covers the area where the travel model shows "significant" changes in traffic volumes, although the percentage of roadways that would be affected by Placer Parkway decreases on the fringes of that area. The TASA extends from Nicolaus Road on the north to I-80 on the south, and from Sierra College Boulevard on the east to west of SR 70/99. This area covers portions of eight jurisdictions: Placer County, Sutter County, Sacramento County, the cities of Roseville, Rocklin, Lincoln, and Sacramento, and the Town of Loomis.

- **The AFA,** also shown in Figure 7, is the area close to the build alternatives and represents the area where most of transportation benefits of constructing Placer Parkway would occur.

Table 31:
Projected 2040 Level of Service on Placer Parkway with 4 or 6 Travel Lanes

	Segment	Average Daily Volume																					
		Alternative 1						Alternative 2				Alternative 3				Alternative 4				Alternative 5

Notes

Numbers in bold represent LOS F conditions
Shaded cells represent potential LOS impacts based on policies of jurisdictions and agencies in TASA.
[1] +2 = Plus two HOV lanes
[2] Levels of service on state highways are from 2004.
[3] Two general locations for a potential interchange on Placer Parkway at the future extension of Watt Avenue were identified with Alternative 1 – a north and a south location (see Figure 4 for assumed interchange locations)

Notes

Shaded cells represent potential LOS impacts based on policies of jurisdictions and agencies in analysis study area.
[1] +2 = Plus two HOV lanes
[2] Levels of service on state highways are from 2004.
[3] Two general locations for a potential interchange on Placer Parkway at the future extension of Watt Avenue were identified with Alternative 1 – a north and a south location (see Figure 4 for assumed interchange locations)

Source: DKS Associates, 2006

Tables 34 and 35 show the projected VMT on congested roadways during commute periods under the 2040 conditions for the TASA (shown in Figure 7). Tables 36 and 37 show this same information but as percentages of the total VMT in the TASA.

Tables 38 and 39 show the projected VMT on congested roadways during commute periods under the 2040 conditions for the AFA (also shown in Figure 7). Tables 40 and 41 show this same information but as percentages of the total VMT in the AFA.

VMT was summarized in those tables separately for roadways that would operate at LOS F for 1 hour, 2 hours, and for 3 or more hours. Key conclusions that can be drawn from this table are:

- Compared to the No-Build Alternative, Alternatives 1 through 5 would increase the total VMT in the TASA.

- Compared to the No-Build Alternative, Alternatives 1 through 5 would reduce the amount of VMT on congested roadways, especially in the AFA. For each alternative, the scenarios with a Watt Avenue interchange would provide a larger reduction in the amount of VMT on congested roadways than without this interchange.

Vehicle delay can be measured in a number of ways. For this analysis, vehicle delay was defined as the additional travel time that vehicle would take to travel on a roadway segment beyond the time that it would take under a given LOS threshold. The added travel time was measured for three LOS thresholds:

- > LOS D – the added travel time for vehicles faced with LOS E and F conditions
- > LOS E – the added travel time for vehicles faced with LOS F conditions
- > LOS F2 – the added travel time for vehicles faced with LOS F3+ conditions.

Table 42 shows the projected vehicle delay during the 3-hour a.m. and 3-hour p.m. peak commute periods combined under the 2040 conditions for the TASA (shown in Figure 7). Table 43 shows this same information for the AFA (also shown in Figure 7). These tables indicate that Placer Parkway would significantly reduce vehicle hours of delay, especially in the AFA. Vehicle delay would be lower for scenarios with a Watt Avenue interchange than without that interchange.

5.3.4 Traffic Effects of Potential Interchange at Watt Avenue

As discussed in Section 2.4, an extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 4). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. However, the connection of Placer Parkway to a potential Watt Avenue interchange could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/EIR evaluate each corridor alternative with and without a Watt Avenue interchange.

The changes in traffic volumes due to each corridor alternative with and without a potential Watt Avenue interchange are described in Tables 27 through 30 and Figures 21 through 31. A review of these tables and figures indicates that a Watt Avenue interchange would increase volumes on some roadway segments and decrease volumes on others. The effects of a Watt Avenue interchange are summarized below.

The connection of Placer Parkway to a potential Watt Avenue interchange would result in higher traffic volumes on some roadways in the TASA than the same corridor alternative without that interchange. The roadway segments that would have the most substantial increase in traffic volume due to a Watt Avenue interchange are the following:

Source: DKS Associates, 2006

- Placer Parkway
- Watt Avenue north of Elverta Road
- SR 70/99 south of Placer Parkway
- Blue Oaks Boulevard west of Foothills Boulevard.

A limited number of other roadway segments would also have higher traffic volumes with a Watt Avenue interchange than without that interchange, but these segments would be located primarily near this potential interchange.

While north of Elverta Road, Watt Avenue would have higher volumes with the Watt Avenue interchange than without that interchange; south of Elkhorn Boulevard the interchange would result in small decreases in traffic volumes. Under all alternatives a Watt Avenue interchange would result in very small changes (increases or decreases) in traffic volumes on the Watt Avenue/I-80 interchange ramps and overpass. At the request of Caltrans, projected traffic volumes on the ramps to the I-80/Watt Avenue interchange have been provided for each alternative. These estimates (see Table 44) show that traffic volumes will increase on the Watt Avenue/I-80 interchange ramps between 2005 and 2040, but the 2040 volumes on these ramps would only change marginally due to any of the build alternatives.

The connection of Placer Parkway to a potential Watt Avenue interchange would result in lower traffic volumes on a number of roadways in the TASA than the same corridor alternative without that interchange. The roadway segments that would have the most substantial reduction in traffic volume due to a Watt Avenue interchange are the following:

- Portions of SR 65 near Placer Parkway
- Portions of I-80
- Baseline Road
- Riego Road
- Fiddyment Road south of Placer Parkway
- Walerga Road.

A number of other roadway segments would also have lower volumes with a Watt Avenue connection than without that connection, including the following:

- Portions of Foothill Boulevard, Woodcreek Oaks Boulevard, Washington Boulevard, Industrial Avenue, and Pleasant Grove Boulevard in the City of Roseville
- Portions of Catlett Road/East Catlett Road, Sierra College Boulevard
- Portions of Elkhorn Boulevard, Elverta Road and Walerga Road in north Sacramento County.

5.4 POTENTIAL IMPACTS AND MITIGATION STRATEGIES

5.4.1 Traffic Impacts and Mitigation Strategies under 2020 Conditions

The comparison between the No-Build Alternative and the other alternatives under 2020 conditions indicates that there would be significant LOS impacts on the roadway segments discussed below.

Impact T-1: Under all of the corridor alternatives/Watt Avenue interchange scenarios, Placer Parkway would add traffic to SR 70/99 between I-5 and Riego Road and would cause a significant impact on the LOS of this freeway segment.

Table 44:
Projected 2040 Daily Traffic Volumes on I-80/SR 51/Watt Avenue Interchange Ramps

Ramp	2005 Average Daily Volume	2040 Average Daily Volume											
			Alternative 1			Alternative 2		Alternative 3		Alternative 4		Alternative 5	
		No-Build	With Watt South[1]	With Watt North[1]	Without Watt	With Watt	Without Watt	With Watt	Without Watt	With Watt	Without Watt	With Watt	Without Watt

[1] Two general locations for a potential interchange on Placer Parkway at the future extension of Watt Avenue were identified with Alternative 1 – a north and a south location (see Figure 4 for assumed interchange locations)
Note: SR 51 is commonly called the Capitol City Freeway

Source: DKS Associates, 2006

Caltrans District 3's Draft Transportation Concept Report (TCR) for SR 99 (May 2004) is a long-range planning document for SR 99 within Sacramento, Sutter, and Butte counties. In addition to a 20-year Route Concept, the TCR includes an Ultimate Concept, which is the ultimate goal for the route beyond the 20-year planning horizon. In the TCR, the 125 miles of SR 99 in District 3 were divided into 15 segments. Placer Parkway would have a significant impact on Segment 4 (I-5 to the Sutter County Line) and on a portion of Segment 5 (Sutter County Line to the SR 70/99 wye).

The 20-year Route Concept calls for upgrading the existing expressway portion of the route between Elkhorn Boulevard and the SR 70/99 wye (north of Catlett Road) to freeway standards and to widen this segment to six lanes. The Ultimate Concept calls for eight freeway lanes on SR 70/99 between I-5 and the SR 70/99 wye.

The 2020 No-Build Alternative assumed that SR 70/99 would be upgraded to a freeway status from I-5 to Riego Road through the construction of interchanges at Elverta Road and Riego Road, but would remain a four-lane facility. With the construction of any of the Placer Parkway alternatives, auxiliary lanes were assumed to be added to SR 70/99 south of the on-ramps and off-ramps to Placer Parkway.

SR 70/99 would operate at LOS F conditions in 2020 between I-5 and Elkhorn Boulevard under the No-Build Alternative. All of the alternatives, with and without a potential interchange on the Parkway at Watt Avenue, would add traffic to SR 70/99 from I-5 to Elkhorn Boulevard, and thereby lengthen the period of time during the peak period when SR 70/99 would operate at LOS F conditions.

This is considered a ***significant impact*** under all alternatives/scenarios.

Mitigation Strategies for Impact T-1: The following strategies (individually or in combinations) could reduce the project's impact's on SR 70/99 by decreasing the length of time spent in LOS F conditions during the morning and evening peak periods:

> **Strategy T-1a:** Add HOV lanes to SR 70/99 between Placer Parkway and I-5.
>
> **Strategy T-1b:** Construct a controlled-access roadway parallel to SR 70/99 between Riego Road and Elkhorn Boulevard. The roadway could carry short to medium-range trips between future growth areas in south Sutter County and Northern Sacramento County that would otherwise use SR 70/99.
>
> **Strategy T-1c:** Provide substantial transit services in the SR 70/99 Corridor, including express bus services during commute periods, and frequent all-day services from urban areas of Sutter and South/west Placer counties to the Natomas area and Downtown Sacramento.
>
> **Strategy T-1d:** Identify "fair share" contributions for new development in portions of Placer, Sutter, and Yuba counties that would contribute traffic to SR 70/99 to help fund improvements to SR 70/99.

The growth in traffic demand on SR 70/99 will stem from development over a wide area. Traffic impact fees on this new development are a potential source of funding for improvements in the SR 70/99 corridor. To adequately spread the cost of improvements on a fair-share basis, a mechanism, such as a multi-jurisdictional Joint Powers Authority that covers portions of Placer, Sutter and Yuba counties, would need to be established to collect fees, and plan, design, and construct improvements.

Impact T-2: Under all of the corridor alternatives/Watt Avenue interchange scenarios, Placer Parkway would add traffic to SR 65 between Placer Parkway and the SR 65 Lincoln Bypass, and would cause a significant impact on the LOS of this freeway segment.

Caltrans District 3's TCR for SR 65 (July 2001) is a long-range planning document for SR 65 in Sacramento and Yuba counties. In addition to a 20-year Route Concept, the TCR includes an Ultimate Concept, which is the ultimate goal for the route beyond the 20-year planning horizon. In the TCR, SR 65 in District 3 was divided into six segments. Placer Parkway would have a significant impact on Segment 2 (between Blue Oaks Boulevard and Industrial Avenue).

The 20-year Route Concept calls for upgrading the existing expressway portion of the route between Blue Oaks Boulevard and the Industrial Avenue to freeway standards. The Ultimate Concept calls for six freeway lanes on this segment of SR 65.

The 2020 No-Build Alternative assumed a four-lane freeway for SR 65 from I-80 to the City of Lincoln, including construction of the SR 65 Lincoln Bypass. With the construction of any of the Placer Parkway alternatives, auxiliary lanes were assumed to be added to SR 65 north and south of the on-ramps and off-ramps to Placer Parkway.

The development forecasts for 2020 include substantial development along the SR 65 Corridor in Placer County. Substantial development is also expected in Yuba and Sutter counties north of the Placer Parkway study area. The anticipated development by 2020 is projected to increase traffic volumes along SR 65 dramatically.

SR 65 would operate at LOS F conditions in 2020 between I-80 and the SR 65 Lincoln Bypass under the No-Build Alternative. All of the build alternatives, with and without a potential interchange on the Parkway at Watt Avenue, would add traffic to SR 65 from the proposed Placer Parkway and the SR 65 Lincoln Bypass, and thereby lengthen the period of time during the peak period when SR 65 would operate at LOS F conditions.

This is considered a ***significant impact*** under all alternatives.

Mitigation Strategies for Impact T-2: Several strategies were identified that by themselves or in combinations could mitigate the LOS impacts on this segment of SR 65. These are as follows:

> **Strategy T-2a:** Widen SR 65 to six lanes between Placer Parkway and the SR 65 Lincoln Bypass.
>
> **Strategy T-2b:** Provide additional north–south capacity on local roadways parallel to SR 65.
>
> **Strategy T-2c:** Provide substantial transit services in the SR 65 Corridor.
>
> **Strategy T-2d:** Identify "fair share" contributions for new development that would contribute traffic to SR 65 to help fund improvements to SR 65.

The growth in traffic demand on SR 65 will stem from development over a wide area. Traffic impact fees on this new development are a potential source of funding for improvements in the SR 65 corridor. The South Placer Regional Transportation Authority (SPRTA), which currently collects traffic impact fees for various improvements to regional roadways in South Placer County (called Tier 1 projects), has

considered additional fees for a set of "Tier 2" projects that would include improvements to SR 65 between Lincoln and I-80.

Impact T-3: Under one scenario, Placer Parkway would add traffic to Watt Avenue between Elverta Road and the Placer County line and would cause a significant impact on the LOS of this roadway segment.

Watt Avenue would operate at LOS E conditions in 2020 between the Elverta Road and the Placer County Line, and LOS F under Alternative 1 with the southern location for a potential interchange on Placer Parkway at Watt Avenue.

This is considered a ***significant impact*** under one scenario.

Mitigation Strategies for Impact T-3: The following strategies were identified to mitigate the LOS impacts on this segment of Watt Avenue:

> **Strategy T-3a:** Construct six lanes on Watt Avenue between Elverta Road and the Placer County line.
>
> **Strategy T-3b:** Identify "fair share" contributions for new development that contribute traffic to Watt Avenue to help fund improvements to Watt Avenue.

This segment of Watt Avenue was assumed to have four lanes in 2020 under all alternatives/scenarios but the Sacramento County General Plan calls for it to ultimately have six lanes.

The growth in traffic demand on Watt Avenue will stem from development in portions of Sacramento and Placer County. Traffic impact fees on this new development are a potential source of funding for improvements to Watt Avenue. Sacramento County has development fees for roadway and transit improvements and they are currently updating those fees.

To spread the cost of improvements on a fair-share basis to portions of both Placer and Sacramento counties, some mechanism, such as a multi-jurisdictional Joint Powers Authority that covers portions of Placer and Sacramento counties, would need to be established.

Impact T-4: Under all corridor alternatives/Watt Avenue interchange scenarios, Placer Parkway would reduce system-wide traffic congestion levels and vehicle delay.

As shown in Tables 18 and 19, compared to the No-Build Alternative, all of the build alternatives would decrease the percentage of vehicle-miles of travel on congested roadways in the TASA. Tables 22 and 23 indicate that the percent reduction in vehicle-miles of travel on congested roadways would be even greater in the Analysis Focus Area.

Tables 24 and 25 indicate that all of the build alternatives would significantly reduce vehicle-hours of delay, especially in the AFA. Vehicle delay would be lower for scenarios with a Watt Avenue interchange than without that interchange.

This impact is considered ***less than significant*** under all alternatives.

5.4.2 Traffic Impacts and Mitigation Strategies under 2040 Conditions

The comparison between the No-Build Alternative and the other alternatives under 2040 conditions indicates that there would be significant LOS impacts on the roadway segments discussed below.

Impact T-5: Under all of the corridor alternatives/Watt Avenue interchange scenarios, Placer Parkway would add traffic to SR 70/99 between I-5 and Riego Road, and would cause a significant impact on the LOS of this freeway segment.

Caltrans District 3's Draft TCR for SR 99 (May 2004) is a long-range planning document for SR 99 within Sacramento, Sutter and Butte counties. In addition to a 20-year Route Concept, the TCR includes an Ultimate Concept, which is the ultimate goal for the route beyond the 20-year planning horizon. In the TCR, the 125 miles of SR 99 in District 3 were divided into 15 segments. Placer Parkway would have a significant impact on Segment 4 (I-5 to the Sutter County Line), and on a portion of Segment 5 (Sutter County Line to the SR 70/99 wye).

The 20-year Route Concept calls for upgrading the existing expressway portion of the route between Elkhorn Boulevard and the SR 70/99 wye (north of Catlett Road) to freeway standards and to widen this segment to six lanes. The Ultimate Concept calls for eight freeway lanes on SR 70/99 between I-5 and the SR 70/99 wye.

The 2040 No-Build Alternative assumed six lanes on SR 70/99 from I-5 to Riego Road, which is consistent with the 20-year Route Concept in the TCR. With the construction of any of the Placer Parkway alternatives, auxiliary lanes were assumed to be added to SR 70/99 south of the on-ramps and off-ramps to Placer Parkway.

Outside of Placer County and south Sutter County, the 2040 development forecasts are based on SACOG's Preferred Blueprint Scenario and include substantial development along the SR 70/99 Corridor. Substantial development is expected in Yuba and Sutter counties north of the Placer Parkway study area. Development is also anticipated in the Natomas Visioning Area, an area of north Sacramento County just south of the study area that was not assumed to have development in SACOG's previous 2025 forecasts for the Metropolitan Transportation Plan. The anticipated development by 2040 is projected to increase traffic volumes along SR 70/99 dramatically.

SR 70/99 would operate at LOS F conditions in 2040 between I-5 and Riego Road under the No-Build Alternative. All of the build alternatives, with and without a potential interchange at Watt Avenue, would add traffic to SR 70/99 from I-5 to the Parkway and thereby lengthen the period of time during the peak period where SR 70/99 would operate at LOS F conditions. Under Alternatives 4 and 5, Placer Parkway would connect to SR 70/99 further north than under Alternatives 1, 2 and 3, and thus a longer stretch of SR 70/99 would be impacted under those two alternatives.

This is considered a ***significant impact*** under all alternatives.

Mitigation Strategies for Impact T-5: Several strategies were identified that by themselves or in combinations could mitigate the LOS impacts on this segment of SR 70/99. These are as follows:

> **Strategy T-5a:** Add HOV lanes to SR 70/99 between Placer Parkway and I-5.
>
> **Strategy T-5b:** Construct a controlled-access roadway parallel to SR 70/99 between Riego Road and Elkhorn Boulevard. The roadway could carry short to medium-range

trips between future growth areas in south Sutter County and Northern Sacramento County that would otherwise use SR 70/99.

Strategy T-5c: Provide substantial transit services in the SR 70/99 Corridor, particularly express bus services during commute periods.

Strategy T-5d: Identify "fair share" contributions for new development in portions of Placer, Sutter, and Yuba counties that would contribute traffic to SR 70/99 to help fund improvements to SR 70/99.

The growth in traffic demand on SR 70/99 will stem from development over a wide area. Traffic impact fees on this new development are a potential source of funding for improvements in the SR 70/99 corridor. To adequately spread the cost of improvements on a fair-share basis, a mechanism, such as a multi-jurisdictional Joint Powers Authority that covers portions of Placer, Sutter, and Yuba counties, would need to be established to collect fees, and plan, design, and construct improvements.

Impact T-6: Under those scenarios with a Watt Avenue interchange near its intersection with Blue Oaks Boulevard, Placer Parkway would add traffic to Blue Oaks Boulevard between Watt Avenue and Westside Drive and would cause a significant impact on the LOS of this roadway segment.

Under the No-Build Alternative, the assumed six-lane segment of Blue Oaks Boulevard between the future Watt Avenue extension and Westside Drive in West Roseville would operate at LOS C conditions in 2040. This segment would operate at LOS D conditions under the following build alternatives and potential Watt Avenue interchange scenarios:

- Alternative 1 with a northern location for a potential Watt Avenue interchange
- Alternative 2 with a potential Watt Avenue interchange
- Alternative 3 with a potential Watt Avenue interchange
- Alternative 4 with a potential Watt Avenue interchange.

The change from LOS C to LOS D condition on this roadway segment is considered a ***significant impact*** for these alternatives.

Mitigation Strategies for Impact T-6: The following strategies were identified to mitigate the LOS impacts on this segment of Blue Oaks Boulevard:

Strategy T-6a: Provide adequate lanes at the Blue Oaks Boulevard/ Westside Drive and Blue Oaks Boulevard/Watt Avenue intersections.

Strategy T-6b: Widen Blue Oaks Boulevard from six to eight lanes between Westside Drive and Watt Avenue.

Strategy T-6c: Identify "fair share" contributions for new development that would contribute traffic to Blue Oaks Boulevard to help fund improvements to Blue Oaks Boulevard.

The location of a potential interchange on Placer Parkway with Watt Avenue is unknown, but a northern location near the intersection of Watt Avenue with Blue Oaks is a likely location under all alternatives. If an interchange is constructed on Placer Parkway at a northern location, peak hour traffic volumes along

Blue Oaks Boulevard would need to be studied in more detail to determine what improvements are needed to meet the City Of Roseville's LOS C standard.

The segment of Blue Oaks Boulevard between Watt Avenue and Westside Drive was assumed to have six lanes under all scenarios. A segment-based analysis suggests a widening of this segment to eight lanes to mitigate the LOS impact. However, Roseville's LOS policy focuses on the operations of signalized intersections during the p.m. peak hour at buildout of the City's entitled land uses. Construction of adequate turn lanes at the intersections of Blue Oaks Boulevard/Westside Drive and Blue Oaks Boulevard/Watt Avenue may provide LOS C conditions without the need for a widening of this segment to eight lanes.

The growth in traffic demand on Blue Oaks Boulevard will stem from development over portions of Roseville, Lincoln and unincorporated Placer County. Traffic impact fees on this new development are a potential source of funding for improvements to Blue Oaks Boulevard, and all three of these jurisdictions have traffic impact fees for roadway improvements within their jurisdictions. To adequately spread the cost of improvements on a fair-share basis, a mechanism, such as a multi-jurisdictional Joint Powers Authority that covers portions of several jurisdictions, would need to be established. Placer County and the City of Roseville have established a Joint Powers Authority that covers portions of those jurisdictions to fund certain roadway improvements in west Placer County including Fiddyment Road and Walerga Road.

Impact T-7: Under some scenarios, Placer Parkway would add traffic to Fiddyment Road north of the future Blue Oaks Boulevard and would cause a significant impact on the LOS of this roadway segment.

The four-lane segment of Fiddyment Road north of Blue Oaks Boulevard would operate at LOS E conditions in 2040 under the No-Build Alternative. This segment would operate at LOS F conditions under all of the build alternatives if there is no interchange on Placer Parkway at Watt Avenue.

This is considered a ***significant impact*** under some scenarios.

Mitigation Strategies for Impact T-7: The following strategies were identified to mitigate the LOS impacts on this segment of Fiddyment Road:

> **Strategy T-7a:** Provide adequate lanes at the Fiddyment Road/Blue Oaks Boulevard and Fiddyment Road/North Hayden Parkway intersections.
>
> **Strategy T-7b:** Widen Fiddyment Road to six lanes between Blue Oaks Boulevard and the Roseville City limits.
>
> **Strategy T-7c:** Construct an interchange on Placer Parkway at Watt Avenue.
>
> **Strategy T-7d:** Identify "fair share" contributions for new development that would contribute traffic to Fiddyment Road to help fund improvements to Fiddyment Road.

Based on discussions with the City of Roseville, the segment of Fiddyment Road between Blue Oaks Boulevard and the Roseville City limits was assumed to have four lanes under all scenarios. A segment-based analysis suggests a widening of this segment to six lanes to mitigate the LOS impact. However, Roseville's LOS policy focuses on the operations of signalized intersections during the p.m. peak hour at buildout of the City's entitled land uses. Construction of adequate turn lanes at the intersections of Fiddyment Road/Blue Oaks Boulevard and Fiddyment Road/North Hayden Parkway may provide LOS C conditions without the need for a widening of this segment to six lanes.

Since this segment of Fiddyment Road would not have a significant LOS impact if an interchange is constructed on Placer Parkway, this interchange could be considered as a mitigation measure.

The growth in traffic demand on Fiddyment Road will stem from development over portions of Roseville, Lincoln, and unincorporated Placer County. Traffic impact fees on this new development are a potential source of funding for improvements to Fiddyment Road. To adequately spread the cost of improvements on a fair-share basis, a mechanism, such as a multi-jurisdictional Joint Powers Authority that covers portions of several jurisdictions, would need to be established. Placer County and the City of Roseville have established a Joint Powers Authority that covers portions of those jurisdictions to fund certain roadway improvements in west Placer County including Fiddyment Road and Walerga Road.

Impact T-8: Under all corridor alternatives/Watt Avenue interchange scenarios, Placer Parkway would add traffic to Sierra College Boulevard between the future Valley View Parkway (in the proposed Clover Valley area of the City of Rocklin) and English Colony Way, and would cause a significant impact on the LOS of this roadway segment.

The segment of Sierra College Boulevard between Valley View Parkway and English Colony Way would operate at LOS D conditions in 2040 under the No-Build Alternative. This segment would operate at LOS E conditions under all of the alternatives with or without an interchange on Placer Parkway at Watt Avenue.

This is considered a ***significant impact*** under all alternatives/scenarios.

Mitigation Strategies for Impact T-8: The following strategies were identified to mitigate the LOS impacts on this segment of Sierra College Boulevard:

> **Strategy T-8a:** Provide adequate turn lanes at the Sierra College Boulevard/Valley View Parkway and Sierra College Boulevard/English Colony Way intersections.
>
> **Strategy T-8b:** Widen Sierra College Boulevard to six lanes between Valley View Parkway and English Colony Way.
>
> **Strategy T-8c:** Identify "fair share" contributions for new development that would contribute traffic to Sierra College Boulevard to help fund improvements to Sierra College Boulevard.

The segment of Sierra College Boulevard between Valley View Parkway and English Colony Way was assumed to have four lanes under all scenarios. A segment-based analysis suggests a widening of this segment to six lanes. However, the intersections along Sierra College Boulevard are "T" intersections with relatively low traffic volumes on its cross streets. Due to those conditions, the daily capacity of this segment may be greater than those used for this analysis. Construction of adequate turn lanes at the intersections of Sierra College Boulevard/Valley View Parkway and Sierra College Boulevard/English Colony Way may provide LOS C conditions without the need for a widening of this segment to six lanes.

The growth in traffic demand on Sierra College Boulevard will stem from development over a wide area. Traffic impact fees on this new development are a potential source of funding for improvements to Sierra College Boulevard. The SPRTA currently collects traffic impact fees for various improvements to regional roadways in South Placer County, including widening this section of Sierra College Boulevard to four lanes. Additional improvements to this section of Sierra College Boulevard could be incorporated into the SPRTA fees.

Impact T-9: Under all of the corridor alternatives/Watt Avenue interchange scenarios, Placer Parkway would add traffic to Valley View Parkway and would cause a significant impact on the LOS of this roadway segment.

Valley View Parkway (in the proposed Clover Valley area of the City of Rocklin) would operate at LOS C conditions in 2040 under the No-Build Alternative. This two-lane segment would operate at LOS D conditions under all of the alternatives with or without an interchange on Placer Parkway at Watt Avenue.

This is considered a ***significant impact*** under all alternatives/scenarios.

Mitigation Strategies for Impact T-8: The following strategies were identified to mitigate the LOS impacts on this segment of Valley View Parkway:

> **Strategy T-9a:** Provide adequate turn lanes at the Valley View Parkway/Sierra College Boulevard and Valley View Parkway/Park Drive intersections.
>
> **Strategy T-9b:** Widen Valley View Parkway to four lanes.
>
> **Strategy T-9c:** Identify "fair share" contributions for new development that would contribute traffic to Valley View Parkway to help fund improvements to Valley View Parkway.

Based on input from the City of Rocklin, Valley View Parkway through the Clover Valley area of Rocklin was assumed to have two lanes under all scenarios. A segment-based analysis suggests a widening of this segment to four lanes to mitigate the LOS impact. However, the intersections along Valley View Parkway/Sierra College Boulevard would have relatively low traffic volumes on its cross streets. Due to those conditions, the daily capacity of this segment may be greater than those used for this analysis. Construction of adequate turn lanes at the intersections of Valley View Parkway/Sierra College Boulevard and Valley View Parkway/Park Drive may provide LOS C conditions without the need for widening this segment to four lanes.

The growth in traffic demand on Valley View Parkway will stem from development in portions of Rocklin and unincorporated Placer County. Traffic impact fees on this new development are a potential source of funding for improvements to Valley View Parkway. The City of Rocklin has development fees for roadway improvements. To spread the cost of improvements on a fair-share basis to portions of both Rocklin and unincorporated Placer County, some mechanism, such as a multi-jurisdictional Joint Powers Authority that covers portions of Rocklin and unincorporated Placer County, would need to be established.

Impact T-10: Under all of the corridor alternatives/Watt Avenue interchange scenarios, Placer Parkway would add traffic to Whitney Ranch Parkway between SR 65 and University Avenue and would cause a significant impact on the LOS of this roadway segment.

Whitney Ranch Parkway would operate at LOS D conditions in 2040 between SR 65 and University Avenue in the City of Rocklin under the No-Build Alternative. This segment would operate at LOS F conditions under all of the alternatives with or without an interchange on Placer Parkway at Watt Avenue.

This is considered a ***significant impact*** under all alternatives/scenarios.

Mitigation Strategies for Impact T-10: The following strategies were identified to mitigate the LOS impacts on this segment of Whitney Ranch Parkway:

> **Strategy T-10a:** Widen Whitney Ranch Parkway to eight lanes west of University Avenue
>
> **Strategy T-10b:** Identify "fair share" contributions for new development that would contribute traffic to Whitney Ranch Parkway to help fund improvements to Whitney Ranch Parkway.

The growth in traffic demand on Whitney Ranch Parkway will stem from development in portions of the cities of Rocklin and Lincoln, as well as unincorporated Placer County. Traffic impact fees on this new development are a potential source of funding for improvements to Whitney Ranch Parkway. The City of Rocklin has development fees for roadway improvements. To spread the cost of improvements on a fair-share basis to portions of several jurisdictions, some mechanism, such as a multi-jurisdictional Joint Powers Authority, would need to be established.

Impact T-11: Under all corridor alternatives/Watt Avenue interchange scenarios, Placer Parkway would reduce system-wide traffic congestion levels and vehicle delay.

As shown in Tables 36 and 37, compared to the No-Build Alternative, all of the build alternatives would decrease the percentage of vehicle-miles of travel on congested roadways in the TASA. Tables 40 and 41 indicate that the percent reduction in vehicle-miles of travel on congested roadways would be even greater in the AFA.

Tables 42 and 43 indicate that all of the build alternatives would significantly reduce vehicle-hours of delay, especially in the AFA. Vehicle delay would be lower for scenarios with a Watt Avenue interchange than without that interchange.

This impact is considered ***less than significant*** under all alternatives.

5.4.3 Transit Impacts and Mitigation Strategies

Impact T-12: Under all corridor alternatives/Watt Avenue interchange scenarios, Placer Parkway would not significantly impact existing or planned transit facilities or services.

While there are a number of existing transit routes and services within the urbanized portion of the broad traffic analysis study area (shown in Figure 1), only a couple of transit routes travel near the proposed build alternatives, and those are located along SR 65, SR 70/99, or in the western portion of the City of Roseville.

The transit operators in Placer County intend to expand services to new growth areas near the build alternatives once sufficient development occurs in those areas. However, the timing and level of future transit services, as well as actual routes for expanded services, is not known and will depend on funding. As discussed in Section 3.4, the transit system assumptions for the No-Build Alternative were based on the "Funded Constrained Alternative" that was recently evaluated by PCTPA as part of the Placer County Long-Range Transit Plan, and reflects the adopted Short-Range (2012) Transit Plans for each transit provider in the area plus some additional transit services.

Placer Parkway would have a significant impact on transit if it would 1) directly remove or obstruct existing and planned transit facilities, routes, or services; or 2) substantially impact travel times on existing or planned transit routes.

Placer Parkway would be a controlled-access facility with interchanges or grade-separations at all existing or planned roadways along its route between SR 65 and SR 70/99. This facility could be readily designed to avoid direct impacts on existing and planned transit facilities, routes, or services. Placer Parkway would reduce traffic volumes on most local roadways, except for roadway segments near interchanges along Placer Parkway. Thus, the Parkway would generally have a positive impact on transit travel times in the transportation analysis area.

This impact is considered ***less than significant*** under all alternatives.

5.4.4 Bikeway Impacts and Mitigation Strategies

Impact T-11: Under all scenarios, Placer Parkway would not significantly impact existing or planned bikeways.

Placer Parkway would have a significant impact on bicycles if it would directly remove or obstruct existing and planned bicycle facilities/bikeways. Placer Parkway would be a controlled-access facility with interchanges or grade-separations at all existing or planned roadways along its route between SR 65 and SR 70/99. This facility could be readily designed to avoid direct impacts on existing and planned bicycle facilities/bikeways.

This impact is considered ***less than significant*** under all alternatives.

6.0 ANALYSES TO BE UNDERTAKEN IN TIER 2

This Transportation Technical Report is prepared in support of a Tier 1 EIS/EIR. The project, or Proposed Action, is the selection and acquisition of a specific corridor within which the future Placer Parkway may be constructed if a decision is made to construct the Parkway. The objective of the Proposed Action is to select and preserve a 500- to 1,000-foot-wide corridor in the project study area. No design or construction work will occur as the result of the Proposed Action, although conceptual designs have been developed to the extent required for environmental analysis. Such designs are entirely conceptual and would be subject to further engineering analysis and refinement during the Tier 2 analysis. Once the Tier 1 EIS/EIR is completed and a corridor is selected, corridor acquisition will begin. This can be accomplished through a combination of mechanisms, including but not limited to fee simple acquisition, purchase of rights of first refusal, grants or transfers of land, grants or purchases of permanent easements, and similar means.

"Tiering" is a streamlining tool for large infrastructure projects with several stages or phases. It is a way to focus environmental studies in the planning process at an appropriate level of detail in each phase of the project. The first Tier document (Tier 1) allows an agency to focus on broad topics such as general location, mode choice, area-wide air quality and land use, and other environmental issues. Second tier (Tier 2) documents involve more focused environmental analyses and review that address a narrower geographical area, a more focused set of issues, and a specific roadway alignment. A Tier 2 document relies on a summary of the work in the Tier 1 document, thereby avoiding unnecessary repetition. The Tier 2 document can then focus on additional details available in later stages of project planning such as design, construction, operation, and maintenance of the project.

The transportation analysis for the Tier 2 EIS/EIR would involve the following elements:

- Evaluation of Existing Plus Project Conditions.
- Revised travel demand forecasts that will be based on the updated Metropolitan Transportation Plan (MTP) that will be adopted in 2007 and have a horizon year of 2032.
- A more detailed analysis of traffic impacts from the project than Tier 1, including:
  - Evaluation of peak-hour operations at all major intersections along roadways that would be impacted by Placer Parkway using the intersection analysis methodology from each jurisdiction.
  - Evaluation of peak-hour operations at each interchange along Placer Parkway, including merge, diverge, and weaving analyses using Highway Capacity Manual (HCM) methodologies.
  - Evaluation of peak-hour operations along SR 65 and along SR 70/99 near Placer Parkway, including mainline, merge, diverge, and weaving analyses using HCM methodologies.
- An updated evaluation of the potential for impacts to transit and bikeway impacts based on the latest information on existing and planned developments in the vicinity of the project.

APPENDIX A: TRAVEL MODEL REFINEMENTS AND VALIDATION

Overview of Model Refinements

The travel forecasting tool used for the Placer Parkway Corridor Preservation Tier 1 EIS/EIR is the Sacramento Metropolitan Travel Demand Model, or "SACMET" model. This model was used for development of the 2006 Metropolitan Transportation Plan (MTP), and for regional air quality conformity analyses. It has provided the basis for recent highway and transit alternatives analyses and environmental documents. SACOG continually maintains SACMET, updating base year and forecast year demographic data and networks, and working with a technical advisory committee to periodically update and enhance the model. Finally, many local jurisdictions use the model as the basis for general plans and environmental studies.

Documentation on this model is provided in *"Sacramento Regional Travel Demand Model Version 2001 – SACMET 01 (SACOG and DKS Associates, March 2002).*

The six-county SACMET model includes a regional system of about 1,300 traffic analysis zones (TAZs). The zones correspond generally with census tracts. While the SACMET zones are appropriately sized for regional forecasts to major existing transportation facilities (i.e., freeways and major arterials), zones in the corridor and tributary areas are too big to adequately distinguish among alignment alternatives within the Placer Parkway corridor.

The Placer County Travel Demand Model, which has been used by the jurisdictions in Placer County to prepare General Plans and Capital Improvement Programs has quite fine zonal and network detail in Placer County, and has been repeatedly refined and improved for over 10 years. Outside of Placer County, this model aggregates data imported from SACMET.

To refine the network detail of SACMET for Placer Parkway, the Placer County model's network was chosen as a suitable resource. The detailed network for Placer County was "grafted" into SACMET, and south Sutter County was split from nine zones to a new system of 35 zones. In total, about 1,300 zones were added to the starting SACMET zone system of 1,142 zones. The resulting Placer Parkway Tier 1 EIS version network has about 2,600 zones.

Within the refined network area, SACOG's 2000 household and employment estimates had to be split down to the finer zone system. In Placer County, the Placer County model's detailed land use (dwelling units and building areas in several categories) was converted to approximate equivalent households and employment in SACMET's categories.

The Placer County model represents residences as single-family, multi-family, and age-restricted households. The SACMET model's residential data, with its three-way classification detail (household size, workers in the household, and household income), does not distinguish between single-family, multi-family, or age-restricted. To split SACMET's cross-classified households into the refined zones, an iterative proportional factoring (IPF) was estimated that maintains control totals of each household category in each regional analysis district, while allowing for a different classification distribution in single-versus multi-family housing unit types. Units in age-restricted developments act as single-family in the IPF process, but are overridden by a cross-classification distribution in the 2000 SACOG regional household travel survey for households with all members age 55 and up in Placer County, western El Dorado County, and Folsom.

Validation Results

It is important to test the model's accuracy and make appropriate adjustments to its equations, parameters, and assumptions through a validation process. Validation refers to the systematic comparison of the model outputs for a base year (i.e., 2000) to observed travel behavior. The validation of the enhanced SACMET model for the Placer Parkway Corridor Preservation Tier 1 EIS/EIR focused on vehicle volume counts on roadway segments (or links in the model networks). The performance of the model in predicting traffic volumes by functional class, volume class, and "screenlines" was evaluated.

The model validation was conducted and presented to the Technical Advisory Committee for their review in 2004.

To validate the refined version of SACMET for the Placer Parkway Corridor Preservation Tier 1 EIS/EIR, this model was first run with 2000-2001 network and land use data, and the resulting highway volumes compared to traffic counts. Table A-1 presents a comparison of total daily volumes on each of several screenlines in and near the Placer Parkway corridor; Figure A-1 shows the locations of these screenlines. This summary shows that the model's traffic volumes on all high-volume screenlines are within 10 percent of traffic counts, and that the combined model volume on all screenlines is within 3 percent of traffic counts.

Table A-2 presents a comparison of travel model volumes to traffic counts summarized by volume range and functional classification for an area between Elkhorn Boulevard and Nicolaus Road and between SR 70/99 and Sierra College Boulevard. This summary shows that it is stable for low- and high-volume ranges and that the combined model volume on all 799 count locations is within 3 percent of traffic counts.

The validation produced results that were within acceptable tolerances for a sub-regional travel model following best practices in travel demand forecasting. The TAC concurred that the travel model was acceptable for use on the Placer Parkway Corridor Preservation Tier 1 EIS/EIR.

Summary covers portion of regional model network that is north of Elkhorn Boulevard and west of Sierra College Boulevard

APPENDIX B: IMPLICATIONS OF TOLL ROAD FACILITY

Introduction

As part of the preliminary evaluation of potential funding options to facilitate the project and subsequent Placer Parkway implementation, PCTPA has conducted an initial assessment of the feasibility of developing Placer Parkway as a toll road. This option, along with several others, including a possible county-wide sales tax and increased private development contributions, is being considered to address project development constraints associated with Federal and state transportation funding limitations. Potential consideration of the feasibility of the Parkway as a toll road was also requested during the corridor alternatives identification process, with several local jurisdictions and developers expressing interest in examining the Parkway's toll road potential. The following discussion summarizes the potential feasibility of Placer Parkway as a toll road, and includes general toll road design/operational aspects, and toll road considerations for the corridor alternatives analysis.

It should be noted that the potential development of Placer Parkway as a toll road is speculative at this time and the discussion is presented for informational purposes only. Federal law restricts tolling on highways constructed with federal-aid highway funds. To establish a toll road or toll lane, it often is necessary to obtain federal authorization for tolling. Innovative finance techniques that rely on federal funds to pay bonds, or that use federal loans or loan guarantees to support a project's financing, are considered federal funding, and would require FHWA approval (AASHTO Practitioner's Handbook – 03, July 2006, "Managing the NEPA Process for Toll Lanes and Toll Roads"). Special action by the California Legislature is required to authorize any new toll roads. There are no existing funding plans that classify Placer Parkway as a toll road facility, and extensive planning, funding, and design investigations would be required before a final decision could be made. At the Tier 1 EIS/EIR level of analysis it is not appropriate to perform a detailed analysis of a potential project element associated with such a high degree of uncertainty; should a future decision be made to develop Placer Parkway as a toll road, then this will be included in a Tier 2 project level environmental analysis.

Toll Road Feasibility Analysis

In 2005, the SPRTA Board retained HDR|HLB Decision Economics (HDR|HLB) to assess, on a very preliminary basis, whether the future Placer Parkway would be a feasible toll road. Specifically, the study's focus was to determine if the future Placer Parkway would be a good candidate to attract private investment and would be an innovative funding mechanism.

The Feasibility Analysis for Placer Parkway as a Toll Road – Final Report (January 9, 2006) concluded that Placer Parkway:

- Meets the criteria for a successful toll road project.
- May generate sufficient traffic and toll revenues to cover private investment costs. It may require some public contribution to increase its private investment attractiveness.

The report recommended several 'next steps':

- Reviewing all forecasting assumptions for traffic and revenue potentials.
- Building a detailed financial plan reflecting all funding sources including non-toll sources such as developer fees and interest earnings on operating reserves.

- Evaluating the financial feasibility of the investment by assessing the debt coverage under various scenarios, and risk level.

Toll Road Design/Operational Aspects

Toll roads are generally limited access highways for which users pay a fee to use the road. They are frequently joint publicly/privately funded ventures and are usually employed to provide an alternative and/or additional source of road funding to government revenue, which is not tied to annual federal or state budgetary processes. The funds from toll revenues can be dedicated to the support of construction and maintenance for a particular road, thereby ensuring that maintenance funds in particular do not compete with the requirements of other roads in the network.

Design concepts for toll facilities range from high-occupancy toll (HOT) lanes, express toll lanes (ETL), or a toll road in which all lanes are tolled. Specific factors include: toll lanes vs. toll road, type of toll facility, payment options, rates, and toll plazas/others. Tolls are usually collected at multiple entry or exit points on a toll road via either Electronic Toll Collection (ETC) or cash. Many toll roads operate a system of Differential Pricing; time-of-day pricing and tolls that vary by other factors like facility location, season, day-of-week, or air quality impact. Toll roads may also employ Dynamic Pricing; which comprises tolls that vary in real time in response to changing congestion levels. Toll road pricing frequently includes High Occupancy Vehicle (HOV) discounts.

Toll Road Considerations for Corridor Alternatives Analysis

Given the speculative nature of implementing Placer Parkway as a toll facility, travel demand forecasts assume tolls were not prepared. Instead, a preliminary assessment was conducted to determine how tolls on Placer Parkway might affect the travel demand forecasts for the corridor alternatives.

The project's travel forecasting model "assigns" traffic to Placer Parkway because Placer Parkway would provide the shortest travel time for those trips. Some people who would use Placer Parkway without tolls would use other roadways if tolls were implemented on Placer Parkway. Of course, the amount of traffic that would use a segment of a toll road would depend on the amount of the toll for the various trips using that segment. In general, shorter-distance trips would be more likely to divert to other local roadways due to the existence of tolls than longer-distance trips because the added travel time for short distance trips would typically be low. Longer-distance trips would typically receive the largest travel time benefit and thus would more likely use the toll road.

The amount of short-distance versus long-distance trips that would use the corridor alternatives can be determined through the travel demand model by analyzing the origins and destinations of trips that would use Placer Parkway. The model was used to analyze travel patterns for the most northern and most southern corridor alternatives: Alternatives 1 and 5. The objective of this analysis was to identify any travel pattern differences between these two corridor alignment alternatives to determine if a toll facility might impact them differently. This analysis indicates the following:

- Alternative 1 with a Watt Avenue interchange would have a somewhat higher level of short-distance trips (that may divert to local roads due to tolls) than Alternative 5 with a Watt Avenue interchange. Placer Parkway is projected to have higher traffic volumes for Alternative 1 than Alternative 5.

- There would be more short-distance trips with a Watt Avenue interchange than without that interchange for all corridor alignment alternatives.

- All of the corridor alternatives would have a significant amount of short-distance trips on the east and west ends of the Parkway – trips between SR 65 and destinations in the Sunset Industrial Area or between SR 70/99 and the proposed Sutter Pointe (Measure M) area in south Sutter County.

- Under all corridor alternatives, most of the trips using the central segment of Placer Parkway would be longer distance and thus more likely to use a toll road.

Based on this preliminary assessment, it is unlikely that the potential future development of Placer Parkway as a toll road would result in substantially different impacts for any of the corridor alignment alternatives, and thus does not appear to be a contributing factor to the selection or rejection of any of the project alternatives. Any potential impacts that would be associated with the development of a toll road would depend on the specifics of the tolling scheme that is used, but in general would be common to all alternatives.

VISUAL IMPACT ASSESSMENT
PLACER PARKWAY CORRIDOR PRESERVATION TIER 1 EIS/PROGRAM EIR

1.0 INTRODUCTION

1.1 TIER 1 EIS/PROGRAM EIR

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

1.2 CORRIDOR SELECTION AND PRESERVATION

The concept for the Placer Parkway is over a decade old. Placer County's 1994 General Plan depicts a "plan line" for it. Two planning studies helped to refine the concept:

- DKS Associates, 2000 Placer Parkway Interconnect Study/Conceptual Plan
- DKS Associates, 2001 Project Study Report (Project Development Support) for Placer Parkway

Placer Parkway is cited as a high priority regional transportation project by the Sacramento Area Council of Governments (SACOG) 2025 Metropolitan Transportation Plan and the 2027 Placer County Regional Transportation Plan. The project vicinity and surrounding area include some of the fastest growing communities in the Sacramento region. A number of large urban development proposals are being considered by Placer and Sutter counties. New development is expected to add a significant amount of residential, commercial, industrial, and educational uses.

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included representatives from planning and public works departments of all affected cities and counties,

environmental, business, agricultural, development, and homeowner interests (the Study Advisory Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report will analyze these five corridor alternatives along with a No-Build Alternative.

Other potential transportation modes such as bus rapid transit may be developed in the corridor in the future, although they are not proposed as part of the current project. The width of the corridor for the Placer Parkway is to vary from approximately 500 feet in the Eastern and Western segments to approximately 1,000 feet wide in the Central Segment. Depending upon the alternative, the corridor's length ranges from a minimum of 14.2 miles to a maximum of 16.2 miles. The selected corridor would contain the roadway, including the median, travel lanes, shoulder, associated access ramps and a no-development buffer zone.

Corridor acquisition may not be completed until after Tier 2, as funding becomes available. Portions of the selected corridor will be preserved as a no-development buffer zone. The buffer would be maintained as a zone where development is either not permitted or is severely restricted. This is intended to restrict access to the proposed interchanges, protect the rural character of agriculturally designated areas in the vicinity of the Parkway as far as possible subject to future development, and to maximize opportunities to incorporate adjacent sensitive areas. It is intended that the buffer would be owned and managed in the future to achieve these objectives. For subsequent Tier 2 (project-level) environmental reviews, the size of this buffer zone could be considered flexible for agriculturally designated land undergoing urban development. In the Tier 2 environmental review, the specific buffer size and location would be determined. This determination would be based on performance standards on a case-by-case basis, depending on the land use needs of future approved development, and taking into account the primary objective of restricting future access to the Parkway.

Project proponents are considering employment of several land management and control mechanisms in order to ensure that the buffer would be effectively maintained as an area where development would either not be permitted, and where construction of any additional access onto the Parkway would not be allowed. These mechanisms could include land use controls, land purchase/leases, general plan amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, urban growth boundaries, etc. "Layering" or using several of these methods would provide more assurance the buffers would be permanent, or at least more difficult to undo.

1.3 TECHNICAL STUDY OBJECTIVE

This Visual Impact Assessment has been prepared to support the Tier 1 Environmental Impact Statement/Program Environmental Impact Report. It presents a Tier 1/Program assessment of potential impacts related to visual resources for five corridor alternatives and the No-Build Alternative as described in Chapter 2.0.

The scope of work performed for this report is based on the Caltrans Local Assistance Procedures Manual (Caltrans, 2006), as modified for purposes of Tier 1/Program analysis by agreement of Caltrans; the Caltrans Highway Design Manual (HDM) (Caltrans, 2001a); and the Caltrans Environmental Handbook (Caltrans, 2004) on preparing a visual impact assessment. In addition, the evaluation considered guidance from the Federal Highway Administration (FHWA), Environmental Checklists for Draft and Final Environmental Documents (FHWA, 1998a; FHWA, 1998b).

This report is organized as follows:

Chapter 2 The Proposed Action
Chapter 3 Methodology

Chapter 4	Regulatory Setting
Chapter 5	Affected Environment
Chapter 6	Potential Direct Impacts
Chapter 7	Secondary and Indirect Impacts
Chapter 8	Cumulative Impacts
Chapter 9	Watt Avenue Interchange
Chapter 10	Avoidance, Minimization and/or Mitigation Strategies
Chapter 11	Analyses to be Undertaken in Tier 2
Chapter 12	References

This report also includes figures and tables, which show the project location, each action alternative, and pertinent technical information prepared to evaluate the action alternatives.

Throughout this document, the Placer Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

2.0 THE PROPOSED ACTION

The Proposed Action for the Placer Parkway Corridor Preservation Project is to select and preserve a 500- to 1,000-foot-wide corridor in the project study area, within which the future four- or six-lane Placer Parkway may be constructed. The ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction, and operation of the Parkway. Although the action taken at Tier 1 on the Placer Parkway Corridor Preservation Project is limited, the underlying project whose effects are studied in this document is the Placer Parkway. To the extent feasible at this early stage, the Tier 1 EIS/EIR addresses the potential effects of construction and operation of the future roadway.

2.1 THE PROJECT STUDY AREA

The project study area is an area of approximately 33,460 acres located in Placer and Sutter Counties, with a small section located in Sacramento County (see Figures 1-1 and 2-1). The portion of the study area in Sacramento County is located in the extreme southwest corner of the study area and does not include any of the proposed corridor alignment alternatives. It extends from SR 70/SR 99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego Roads.

For the purposes of the analysis the study area is divided into three segments:

- Western Segment: the Western Segment extends from SR 70/99 to Pleasant Grove Road in Sutter County.
- Central Segment: the Central Segment extends from Pleasant Grove Road in Sutter County to approximately 2,300 feet north of Pleasant Grove Creek in Placer County.
- Eastern Segment: the Eastern Segment extends from approximately 2,300 feet north of Pleasant Grove Creek to SR 65 in Placer County.

2.2 CORRIDOR ALTERNATIVES

The following subsections describe the corridor alternatives, which are depicted on Figure 2-1, and are numbered according to location from south to north in the study area.

2.2.1 The No-Build Alternative

Under the No-Build alternative, land for the Parkway would not be acquired and the Parkway would not be constructed.

2.2.2 Alternative 1 – the Red Alternative

Alternative 1 would extend from SR 70/99 approximately ½ mile north of Riego Road, eastward approximately 1 mile north of Baseline Road to approximately Watt Avenue, proceeding north and transitioning in an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment alternative is 16.2 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.3 Alternative 2 – the Orange Alternative

Alternative 2 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed northeast, then in a northerly direction south of Pleasant Grove Creek, transitioning to an easterly direction before it reaches Sunset Boulevard West, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.4 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.4 Alternative 3 – the Blue Alternative

Alternative 3 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed north along the Sutter/Placer County Line, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.6 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.5 Alternative 4 – the Yellow Alternative

Alternative 4 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.3 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.2.6 Alternative 5 – the Green Alternative

Alternative 5 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 4,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.2 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.3 PARKWAY DESIGN ASSUMPTIONS

Although the Parkway would be designed and construction-level impacts analyzed during Tier 2, for the purpose of this report and the Tier 1 EIS/Program EIR, several assumptions have been made about potential design and configuration concepts. These assumptions would be subject to further development and refinement, and specific decisions about design of the roadway would be made during the Tier 2 process. For example, the number, location, and design of over-crossings would be determined at the time of final Parkway design, in consultation with local jurisdictions. The following sections outline assumptions for the future roadway.

Preliminary costs estimates for the Parkway range from $600 to $650 million (2005 dollars). This includes costs for right-of-way, design, construction, and environmental mitigation for the four- to six-lane facility. The funding situation has spurred interest in exploring other more creative funding options.

These include a county-wide sales tax, more developer contributions, and tolling facilities. The Technical Report and Tier 1 EIS/Program EIR do not make any assumptions about funding sources.

2.3.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane facility. A preliminary conceptual cross section (see Figure 2-2) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/ Program EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

2.3.2 Conceptual Roadway Elevation

As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on either side of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways, or trails.

Throughout the project study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These over-crossings would not connect to the Parkway. Parkway access would be via the interchanges described below.

2.3.3 Interchange Concepts

The analysis assumes that the location of interchanges (see Figure 2-1) is as follows.

- SR 70/99 (at ½ mile north of Riego Road or at Sankey Road)
- One or two locations to be determined in southern Sutter County
- Fiddyment Road
- Foothills Boulevard
- SR 65 at Whitney Ranch Parkway

The following discussion outlines concepts and assumptions for the six interchanges that could potentially serve Placer Parkway.

2.3.3.1 Western Segment

Within the Western Segment of the Parkway, a high-speed, freeway-to-freeway type interchange would connect the Parkway with SR 70/99 at one of following potential locations depending on the project alternative (see Section 2.2). Placer Parkway would terminate at SR 70/99.

- **Placer Parkway/SR 70/99 Interchange at North of Riego Road.** This alternative concept uses "braided" ramps to eliminate weaving problems or conflicts with the future SR 70/99 at Riego Road interchange being developed by Sutter County and Caltrans.

- **Placer Parkway/SR 70/99 Interchange at Sankey Road.** Under this alternative concept, the existing two-lane Sankey Road would be realigned to the south of Placer Parkway and the proposed freeway-to-freeway interchange, extending from approximately ¼ mile west of SR 70/99 to approximately ¼ mile east of the Union Pacific railroad tracks. There would be no direct access to SR 70/99 or Placer Parkway from the realigned Sankey Road.

Depending on the final alignment selected, one or two additional arterial interchanges would also be located in south Sutter County. Conceptual locations are identified for purposes of this Tier 1/Program analysis (see Figure 2-1). The actual location of these interchanges would be developed in the Tier 2 phase, based on Sutter County requirements.

2.3.3.2 Central Segment

Within the Central Segment of the Parkway, there would not be any access proposed as part of the Project in the 7-mile segment between Fiddyment Road and Pleasant Grove Road. Please see Section 2.4 regarding a potential connection to a future extension of Watt Avenue (Figure 2-3) which could be proposed and constructed by others in the Central Segment; such an interchange is not part of the Placer Parkway.

2.3.3.3 Eastern Segment

Within the Eastern Segment of the Parkway, a signalized high-speed freeway-to-freeway and local access interchange would connect the Parkway to SR 65 at Whitney Ranch Parkway (Figure 2-1). From SR 65 eastward Placer Parkway would terminate and become Whitney Ranch Parkway east of the SR 65 exit ramp intersection. Traffic signals would be provided at the exit ramp terminals. This interchange would be approximately 1 mile north of a planned SR 65/Sunset Boulevard interchange and 1.2 miles south of the existing Twelve Bridges interchange.

As part of this interchange, auxiliary lanes would be required on SR 65 in both directions to enhance traffic operations on the north side of the future SR 65/Sunset Boulevard interchange. The southbound SR 65 exit-ramp at Sunset Boulevard is being designed to accommodate an additional auxiliary lane required for the future Placer Parkway/Whitney Ranch Parkway interchange to minimize the reconstruction of this ramp in the future. Within the Eastern Segment of the Parkway, from SR 65 westward, two interchanges with local roadways would be constructed, one at Foothills Boulevard and one at Fiddyment Road, as depicted on Figure 2-1.

The future interchange on Placer Parkway at Fiddyment Road would be located near the existing intersection of Fiddyment Road and Sunset Boulevard West. To provide acceptable traffic operations, additional distance needs to be provided between the Fiddyment Road/Sunset Boulevard West intersection and the Fiddyment Road/Placer Parkway westbound off-ramp intersection. Therefore, Sunset Boulevard West will need to be realigned to the north as it nears Fiddyment Road.

2.3.4 Landscaping Concept

For the purposes of this environmental analysis, preliminary landscaping concepts have been developed for Placer Parkway. These are entirely conceptual and would be subject to further refinement during the Tier 2 environmental process. It is anticipated that landscaping would be used to reflect local topography and vistas in the study area and complement the varying character of land adjacent to the Parkway corridor. Landscape design would vary within the Parkway's three segments depending on corridor width and type and density of surrounding land uses. Landscaping would be used within the median and the Parkway buffer zone to enhance the aesthetics of the Parkway, and would be used to provide screening and enhance local and long distance views. Where appropriate, more concentrated plantings would be considered to buffer the Parkway from future adjacent land uses that may be incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Landscape design would likely include a mix of compatible native and non-native plants that may require some irrigation. Wherever possible, native plant species would be used in line with Caltrans policy. Where possible and depending on availability, feasibility and cost, recycled water would be used for irrigation.

During a future design phase, lighting elements would be designed for safety and would consider the proposed landscaping plan in order to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower-voltage lighting, and proposing lighting fixtures that conform with the visual character of the area).

2.4 POTENTIAL WATT AVENUE INTERCHANGE

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 2-3). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/Program EIR. However, the connection of Placer Parkway to a potential Watt Avenue extension could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/Program EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges with Placer Parkway.

2.5 AGENCY PERMITS AND APPROVALS

The Proposed Action would preserve a preferred corridor for a future transportation facility. In the future, permits and approvals would be obtained from appropriate agencies prior to construction of the Parkway. These permits and approvals may include specific design or mitigation requirements that would be incorporated into the project.

2.6 SUBSEQUENT TIER 2 INFORMATION

As noted earlier, the design and construction of Placer Parkway—including its interchanges and over-crossings, and ancillary features such as stream crossings, safety devices, stormwater management structures, and similar improvements—would be evaluated in a subsequent Tier 2 environmental review process once a corridor has been identified. Chapter 11 provides more detailed information regarding Tier 2 studies.

3.0 METHODOLOGY

The National Environmental Policy Act (NEPA) requires " . . . the use [of] all practical means . . . to assure . . . esthetically . . . pleasing surroundings." FHWA regulations governing compliance with NEPA included the Visual Impact Assessment for Highway Projects (VIAHP) manual (1981). The methodology used in this visual impact study follows the guidelines outlined in this publication, and adheres to guidance within CEQA, and that published by Sutter and Placer Counties, the cities of Roseville, Rocklin, and Lincoln, and Caltrans (see Chapter 4, Regulatory Setting).

Evaluation of visual impacts is often considered highly subjective, even where established federal methodology and guidance are used. Adherence to a clear, comprehensive and understandable visual impact assessment (VIA) methodology helps to ensure that the potential visual impacts associated with a project are evaluated objectively, and that public opinion, concerns and input are taken into account throughout. The FHWA methodology utilized to conduct this VIA follows four principal steps:

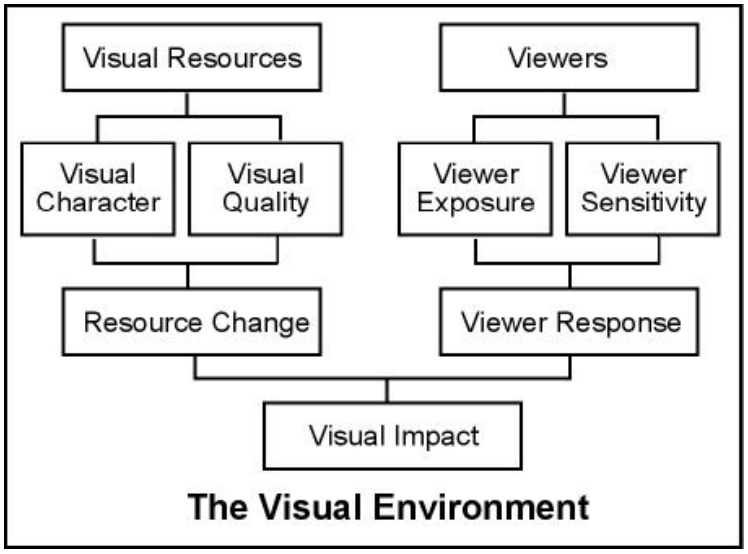
1. Define the affected environment, including project setting and viewshed.

2. Identify key views for visual assessment.

3. Assess the visual impacts of project, including resource change and viewer response.

4. Propose methods to mitigate adverse visual impacts.

The following diagram illustrates the FHWA definition of a visual impact:



As this diagram above illustrates, VIAHP guidelines define "visual impact" as follows: resource change + viewer response = visual impact.

3.1 RESOURCE CHANGE

To evaluate "resource change," the presence, character, and quality of visual resources in the study area must be determined.

3.1.1 Visual Character

Visual character is descriptive and non-evaluative. Landscape visual character (e.g., water, vegetation, and manmade development) is usually described by identifying *landscape types* that form *visual units*. These units include *pattern elements* (form, line, color, texture) and *pattern character* (dominance, scale, diversity, continuity). Any change to these visual units cannot be described as positive or negative until compared with the viewer response to change. For instance, if there is public preference for the established visual character of an area's landscape, any change that would contrast the character of the landscape can be evaluated.

3.1.2 Visual Quality

The FHWA VIA Manual uses three criteria to measure visual quality: vividness, intactness, and unity. An area or landscape unit is considered to have high visual quality if it is rated high for all three criteria. These are defined as follows:

- Vividness: The visual power or memorability of landscape components as they combine in distinctive visual patterns.
- Intactness: The visual integrity of the natural and human-built landscape and its freedom from encroaching elements. It can be present in well-kept urban and rural landscapes, as well as in natural settings.
- Unity: The visual coherence and compositional harmony of the landscape considered as a whole. It frequently attests to the careful design of individual components in the landscape.

Vividness is assessed using landform and landcover. Landform vividness is frequently determined by the pattern elements of form or line, such as the strongly defined skyline of a mountain landscape. Landcover is comprised of water, surface geology, vegetation, and manmade development. Areas with high vividness, for example, often contain water, which creates a vivid landscape component as a result of linear visual effects (such as a shoreline or the sharp edge of a waterfall) and color. Intactness can be assessed in terms of the quality of the natural visual appearance of an area. Low intactness occurs when an unsightly manmade element ("eyesore") encroaches into an undisturbed natural area. High intactness is attributable to the natural visual order of an untouched landscape, such as the Redwood National Forest. Unity is generally used as a measure of how manmade and natural elements work together within the same visual unit. Manmade environments with no visual relation to natural landform or landcover patterns are usually considered to lack visual unity.

As the evaluation of visual character and quality is highly subjective, FHWA Landscape Unit Checklist/Visual Inventory and Analysis worksheets (Figure 3-1) are used as an assessment tool. Appendix A contains completed worksheets used for the visual impact analysis outlined subsequently in Chapter 6.

3.2 VIEWER RESPONSE

To evaluate *viewer response*, one must define the viewers (*of* and *from* the project), their exposure, and their sensitivity. Viewer response is a measurement of existing viewers. FHWA does not require a visual analysis to hypothesize future viewers who may be impacted by a project. Therefore, a Visual Impact Assessment analyzes impacts of a future project on existing viewers.

3.2.1 Viewer Exposure

Viewer exposure is determined by assessing the *number* of viewers exposed to the resource change and the type of viewer activity, the physical *location* of the viewer, as well as the *duration* of their view. Duration of view is influenced by location of the viewer. A viewer traveling in a vehicle experiences a limited duration of a particular view while a resident may have a view that is constant. Viewer exposure is also affected by features such as topography or the built environment, which may block or partially obscure views. All such factors are considered when assessing viewer exposure of a project. High viewer exposure can increase the need for design modifications early in project development in order to avoid or minimize adverse visual impacts.

3.2.2 Viewer Sensitivity

Viewer sensitivity is defined as viewer *activity*, *awareness*, local *values*, and cultural *significance* of the visual resource. Understanding viewers' concern for scenic quality and the viewers' response to change of the visual resources that make up the view helps to determine viewer sensitivity. Often communities may place visual significance on landscape components and areas that would otherwise appear unexceptional in a visual resource analysis; in effect assessment of viewer sensitivity takes into account local values and goals.

4.0 REGULATORY SETTING

This VIA has been prepared in accordance with relevant federal, state and local laws, regulations, guidance, and planning policies. These are summarized below.

4.1 FEDERAL REGULATIONS

4.1.1 National Environmental Policy Act

NEPA requires that proposed federal projects consider potential effects that the project would likely have on the environment. The U.S. Environmental Protection Agency considers visual resources an integral part of the environment and as such includes the topic in NEPA.

4.1.2 FHWA Visual Impact Assessment for Highway Projects

FHWA regulations governing compliance with NEPA are described in Chapter 3 and include the Visual Impact Assessment for Highway Projects (VIAHP) manual (1981).

4.1.3 National Historic Preservation Act of 1966

The VIAHP Manual sets out FHWA's approach to implementation of the National Historic Preservation Act (NHPA). This act, along with its 1976 implementing regulations defined "the criteria of adverse effect (Section 800.8), including the introduction of visual, audible or atmospheric elements that are out of character with the property or alter its setting." A historic district, Reclamation District No. 1000, has been identified within the study area, therefore adherence to these aesthetic regulations apply. This district is a rural historic landscape that has been determined to be historically significant for the reclamation and flood control activities that have occurred within the Sacramento River Basin for the Sacramento Flood Control Project.

4.1.4 Department of Transportation Act, Section 4(f)

This law serves to preserve and protect public parks and recreational lands, wildlife and waterfowl refuges, and historic sites. There are no federally recognized parks and recreational lands, wildlife or waterfowl refuges within the study area. There was found to be one historic resource, as defined in Section 4(f), within the study area (see Section 4.1.3, above).

4.1.5 Wild and Scenic Rivers Act

Originally adopted as law in 1968 the Wild and Scenic Rivers Act designated select rivers which, "possess outstandingly remarkable scenic, recreational, geologic, fish and wildlife, historic, cultural, or other similar values . . ." in order to preserve them in their "free-flowing condition, and that they and their immediate environments shall be protected for the benefit and enjoyment of present and future generations.". There are no federally designated scenic rivers within the study area.

4.2 STATE REGULATIONS

4.2.1 California Scenic Highway Program

California's Scenic Highway Program was created by the Legislature in 1963. Its purpose is to preserve and protect scenic highway corridors from change that would diminish the aesthetic value of lands adjacent to highways. The state laws governing the Scenic Highway Program are found in the Streets and Highways Code, Section 260 et seq. There are no state designated scenic highways within the study area.

4.2.2 California Environmental Quality Act

Appendix G of the State CEQA Guidelines specifies that a significant impact would occur if a project would have a substantial, demonstrable negative aesthetic effect. Specifically, a significant impact to visual resources:

- Has a substantial adverse effect on a scenic vista;
- Substantially damages scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway;
- Substantially degrades the existing visual character or quality of the site and its surroundings; or
- Creates a new source of substantial light or glare, which would adversely affect day or nighttime views in the area.

4.3 LOCAL REGULATIONS AND GUIDANCE

General Plans for Placer County, Sutter County, Sacramento County, the City of Roseville, the City of Rocklin, and the City of Lincoln were reviewed for guidelines relevant to visual resources. Table 4-1 below shows a summary of relevant visual resource guidelines contained within these plans.

Table 4-1
Summary of General Plan Policies and Goals (P&Gs)

Document	P&Gs	Requirements
Sutter County General Plan	Land Use Visual and Scenic Routes *Goal 1.H*	To preserve and protect the visual and scenic resources of the area.
	Land Use Visual and Scenic Routes *Policy 1.H-1*	The County shall require that new development be designed to utilize vegetation for screening structures and parking areas.
	Conservation/Open Space – Natural Resources *Goal 4.E*	To conserve, protect, and enhance open space lands and natural resources in Sutter County.
	Conservation/Open Space – Natural Resources *Goal 4.E-1*	The County shall support the preservation of natural land forms, natural vegetation, and natural resources as open space to the maximum extent feasible.
Placer County General Plan	Land Use Visual and Scenic Resources *Policy 1.K.3*	The County shall require that new development in rural areas incorporates landscaping that provides a transition between the vegetation in developed areas and adjacent open space or undeveloped areas.

Table 4-1 (Continued)
Summary of General Plan Policies and Goals (P&Gs)

Document	P&Gs	Requirements
Placer County General Plan (continued)	Land Use Visual and Scenic Resources *Policy 1.K.4*	The County shall require that new development incorporates sound soil conservation practices and minimizes land alterations. Land alterations should comply with the following guidelines: a. Limit cuts and fills; b. Limit grading to the smallest practical area of land; c. Limit land exposure to the shortest practical amount of time; d. Replant graded areas to ensure establishment of plant cover before the next rainy season; and e. Create grading contours that blend with the natural contours on site or with contours on property immediately adjacent to the area of development.
	Land Use Visual and Scenic Resources *Policy 1.K.5*	The County shall require that new roads, parking, and utilities be designed to minimize visual impacts. Unless limited by geological or engineering constraints, utilities should be installed underground and roadways and parking areas should be designed to fit the natural terrain.
	Land Use Scenic Routes *Policy 1.L.3*	The County shall protect and enhance scenic corridors through such means as design review, sign control, undergrounding utilities, scenic setbacks, density limitations, planned unit developments, grading and tree removal standards, open space easements, and land conservation contracts.
	Land Use Scenic Routes *Policy 1.L.4*	The County shall provide for landscaping and/or landscaped mounding along designated scenic corridors where desirable to maintain and improve scenic qualities and screen unsightly views.
	Land Use Scenic Routes *Policy 1.L.8*	The County shall include aesthetic design considerations in road construction, reconstruction, or maintenance for all scenic routes under County jurisdiction.
	Land Use Development Form and Design *Goal 1.O*	To promote and enhance the quality and aesthetics of development in Placer County
	Land Use Development Form and Design *Policy 1.O.9*	The County shall discourage the use of outdoor lighting that shines unnecessarily onto adjacent properties or into the night sky.
	Recreational & Cultural Resources Recreational Trails *Goal 5.C*	To develop a system of interconnected hiking, riding, and bicycling trails and paths suitable for active recreation and transportation circulation.

Table 4-1 (Continued)
Summary of General Plan Policies and Goals (P&Gs)

Document	P&Gs	Requirements
Placer County General Plan (continued)	Recreational & Cultural Resources Recreational Trails *Policy 5.C.4*	The County shall require the proponents of new development to dedicate rights-of-way and/or the actual construction of segments of the Countywide trail system pursuant to trails plans contained in the County's various community plans.
	Recreational & Cultural Resources Recreational Trails *Policy 5.C.5*	The County shall encourage the preservation of linear open space along rail corridors and other public easements for future use as trails.
County of Sacramento General Plan	Land Use Element Agricultural-Recreation Reserve	This designation identifies lands that have potential recreational value, but which would remain in agricultural or related and compatible open space use for the plan period. The location and extent of this category is generally determined by the presence of scenic, aesthetic, wildlife or other resources which require special protection and which may have potential recreational value. The intent of the General Plan is that these lands remain in agricultural uses through the plan period, although some low-intensity recreational uses which do not require the provision of urban services or flood protection may be permitted. Such recreational uses may be either publicly or privately owned and must be compatible with adjoining agricultural and natural preserve uses.
	Land Use Element Visual Quality *LU-24*	Require overhead light fixtures to be shaded and directed away from adjacent residential areas.
County of Sacramento General Plan	Land Use Element Visual Quality *LU-25*	Require exterior lighting to be low-intensity and only used where necessary for safety and security purposes.
	Circulation Element *Policy CI-6*. *Implementation Item B*	Prepare new Transportation Improvement Standards that better integrate pedestrian, transit, and bicycle access and aesthetics.
	Circulation Element *Policy CI-16*	Sacramento County shall implement a program to buffer land uses from each other and transportation system facilities that is effective, aesthetically pleasing, and minimizes the amount of land lost to buffers.
	Open Space Element *Policy OS-10*	Permit development clustering in urban areas where grouping of units at a higher density would facilitate on-site protection of woodlands, wetlands, steep slopes, urban stream corridors, scenic areas, or other appropriate natural features as open space.
	Open Space Element *Key Open Space Concepts*	Open space linkages in the urban environment are also important because they provide definition and scale to neighborhoods and visual, psychological relief to the pervasiveness of urban sprawl. They also create the opportunity for attractive, safe transportation corridors for non-vehicular travel.

Table 4-1 (Continued)
Summary of General Plan Policies and Goals (P&Gs)

Document	P&Gs	Requirements
Roseville General Plan	Land Use Element Growth Management *Goal 13*	New development to the west of Fiddyment Road shall be consistent with the City's desire to establish an edge along the western boundary of the City that fosters a physical separation from County lands through a system of connected open space; a well-defined sense of entry to City from west; opportunities for habitat preservation and recreation; and view preservation corridors that provide an aesthetic and recreational resource for residents.
	Land Use Element Community Design *Policy 8*	Encourage and promote the preservation of historic and/or unique, culturally and architecturally significant buildings, features, and visual environments.
City of Rocklin General Plan	Conservation, Development, and the Utilization of Natural Resources *Goal OCR- 53*	To consider the visual qualities of development projects and project compatibility with surrounding areas, especially when projects are proposed in urbanizing areas abutting rural or semi-rural areas where significant natural resource values exist.
City of Lincoln General Plan	Land Use *Goal LU-12*	To enhance the urban form while maintaining visual and physical access to distinctive environmental features.
	Land Use Open Space Views *Policy LU-12.1*	The City shall maintain visual access to hillside views by regulating building orientation, height, and bulk.
City of Lincoln General Plan	Land Use Open Space Views *Policy LU-12.3*	To enhance views of hillsides, open space, and other distinctive views within the community, project designs would be expected to maintain some viewshed by regulating building orientation, height, and mass.
	Land Use Visual Access to Creeks and Wetland Areas *Policy LU-12.6*	Wherever practical, the City would encourage new development to be oriented towards adjacent creeks and wetland areas and provide visual access to these areas.
	Open Space and Conservation Protect Natural Resources *Policy OSC-1.1*	The City shall strive to protect natural resource areas, fish and wildlife habitat areas, scenic areas, open space areas and parks from encroachment or destruction by incompatible development.
	Open Space and Conservation Encourage Planting of Native Vegetation *Policy OSC-5.4*	The City shall encourage the planting of native trees, shrubs, and grasslands in order to preserve the visual integrity of the landscape, provide habitat conditions suitable for native vegetation, and ensure that a maximum number and variety of well-adapted plants are maintained.

5.0 AFFECTED ENVIRONMENT

5.1 STUDY AREA

The study area is located in southwestern Placer County and southeastern Sutter County, just over a mile north of Sacramento County (Figure 1-1). The study area largely consists of flat agricultural lands (as shown in the photograph, right), with interspersed rural development surrounded by the peaks of the Sierra Nevada to the east, the Sutter Buttes to the northwest, and the Inner Coastal Range to the West. Some industrial development occurs in the westernmost and easternmost portions of the study area. More dense urban development is located adjacent to the eastern end of the study area, in the incorporated cities of Lincoln and Rocklin. The City of Roseville lies to the south of the Eastern Segment and to the east of the Central Segment of the project.

Approximately 91 percent of the parcels within the study area support various forms of agriculture, including pasture/grazing land (for cattle or sheep), cultivated agriculture (such as rice production), or other ranchland (Mara Feeney and Associates, 2006).

5.2 LANDSCAPE UNITS

FHWA guidance defines affected environment in terms of landscape units, or outdoor rooms. Landscape units are defined as an area or volume of distinct landscape character, which forms a spatially enclosed unit at ground level; it may include more than one landscape type. There are three dominant landscape units, each having their own distinct character. These are the Western, Central and Eastern Segment Landscape Units (Figure 5-1).

The Western Segment Landscape Unit is characterized by an agricultural/urban co-dominant landscape character. Key features include the north-south running SR 70/99 corridor and the intersecting Cross and Natomas East Main Drainage canals. Primary local roadways include sections of Riego Road and Sankey Road which run east-west through the landscape unit. The Western Segment Landscape Unit also contains several industrial facilities that add to the urbanized character of this area. The Western Segment Landscape Unit includes industrial, agricultural and/or rural, urban roadway and waterway landscape types.

The Central Segment Landscape Unit is predominantly agricultural in character. Although local roadways, including Sunset Boulevard West, Philips Road, Brewer Road, and Baseline Road, traverse the landscape unit, they are subordinate to the agricultural/rural uses surrounding them. In addition, no state or federal highways run through the Central Landscape Unit area. The Central Segment Landscape Unit is made up of predominantly agricultural and/or rural landscape types.

The Eastern Segment Landscape Unit is characterized as predominantly urban with agricultural influences. This Landscape Unit is directly adjacent to three incorporated cities (Lincoln, Rocklin, and Roseville) and is intersected by SR 65 at its easternmost edge. The Eastern Segment Landscape Unit includes urban development, urban roadway, and agricultural/rural landscape types.

Within each landscape unit select viewsheds (including combinations of foreground, middle ground, and background views) have been identified and classified as representative Landscape Unit Viewshed Locations. Background views from all Segment Landscape Units include views of the Inner Coastal Range to the West, the Sutter Buttes to the northwest and views of the peaks of the Sierra Nevada to the east. In total, twenty-two Viewshed Locations (Figure 5-1) were selected and are inventoried further in this chapter, illustrated in Figures 5-2 through 5-23, and described in Tables A-1 through A-22 in Appendix A.

5.2.1 Visual Character

5.2.1.1 Western Segment Landscape Unit

The visual character for the Western Segment Landscape Unit is generally described as agricultural in nature with minimal influence from development. The Western Segment Landscape Unit includes unincorporated portions of Sutter and Sacramento counties and is approximately 10,402 acres (approximately 29 percent of the study area). SR 70/99 runs north to south along the western edge of the segment, while major east to west arterials include Riego Road (rural arterial), Sankey Road (rural roadway), Howsley Road (roadway), and Pleasant Grove Road (rural arterial), which straddles the border between the Western and Central segments. Other infrastructure in this segment landscape unit includes the Union Pacific Railroad, which runs north to south in the middle of the segment landscape unit, as well as a fire station near Sankey Road. Water features in the Western Segment Landscape Unit include Pleasant Grove Creek, the Cross Canal, the Natomas East Main Drainage Canal, Steelhead Creek, and scattered vernal pool wetland complexes. As in the Central Segment Landscape Unit, the majority of land use in this area is cultivated agricultural land in both Sacramento and Sutter counties, with interspersed pockets of development, including rural roadways, rural residences, and scattered industrial land uses.

Background views from the Western Segment Landscape Unit include views of the Inner Coastal Range to the West, the Sutter Buttes to the northwest and views of the peaks of the Sierra Nevada to the east. The Western Segment Landscape Unit contains industrial/commercial uses within Sutter County, including the Sysco facility along Pacific Avenue near the intersection of Sankey Road, and an industrial park located south of the Sysco facility. As in the Eastern Segment Landscape Unit, these industrial facilities are located near a major highway, in this case SR 70/99, which is approximately 1 mile west. There are also areas of rural residential development located on or near Pleasant Grove Road within this landscape unit. Land use in this area of Sutter County is rice production with scattered rural residences (also see Appendix A (Landscape Unit/Visual Inventory Worksheets), Tables A-8, A-1, and A-2).

5.2.1.2 Central Segment Landscape Unit

The Central Segment Landscape Unit has a visual character that is agricultural in nature with large expanses of relatively undeveloped or farmed lands. The Central Segment Landscape Unit encompasses parts of unincorporated Placer and Sutter counties and is the largest of the three segment landscape units. It includes approximately 15,292 acres (approximately 43 percent of the study area). The major roadways include Baseline Road, Riego Road, Sankey Road, and Pleasant Grove Road that straddles the border between the Western and Central segments. The public land uses existing within this segment landscape unit include the planned City of Roseville's Retention Basin near Phillip Road, and a small wildlife preserve near the Brewer Road crossing of Curry Creek. Water-related features in the Central Segment Landscape Unit include Pleasant Grove Creek, Steelhead Creek, Curry Creek, a small water ski park/catfish farm near the intersection of Baseline Road and Locust Road, and various vernal pool and wetland complexes located throughout the segment landscape unit. Background views from the Central Segment Landscape Unit include views of the Inner Coastal Range to the West, the Sutter Buttes to the northwest and views of the peaks of the Sierra Nevada to the east. The predominant land uses in this segment landscape unit are agricultural, with small enclaves of rural residential uses (specifically near

Baseline and Pleasant Grove roads). In addition, there is a small industrial wood fabrication facility located near the rural residential homes close to the intersection of Baseline and Pleasant Grove roads (also see Appendix A, Tables A-4 through A-13).

5.2.1.3 Eastern Segment Landscape Unit

The Eastern Segment Landscape Unit is characterized as a varied landscape which includes agricultural land, areas of dense residential development, and areas developed as major roadways. The Eastern Segment Landscape Unit is approximately 9,754 acres in size (approximately 28 percent of the study area) and includes areas within the City of Rocklin, the City of Roseville, and unincorporated Placer County. SR 65 and several regional arterial roadways such as Sunset Boulevard, Blue Oaks Boulevard, Pleasant Grove Boulevard, and Baseline Road run through portions of this segment landscape unit. Large regional facilities and infrastructure in this segment landscape unit include the Western Regional Sanitary Landfill/Materials Recovery Facility, the Pleasant Grove Wastewater Treatment Plant (PGWWTP), the newly constructed Roseville Energy Park (REP), and Sacramento Municipal Utilities District (SMUD)/Western Area Power Authority (WAPA) power lines. Streams in this segment landscape unit include a small tributary of Orchard Creek in the northern part of the eastern segment, north of the proposed corridor alignment, Pleasant Grove Creek, and Curry Creek. This segment landscape unit also contains the largest area of vernal pool and wetland complexes, specifically in the area adjacent to the existing PGWWTP. Background views from the Eastern Segment Landscape Unit include views of the Inner Coastal Range to the West, the Sutter Buttes to the northwest and views of the peaks of the Sierra Nevada to the east. The current land use in the easternmost portion of this segment landscape unit is a mixture of industrial and commercial uses near the SR 65 corridor. Public facilities, including the landfill and the PGWWTP, grazing land, or idle farmland, cultivated agricultural land, and a few rural residences are located in the western portion of this segment landscape unit (also see Appendix A, Tables A-12 through A-22).

5.2.2 Visual Quality

In addition to inventorying visual character for each of the landscape units, existing visual quality was assessed. Visual quality ratings are defined by the FHWA by assessing three criteria: vividness, intactness, and unity (see Chapter 3 for descriptions).

All three factors (vividness, intactness, and unity) must be rated high to indicate high visual quality for a study area. Table 5-1 indicates ratings for the three landscape units in relation to the FHWA's three criteria.

Table 5-1
FHWA Visual Quality Assessment

Segment Landscape Units	FHWA Criteria		
	Vividness	Intactness	Unity
Western	Moderate	Low	Low
Central	Moderate	Low	Moderate
Eastern	Moderate/Low	Low	Low

Each segment landscape unit's overall visual quality rating is moderate to low. There are no areas of high visual quality affected by the project corridor alignment alternatives. Appendix A comprises completed FHWA Landscape Unit Checklist/Visual Inventory and Analysis Worksheets for each of the Viewshed

Locations within the three identified landscape units; these provide a thorough analysis of visual character/quality.

5.3 EXISTING PROJECT VIEWSHED

A viewshed is defined as the visual limits of the views located from a proposed project or location. It comprises views from, and of, that location. For the purposes of this report the viewshed includes views to and from the corridor alternatives, discussed by segment landscape unit.

The VIAHP Manual defines three distinct distance zones for the assessment of potential visual impacts. These are: foreground views (0 to ¼ – ½ mile), middle ground views (¼ – ½ mile to 3 – 5 miles), and background views (3 – 5 miles to infinite miles). The flat topography of the area lends itself to broad, expansive views, which comprise all three distance zones.

Principal travel corridors are important to an analysis of aesthetic features because they define the vantage point for the largest number of viewers. Within the study area there are numerous roadways, many of which traverse large portions of their respective study area segment landscape units. In addition, numerous roadways just outside the study area have views to the project corridors. As required by FHWA guidelines, a variety of roadways (and the segment landscape units they view) were chosen to help represent a wide variety of traveler views of the project within the study area (see Figure 5-1).

- SR 70/99 — Western Segment Landscape Unit
- Pleasant Grove Road — Western Segment Landscape Unit/Central Segment Landscape Unit
- Keys Road — Western Segment Landscape Unit/Central Segment Landscape Unit
- Sankey Road — Western Segment Landscape Unit/Central Segment Landscape Unit
- Riego/Baseline Road — Western Segment Landscape Unit/Central Segment Landscape Unit/Eastern Segment Landscape Unit
- Locust Road — Central Segment Landscape Unit
- County Acres Lane — Central Segment Landscape Unit
- Sunset Boulevard West — Central Segment Landscape Unit/Eastern Segment Landscape Unit
- Watt Avenue — Central Segment Landscape Unit/Eastern Segment Landscape Unit
- SR 65 — Eastern Segment Landscape Unit
- Industrial Avenue — Eastern Segment Landscape Unit
- Whitney Boulevard — Eastern Segment Landscape Unit
- Twelve Bridges Road — Eastern Segment Landscape Unit
- Athens Avenue — Eastern Segment Landscape Unit
- Fiddyment Road — Eastern Segment Landscape Unit
- Sunset Boulevard — Eastern Segment Landscape Unit

Other views taken into account include nearby residential views at the western boundary of the City of Roseville; specifically, backyard views from the Crocker Ranch Homes, as well as views from residences along Westhills Drive and Del Webb Boulevard. Background views from all Segment Landscape Units include views of the Inner Coastal Range to the West, the Sutter Buttes to the northwest and views of the peaks of the Sierra Nevada to the east. All analyzed views correspond to the twenty-two Viewshed Locations, which have been chosen to help identify and assess possible aesthetic concerns of the project. Twenty-two viewshed locations are shown in Figures 5-2 through 5-23 and listed in Section 5.4 below.

Several of these figures show land within the area of the West Roseville Specific Plan (WRSP), which was approved in 2004. Since the aerial photographs of this area were taken, this land has been extensively graded and continues to change as additional improvements proposed within the WRSP are implemented.

5.3.1 Existing Viewshed Lighting

FHWA guidance requires assessment of nighttime views and changes to lighting and glare. Placer Parkway would require installation of nighttime lighting fixtures. Existing lighting sources in the study area are limited to the developed areas, which are predominantly in the Eastern Segment Landscape Unit. At the Tier 1 stage, detailed design information on potential location, types and quantity of project lighting is not available, and therefore analysis of impacts from proposed lighting are not included in this assessment. These elements would be evaluated within the Tier 2 level analysis.

5.4 EXISTING VIEWER SENSITIVITY/VIEWER EXPOSURE

5.4.1 Viewer Sensitivity

Viewer sensitivity relates directly to the viewshed in which a potential project would be located. The viewshed includes all areas where physical changes associated with the project are visible from a sensitive viewpoint, and it is influenced by existing topography, vegetation, and structures. As described in Section 3.1.3, viewer sensitivity is defined as viewer *activity*, *awareness*, local *values*, and cultural *significance* of the visual resource.

For purposes of this visual analysis, the project viewshed consists of a wide variety of foreground, middleground and background views. These foreground and middleground viewsheds generally follows the study area boundary. Background views of the surrounding landscapes (including, but not limited to, the snowy peaks of the Sierra Nevada, the Sutter Buttes and the Inner Coastal Range) are found throughout all viewshed landscape units.

The sensitivities of different types of viewers within the foreground, middleground and background of the study area vary depending upon viewer activity and awareness of and familiarity with the surrounding environment. The following describes the comparative sensitivity of the various types of viewers in decreasing order of sensitivity.

Recreational Viewers. Recreational viewers, including those at park locations, playgrounds, baseball fields etc., particularly those with views of the Parkway, would be most sensitive to change because the nature of their viewing experience is often focused on their visual surroundings.

Residents. Residents, particularly those with views of the Parkway from their homes, would be most sensitive to potential visual impacts because of the relative permanency of their viewing experience.

Workers. Employees of retail, industrial, and professional establishments within the viewshed of the Parkway would be considered sensitive viewers because they have frequent opportunities to experience the views from their workplaces and routinely visit the area. These views can be fleeting or lengthy in duration.

Pedestrians. Pedestrians would be considered sensitive viewers, as they would be directly within the viewshed and would have lengthy exposure to views.

Regular Motorists. Regular motorists (including regular railroad riders) would be those who live in the study area or who commute through it on a regular basis and are familiar with the surrounding views.

However, their sensitivity to these views would be less compared to that of pedestrians, as passage of drivers through the study area is quicker and their attention likely to be less focused on visual qualities.

Occasional Motorists. Occasional motorists (including occasional railroad riders) are typically nonresident, non-commuter tourists. These motorists would have short duration, temporary views of the Parkway and would therefore be considered less sensitive than regular motorists.

5.4.2 Viewer Exposure

In addition to viewer sensitivity, viewer exposure to the future Parkway must also be assessed. Viewer exposure is typically assessed by measuring the number of viewers exposed to the resource change, type of viewer activity, duration of their view, speed at which the viewer moves, and position of the viewer. In order to help assess existing viewer exposure, existing population and traveler counts were analyzed and included for the study area and adjacent localities (Figure 5-24). U.S. Census data are updated intermittently. Therefore, it should be noted that year 2000 data (the most current data available) were used to assess existing conditions for this project. In addition, it should be noted that Census population numbers are helpful when assessing the general number of potential residential viewers within the region; however, since Census numbers are generated by Census block groups, the actual location of these population numbers can vary within that Census block group itself. In addition, traffic counts throughout the region were provided by DKS Associates, dated 2007. Viewer activity would vary throughout the region. While the number of potential viewers can generally be assessed by reviewing Census and Average Daily Count numbers, viewer activity, duration of views, speed at which the viewer is moving (for traveler views), and position of the viewer would vary.

5.5 EXISTING TYPICAL VIEWSHEDS

Based upon assessment of viewer sensitivity and viewer exposure as defined in Section 5.4.2, and, the extent of the viewshed, twenty-two viewsheds and three landscape units for this project have been identified. Viewshed locations within the three identified landscape units represent typical key views of various sensitivities within the project vicinity from a variety of view distances (foreground, middleground, and background).

Although project features (e.g., interchange locations) were taken into account when selecting typical viewshed locations, per FHWA guidelines the main factors for choosing Viewshed Locations are viewer sensitivity (viewer activity, awareness, local values, and cultural significance of the area) and viewer exposure (number of viewers, type of activity, location of viewer, and duration of view).

5.5.1 Landscape Unit Viewshed Locations

Twenty-two representative landscape unit viewshed locations (Figures 5-2 through 5-23), along with existing visual quality ratings for each view are listed below. Viewshed Locations have been grouped by Landscape Unit affected. Numbering of viewshed locations is purely for identification purposes only and is not meant to reflect ranking or priority of views. Where viewshed locations overlap (i.e., the viewshed location has views to more than one landscape unit), the viewshed location is included in the primary affected landscape unit inventories list only. Several representative landscape unit viewshed locations have either a foreground, middle-ground or background view of the project or have a combination of views, and represent a variety of combinations of views and viewers affected.

Western Segment Landscape Unit Viewshed Locations:

Viewshed #1: Western Segment Landscape Unit – Eastbound traveler views on Riego Road at SR 70/99 Intersection looking northeast toward project. Sutter County. *(Typical Viewshed #1, see Figure 5-2, see also Appendix Table A-1.)* Existing visual quality rating is Low.

Viewshed #2: Western Segment Landscape Unit – Northbound traveler views on SR 70/99 at Sankey Road looking east toward project. County of Sutter County. *(Typical Viewshed #2, see Figure 5-3, see also Appendix Table A-2.)* Existing visual quality rating is Low.

Viewshed #3: Western Segment Landscape Unit – Southbound traveler views on SR 70/99 looking south toward Sankey Road intersection. Sutter County. *(Typical Viewshed #3, see Figure 5-4, see also Appendix Table A-3.)* Existing visual quality rating is Low.

Central Segment Landscape Unit Viewshed Locations:

Viewshed #4 Central Segment Landscape Unit – Eastbound traveler on Sunset Boulevard West between Pettigrew Road and Dinky Lane looking south toward proposed project. Placer County. *(Typical Viewshed #4, see Figure 5-5, see also Appendix Table A-4.)* Existing visual quality rating is Low.

Viewshed #5: Western/Central Segment Landscape Units – Eastbound traveler on Sunset Boulevard West at Pleasant Grove Road intersection (project would be in distant background). Sutter County. *(Typical Viewshed #5, see Figure 5-6, see also Appendix Table A-5.)* Existing visual quality rating is Moderate.

Viewshed #6: Western/Central Segment Landscape Units – Southbound traveler on Pleasant Grove Road at Keys Road intersection looking southeast toward project. Sutter County. *(Typical Viewshed #6, see Figure 5-7, see also Appendix Table A-6.)* Existing visual quality rating is Moderate.

Viewshed #7: Western/Central Segment Landscape Units – Southbound traveler on Pleasant Grove Road near Sankey Road looking east toward project. Sutter County. *(Typical Viewshed #7, see Figure 5-8, see also Appendix Table A-7.)* Existing visual quality rating is High.

Viewshed #8: Western/Central Segment Landscape Units – Northbound traveler on Pleasant Grove Road at Riego Road/Baseline Road looking north toward project. Sutter/Placer County. *(Typical Viewshed #8, see Figure 5-9, see also Appendix Table A-8.)* Existing visual quality rating is Moderate.

Viewshed #9: Central Segment Landscape Unit – Northbound traveler just off Locust Road at Baseline Road looking north toward project. Sutter/Placer County. *(Typical Viewshed #9, see Figure 5-10, see also Appendix Table A-9.)* Existing visual quality rating is Low.

Viewshed #10: Central Segment Landscape Unit – Eastbound traveler on Baseline Road at Country Acres Lane looking north toward project. Placer County. *(Typical Viewshed #10, see Figure 5-11, see also Appendix Table A-10.)* Existing visual quality rating is Low.

Viewshed #11: Central/Eastern Segment Landscape Units – Westbound traveler on Baseline Road at Watt Avenue looking northwest toward project. Placer County. *(Typical Viewshed #11, see Figure 5-12, see also Appendix Table A-11.)* Existing visual quality rating is Low.

Viewshed #12: Central/Eastern Segment Landscape Units – Residential views/Westbound traveler on Westhills Drive at Fiddyment Road looking west toward project. City of Roseville/Placer County. Note that the area of the WRSP shown in this figure has been substantially graded and developed since the aerial photograph was taken. *(Typical Viewshed #12, see Figure 5-13, see also Appendix Table A-12.)* Existing visual quality rating is Low.

Viewshed #13: Central/Eastern Segment Landscape Units – Residential views/Northbound traveler on Fiddyment Road at Del Webb Boulevard looking west toward project. City of Roseville, Placer County. Note that the area of the WRSP shown in this figure has been substantially graded and developed since the aerial photograph was taken. *(Typical Viewshed #13, see Figure 5-14, see also Appendix Table A-13.)* Existing visual quality rating is Moderate.

Eastern Segment Landscape Unit Viewshed Locations:

Viewshed #14: Eastern Segment Landscape Unit – Northbound traveler on Industrial Avenue at Pleasant Grove Creek Bridge (proposed project would be behind bridge in this photo). City of Roseville, Placer County. *(Typical Viewshed #14, see Figure 5-15, see also Appendix Table A-14.)* Existing visual quality rating is Low.

Viewshed #15: Eastern Segment Landscape Unit – Northbound traveler on SR 65 at Placer County/City of Roseville/City of Rocklin merge looking north toward project. City of Rocklin/City of Roseville, Placer County. *(Typical Viewshed #15, see Figure 5-16, see also Appendix Table A-15.)* Existing visual quality rating is Low.

Viewshed #16: Eastern Segment Landscape Unit – Northbound traveler on SR 65 at Whitney Boulevard looking northwest toward proposed project. Placer County. *(Typical Viewshed #16, see Figure 5-17, see also Appendix Table A-16.)* Existing visual quality rating is Low.

Viewshed #17: Eastern Segment Landscape Unit – Westbound traveler on Whitney Boulevard at SR 65 looking west toward proposed project. Placer County. *(Typical Viewshed #17, see Figure 5-18, see also Appendix Table A-17.)* Existing visual quality rating is Low.

Viewshed #18: Eastern Segment Landscape Unit – Westbound traveler on Twelve Bridges Road at SR 65 looking southwest toward proposed project. City of Lincoln, Placer County. *(Typical Viewshed #18, see Figure 5-19, see also Appendix Table A-18.)* Existing visual quality rating is Low.

Viewshed #19: Eastern Segment Landscape Unit – Westbound traveler on Athens Avenue between Fiddyment Road and SR 65 looking south toward proposed project. Placer County. *(Typical Viewshed #19, see Figure 5-20, see also Appendix Table A-19.)* Existing visual quality rating is High.

Viewshed #20: Eastern Segment Landscape Unit – Southbound traveler on Fiddyment Road between Athens and Sunset Boulevard West looking south toward proposed project. Placer County. *(Typical Viewshed #20, see Figure 5-21, see also Appendix Table A-20.)* Visual quality rating is Moderate.

Viewshed #21: Eastern Segment Landscape Unit – Residential backyard views within Crocker Ranch Homes at Mt. Tamalpais Drive near Big Bear Drive looking north toward proposed project. City of Roseville, Placer County. *(Typical Viewshed #21, see Figure 5-22, see also Appendix Table A-21.)* Visual quality rating is Low.

Viewshed #22: Eastern Segment Landscape Unit – Westbound traveler views on Sunset Boulevard West at Fiddyment Road looking west down Sunset Boulevard West toward proposed project. Placer County. *(Typical Viewshed #22, see Figure 5-23, see also Appendix Table A-22.)* Visual quality rating is Low.

The viewshed locations identified above include a variety of representative views "of" and "from" a variety of locations within each of the identified Landscape Units. Table 5-2 below identifies existing Visual Character/Quality and Viewer Sensitivity/Exposure by Landscape Unit based upon this analysis.

Table 5-2
Existing Visual Character/Quality and Viewer Sensitivity/Exposure by Landscape Unit

Segment Landscape Unit	Visual Character	Visual Quality	Viewer Sensitivity	Viewer Exposure
Western	Agricultural/Urban Co-Dominant	Moderate/ Low	Moderate	Moderate
Central	Agricultural with Urban Influence	Moderate	Low/Moderate	Low/Moderate
Eastern	Urban with Agricultural Influence	Moderate/ Low	Moderate/High	Moderate/High

6.0 POTENTIAL DIRECT IMPACTS

As specified in FHWA Guidelines, visual resource change is the sum of the change in visual character and change in visual quality. The first step in determining visual resource change is to assess the compatibility of the project with the visual character of the existing landscape. The second step is to compare the visual quality of the existing resources with projected visual quality after the project is constructed.

The viewer response to project changes is the sum of viewer exposure and viewer sensitivity to the project. The resulting level of visual impact is determined by combining the severity of resource change with the degree to which people are likely to oppose the change.

The FHWA has defined the following measures of visual impact levels:

- **Low** – Minor adverse change to the existing visual resource, with low viewer response to change in the visual environment. May or may not require mitigation.
- **Moderate** – Moderate adverse change to the visual resource with moderate viewer response. Impact can be mitigated within 5 years using conventional practices.
- **Moderately High** – Moderate adverse visual resource change with high viewer response or high adverse visual resource change with moderate viewer response. Extraordinary mitigation practices may be required. Landscape treatment required would generally take longer than 5 years to mitigate.
- **High –** A high level of adverse change to the resource or a high level of viewer response to visual change such that architectural design and landscape treatment cannot mitigate the impacts. Viewer response level is high. An alternative project design may be required to avoid highly adverse impacts.

6.1 NO-BUILD ALTERNATIVE

Under the No-Build Alternative, land for the future construction of the Placer Parkway would not be acquired and the Placer Parkway would not be constructed. No impacts to visual resources would occur as a result of the No-Build Alternative.

6.2 ALTERNATIVE 1 – THE RED ALTERNATIVE

Figure 2-1 indicates the proposed Alternative 1 corridor through the project's three identified landscape units (Western, Central and Eastern). Per FHWA guidelines, potential visual impacts are assessed by reviewing resource change (changes to visual character and visual quality) and viewer response to those changes (identified by assessing viewer sensitivity and viewer exposure). In order to understand potential changes and overall impacts from Alternative 1, potential impacts relating to resource change and viewer response (per Landscape Unit) were assessed. Potential visual impacts of Alternative 1 are described in Sections 6.2.1 through 6.2.3. A summary of potential impacts of Alternative 1 are included in Section 6.2.4.

6.2.1 Western Segment Landscape Unit

6.2.1.1 Resource Change

See Appendix A for FHWA Inventory Sheets of Visual Character for each Viewshed Location within the landscape unit.

Visual Character

Under Alternative 1, visual character in the Western Segment Landscape Unit would change from predominantly agricultural in nature with urban influences, to a shared urban and agricultural character. The Parkway would bring co-dominance between agricultural- and urban-based forms, lines, colors, and textures. Agricultural pattern elements (flat forms, clean lines, green/natural undertones and rich rural textures) currently dominate the Western Segment Landscape Unit. The influence of additional urban pattern elements (linear and concrete forms, more dominant roadway and structural lines, gray and black color undertones, and concrete/pavement textures) would create a strong change in visual character, and would increase the visual diversity of the study area; a process already began with the implementation of the WRSP, which has introduced grading and other pre-construction improvements to the area. Landscaping and other mitigation strategies are identified to help soften the change in character (see Chapter 10, Avoidance, Minimization, and/or Mitigation Strategies).

The continuity of farming lands in the Western Segment Landscape Unit for Alternative 1 is currently broken up by rural roadways, rural residences, and scattered industrial land uses. Alternative 1 would result in a change in character within the Western Segment Landscape Unit, as agricultural land is converted to highway use. Changes to the visual character with the Parkway would include the introduction of new, highly visible structures, including two or three interchanges, with both a freeway-to-freeway interchange, bridges, and local street over crossings (Figure 5-1). The scale and dominance of these changes in conjunction with the existing flat natural environmental would change existing panoramic views of the area. Consequently, due to changes in the form, line, color, and textures introduced by the Parkway creating changes in scale, continuity, diversity, and dominance, under Alternative 1, the character of the Western Segment Landscape Unit would be characterized as agricultural/urban co-dominant (see Table 6-1).

Visual Quality

Alternative 1 would not affect the characterization of visual quality in the Western Segment Landscape Unit, which would remain moderate to low. Under Alternative 1, the Western Segment Landscape Unit would continue to be characterized as having moderate visual intactness, and the addition of the Parkway would further contribute to the lack of integrity of the landscape. Existing unity for the Western Segment Landscape Unit is considered low, as agricultural areas are interspersed with roadways and limited urban development. Background views from the Western Segment Landscape Unit would continue to include views of the Inner Coastal Range to the West, the Sutter Buttes to the northwest and views of the peaks of the Sierra Nevada to the east. The Parkway would further reduce this unity. Overall, the Western Segment Landscape Unit under Alternative 1 would maintain a moderate/low visual quality rating (Table 6-1).

6.2.1.2 Viewer Response

Viewer Sensitivity

Viewer sensitivity is defined by the FHWA as follows: The preferences, values, and opinions of different viewer groups can be documented in the following ways: viewer activity and awareness, local values and cultural significance of the visual resource (FHWA, 1981, p. 68). Local values and cultural significance of the visual resource are difficult to obtain at this preliminary phase of project development (Tier 1 EIS/EIR). However, based upon a limited review of viewers surrounding the project alternative, a sensitivity rating is given for each Viewshed Location within the area. The viewshed locations identified in Section 5.4 that relate to the Western Segment Landscape Unit under Alternative 1 comprise Viewshed Locations #1-3, and #5-8 (see Section 5.5.1).

Under Alternative 1, viewer sensitivity to the Western Segment Landscape Unit has been classified as Moderate/High since the viewer's concern for scenic quality and change to the existing visual setting is anticipated to be high. Currently most viewers within the study area are commuters using existing roadways, and therefore existing viewer sensitivity is low. Viewer sensitivity may change with the introduction of new major structures associated with the Parkway, such as the freeway-to-freeway interchange and one or two additional interchanges within this landscape unit. Although viewer focus would likely be on the Parkway itself, new structures would create visual interest and would heighten traveler viewer sensitivity to the project. Heightened viewer sensitivity would also occur as agricultural lands are utilized for the Parkway. In addition, there are scattered rural residences and some residential communities that would have views of the Parkway with the introduction of this alternative. Viewer sensitivity under Alternative 1 would shift from Moderate (Table 5-2) to Moderate/High Sensitivity (Table 6-1).

Viewer Exposure

Viewer exposure is defined by the FHWA as the degree to which viewers are exposed to a view by their physical location, the number of people viewing, and the duration of view (FHWA). Figure 5-24 shows population and traffic counts for exposed viewers within the region. This figure shows physical location, the number of people viewing and the duration of view (e.g., residential – long duration, travelers – shorter duration). The Viewshed Locations identified in Section 5.4 that relate to the Western Segment Landscape Unit under Alternative 1 include Viewshed Locations #1-3 and #5-8 (see Section 5.5.1).

Alternative 1 would create a change in viewer exposure from and of the Parkway. The majority of viewers of Alternative 1 within the Western Segment Landscape Unit would be travelers viewing the project from SR 70/99. Existing traffic along this major roadway can be characterized as moderate to heavy and continuous. Existing exposure for views from SR 70/99 of Alternative 1, however, can be characterized as moderate to low since most viewers would be exposed to changes in views for minimal duration (while traveling) at high rates of speed. Alternative 1 would add vehicular capacity to the study area, thereby adding additional viewers from Alternative 1. In addition, Alternative 1 would potentially have recreational/commuter bicycle viewers in the study area who would have longer, continual views of Alternative 1. The number of viewers would remain moderate to heavy. Existing residences within the study area would have stationary views (in addition to moving views to and from their homes) of Alternative 1. The number of residences (see Census population counts shown on Figure 5-24) with views of the alternative are characterized as low for the Western Segment Landscape Unit. However, the frequency of exposure for these residences is high. Although over-crossings and interchanges would be visible from a variety of nearby residential viewers and travelers, the existing flat topography minimizes direct views of the roadway itself for most viewsheds within the Western Segment Landscape Unit. Overall viewer exposure of the Western Segment Landscape Unit under Alternative 1 would shift from Moderate (Table 5-2) to Moderate/High (Table 6-1).

6.2.2 Central Segment Landscape Unit

6.2.2.1 Resource Change

Visual Character

Under Alternative 1, the character in the Central Segment Landscape Unit would remain agricultural in nature but would have a stronger urban influence due to the addition of the Parkway. The resource area would change from predominantly agricultural in nature with large expanses of relatively undeveloped or farmed lands to a mix of urban- and rural-influences. Agricultural pattern elements (flat forms, clean lines, green/natural undertones and rich rural textures) currently dominate the Central Segment Landscape Unit. Alternative 1 would introduce urban-based forms, lines, colors and textures to a relatively rural

area; a process already began with the implementation of the WRSP, which has introduced grading and other pre-construction improvements to the area. The influence of urban pattern elements (linear and concrete forms, more dominant roadway and structural lines, gray and black color undertones, and concrete/pavement textures) would increase visual diversity. Landscaping and other mitigation is proposed to help soften the change in character (see also Chapter 10, Avoidance, Minimization, and/or Mitigation Strategies). Even with the inclusion of the Parkway, the Central Segment Landscape Unit itself would remain agricultural in nature but the additional urban pattern elements will unquestionably add to the urban influence already found in the region.

The continuity of farming lands in the Central Segment Landscape Unit area is currently broken up by rural roadways. Alternative 1 would cause a distinct change in character for a corridor within this landscape unit, as agricultural areas are utilized for the Parkway. Changes to the visual character with the project would include the introduction of new highly visible structures, including a bridge over Pleasant Grove Creek, and local street over-crossings. The scale and dominance of these changes in conjunction with the existing flat natural environmental would impede some existing panoramic views and add views to other areas of the region. Alternative 1 will create changes in the form, line, color, and textures introduced by the Parkway creating changes in scale, continuity, diversity and dominance. However, under Alternative 1, the character of the Central Segment Landscape Unit would remain agricultural with a urban influence.

Visual Quality

Alternative 1 would not affect the existing vividness of the Central Segment Landscape Unit, which is characterized as moderate, reflecting its flat rural terrain. Background views from the Central Segment Landscape Unit would continue to include views of the Inner Coastal Range to the West, the Sutter Buttes to the northwest and views of the peaks of the Sierra Nevada to the east. The existing low intactness rating of the Central Segment Landscape Unit would not be substantially affected by Alternative 1. Urban development (including rural roadways and scattered residences/businesses) intermixed with rural development (agricultural fields) has already changed the original natural setting that once existed. Alternative 1 would only add to the lack of integrity of the landscape, further lowering the intactness of the area. Existing unity for the Central Segment Landscape Unit is considered moderate. Man-made natural landscapes (e.g., agricultural areas) co-exist with the rural roadways and limited rural-based development, but the overall harmony of the agricultural setting in the region remains unified. Alternative 1 would result in the Central Segment Landscape Unit becoming less predominantly agricultural in nature. The introduction of a man-made, urban feature would decrease the unity of the area to low. Overall, the Central Segment Landscape Unit under Alternative 1 would maintain a moderate visual quality rating.

6.2.2.2 Viewer Response

Viewer Sensitivity

A representation of viewers within the landscape unit have been included to help evaluate potential viewer sensitivity to Alternative 1. To help with this evaluation, a sensitivity rating has been assigned for each Viewshed Location within the landscape unit. The viewshed locations identified in Section 5.4 that relate to the Central Segment Landscape Unit under Alternative 1 include Viewshed Locations #4-13 (see Section 5.5.1).

Under Alternative 1, viewer sensitivity to the Central Segment Landscape Unit has been classified as Moderate/High since the viewer's concern for scenic quality and change to existing visual is anticipated to be high. Currently most viewers within the study area are commuters using existing roadways, and therefore existing viewer sensitivity to the proposed Alternative is low. Viewer sensitivity may change

with the introduction of proposed structures associated with the alternative, such as the over-crossings within this landscape unit. Although viewer focus would likely be on the alternative itself, new structures would create visual interest and would heighten traveler viewer sensitivity of the project. In addition, heightened viewer sensitivity from nearby residences (and other viewers) of the alternative would occur as agricultural lands are converted to urban Parkway uses. Viewer sensitivity under Alternative 1 would shift from Low/Moderate to Moderate/High.

Viewer Exposure

Figure 5-24 shows population (Census of Population and Housing, 2000) and existing traffic counts for exposed viewers within the region. This figure presents a representative physical location, number of people viewing, and duration of view (e.g., residential – long duration, travelers – shorter duration). The viewshed locations identified in Section 5.4 that relate to the Central Segment Landscape Unit under Alternative 1 comprise Viewshed Locations #7, 8, 9, 10, 11, 12, and 13 (see Section 5.5.1). (See comments in Western Segment Landscape Unit about Figure 5-24.)

Alternative 1 would create a change in viewer exposure from and to the Parkway. Although existing traffic through the landscape unit is characterized as moderate to heavy and continuous, the existing exposure for the majority of viewers is characterized as moderate to low since most viewers would be exposed to changes in views for minimal duration (while traveling) at high rates of speed. In addition, Alternative 1 would potentially have recreational/commuter bicycle viewers in the study area who would have longer, continual views of Alternative 1. Viewers in existing residences within the study area would primarily have stationary views of Alternative 1, and would experience relatively high exposure to these views. Over-crossings and interchanges would be visible from a variety of nearby viewers and travelers and existing flat topography allows direct views of the roadway itself for viewsheds in close proximity to Alternative 1 within the Central Segment Landscape Unit. Overall viewer exposure of the Central Segment Landscape Unit under Alternative 1 would shift from Low/Moderate to Moderate.

6.2.3 Eastern Segment Landscape Unit

6.2.3.1 Resource Change

Visual Character

Under Alternative 1, the character of the Eastern Segment Landscape Unit would change dramatically. Substantial additional urban influences would be introduced to the character of the area (e.g., three new interchanges including a freeway-to-freeway interchange and local street overcrossings). The Eastern Segment Landscape Unit includes views from portions of the following incorporated cities within Placer County: Rocklin, Roseville, and Lincoln. Agricultural lands and rural development surround the urban development, but of the three landscape units, the Eastern Segment Landscape Unit contains the most urban character. This segment landscape unit contains a mixture of industrial and commercial uses including large regional facilities and infrastructure. Alternative 1 would introduce additional urban-based forms, lines, colors and textures, creating a stronger urban influence. Linear and concrete forms, more dominant roadway and structural lines, gray and black color undertones, and concrete/pavement textures would add to the urban characterization of the area. However, agricultural pattern elements (flat forms, clean lines, green/natural undertones and rich rural textures) would remain a dominant influence. Landscaping and other mitigation is proposed to help soften the edges of these mixed areas (see also Chapter 10, Avoidance, Minimization, and/or Mitigation Strategies).

The Eastern Segment Landscape Unit is characterized as diverse, with areas of flat, rural agricultural lands adjacent to large-scale residential developments lying within and adjacent to the alternative corridor. Currently there are few above-ground structures, over-crossings or interchanges within the

Eastern Segment Landscape Unit of Alternative 1. Urban influences in the Eastern Segment Landscape Unit do include the Union Pacific Railroad and the Rio Bravo biomass power plant property in the vicinity of Industrial Boulevard. Changes in visual character would affect views of and from the Parkway from surrounding areas. Consequently, due to changes in the form, line, color, and textures introduced by Alternative 1 creating changes in scale, continuity, diversity and dominance, the character of the Eastern Segment Landscape Unit would shift from Urban with Agricultural influence to Agricultural/Urban Co-Dominant.

Visual Quality

Alternative 1 would not substantially affect the vividness of the Eastern Segment Landscape Unit, which would remain moderate to low. This segment landscape unit is typified by a mix of agricultural lands and dense residential developments. Notable visual features consist of industrial and commercial structures. Background views from the Eastern Segment Landscape Unit would continue to include views of the Inner Coastal Range to the West, the Sutter Buttes to the northwest and views of the peaks of the Sierra Nevada to the east. The addition of the alternative would contribute further to the lack of integrity of the landscape, further lowering the intactness of the area. Existing unity for the Eastern Segment Landscape Unit is considered low, with agricultural landscapes interspersed with roadways and areas of urban development. Alternative 1 would further disrupt this existing low level of visual unity. Overall, the Eastern Segment Landscape Unit under Alternative 1 would maintain a moderate to low visual quality rating.

6.2.3.2 Viewer Response

Viewer Sensitivity

The viewshed locations identified in Section 5.4 that relate to the Eastern Segment Landscape Unit under Alternative 1 include Viewshed Locations #14-22 and #11-13 (see Section 5.5.1).

Under Alternative 1, viewer sensitivity to the Eastern Segment Landscape Unit has been classified as Moderate/High. Currently most viewers within the study area are commuters using existing roadways. Viewer sensitivity would change with the introduction of new major structures associated with the alternative, such as the freeway-to-freeway interchange and over-crossings. Although viewer focus would likely be on the Parkway itself, new structures would create visual interest and would heighten traveler viewer sensitivity of the project. Heightened viewer sensitivity would also occur for those viewers within the region who view the alternative on a regular basis (e.g., residents and commuters). Viewer sensitivity under Alternative 1 would shift from Low/Moderate to Moderate/High.

Viewer Exposure

Figure 5-24 shows population and traffic counts for exposed viewers within the region. This figure shows physical location, the number of people viewing and the duration of view (e.g., residential – long duration, travelers – shorter duration) for Alternative 1 within the Eastern Segment Landscape Unit. The viewshed locations identified in Section 5.4 that relate to the Eastern Segment Landscape Unit under Alternative 1 comprise Viewshed Locations #14-22 and #11-13 (see Section 5.5.1).

The Eastern Segment Landscape Unit currently has a Moderate/High viewer exposure due to the large numbers of residential and traveler viewers within the area. The majority of traveler viewers of Alternative 1 within the Eastern Segment Landscape Unit would have views from SR 65. Existing traffic along this major roadway can be characterized as moderate to heavy and continuous. Most viewers of Alternative 1 from SR 65 would be exposed to changes in views for minimal duration (while traveling) at high rates of speed. Alternative 1 would add vehicular capacity to the study area, thereby adding

additional viewers from Alternative 1. In addition, Alternative 1 would potentially have recreational/ commuter bicycle viewers in the study area who would have longer, continual views of Alternative 1. The number of viewers would remain moderate to heavy. Viewers in existing residences within the study area would have primarily stationary views of Alternative 1 and would experience relatively high exposure to these views. The number of residences (see Census population counts shown on Figure 5-24) with views of Alternative 1 are characterized as high for the Eastern Segment Landscape Unit because of the nearby developed areas (including potential views from the three surrounding incorporated cities). Although over-crossings and interchanges would be visible from a variety of nearby residential viewers and travelers, the existing flat topography minimizes direct views of the roadway itself for many viewsheds at a greater distance from the alternative within the Eastern Segment Landscape Unit. Overall viewer exposure of the Eastern Segment Landscape Unit with Alternative 1 in place would remain unchanged at Moderate/High.

6.2.4 Summary of Potential Visual Impacts

For Alternative 1 potential visual impacts are found to be Moderate/High, as defined by FHWA criteria. This conclusion was made based on analyzing the changes to the resource area (reviewing potential changes to visual character and visual quality) as well as reviewing anticipated viewer response to that change (as identified by analyzing viewer sensitivity and viewer exposure) by landscape unit (Western, Central, and Eastern segment landscape units). Table 6-1 below illustrates the summary of potential visual impacts, by Landscape Unit with Alternative 1 in place using FHWA visual impact methodology.

Table 6-1
Summary of Potential Visual Impacts of Alternative 1
(FHWA Criteria)

Segment Landscape Unit	Resource Change		Viewer Response		Potential Impact
	Visual Character	Visual Quality	Viewer Sensitivity	Viewer Exposure	
Western	Agricultural/Urban Co-Dominant	Moderate/Low	Moderate/High	Moderate/High	Moderate/High
Central	Agricultural with Urban Influence	Moderate	Moderate/High	Moderate	Moderate
Eastern	Agricultural/Urban Co-Dominant	Moderate/Low	Moderate/High	Moderate/High	Moderate/High

In addition to FHWA visual impact assessment methodology, state-level CEQA guidelines (as identified in Section 4.2.2) are often used to help identify visual impact significance. The summaries in Table 6-2 identify the potential level of significance under CEQA per visual impact criteria with build alternatives in place. For CEQA, while potential impacts vary somewhat among alternatives, in general impacts are similar, which results in the same level of significance for each alternative for a given CEQA significance criteria. These two summary tables provide a preliminary assessment of potential visual impacts associated with existing conditions with Alternative 1 in place.

Based on a Tier 1 analysis, Alternative 1 is consistent with local General Plan policies and goals. It includes a buffer between the roadway and adjacent uses, incorporates context-appropriate landscaping concepts, and would be compatible with planned trail systems. Roadway design details have not been developed for this Tier 1 EIS/EIR.

6.3 ALTERNATIVE 2 – THE ORANGE ALTERNATIVE

Figure 2-1 identifies the proposed Alternative 2 corridor through the project's three identified segment landscape units (Western, Central and Eastern). Potential visual impacts of Alternative 2 are described in Sections 6.3.1 through 6.3.3. Potential impacts of Alternative 2 are summarized in Section 6.3.4.

6.3.1 Western Segment Landscape Unit

The Western Segment Landscape Unit of Alternative 2 is the same as that for Alternative 1. Therefore, the potential impacts for this segment landscape unit are the same as discussed for Alternative 1.

6.3.2 Central Segment Landscape Unit

The potential impacts for Alternative 2 through the Central Segment are virtually the same as Alternative 1 (see Section 6.2.2). The following focuses on impacts which differ among alternatives.

Table 6-2
Potential CEQA Aesthetic Impacts with Build Alternatives in Place

CEQA Guidelines Appendix G Significance Criteria	Alternative 1	Level of Significance
Has a substantial adverse effect on a scenic vista?	The study area contains few scenic vistas. Agricultural surroundings and rural-urban mixed uses typify the area. Although there are creek crossings and locally scenic roadways and vistas, there are no state scenic areas or roadways in the project vicinity. Surrounding land uses provide views from residential, commercial, and other rural-use views. All Segment Landscape Units would continue to have background views of the Inner Coastal Range to the West, the Sutter Buttes to the northwest and views of the peaks of the Sierra Nevada to the east. Although the Parkway would change the existing setting, it would preserve an agricultural "Parkway" look and feel as efforts will be made to design the Parkway to be as visually compatible as possible with the character of the surrounding area through the use of appropriate design techniques, such as landscaping, lighting and grading. The Parkway, by adding additional lanes and creating local roadway overpasses, would also allow more viewers access to the vistas in the area.	Less Than Significant
Substantially damages scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	There are no designated state scenic highways within the project vicinity. In fact, there are no officially designated or eligible Scenic Highways in Sutter County or Placer County. The nearest Eligible State Scenic Highway (SR 49) in Placer County has no views of the study area. Sacramento County has officially Designated State Scenic Highways, but again, none are within views of the study area. Therefore, no impact to a State Designated Scenic Highway is anticipated as a result of any of the build alternatives.	No Impact

Table 6-2 (Continued)
Potential CEQA Aesthetic Impacts with Build Alternatives in Place

CEQA Guidelines Appendix G Significance Criteria	Alternative 1	Level of Significance
Substantially degrades the existing visual character or quality of the site and its surroundings?	The project comprises the selection and preservation of a corridor for the future construction of Placer Parkway -- a new east-west connector between SR 65 and SR 70/99. The vision for the Parkway is to preserve the agricultural character of the area, and it would be designed to avoid degradation of the existing quality or character of the roadway corridor and its surroundings. Although project features (e.g., freeway-to-freeway connectors at either end, interchanges, and local street overcrossings) would be significant additions to the study area, with proper mitigation the project would strive to keep the integrity, character, and overall viewshed of the study area intact. Temporary aesthetic impacts may occur during construction; however, it is anticipated that the visual character and quality of the site and surroundings would remain consistent with existing viewsheds overall with proper mitigation. Although future mitigation measures would be suggested once a project-level environmental document is required, general mitigation strategies are recommended to maintain visual integrity of the project area as well as to keep the overall agricultural nature of the project vicinity. These are listed in Chapter 10 of this document.	Potentially Significant Impact
Creates a new source of substantial light or glare, which would adversely affect day or nighttime views in the area?	The project, by necessity, would include the installation of nighttime lighting fixtures. Mitigation strategies (see Chapter 10) are proposed to reduce potential impacts. The effectiveness of mitigation in reducing impacts to a less than significant level would be evaluated in Tier 2.	Potentially Significant Impact

6.3.2.1 Resource Change

Visual Character

The Visual Character within the Central Segment Landscape Unit of Alternative 2 is similar to that for Alternative 1; agricultural with urban influence. Alternative 2, however, crosses many branches of Curry Creek, thereby adding additional urban influences to the rural agricultural setting and character of the area. In addition, the distance from Country Acres residences is farther for Alternative 2 than from Alternative 1, hence urban influences with this alternative will likely be more out of character with the existing setting. Even with these differences, the overall visual character for the Central Segment Landscape Unit with Alternative 2 in place will continue to be characterized as agricultural with an urban influence.

Visual Quality

The Visual Quality within the Central Segment Landscape Unit of Alternative 2 is similar to that for Alternative 1. Therefore, the potential impacts for this segment landscape unit are the same as discussed for Alternative 1. The additional creek crossings associated with Alternative 2 will likely degrade the existing scenic quality more than under Alternative 1; this is the main difference between the two alternatives. Therefore, although the visual quality for both alternatives remains unchanged, both being classified as having moderate to low scenic visual quality, Alternative 2 will likely have a lower visual quality rating than Alternative 1.

6.3.2.2 Viewer Response

The Viewer Sensitivity and Exposure for Alternative 2 is similar to that for Alternative 1 in the Central Segment Landscape Unit. The key difference is that Alternative 2 is farther away from the majority of traveler views and residential views (particularly from Country Acres residents). Impacts from viewer sensitivity and viewer exposure, therefore, would be slightly less for Alternative 2 within the Central Segment Landscape Unit than for Alternative 1. These differences are noted below.

Viewer Sensitivity

The Viewer Sensitivity for Alternative 2 is similar to that for Alternative 1 in the Central Segment Landscape Unit. The key difference is that Alternative 2 is farther away from the majority of traveler views and residential views (particularly from Country Acres residents). Impacts from viewer sensitivity, therefore, would be slightly lessened for Alternative 2 within the Central Segment Landscape Unit than from Alternative 1. Overall, viewer sensitivity for the Central Segment Landscape Unit with Alternative 2 in place would shift from Low/Moderate to Moderate.

Viewer Exposure

The Viewer Exposure for Alternative 2 is similar to that for Alternative 1 in the Central Segment Landscape Unit. The key difference is that Alternative 2 is farther away from the majority of traveler views and residential views (particularly from Country Acres residents). Impacts to viewer exposure, therefore, would be slightly lessened for Alternative 2 within the Central Segment Landscape Unit than from Alternative 1. Viewer exposure for the Central Segment Landscape Unit with Alternative 1 in place would remain similar to existing conditions, categorized as Moderate/High.

6.3.3 Eastern Segment Landscape Unit

The Eastern Segment Landscape Unit of Alternative 2 is the same as that for Alternative 1. Therefore, the potential impacts for this segment landscape unit are the same as discussed for Alternative 1.

6.3.4 Summary of Potential Visual Impacts

For Alternative 2 potential visual impacts are found to be Moderate/High, as defined by FHWA criteria. This conclusion was made based on analyzing the changes to the resource area (reviewing potential changes to visual character and visual quality) as well as reviewing anticipated viewer response to that change (as identified by analyzing viewer sensitivity and viewer exposure) by landscape unit (Western, Central, and Eastern segment landscape units). Table 6-3 below illustrates the summary of potential visual impacts, by landscape unit with Alternative 2 in place using FHWA visual impact methodology.

Table 6-3
Summary of Potential Visual Impacts of Alternative 2
(FHWA Criteria)

Segment Landscape Unit	Resource Change		Viewer Response		Potential Impact
	Visual Character	Visual Quality	Viewer Sensitivity	Viewer Exposure	
Western	Agricultural/Urban Co-Dominant	Moderate/Low	Moderate/High	Moderate/High	Moderate/High
Central	Agricultural with Urban Influence	Moderate	Moderate	Moderate	Moderate
Eastern	Agricultural/Urban Co-Dominant	Moderate/Low	Moderate/High	Moderate/High	Moderate/High

In addition to FHWA visual impact assessment methodology, state-level CEQA guidelines (as identified in Section 4.3.2) are often used to help identify visual impact significance (see Table 6-2). From a CEQA perspective, potential impacts of Alternative 2 are similar to Alternative 1.

Based on a Tier 1 analysis, Alternative 2 is consistent with local General Plan policies and goals. It includes a buffer between the roadway and adjacent uses, incorporates context-appropriate landscaping concepts, and would be compatible with planned trail systems. Roadway design details have not been developed for this Tier 1 EIS/EIR.

6.4 ALTERNATIVE 3 – THE BLUE ALTERNATIVE

Figure 2-1 identifies the proposed Alternative 3 corridor through the project's three identified landscape units (Western, Central and Eastern). Potential visual impacts of Alternative 3 are described in Sections 6.4.1 through 6.4.3. The potential impacts of Alternative 1 are summarized in Section 6.4.4.

6.4.1 Western Segment Landscape Unit

The Western Segment Landscape Unit of Alternative 3 is the same as that for Alternative 1. Therefore, the potential impacts for this segment landscape unit are the same as discussed for Alternative 1.

6.4.2 Central Segment Landscape Unit

Although Alternative 3 varies from Alternative 1 within the Central Segment Landscape Unit, the potential impacts for both are similar. Therefore, the reader should review the discussions for Alternative 1 wherever it is cited. The following discussions cover only the ways in which the impacts of Alternative 3 differ from those of Alternative 1.

6.4.2.1 Viewer Response

The Resource Changes within the Central Segment Landscape Unit of Alternative 3 are similar to that for Alternative 1. The key difference is that Alternative 3 is farther from the majority of traveler views assessed (e.g., Viewshed Locations #9 through #13). Additional Viewshed Locations that were assessed for this alternative are discussed below. Overall, impacts from viewer sensitivity and viewer exposure for Alternative 3 would be less than both those for Alternative 1 and Alternative 2 within the Central Segment Landscape Unit. These differences are noted below.

Viewer Sensitivity

The Viewer Sensitivity for Alternative 3 is similar to that of Alternative 1 and Alternative 2 in the Central Segment Landscape Unit. The key difference is that Alternative 3 is farther from the majority of traveler views and residential views (particularly from Country Acres residents). Impacts from viewer sensitivity, therefore, would be slightly less for Alternative 3 than from either Alternative 1 or Alternative 2 within the Central Segment Landscape Unit. Overall, viewer sensitivity for the Central Segment Landscape Unit with Alternative 3 in place would shift from Low/Moderate to Moderate.

Viewer Exposure

The Viewer Exposure for Alternative 3 is similar to that for Alternative 1 and Alternative 2 in the Central Segment Landscape Unit. The key difference is that Alternative 3 is farther from the majority of traveler views and residential views (particularly from Country Acres residents). Impacts to viewer exposure, therefore would be slightly lessened for Alternative 3 within the Central Segment Landscape Unit than from Alternative 1 or Alternative 2. Viewer exposure for the Central Segment Landscape Unit with Alternative 3 in place would shift from Low/Moderate to Moderate.

6.4.3 Alternative 3 – Eastern Segment Landscape Unit

The Eastern Segment Landscape Unit of Alternative 3 is the same as that for Alternative 1. Therefore, the potential impacts for this segment landscape unit are the same as discussed for Alternative 1.

6.4.4 Summary of Potential Visual Impacts

For Alternative 3 potential visual impacts are found to be Moderate/High, as defined by FHWA criteria. This conclusion was made based on analyzing the changes to the resource area (reviewing potential changes to visual character and visual quality) as well as reviewing anticipated viewer response to that change (as identified by analyzing viewer sensitivity and viewer exposure) by landscape unit (Western, Central, and Eastern segment landscape units). Table 6-4 below illustrates the summary of potential visual impacts, by Landscape Unit with Alternative 3 in place using FHWA visual impact methodology.

Table 6-4
Summary of Potential Visual Impacts of Alternative 3
(FHWA Criteria)

Segment Landscape Unit	Resource Change		Viewer Response		Potential Impact
	Visual Character	Visual Quality	Viewer Sensitivity	Viewer Exposure	
Western	Agricultural/Urban Co-Dominant	Moderate/Low	Moderate/High	Moderate/High	Moderate/High
Central	Agricultural with Urban Influence	Moderate	Moderate	Moderate	Moderate
Eastern	Agricultural/Urban Co-Dominant	Moderate/Low	Moderate/High	Moderate/High	Moderate/High

In addition to FHWA visual impact assessment methodology, State-level CEQA guidelines (as identified in Section 4.2.2) are often used to help identify visual impact significance (see Table 6-2). From a CEQA perspective, potential impacts of Alternative 3 are similar to Alternative 1.

Based on a Tier 1 analysis, Alternative 3 is consistent with local General Plan policies and goals. It includes a buffer between the roadway and adjacent uses, incorporates context-appropriate landscaping concepts, and would be compatible with planned trail systems. Roadway design details have not been developed for this Tier 1 EIS/EIR.

6.5 ALTERNATIVE 4 – THE YELLOW ALTERNATIVE

Figure 2-1 identifies the proposed Alternative 4 corridor through the project's three identified landscape units (Western, Central, and Eastern). Potential visual impacts of Alternative 4 are described in Sections 6.5.1 through 6.5.3. The potential impacts of Alternative 4 are summarized in Section 6.5.4.

6.5.1 Western Segment Landscape Unit

6.5.1.1 Resource Change

Visual Character

Under Alternative 4, the character of the Western Segment Landscape Unit would change from predominantly agricultural in nature with urban influences, to a shared urban and agricultural character. The Parkway would bring co-dominance between agricultural- and urban-based forms, lines, colors, and

textures. These agricultural pattern elements (flat forms, clean lines, green/natural undertones and rich rural textures) currently dominate the Western Segment Landscape Unit. The influence of additional urban pattern elements (linear and concrete forms, more dominant roadway and structural lines, gray and black color undertones, and concrete/pavement textures) would add diversity to the area. Landscaping and other mitigation is proposed to help soften the change in character (see also Chapter 10, Avoidance, Minimization, and/or Mitigation Strategies). The continuity of farming lands in the Western Segment Landscape Unit for Alternative 4 is currently broken up by rural roadways, rural residences, and scattered industrial land uses. Currently there are no above-ground roadway structures, over-crossings, or interchanges within the Western Segment Landscape Unit area. Alternative 4 would change this existing visual character with the introduction of the roadway and associated features (most predominantly the freeway-to-freeway interchange at Sankey Road). This would include conversion of agricultural land to highway use. Changes in visual character would affect views "of" and "from" the road from surrounding areas. The scale and dominance of these changes in conjunction with the existing flat natural environmental allow for vast unimpeded panoramic views of the area. Character change would greatly affect the existing roadway(s) as well as the surrounding nature of the area.

Consequently, due to changes in the form, line, color, and textures introduced by Alternative 4 creating changes in scale, continuity, diversity, and dominance, the character of the Western Segment Landscape Unit would shift from agriculturally dominant to urban and agriculturally co-dominant.

Visual Quality

Under Alternative 4, vividness of the Western Segment Landscape Unit would remain characterized as moderate. The rural nature of the project vicinity is typical of the area and includes very few notable foreground/middleground visual features. Background views from the Western Segment Landscape Unit would however, continue to include views of the Inner Coastal Range to the West, the Sutter Buttes to the northwest and views of the peaks of the Sierra Nevada to the east. Alternative 4 would affect the intactness of the Western Segment Landscape Unit by introducing additional urban structures/roadway (most notably the freeway-to-freeway interchange at Sankey Road). Consequently the visual quality of the area would remain characterized as low. In addition, Alternative 4 would contribute further to the lack of landscape integrity of the area. Existing unity for the Western Segment Landscape Unit is considered low and would remain low. Manmade natural landscapes (e.g., agricultural areas) currently co-exist with the roadways and limited urban development. This visual quality would be similar under Alternative 4. With the introduction of Alternative 4, the Western Segment Landscape Unit unity would degrade further. Overall, the Western Segment Landscape Unit would maintain a moderate/low visual quality rating under Alternative 4.

6.5.1.2 Viewer Response

Viewer Sensitivity

Under Alternative 4, viewer sensitivity to the Western Segment Landscape Unit has been classified as Moderate/High since the viewer's concern for scenic quality and change to existing visual is anticipated to be moderate. Currently most viewers within the study area are commuters using existing roadways, and therefore existing viewer sensitivity is low. Viewer sensitivity may change with the introduction of the Parkway. In addition, the realignment of Sankey Road would bring heightened sensitivity to those familiar with the existing roadway. Although viewer focus would likely be on the freeway itself, new structures would create visual interest and would heighten traveler viewer sensitivity of the project. Heightened viewer sensitivity would also occur as agricultural lands are utilized for the Parkway.

Viewer Exposure

Alternative 4 would create a change in viewer exposure from and of the Parkway. The majority of viewers of Alternative 4 within the Western Segment Landscape Unit would be traveler views from SR 70/99. Existing traffic along this major roadway can be characterized as moderate to heavy and continuous.

Existing exposure for views from SR 70/99 of Alternative 4, however, can be characterized as moderate to low since most viewers would be exposed to changes in views for minimal duration (while traveling) at high rates of speed. Sankey Road, once it is converted and realigned, would dramatically change the exposure to nearby viewers. Alternative 4 would add vehicular capacity to the study area, thereby adding additional viewers from and to Alternative 4. In addition, Alternative 4 would potentially have recreational/commuter bicycle viewers in the study area who would have longer, continual views of Alternative 4. The number of viewers would remain moderate to heavy. Viewers in existing residences within the study area would primarily have stationary views of Alternative 4, and the frequency of exposure to these views for these residences is relatively high. The number of residences with views of the alternative are characterized as low for the Western Segment Landscape Unit (see Census population counts shown on Figure 5-24). Although over-crossings and interchanges would be visible from a variety of nearby residential viewers and travelers, the existing flat topography minimizes direct views of the roadway itself for most viewsheds within the Western Segment Landscape Unit. Overall viewer exposure of the Western Segment Landscape Unit under Alternative 4 would shift from Moderate to Moderate/High.

6.5.2 Central Segment Landscape Unit

Although Alternative 4 varies from Alternative 1 within the Central Segment Landscape Unit, the potential impacts for both similar. Therefore, the reader should review the discussions for Alternative 1 wherever it is cited. The following discussions cover only the ways in which the impacts for Alternative 4 differ from those of Alternative 1.

6.5.2.1 Resource Change

Visual Character

The Visual Character within the Central Segment Landscape Unit of Alternative 4 is similar to that for Alternative 1. Although each alternative would clearly cause substantial resource changes, the precise extent of such effects cannot be defined at the Tier 1 level. This level of detail would be included in the Tier 2 visual analysis. Until that time, potential impacts for Alternative 4 within the Central Segment Landscape Unit are considered the same as discussed for Alternative 1.

Visual Quality

The Visual Quality within the Central Segment Landscape Unit of Alternative 4 is similar to that for Alternative 1. Although each alternative would clearly cause substantial resource changes, the precise extent of such effects cannot be defined at the Tier 1 level. This level of detail would be included in the Tier 2 visual analysis. Until that time, potential impacts for Alternative 4 within the Central Segment Landscape Unit are considered the same as discussed for Alternative 1.

6.5.2.2 Viewer Response

The Viewer Sensitivity and Exposure for Alternative 4 is similar to that for Alternative 1 in the Central Segment Landscape Unit. The key difference is that Alternative 4 is farther away from the majority of traveler views and residential views (particularly from Country Acres residents). Impacts from viewer sensitivity and viewer exposure, therefore, would be less for Alternative 4 within the Central Segment Landscape Unit than impacts associated with Alternative 1. These differences are noted below.

Viewer Sensitivity

The Viewer Sensitivity for Alternative 4 is similar to that for Alternative 1 in the Central Segment Landscape Unit. The key difference is that Alternative 4 is farther away from the majority of traveler views and residential views (particularly from Country Acres residents). Impacts from viewer sensitivity, therefore, would be slightly less for Alternative 4 within the Central Segment Landscape Unit than for

Alternative 1. Overall, viewer sensitivity for the Central Segment Landscape Unit with Alternative 4 in place would shift from Low/Moderate to Moderate.

Viewer Exposure

The Viewer Exposure for Alternative 4 is similar to that for Alternative 1 in the Central Segment Landscape Unit. The key difference is that Alternative 4 is farther away from the majority of traveler views and residential views (particularly from Country Acres residents). Impacts to viewer exposure, therefore, would be slightly less for Alternative 4 within the Central Segment Landscape Unit than for Alternative 1. Viewer exposure for the Central Segment Landscape Unit with Alternative 4 in place would remain similar to existing conditions, categorized at Moderate/High.

6.5.3 Eastern Segment Landscape Unit

The Eastern Segment Landscape Unit of Alternative 4 is the same as that for Alternative 1. Therefore, the potential impacts for this segment landscape unit are the same as discussed for Alternative 1.

6.5.4 Summary of Potential Visual Impacts

For Alternative 4 potential visual impacts are found to be Moderate, as defined by FHWA criteria. This conclusion was made based on analyzing the changes to the resource area (reviewing potential changes to visual character and visual quality) as well as reviewing anticipated viewer response to that change (as identified by analyzing viewer sensitivity and viewer exposure) by landscape unit (Western, Central, and Eastern segment landscape units). Table 6-5 illustrates the summary of potential visual impacts, by Landscape Unit with Alternative 4 in place using FHWA visual impact methodology.

Table 6-5
Summary of Potential Visual Impacts of Alternative 4
(FHWA Criteria)

Segment Landscape Unit	Resource Change		Viewer Response		Potential Impact
	Visual Character	Visual Quality	Viewer Sensitivity	Viewer Exposure	
Western	Agricultural/Urban Co-Dominant	Moderate/Low	Moderate	Moderate/High	Moderate
Central	Agricultural with Urban Influence	Moderate	Moderate	Moderate	Moderate
Eastern	Agricultural/Urban Co-Dominant	Moderate/Low	Moderate/High	Moderate/High	Moderate/High

In addition to FHWA visual impact assessment methodology, state-level CEQA guidelines (as identified in Section 4.2.2) are often used to help identify visual impact significance (see Table 6-2). From a CEQA perspective, potential impacts of Alternative 4 are similar to Alternative 1.

Based on a Tier 1 analysis, Alternative 4 is consistent with local General Plan policies and goals. It includes a buffer between the roadway and adjacent uses, incorporates context-appropriate landscaping concepts, and would be compatible with planned trail systems. Roadway design details have not been developed for this Tier 1 EIS/EIR.

6.6 ALTERNATIVE 5 – THE GREEN ALTERNATIVE

Figure 2-1 identifies the proposed Alternative 5 corridor through the project's three identified landscape units (Western, Central, and Eastern). Potential visual impacts of Alternative 1 are described in Sections 6.6.1 through 6.6.3. The potential impacts of Alternative 5 are summarized in Section 6.6.4.

6.6.1 Alternative 5 – Western Segment Landscape Unit

The Western Segment Landscape Unit of Alternative 5 is the same as that for Alternative 4. Therefore, the potential impacts for this segment landscape unit are the same as discussed for Alternative 4.

6.6.2 Alternative 5 – Central Segment Landscape Unit

The Central Segment Landscape Unit of Alternative 5 is similar to that for Alternative 4. The resource change and viewer response, in fact would be the same for both alternatives. Therefore, the potential impacts for Alternative 5 within the Central Segment Landscape Unit are the same as discussed for Alternative 4.

6.6.3 Alternative 5 – Eastern Segment Landscape Unit

The Eastern Segment Landscape Unit of Alternative 4 is the same as that for Alternative 1. Therefore, the potential impacts for this segment landscape unit are the same as discussed for Alternative 1.

6.6.4 Summary of Potential Visual Impacts

For Alternative 5 potential visual impacts are found to be Moderate, as defined by FHWA criteria. This conclusion was made based on analyzing the changes to the resource area (reviewing potential changes to visual character and visual quality) as well as reviewing anticipated viewer response to that change (as identified by analyzing viewer sensitivity and viewer exposure) by landscape unit (Western, Central, and Eastern segment landscape units). Table 6-6 below illustrates the summary of potential visual impacts, by landscape unit with Alternative 5 in place using FHWA visual impact methodology.

Table 6-6
Summary of Potential Visual Impacts of Alternative 5
(FHWA Criteria)

Segment Landscape Unit	Resource Change		Viewer Response		Potential Impact
	Visual Character	Visual Quality	Viewer Sensitivity	Viewer Exposure	
Western	Agricultural/Urban Co-Dominant	Moderate/Low	Moderate	Moderate/High	Moderate
Central	Agricultural with Urban Influence	Moderate	Moderate	Moderate	Moderate
Eastern	Agricultural/Urban Co-Dominant	Moderate/Low	Moderate/High	Moderate/High	Moderate/High

In addition to FHWA visual impact assessment methodology, state-level CEQA guidelines (as identified in Section 4.2.2) are often used to help identify visual impact significance (see Table 6-2). From a CEQA perspective, the potential impacts of Alternative 5 are similar to those of Alternative 1.

Based on a Tier 1 analysis, Alternative 5 is consistent with local General Plan policies and goals. It includes a buffer between the roadway and adjacent uses, incorporates context-appropriate landscaping

concepts, and would be compatible with planned trail systems. Roadway design details have not been developed for this Tier 1 EIS/EIR.

6.7 COMPARISON OF ALTERNATIVES

Potential impacts for the five build alternatives, by segment landscape unit, are summarized in Table 6-7. The No-Build Alternative is not shown on Table 6-7 because no impacts would be associated with this alternative.

Table 6-7
Comparison of Aesthetic Impacts with Alternatives in Place

Alternative	Segment Landscape Unit	Visual Character	Visual Quality	Viewer Sensitivity	Viewer Exposure
Alternative 1	Western	Agricultural/Urban Co-Dominant	Moderate/ Low	Moderate/High	Moderate/High
	Central	Agricultural with Urban Influence	Moderate	Moderate/High	Moderate
	Eastern	Agricultural/Urban Co-Dominant	Moderate/ Low	Moderate/High	Moderate/High
Alternative 2	Western	Agricultural/Urban Co-Dominant	Moderate/ Low	Moderate/High	Moderate/High
	Central	Agricultural with Urban Influence	Moderate	Moderate	Moderate
	Eastern	Agricultural/Urban Co-Dominant	Moderate/ Low	Moderate/High	Moderate/High
Alternative 3	Western	Agricultural/Urban Co-Dominant	Moderate/ Low	Moderate/High	Moderate/High
	Central	Agricultural with Urban Influence	Moderate	Moderate	Moderate
	Eastern	Agricultural/Urban Co-Dominant	Moderate/ Low	Moderate/High	Moderate/High
Alternative 4	Western	Agricultural/Urban Co-Dominant	Moderate/ Low	Moderate	Moderate/High
	Central	Agricultural with Urban Influence	Moderate	Moderate	Moderate
	Eastern	Agricultural/Urban Co-Dominant	Moderate/ Low	Moderate/High	Moderate/High
Alternative 5	Western	Agricultural/Urban Co-Dominant	Moderate/ Low	Moderate	Moderate/High
	Central	Agricultural with Urban Influence	Moderate	Moderate	Moderate
	Eastern	Agricultural/Urban Co-Dominant	Moderate/ Low	Moderate/High	Moderate/High

Table 6-8 below shows a summary and ranking of the five build alternatives based upon the information provided in Tables 6-1 through 6-6 and the summary table, Table 6-7. A ranking of 1 indicates the least potential for aesthetic impacts among the five build alternatives, as rated by FHWA criteria.

Table 6-8
Summary and Ranking of Alternatives by Aesthetic Impact Rating

Alternative	Visual Character*	Visual Quality*	Viewer Sensitivity*	Viewer Exposure*	Impact Ranking (Lowest to Highest)
Alternative 4	Moderate/High	Moderate/Low	Moderate/High	Moderate	1
Alternative 5	Moderate/High	Moderate/Low	Moderate/High	Moderate	1
Alternative 3	Moderate	Moderate/Low	Moderate/High	Moderate	3
Alternative 2	Moderate	Moderate/Low	High	Moderate	5
Alternative 1	Moderate	Moderate/Low	High	Moderate	5

1 = least potential impacts 5 = greatest potential impacts

*With Build Alternative in place.

Alternatives 4 and 5 would have potentially Moderate impacts using FHWA visual impact criteria. Using CEQA significance thresholds, these impacts would likely be significant; however, with mitigation incorporated they could potentially be mitigated to a less-than-significant level.

Alternative 3 would have more impacts than Alternatives 4 and 5 and would be considered Moderate/ High using FHWA visual impact criteria. These impacts would be considered potentially significant using CEQA thresholds.

Alternatives 1 and 2 would have the most visual impacts of all alternatives; having potentially Moderate/ High impacts using FHWA visual impact criteria. These impacts would also be considered significant visual impacts under CEQA.

7.0 SECONDARY AND INDIRECT IMPACTS

Recent FHWA, EPA, and Caltrans guidance on growth inducement (Mare Island Accord, 2006) advises that analysis of potential impacts associated with growth should include an evaluation of the effects of growth on resources of concern. The following discussion presents a qualitative evaluation of potential secondary and indirect impacts of Anticipated Growth (see below for definition) on human and environmental resources in the study area.

The Council on Environmental Quality (CEQ) provided clarification of the terminology "indirect impacts" when it issued the National Environmental Policy Act in 1978. Secondary and indirect impacts are defined as impacts "caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable." Moreover, indirect effects ". . . may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems."

A key term used in this section is "Anticipated Growth." This is defined as the growth that is anticipated in the study area as described in the relevant General Plans and adopted regional forecasts, such as the SACOG Blueprint scenario including additional growth that may occur as a result of major new development proposals that have not yet been formally approved. It is possible that this additional growth may accelerate the rate of buildout in the study area, but it is not ultimately expected to result in any greater levels of development than is presented in adopted regional forecasts.

The following discussion considers secondary and indirect impacts on visual resource that may occur as a result of direct impacts associated with the Parkway, and also as a result of anticipated growth. The study area for the analysis of secondary and indirect impacts is shown in Figure 7-1.

7.1 GROWTH INDUCEMENT SCENARIO

NEPA and CEQA both require environmental analyses to consider the effects of a project on growth. Caltrans defines growth inducement as the relationship between a proposed project and growth. This section summarizes the relationship between the Placer Parkway project and regional growth, and discusses potential secondary and indirect effects of the project related to growth inducement.

Placer Parkway would be growth inducing, as a component of the rapidly evolving urban matrix in western Placer County. While the project study area is predominately undeveloped at this time, parts of the study area are within local General Plan designations allowing urban growth. In addition, numerous proposals for major new development projects in and around the study area depicted on Figure 7-2 that are currently in various stages of the approval and entitlement process. Portions of the surrounding area (especially northern Sacramento County and southwestern Placer County) have developed very rapidly over the past several decades. This has occurred as a result of many factors, including continuing net population growth statewide, strong employment growth in the Sacramento region, relative housing affordability, and location amenities.

Population and employment growth projections for California and the Sacramento Region in general, and for southwestern Placer County and south Sutter County in particular (described in detail in the Tier 1 EIS/EIR Community Impact Assessment), indicate that that development pressures in the project vicinity will remain relatively intense, irrespective of the Placer Parkway project. Between 1950 and 2000, the California population more than tripled. During the same period, population in the six-county SACOG region increased by more than 800 percent (DOF, 2006). Projections and established goals and policies from a wide range of sources, including SACOG, Placer, Sacramento and Sutter counties, and the Cities of Roseville, Rocklin and Lincoln, confirm that relatively high rates of population and employment growth and housing and commercial development are anticipated in the six-county region by 2050. Between 2000 and 2050, California's population is expected to increase from approximately 34 million to 55 million. During the same time period, SACOG projects that the region's growth will double, from

1.9 million in 2000 to 3.95 million in 2050, with the Roseville-Rocklin-Lincoln area remaining one of the fastest growing areas in the region (Levy and Doche-Boulos, 2005; SACOG, 2006).

Placer Parkway would be growth inducing because it would help support changes in the amount of growth beyond current general plan levels, and could influence the pace and location of some development. It is likely that Placer Parkway could help to implement the various specific development proposals in the study area, since it would serve to relieve traffic congestion associated with these proposals. Furthermore, the Parkway could affect the timing of development in the vicinity of the proposed interchange locations, particularly those proposed near vacant land adjacent to rapidly developing areas or areas now proposed for urban development. However, as the Parkway would be a limited-access road located in an area that is already undergoing extensive and rapid urbanization, its potential to facilitate growth that would not have otherwise occurred is limited. It could result in different land uses, or more intensive land uses, in the vicinity of interchanges where land use plans are still being developed and have not yet been approved. Also, it could hasten the buildout of planned commercial and industrial uses, especially in the Sunset Industrial Area and proposed Placer Ranch Specific Plan area, as well as in the proposed South Sutter County SPSP area.

In the longer term, improved access provided to lands in the Western and Eastern segments could be a factor in stimulating additional growth and development in areas west of SR 70/99 not protected by the Natomas Basin HCP, or north of the Sutter SPSP area, or north of Sunset Boulevard West in Placer County. Although growth is anticipated in these areas over time (as reflected in SACOG's preferred Blueprint scenario, the Sutter County General Plan, and the City of Lincoln General Plan), such development is not reflected in general plans at present and has not been formally proposed by landowners. By providing improved access to adjacent areas, Placer Parkway could be one of many factors that would encourage growth in these areas sooner than this might otherwise occur.

The factors influencing growth in the region are complex. Placer Parkway is one of several major urban development proposals in the region. While the Parkway would contribute to regional growth, including growth beyond the level identified in current general plans, it is not feasible to quantify the amount of its contribution. A single new transportation facility such as the Parkway is only one of the many factors contributing to regional growth, and it is speculative to assign a particular quantity of growth to any one factor.

Furthermore, several factors serve to limit the likely effect of the Parkway on growth, including the following:

- No interchanges are proposed for any areas that are not already approved or proposed for development;
- All approved and proposed residential development that has not already been built is projected to be built out prior to 2020, when the Parkway is proposed to open; and
- Real estate market pressures in the area have been and continue to be intense without the Parkway, and local government jurisdictions have been supportive of processing development applications in spite of anticipated regional transportation challenges.

It is unlikely that the choice of one Placer Parkway alternative over another would substantially change expected patterns of growth and development in the project study area and the surrounding region. In the Western Segment, all corridor alignment alternatives would provide new access to an area that is currently undeveloped farmland, but that is proposed for mixed use urban development. The three more southerly alignments (Alternatives 1, 2, and 3) would provide two interchanges in the South Sutter SPSP area, while the more northerly alignments (Alternatives 4 and 5) would provide only one interchange in this area, approximately one mile farther north of the more southerly alignments in the Western Segment. Since none of the alternative alignments would include any intersections in the Central Segment, there would be little

difference in growth inducement effects among the alternatives in this segment. In the Eastern Segment, two interchanges are proposed within the existing Sunset Industrial Area Plan, in an area proposed for the Placer Ranch Specific Plan. While these interchanges would provide new access to a currently undeveloped area, this area is planned for growth. In the Eastern Segment all alternatives would follow an identical alignment, so there would be no differences in growth inducement effects among the alternatives.

A future interchange at Watt Avenue could be growth inducing, because it would provide major new regional access to a portion of the study area that is currently rural and undeveloped, although both conceptual interchange locations are now surrounded by formal development proposals or land controlled by development interests. A Watt Avenue interchange is not proposed as part of the project.

7.2 SECONDARY AND INDIRECT EFFECT EVALUATION

7.2.1 No-Build Alternative

Under the No-Build Alternative, land for the Parkway would not acquired and the Parkway would not be constructed. There would not be any secondary or indirect impacts on visual resources under the No-Build Alternative.

7.2.2 Build Alternatives

Secondary and indirect impacts on visual resources could occur as a result of anticipated growth, and also as a result of direct impacts associated with the Parkway.

Anticipated growth associated with the Parkway would result in additional development in the study area. These projects could have adverse impacts on visual resources. Such impacts would be considered to be direct impacts of these projects and subject to independent environmental review. Although it is not feasible to perform a detailed evaluation of these projects at this stage as specific design details are not known, potential impacts are taken into account in the Placer Parkway 2040 Cumulative analysis (see Section 7.2). This analysis evaluates a 2040 cumulative scenario, which is considered to be an appropriate projection of future development. This scenario includes full-residential build-out in Placer County west of Sierra College Boulevard, including general plan areas and major developments, and employment and population growth in line with SACOG forecasts. It assumes levels of growth and development will occur at the higher end of a potential feasible range and therefore represents a reasonable maximum development scenario for which cumulative and secondary and indirect impacts have been analyzed.

Placer Parkway would result in a conversion of portions of a rural area into a more urban landscape. This could result in a perceived reduction in the visual quality of the existing natural environment. The Parkway would also result in changes in the type of viewer in the study area. The presence of the Parkway would result in changes to the viewer exposure (e.g., number, location, and duration of existing viewers) to the area. The Parkway would introduce numerous commuters to the area, who would experience short-duration views of the surrounding landscape from the Parkway, in contrast to the limited number of existing viewers who comprise primarily of local residents and agricultural workers.

Alternatives 1, 2, and 3 would potentially have more interchanges than Alternatives 4 and 5 (six versus five) and therefore bring more visually dominant man-made/urban structures to the area. This will increase the urban influences in the area, consequently adding more “grey” than “green” with future growth (i.e., more pavement and structures than natural elements). In addition, the positioning of Alternatives 1 and 2, are closer in vicinity to an existing frequently traveled local roadway, Baseline Road, thereby introducing additional light, movement, and urban feel to the area. This could have a secondary impact of bringing in more urbanization to an area now dominated by rural influences.

8.0 CUMULATIVE IMPACTS

8.1 CUMULATIVE IMPACT SCENARIO

Analysis of cumulative impacts is required under NEPA and CEQA. Cumulative impacts result when the effects of an action are added to or interact with other effects in a particular place and within a particular time. It is the combination of these effects, and any resulting environmental degradation, that should be the focus of cumulative impact analysis. The Council on Environmental Quality (CEQ)'s regulations (CEQ, 1987) explicitly state that cumulative impacts must be evaluated along with the direct and indirect effects of each alternative.

FHWA has requested that cumulative conditions for the analysis of project alternatives in the EIS/EIR for Placer Parkway be based on development levels that are 20 years beyond the projected opening of the Parkway. For planning purposes, Placer County Transportation Planning Agency (PCTPA) has identified 2020 as the opening year of the Parkway. Cumulative impacts are therefore being evaluated for the year 2040. This 2040 scenario includes the following projects (Figure 7-2):

- Full build-out of all residential land in Placer County west of Sierra College Boulevard, including current general plan areas and the following major development proposals in West Placer County:
  - The Creekview and Sierra Vista Specific Plan areas in Roseville's Memorandum of Understanding (MOU) Remainder Area
  - The Sphere of Influence expansion areas of Lincoln
  - The Placer Vineyards, the Regional University, Placer Ranch Specific Plan in unincorporated Placer County
  - The Curry Creek Community Plan area
- Growth in retail employment in Placer County that balances the growth in residential development by matching SACOG's countywide estimate of about 0.32 employees per dwelling unit from their 2025 forecasts.
- Growth in total employment levels in Placer County that balances the growth in residential development by matching SACOG's 1.3 employee per dwelling unit from their 2025 forecasts.
- Full build-out of the residential development in the proposed South Sutter SPSP area along with a non-residential development level that balances the residential development in that area.
- Estimated 2040 developments in all other portions of SACOG's six-county region based on assuming a constant rate for the development growth between 2005 levels and the 2050 Preferred Blueprint scenario for each of SACOG's traffic analysis zones (TAZs).

8.2 CUMULATIVE IMPACT EVALUATION

Future planned and proposed development is considered in order to take into account the level at which viewers would be exposed to and potentially impacted by the Parkway along with projects planned for the area in subsequent years. Figure 7-2 shows future planned/proposed development within the study area. As

is evident from the figure, the area under consideration for the Parkway will undergo substantial growth with many Specific Plans, proposals for development, and other guiding documents in various stages of review and implementation. The 2040 Cumulative Development scenario (Section 8.1) would result in many more potential viewers residing in and traveling through the study area. Following is a description of the potential cumulative impacts associated with each Placer Parkway build alternative when considered in conjunction with other planned and proposed development in the study area.

8.2.1 No-Build Alternative

Under the No-Build Alternative, land for the Parkway would not be acquired and the Parkway would not be constructed. These would not be any cumulative impacts on visual resources under the No-Build Alternative.

8.2.2 Alternative 1 – The Red Alternative

8.2.2.1 Western Segment Landscape Unit – Planned/Proposed Development

With the addition of the Sutter Pointe Specific Plan (SPSP) (in full buildout), there would be an increase in potential viewers of Alternative 1 in the landscape unit, but also more views from the Parkway would be created due to increased traveler capacity. Along with increased numbers of people/viewers there would also be an expanded built environment (versus the existing open, agricultural aesthetic). The proposed built environment of SPSP would also obscure/screen views (of and from the proposed Alternative 1) of many potential viewers. While the Parkway would change the visual character of the region, it may, when combined with the visual effect of the SPSP, have a reduced impact as compared to direct impacts discussed in Chapter 6, as it would more readily blend with the changing nature of the landscape, which would be shifting from rural/agricultural to more urban/commercial. Nevertheless, when considering Alternative 1 together with the SPSP, there would be a cumulatively significant impact to the existing visual resources. Placer Parkway would provide a cumulatively considerable contribution to this impact, resulting in a cumulatively significant impact of the Parkway.

8.2.2.2 Central Segment Landscape Unit – Planned/Proposed Development

The Central Segment Landscape Unit would undergo considerable growth if the multiple planned/proposed projects identified for this area occur. The following development could be located within the Central Segment Landscape Unit and, if built, would contribute to an overall shift in visual character from predominantly rural agricultural to a mix of rural/agricultural and urban commercial/residential. This would be a cumulatively significant visual impact.

Regional University Specific Plan

A preliminary draft of this proposed Specific Plan is under review by Placer County planning staff. The proposed Regional University Specific Plan has been conceptualized as a 1,100-acre mixed-use community, with two primary components: a University campus and an adjoining community. The Plan Area is currently open agricultural land that lies between Alternatives 1 and 4, and which would be bisected by Alternative 2.

Curry Creek Community Plan (Placer County)

This Community Plan has been generally identified for land west of Roseville's sphere of influence and south of the Regional University Specific Plan area (Alternatives 1 and 2 would cross the plan area). There are no publicly available concepts or proposals for this area, although a mixed use concept is envisioned. It is estimated that the Plan would not be completed before January 2008.

Placer Vineyards Specific Plan

The proposed 5,148-acre Placer Vineyards (PVSP) area lies south of all build alternatives. It would include approximately 14,132 dwelling units, 140 acres of commercial retail development, and 930 acres of parkland. At full build-out (along a 20- to 30-year timeframe) the development is expected to bring 33,000 residents to the area (Placer Vineyards New Revised Draft Specific Plan EIR, March 2006). The PVSP is also analyzing an alternative scenario that reflects the SACOG Blueprint Scenario (see Section 8.1). This scenario assumes an area of 5,148 acres for the PVSP, with approximately 21,631 dwelling units.

Sierra Vista Specific Plan

In June 2005, the City of Roseville began efforts to process the ±2,000-acre Sierra Vista Specific Plan area, the western portion of which falls in the Central Segment Landscape Unit. The project is envisioned as mixed use with a strong residential component. In July 2005, the City Council approved a comprehensive work program for the Plan and at the City Council hearing on August 17, 2005, the necessary funding agreements and consultant contracts for the planning effort were approved. City staff and the landowner team are currently in the process of identifying key project issues, including the location of natural resources (such as wetlands and oak trees) within the plan area. A project schedule has not yet been developed for the plan.

Reason Farms Environmental Preserve

In 2003, the Roseville City Council approved the acquisition of two parcels of land that total approximately 1,700 acres along Pleasant Grove Creek. These properties were acquired for the purpose of constructing a stormwater retention basin, in addition to providing potential open space and recreational opportunities for the City of Roseville. The Parks and Recreation Department is in the preliminary stages of updating the Master Plan, including refining it for the recreational aspects of the project. The recreational components will be balanced with the considerations for the recreational needs of the city, and the need to properly manage the natural resources within and surrounding the project site.

Future proposed uses of the City of Roseville's Reason Farms Retention Basin include certain recreational uses such as picnicking, hiking, horseback riding, and model airplane flying. The City of Roseville held public workshops in the spring of 2006 to obtain community input on the concept master plan for the Retention Basin and it is continuing to modify the conceptual plan for the Retention Basin based on input received from the public and from the Park and Recreation Commission. A Final Supplemental EIR on the master plan is expected before the end of 2007 (Morse, 2006).

It is evident that the City of Roseville is considering the Placer Parkway concept in its planning for the Retention Basin, as indicated by the Placer Parkway corridor concept line shown on the current Master Plan, and it appears that recreational uses are generally planned for the central area of the Retention Basin, away from the southeastern area where the Placer Parkway would cross the property. Until the plan is finalized, the location of specific recreation facilities will not be confirmed.

AKT Development

In addition to the Regional University Specific Plan area, AKT Development owns thousands of acres of undeveloped agricultural land within the Central and Eastern segments of the Parkway project (adjacent to and west of the West Roseville Specific Plan area, including land within the Curry Creek Community Plan area). This land is currently in agricultural production, including rice farming. The current Placer County General Plan land use designations for these properties allow for agricultural land uses on 80-acre minimum lot sizes.

Alternative 1 would be located within the proposed Curry Creek Community Plan area, land owned by AKT Development, as well as the Regional University Specific Plan area. It would be located along the western boundary of the Sierra Vista Specific Plan area, and the City of Roseville Retention Basin. As previously discussed in Section 6.2.2, visual impacts are found to be high (as defined by FHWA criteria) for Alternative 1 within the Central Segment Landscape Unit. For this segment landscape unit, Alternative 1 would introduce a moderate to high level of adverse change to the resource area, and a high level of viewer response to visual change is anticipated. Architectural design and landscape treatments can help mitigate these potential impacts, but not below a level of significance. This conclusion was made based on analyzing the changes to the resource area (reviewing potential changes to visual character and visual quality) as well as reviewing anticipated viewer response to that change (as identified by analyzing viewer sensitivity and viewer exposure).

When considered in combination with all the projects proposed for the Central Segment Landscape Unit, the visual impact of the proposed Alternative 1 is diminished, yet still significant, due to the increase in number of potential viewers. Under present conditions, if the Parkway were built, it would contrast greatly with the existing rural/agricultural aesthetic. However, in 2040, assuming projects occur as is currently planned/proposed, Placer Parkway would not be as visible due to the fact that it would be more similar to the surrounding environment. When considering Alternative 1 with the planned/proposed developments in the Central Segment, there will be a cumulatively significant visual impact. Placer Parkway would provide a cumulatively considerable contribution to this impact, resulting in a cumulatively significant impact of the Parkway.

8.2.2.3 Eastern Segment Landscape Unit – Planned/Proposed Development

Like the Central Segment Landscape Unit, the Eastern Segment would undergo substantial growth if the multiple planned/proposed projects identified for this area occur. The following development projects fall within the Central Segment Landscape Unit and if built would continue the shift in the visual character of this area from rural agricultural mixed with urban/residential to predominantly urban commercial/ residential. Some developments would, in effect, expand the boundaries of Roseville westward.

West Roseville Specific Plan

The West Roseville Specific Plan (WRSP) area is located within the Eastern Segment Landscape Unit. The WRSP was approved by the City Council in February 2004 and annexed to the City August 18, 2004. While it is an approved development, it is just now undergoing initial construction phases. The character of the Plan area will be different in 2040 than at present. With the WRSP, the City of Roseville's total area is now 35.98 square miles. The community is particularly proud of the plan's concept of a Village Center that would provide a mix of land uses in proximity to each other to encourage pedestrian and transit access. Other amenities provided include over 10 miles of class I bicycle trails, a high school, middle school and four elementary schools, a regional soccer complex, a natural oak grove regional park, and offsite open space mitigation and significant air quality mitigation exceeding city standards.

Creekview Specific Plan

In June 2005, the City of Roseville began efforts to process the ±530-acre Creekview Specific Plan area (northwest of the WRSP). The project is envisioned as mixed use with a strong residential component. In July 2005, the City Council approved a comprehensive work program for the Plan and at the August 17, 2005, City Council hearing the necessary funding agreements and consultant contracts for the planning effort were approved. City staff and the landowner teams are currently in the process of identifying key project issues, including the location of natural resources (such as wetlands and oak trees) within the Plan areas. A project schedule has not yet been developed for the Plan.

Placer Ranch Specific Plan

The Placer Ranch Specific Plan (PRSP) is currently being drafted and is intended to define a mixture of industrial, commercial, office and professional, residential, and educational land uses on approximately 2,213 acres surrounding a portion of the Parkway as it travels through the Eastern Segment Landscape Unit. The Plan would add 6,700 dwelling units and use 290 acres for a 25,000 student University site. The PRSP Notice of Preparation acknowledges that the Parkway is expected to be routed through the northern portion of the PRSP site.

Sunset Industrial Area Plan

The Sunset Industrial Area Plan (SIAP) is a community plan that further refines the goals and policies of the Placer County General Plan. The 8,883-acre SIAP area is bounded on the north by the City of Lincoln, on the east by the City of Rocklin, and on the south by the City of Roseville. West of the SIAP lies a large area of agricultural land within Placer County. The SIAP Area includes a variety of industrial and warehousing uses located along Industrial Boulevard, as well as business park developments along SR 65. SIAP was established to improve opportunities for industrial development in the plan area to attract new industries, retain existing industries, and allow them to expand. In addition, the area was planned to provide facilities that would help all area businesses to thrive. The Parkway would bisect the 1997 SIAP area in unincorporated Placer County in the Eastern Segment of the study area. Development within this area is guided by the Placer County General Plan and the SIAP.

Brookfield

Brookfield Communities controls property north of the proposed Creekview Specific Plan area, south of Sunset Boulevard West, and northeast of the WRSP area. The property is currently undeveloped and no development is proposed at the present time. Existing land use designations on the property allow for agricultural land uses on 80-acre minimum parcels. The Parkway would cut across the Brookfield property.

As previously described in Section 6.2.3, for Alternative 1 within the Eastern Segment Landscape Unit, visual impacts are found to be high, as defined by FHWA criteria. For this segment landscape unit, Alternative 1 would introduce a moderate to high level of adverse change to the resource area and a high level of viewer response to visual change is anticipated. Architectural design and landscape treatments can help mitigate these potential impacts, but not below a level of significance. This conclusion was made based on analyzing the changes to the resource area (reviewing potential changes to visual character and visual quality) as well as reviewing anticipated viewer response to that change (as identified by analyzing viewer sensitivity and viewer exposure). More viewers will reside in and travel through the area, and thus be exposed to views of the Parkway. The Parkway would not be as visually prominent when contrasted with the development that is proposed to occur. When considering Alternative 1 with the planned/proposed developments in the Eastern Segment, there will be a cumulatively significant visual impact. Placer Parkway would provide a cumulatively considerable contribution to this impact, resulting in a cumulatively significant impact of the Parkway.

8.2.3 Alternative 2 – The Orange Alternative

8.2.3.1 Western Segment Landscape Unit – Planned/Proposed Development

The Western Segment Landscape Unit of Alternative 2 is the same as that for Alternative 1. Therefore, the potential cumulative impacts for this segment landscape unit would be the same as discussed for Alternative 1.

8.2.3.2 Central Segment Landscape Unit – Planned/Proposed Development

Although Alternative 1 varies from Alternative 2 within the Central Segment Landscape Unit, the potential cumulative impacts for both are similar as they would travel through the same planned/proposed development areas. Because Alternative 2 would bisect the proposed Regional University Specific Plan, its contribution to cumulative visual impacts would be greater than under Alternative 1.

8.2.3.3 Eastern Segment Landscape Unit – Planned/Proposed Development

The Eastern Segment Landscape Unit of Alternative 2 is the same as that for Alternative 1. Therefore, the potential cumulative impacts for this segment landscape unit are the same as discussed for Alternative 1.

8.2.4 Alternative 3 – The Blue Alternative

8.2.4.1 Western Segment Landscape Unit – Planned/Proposed Development

The Western Segment Landscape Unit of Alternative 3 is the same as that for Alternative 1. Therefore, the potential cumulative impacts for this segment landscape unit would be the same as discussed for Alternative 1.

8.2.4.2 Central Segment Landscape Unit – Planned/Proposed Development

Alternative 3 would not cross directly through any of the numerous development projects planned for the Central Segment Landscape Unit. However, Alternative 3 would contribute to the overall urban influences encroaching on the area in 2040 and would contribute to cumulatively significant visual impacts. Section 6.4.2 previously identified that, for Alternative 3 within the Central Segment Landscape Unit, visual impacts are found to be moderate, as defined by FHWA criteria. For this segment landscape unit, Alternative 3 would introduce a moderate level of adverse change to the resource area, and a high level of viewer response to visual change is anticipated. Architectural design and landscape treatments can help mitigate these potential impacts, but not below a level of significance. This conclusion was made based on analyzing the changes to the resource area (reviewing potential changes to visual character and visual quality) as well as reviewing anticipated viewer response to that change (as identified by analyzing viewer sensitivity and viewer exposure). When considering Alternative 1 with the planned/proposed developments in the Central Segment, there will be a cumulatively significant visual impact. Placer Parkway would provide a cumulatively considerable contribution to this impact, resulting in a cumulatively significant impact of the Parkway.

8.2.4.3 Eastern Segment Landscape Unit – Planned/Proposed Development

The Eastern Segment Landscape Unit of Alternative 3 is the same as that for Alternative 1. Therefore, the potential cumulative impacts for this segment landscape unit are the same as discussed for Alternative 1.

8.2.5 Alternative 4 – The Yellow Alternative

8.2.5.1 Western Segment Landscape Unit – Planned/Proposed Development

Under Alternative 4, within the Western Segment Landscape Unit, visual impacts are found to be moderate, as defined by FHWA criteria. For this segment landscape unit, Alternative 4 would introduce a moderate level of adverse change to the resource area and a high level of viewer response to visual change is anticipated. Architectural design and landscape treatments can help mitigate these potential impacts, but not below a level of significance. This conclusion was made based on analyzing the changes to the resource area (reviewing potential changes to visual character and visual quality) as well as

reviewing anticipated viewer response to that change (as identified by analyzing viewer sensitivity and viewer exposure). These factors are described below.

As for Alternatives 1, 2, and 3, whose cumulative impacts are described above, with the addition of SPSP (in full build-out) there would be an increase in potential viewers of Alternative 4 in the landscape unit, but also more views from the Parkway would be created due to increased traveler capacity. Along with increased numbers of people/viewers there would also be an expanded built environment (versus the existing open, agricultural aesthetic). The planned/proposed built environment of SPSP would also obscure/screen views (of and from the proposed Alternative 1) of many potential viewers. While Placer Parkway would change the visual character of the region, it may, when combined with the visual effect of the SPSP project, have a reduced impact as compared to direct impacts described in Chapter 6, as it would more readily blend with the changing nature of the landscape that would be shifting from rural/agricultural to more urban/commercial. Nevertheless, when considering Alternative 4 together with SPSP, there would be a cumulatively significant impact to the existing visual resources. Placer Parkway would provide a cumulatively considerable contribution to this impact, resulting in a cumulatively significant impact of the Parkway.

8.2.5.2 Central Segment Landscape Unit – Planned/Proposed Development

Despite the large amount of planned development for the Central Segment Landscape Unit, Alternative 4 would travel through predominantly agricultural/rural land. The Regional University Specific Plan development area would be just south of Alternative 4 and would shift the aesthetic for much of the central area to more urban/residential. For Alternative 4 within the Central Segment Landscape Unit, cumulative visual impacts would be significant. For this segment landscape unit, Alternative 4 would introduce a moderate level of adverse change to the resource area, and a high level of viewer response to visual change is anticipated. Architectural design and landscape treatments can help mitigate these potential impacts, but not below a level of significance. This conclusion was made based on analyzing the changes to the resource area (reviewing potential changes to visual character and visual quality) as well as reviewing anticipated viewer response to that change (as identified by analyzing viewer sensitivity and viewer exposure). When considering Alternative 1 with the planned/proposed developments in the Central Segment, there will be a cumulatively significant visual impact. Placer Parkway would provide a cumulatively considerable contribution to this impact, resulting in a cumulatively significant impact of the Parkway.

8.2.5.3 Eastern Segment Landscape Unit – Planned/Proposed Development

The Eastern Segment Landscape Unit of Alternative 4 is the same as that for Alternative 1. Therefore, the potential cumulative impacts for this segment landscape unit are the same as discussed for Alternative 1.

8.2.6 Alternative 5 – The Green Alternative

8.2.6.1 Western Segment Landscape Unit – Planned/Proposed Development

The Western Segment Landscape Unit of Alternative 5 is the same as that for Alternative 4. Therefore, the potential cumulative impacts for this segment landscape unit are the same as discussed for Alternative 4.

8.2.6.2 Central Segment Landscape Unit – Planned/Proposed Development

The Central Segment Landscape Unit of Alternative 5 is similar to that for Alternative 4. The resource change and viewer response would also be similar for both alternatives. Therefore, the potential cumulative impacts for Alternative 5 within the Central Segment Landscape Unit are generally the same

as discussed for Alternative 4. However, Alternative 5 would run just south of the Reason Farms Environmental Preserve where land has been set aside for various recreational uses within the City of Roseville Retention Basin property. While Alternative 5 would be adjacent to the Preserve it appears that recreational uses are generally planned for the central area of the Retention Basin property, away from the southeastern area where the Placer Parkway would border the property. Consequently, Alternative 5 would have a slightly greater impact than Alternative 4 due to its closer proximity to an area intended for preservation as an undeveloped area suitable for informal recreation.

8.2.6.3 Eastern Segment Landscape Unit – Planned/Proposed Development

The Eastern Segment Landscape Unit of Alternative 5 is the same as that for Alternative 1. Therefore, the potential cumulative impacts for this segment landscape unit are the same as discussed for Alternative 1.

8.3 SUMMARY OF CUMULATIVE IMPACTS ON VISUAL RESOURCES

Figure 7-2 illustrates planned and potential development in and near the study area. The combined visual effect of this development would change the visual character of the region. In fact, the extensive development, while bringing more potential viewers to the area, may diminish the visual impact of the Parkway as it would more readily blend with the changing nature of the landscape, which would be shifting from rural/agricultural to more urban/residential. Because there would be an increase in residents and potential viewers in the area, the potential cumulative impacts should continue to be assessed. It is recommended that the Tier 2 EIS/EIR continue to consider cumulative impacts in the visual analysis performed at that time.

All corridor alignments alternatives in conjunction with the planned and proposed development in and near the study area will contribute to a change in visual character and quality of the study area. By 2040, the study area will consist of much more built environment versus farming environment, many more structures/ roads versus open space; essentially, the area will shift from rural to urban/suburban. This will result in a cumulatively significant visual impact. Placer Parkway's incremental contribution to cumulative impacts related to planned/proposed development in the area would be cumulatively considerable. Placer Parkway's cumulative visual impacts would therefore be significant.

9.0 WATT AVENUE INTERCHANGE

As shown on Figure 2-3, four potential locations are assumed for the Watt Avenue interchange. The first location (Option One) for the interchange, associated only with Alternative 1, would be located near and potentially cross Curry Creek. Option One would most likely have potential impacts relating to both resource change and viewer response. Resource change (consisting of visual character and visual quality) would change as follows: visual character would shift slightly from predominantly agricultural with urban influences to a stronger urban influenced agricultural character; visual quality is currently rated as low within the Central Segment Landscape Unit (where the proposed location lies), therefore the visual quality will likely degrade further but still remain low for this connection option. Viewer response (consisting of viewer sensitivity and viewer exposure) for this connection option is likely to be as follows: viewer sensitivity will most likely be heightened. The structure in and of itself will be a dramatic change for traveler views from the Parkway as well as for travelers and residents and other views of the connection; viewer exposure will also increase. Travelers along the Parkway will add additional viewers of and from the Parkway, adding to the viewer exposure of Option One. In summary, potential visual impacts associated with Option One would likely be Moderate/High.

The second potential location for the Watt Avenue interchange, which would apply to Alternative 1 (Option Two) and also Alternative 2, is located outside of the Pleasant Grove Creek floodplain south of Pleasant Grove Creek. The potential impacts of this interchange on visual character and quality would be less than for Alternative 1 (Option One). This option would be located along the edges of the proposed Curry Creek Community Plan and the open space buffer in the adopted West Roseville Specific Plan, and only with some portion outside of any current proposed development. It also would not span a creek. Because it is partly anticipated that viewer response to this interchange location under these circumstances would be more favorable, there would be less of an impact to aesthetic resources than under Option One. Potential visual impacts with this alternative connection in place would likely be Moderate to Moderate/High.

The other two potential Watt Avenue interchange locations are associated with Alternatives 3 through 5. These locations are outside of any area of proposed development. While they would still be visible, the visual impacts would be less than those associated with either of the other two potential locations under Alternative 1, Option 2, or Alternative 2. Under Alternatives 3 and 4, a Watt Avenue connection would be most visible from the northern portion of the Curry Creek Community Plan, in which no development proposals are available. Under Alternative 5, recreational users of the City of Roseville Retention Basin would be in close proximity to a Watt Avenue connection. The likely proximity to these viewers from this future development would likely result in Moderate to Moderate/High visual impacts under Alternatives 3, 4, and 5.

10.0 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION STRATEGIES

FHWA mandates that a qualitative aesthetic approach should be taken to mitigate for visual quality loss. This approach addresses the actual cumulative loss of visual quality that would occur in the project viewshed when the project is implemented. This qualitative approach is based on visual resource change and viewer response considering regional future planned development. Chapter 8 provides additional discussion of cumulative impacts.

Potential mitigation strategies that would likely be implemented to reduce potential adverse effects are identified below. A Supplemental Visual Impact Assessment would be produced once the project is further defined and Tier 2 analysis commences. It is recommended that all suggested future mitigation be reviewed by the Caltrans District Landscape Architect.

The suggested mitigation strategies are arranged by project feature and are listed in order of effectiveness. All visual mitigation strategies would be designed and implemented with the concurrence of the Caltrans District Landscape Architect, or as defined by FHWA. Although not mandated, it is also assumed that local jurisdictions and the owner/operator of the roadway would also review the Visual Impact Assessment for compatibility with future planning efforts.

In order to reduce the likelihood and magnitude of potential adverse temporary and permanent visual impacts associated with activities of the Placer Parkway Project, the following aesthetic-related mitigation strategies are recommended:

1. Project features and treatments shall be designed to help complement the existing agricultural "look and feel" within south Sutter and southwestern Placer counties where agricultural activities are projected to continue. In accordance with the FHWA and Caltrans requirements, Caltrans District Landscape Architect shall review all project features and treatments before project design completion.

2. Landscaping concepts for Placer Parkway shall respect the topography and vistas in the study area and shall complement the varying character of land adjacent to the Parkway corridor. Where wetlands adjoin the Parkway, designs shall utilize appropriate wetland species to the extent practicable. At the time of the Tier 2 environmental review, a Landscaping Conceptual Plan shall be developed for the project, to be reviewed by the Caltrans District Landscape Architect (see Section II for further details).

3. Lighting elements shall be designed at the Tier 2 stage, and will be approved for safety and other features by Caltrans. Design shall consider requirements of the Landscaping Conceptual Plan for minimizing potential aesthetic impacts (e.g., shielding lighting elements, using lower voltage lighting for planting areas, and proposing lighting fixtures that complement the visual character of the area).

11.0 ANALYSES TO BE UNDERTAKEN IN TIER 2

The technical studies and reports that would be completed as part of Tier 2 include the following:

- Completion of a Visual Impact Analysis (VIA), as mandated by FHWA and Caltrans. This VIA would be a project-level VIA. It would evaluate all major design features, including, but not limited to interchanges, roadway/creek crossings, and lighting review; and

- Development of a Landscape Conceptual Plan (as required by the FHWA and Caltrans). This would incorporate use of native plant materials as much as possible and include selection of appropriate species, such as sycamores and poplars, in areas requiring drainage. Where appropriate, shrubs and ground cover plantings would be used in lieu of grasses to reduce irrigation requirements, with the exception of wetland areas, which would utilize appropriate wetland species. This plan would utilize guidance included in "Landscape Concepts" Dated December 7, 2005 as approved by the Caltrans Sacramento Office of Landscape Architecture and attached herein as Appendix B.

To better understand potential viewer response to the project, it is recommended that existing viewer conditions (e.g., existing population and travel counts) be updated with future evaluations of the study area. This would help better understand existing viewer exposure (number of viewers, location of viewers, and duration of current views) as well as viewer sensitivities to the project (to include: viewer activity, local values, cultural significance of the area).

Table A-1
FHWA's Landscape Unit Checklist/Visual Inventory and Analysis Worksheet

Project Name	**Placer Parkway**	**Evaluator**	**Angela L. Leiba**
S.R. Number	**28066954.40300**	**Date**	**3/14/06**
Assessment Unit	**Western Segment Landscape Unit (Viewshed #1)**	**Weather**	**Cloudy/Sunny**
L/F District	**County: Sutter**		
L/F Section	**City:**		
L/F Province	**Community:**		

	Visual Information (Perception)	**Visual Character (Cognition)**
	Resource Supply: **3 High Prominence** **2 Moderate Prominence** **1 Present** **0 Absent**	**Landform:** Situated at the base of the Sierra foothills in northern California, the study area covers mostly flat rural and agriculture land with slight variations of topographic features (elev. approx. 250 feet). Background views to the peaks of the Sierra Nevada, the Sutter Buttes and the Inner Coastal Range are visible from this location. The project alternatives are proposed to cross Placer and Sutter Counties. Land Cover – Water: Various streams and creeks are along the study area. No rivers. Irrigation canals are present. Land Cover – Vegetation: The landscape unit is mostly rural agriculture land with scattered commercial/industrial and residential landscaped areas. Vegetative land cover in the project vicinity consists predominantly of cultivated agricultural crops. Land Cover – Manmade Development: Land uses include agriculture, industrial/commercial, and residential. SR 70/99 runs along the western edge of the landscape unit. Irrigation canals and a north/south railroad route are also within the landscape unit.
LANDFORM	**_2_ Mountains** **___ Steep Hills/Ridges** **___ Rolling Hills** **___ Undulating Land** **_3_ Plateaus/Plains** **___ Valleys** **___ Cliffs, Bluffs** **___ Points** **___ Beaches** **___ Other**	
Land Cover WATER	**___ Bays/Inlets** **___ Rivers** **___ Streams** **___ Lakes** **___ Ponds** **___ Marshes** **___ Waterfalls/Rapids**	

Table A-1 (cont.)
Placer Parkway Landscape Unit Checklist/Visual Inventory and Analysis Worksheet

	Resource Supply	Pattern Elements	Pattern Character
Land Cover VEGETATION	___ **Coniferous Woods** ___ **Deciduous Woods** ___ **Scrubland** 3 **Grassland** 3 **Pasture/Croplands** ___ **Parks/Lawns** 2 **Street Trees** 3 **Agriculture** ___ **Other**	**Pattern Elements:** Form: Visual masses are dominated by low-lying agriculture areas broken up by roadways, industrial/commercial development and residential/urban structures. Line: Existing roadways, canals, and agricultural boundaries form the majority of lines in the region. Color: Fertile land, agricultural crops, and urban development provide variation in color. Texture: Urban textures contrast with agricultural lands in the region. **Pattern Character:** Dominance: Agricultural and urban features are co-dominant. Scale: Scale of project features would contrast with the flat, open expansive area. Diversity: Project would add to the existing urban diversity. Continuity: Currently the landscape unit lacks continuity of form and line. The project would add further to lack of continuity.	
Land Cover MANMADE DEVELOPMENT	___ **Urban Centers** ___ **Suburban Areas** ___ **Industrial Areas** ___ **Commercial Areas** ___ **Institutional Areas** ___ **Residential Areas** ___ **Historic Features** 1 **Highways** ___ **Railroads** 1 **Utility Lines** ___ **Towers/Structures** ___ **Docks/Piers/Boats** ___ **Bridges/Storage Yard** ___ **Embankments/Cuts/Pits** ___ **Billboards/Signs**

Project Name	**Placer Parkway**	**Evaluator**	**Angela L. Leiba**
S.R. Number	**28066954.40300**	**Date**	**3/14/06**
Assessment Unit	**Western/Central Segment Landscape Units (Viewshed #5)**	**Weather**	**Cloudy**
L/F District	**County: Sutter**		
L/F Section	**City:**		
L/F Province	**Community:**		

	Visual Information (Perception)	**Visual Character (Cognition)**
	Resource Supply: **3 High Prominence** **2 Moderate Prominence** **1 Present** **0 Absent**	**Landform:** Situated at the base of the Sierra foothills in northern California, the study area covers mostly flat rural and agriculture land with slight variations of topographic features (elev. approx. 250 feet). Background views to the peaks of the Sierra Nevada, the Sutter Buttes and the Inner Coastal Range are visible from this location. The project alternatives are proposed to cross Placer and Sutter Counties. Land Cover – Water: Various streams and creeks are along the study area. No rivers. Irrigation canals are present. Land Cover – Vegetation: The landscape unit is mostly rural agriculture land with scattered commercial/industrial and residential landscaped areas. Vegetative land cover in the project vicinity consists predominantly of cultivated agricultural crops. Land Cover – Manmade Development: Land uses include agriculture, industrial/commercial, and residential. SR 70/99 runs along the western edge of the landscape unit. Irrigation canals and a north/south railroad route are also within the landscape unit.
LANDFORM	**1 Mountains** **____ Steep Hills/Ridges** **___ Rolling Hills** **___ Undulating Land** **3 Plateaus/Plains** **___ Valleys** **___ Cliffs, Bluffs** **___ Points** **___ Beaches** **___ Other**	
Land Cover WATER	**___ Bays/Inlets** **1 Rivers** **1 Streams** **___ Lakes** **___ Ponds** **___ Marshes** **___ Waterfalls/Rapids**

	Resource Supply	Pattern Elements	Pattern Character
Land Cover VEGETATION	___ **Coniferous Woods** ___ **Deciduous Woods** ___ **Scrubland** **3** **Grassland** **3** **Pasture/Croplands** ___ **Parks/Lawns** **1** **Street Trees** **1** **Agriculture** ___ **Other**	**Pattern Elements:** Form: Visual masses are dominated by low-lying agriculture areas broken up by roadways, industrial/commercial development and residential/urban structures. Line: Existing roadways, canals, and agricultural boundaries form the majority of lines in the region. Color: Fertile land, agricultural crops, and urban development provide variation in color. Texture: Urban textures contrast with agricultural lands in the region. **Pattern Character:** Dominance: Agricultural and urban features are co-dominant. Scale: Scale of project features would contrast with the flat, open expansive area. Diversity: Project would add to the existing urban diversity. Continuity: Currently the landscape unit lacks continuity of form and line. The project would add further to lack of continuity.

Land Cover VEGETATION	___ Coniferous Woods ___ Deciduous Woods ___ Scrubland ___ Grassland 3 Pasture/Croplands ___ Parks/Lawns 1 Street Trees 3 Agriculture ___ Other	**Pattern Elements:** Form: Visual masses are dominated by low-lying agriculture areas broken up by roadways, industrial/commercial development and residential/urban structures. Line: Existing roadways, canals, and agricultural boundaries form the majority of lines in the region. Color: Fertile land, agricultural crops, and urban development provide variation in color. Texture: Urban textures contrast with agricultural lands in the region. **Pattern Character:** Dominance: Agricultural and urban features are co-dominant. Scale: Scale of project features would contrast with the flat, open expansive area. Diversity: Project would add to the existing urban diversity. Continuity: Currently the landscape unit lacks continuity of form and line. The project would add further to lack of continuity.	
Land Cover MANMADE DEVELOPMENT	___ Urban Centers 1 Suburban Areas 1 Industrial Areas ___ Commercial Areas ___ Institutional Areas 1 Residential Areas ___ Historic Features 2 Highways 1 Railroads 2 Utility Lines ___ Towers/Structures ___ Docks/Piers/Boats 1 Bridges/Storage Yard 1 Embankments/Cuts/Pits ___ Billboards/Signs

	Visual Information (Perception)	**Visual Character (Cognition)**
	Resource Supply: **3 High Prominence** **2 Moderate Prominence** **1 Present** **0 Absent**	**Landform:** Situated at the base of the Sierra foothills in northern California, the study area covers mostly flat rural and agriculture land with slight variations of topographic features (elev. approx. 250 feet). Background views to the peaks of the Sierra Nevada, the Sutter Buttes and the Inner Coastal Range are visible from this location. The project alternatives are proposed to cross Placer and Sutter Counties. Land Cover – Water: Various streams and creeks are along the study area. No rivers Land Cover – Vegetation: The landscape unit is mostly rural agriculture land with scattered commercial/industrial and residential landscaped areas. Vegetative land cover in the project vicinity consists predominantly of cultivated agricultural crops. Land Cover – Manmade Development: Land uses include agriculture, industrial/commercial, and residential. A north/south railroad route runs through the landscape unit as well as SR 65 which follows the eastern edge of the landscape unit.

Appendix B
Caltrans Landscape Concepts

LANDSCAPE CONCEPTS: Caltrans Sacramento Office of Landscape Architecture

DRAFT FOR INTERNAL REVIEW

December 7, 2005

Landscaping Concepts

Corridor alternatives lay along relatively flat topography with open vistas of rural agriculture and distant foothill ridges, with intermittent trees, farm buildings and residences. In the future, industrial, educational and residential uses may occur within the study area. Landscaping concepts for Placer Parkway will respect the topography and vistas in the study area and will complement the varying character of land adjacent to the Parkway corridor.

Landscaping treatment may vary depending upon the final corridor selected. Eastern and western segment treatment may be limited because of reduced corridor width and more urban adjacent land uses. The 7-mile-long wider central segment (Fiddyment Road to Pleasant Grove Road) may provide more opportunities for enhanced landscaping. More southerly alternatives may be more urban in character than those closer to Pleasant Grove Creek.

Landscaping will be installed within the Parkway's "buffer areas", i.e., the portions of the 500- and 1,000-foot-wide corridors not used as part of the roadway cross-section, as well as within the median. Landscaped buffer areas will incorporate fire-retardant low-maintenance plantings that are compatible with and may enhance the variety of existing landscape features in the study area such as Pleasant Grove Creek and vistas of the Sierra Foothills. Consideration will be given to incorporating distinctive landscaping areas where adjacent focal points could be emphasized, such as within the planned City of Roseville Retention Basin or the proposed industrial development in South Sutter County. Consideration will also be given to enhancing longer views from structures such as bridges over Pleasant Grove Creek and the Sutter County Cross-Canal. Within the Placer Parkway median, landscaping concepts include low grasses and/or low-growing ground cover that require minimal maintenance. This concept would be supplemented by selected shrub and/or tree plantings, with trees offset by a minimum of 40 feet from the planned 6-lane roadway. Concepts such as a meandering flow lane, pockets of plant densification combined with more widely spaced plantings, and consideration of texture and color differences to enhance interest will be considered. Reduction of fire hazards will be an important component of the landscaping plan.

Where appropriate, more concentrated plantings will be considered to buffer the Parkway from future adjacent land uses that may incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Plantings will likely include a mix of compatible native and non-native plants that may require some irrigation. The plant pallet will consider but not be limited to the following:

Trees

- Valley oak (*Quercus lobata*)
- Blue oak (*Quercus douglasii*)
- Interior live oak (*Quercus wislizenii*)
- Cottonwood (*Populus fremontii*)
- Oregon ash (*Fraxinus latifolia*)
- California sycamore (*Platanus racemosa*)

Shrubs

- Arroyo willow (*Salix lasiolepis*)
- Goodding's willow (*Salix gooddingii*)
- California buckeye (*Aesculus californica*)
- Coyote brush (*Baccharis pilularis*)
- Coffeeberry (*Rhamnus californica* and *R. crocea*)

- Ceanothus species (*Ceanothus* spp.)
- Western redbud (*Cercis occidentailis*)
- Buttonwillow (*Cephalanthus occidentalis*)
- California rose (*Rosa californica*)
- Blue elderberry (*Sambucus mexicana*)[1]
- California blackberry (*Rubus ursinus*)
- Manzanita species (*Arctostaphylos* spp.)

Grasses/Ground Covers

- Deergrass (*Muhlenbergia rigens*) – very nice shaped, large perennial bunchgrass
- Wildrye (*Leymus triticoides*)
- Coyote brush (*Baccharis pilularis*) – select varieties with lower, spreading growth forms
- Purple needlegrass (*Nassella pulchra*)

Use of recycled water for irrigation will be explored, and will depend on availability, feasibility and cost.

Lighting elements would be designed during a future design phase. Lighting elements would be designed for safety and would consider the proposed landscaping conceptual plan to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower voltage lighting, and proposing lighting fixtures that conform with the visual character of the area).

[1] Blue elderberry is the host plant for the federally listed valley elderberry longhorn beetle. This planting would be appropriate for sites not intended for future expansion of the roadway where the presence of the beetle's host plant would not conflict with maintenance requirements.

WATER QUALITY TECHNICAL MEMORANDUM
PLACER PARKWAY CORRIDOR PRESERVATION TIER 1 EIS/ PROGRAM EIR

1.0 INTRODUCTION

1.1 TIER 1 EIS/PROGRAM EIR

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

1.2 CORRIDOR SELECTION AND PRESERVATION

The concept for the Placer Parkway is over a decade old. Placer County's 1994 General Plan depicts a "plan line" for it. Two planning studies helped to refine the concept:

- DKS Associates, 2000, Placer Parkway Interconnect Study/Conceptual Plan
- DKS Associates, 2001, Project Study Report (Project Development Support) for Placer Parkway

Placer Parkway is cited as a high-priority regional transportation project by the Sacramento Area Council of Governments (SACOG) 2025 Metropolitan Transportation Plan and the 2027 Placer County Regional Transportation Plan. The project vicinity and surrounding area include some of the fastest growing communities in the Sacramento region. A number of large urban development proposals are being considered by Placer and Sutter counties. New development is expected to add a significant amount of residential, commercial, industrial, and educational uses.

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included

representatives from planning and public works departments of all affected cities and counties, environmental, business, agricultural, development, and homeowner interests (the Study Advisory Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report will analyze these five corridor alternatives along with a No-Build Alternative.

Other potential transportation modes such as bus rapid transit may be developed in the corridor in the future, although they are not proposed as part of the current project. The width of the corridor for the Placer Parkway is to vary from approximately 500 feet in the Eastern and Western segments to approximately 1,000 feet in the Central Segment. Depending upon the alternative, the corridor's length ranges from a minimum of 14.2 miles to a maximum of 16.2 miles. The selected corridor would contain the roadway, including the median, travel lanes, shoulder, associated access ramps and a no-development buffer zone.

Corridor acquisition may not be completed until after Tier 2, as funding becomes available. Portions of the selected corridor would be preserved as a no-development buffer zone. The buffer would be maintained as a zone where development is either not permitted or is severely restricted. This is intended to restrict access to the proposed interchanges, protect the rural character of agriculturally designated areas in the vicinity of the Parkway as far as possible subject to future development, and to maximize opportunities to incorporate adjacent sensitive areas. It is intended that the buffer would be owned and managed in the future to achieve these objectives. For subsequent Tier 2 (project-level) environmental reviews, the size of this buffer zone could be considered flexible for agriculturally designated land undergoing urban development. In the Tier 2 environmental review, the specific buffer size and location would be determined. This determination would be based on performance standards on a case-by-case basis, depending on the land use needs of future approved development, and taking into account the primary objective of restricting future access to the Parkway.

Project proponents are considering employment of several land management and control mechanisms in order to ensure that the buffer would be effectively maintained as an area where development would either not be permitted, and where construction of any additional access onto the Parkway would not be allowed. These mechanisms could include land use controls, land purchase/leases, general plan amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, urban growth boundaries, etc. "Layering" or using several of these methods would provide more assurance that the buffers would be permanent, or at least more difficult to undo.

1.3 TECHNICAL STUDY OBJECTIVE

This Water Quality Technical Memorandum has been prepared to support the Tier 1 Environmental Impact Statement/Program Environmental Impact Report. It presents a Tier 1/Program-level assessment of potential impacts related to water quality for five corridor alternatives and the No-Build Alternative as described in Chapter 2.

The scope of work performed for this report is based on the Caltrans Local Assistance Procedures Manual (Caltrans, 2006), as modified for purposes of Tier 1/Program analysis by agreement of Caltrans; the Caltrans Highway Design Manual (HDM) (Caltrans, 2001b); and the Caltrans Environmental Handbook (Caltrans, 2005) on preparing a Water Quality Technical Memorandum. In addition, the evaluation considered guidance from the FHWA Environmental Checklists for Draft and Final Environmental Documents (FHWA, 1998a; FHWA, 1998b).

This report is organized as follows:

Chapter 2	The Proposed Action
Chapter 3	Regulatory Setting
Chapter 4	Affected Environment
Chapter 5	Potential Direct Impacts
Chapter 6	Secondary and Indirect Impacts
Chapter 7	Cumulative Impacts
Chapter 8	Watt Avenue Interchange
Chapter 9	Avoidance, Minimization and/or Mitigation Strategies
Chapter 10	Analyses to be Undertaken in Tier 2
Chapter 11	References

This report also includes figures and tables, which show the project location, each build alternative, and pertinent technical information prepared to evaluate the build alternatives.

Throughout this document, the Placer Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

2.0 THE PROPOSED ACTION

The Proposed Action for the Placer Parkway Corridor Preservation Project is to select and preserve a 500- to 1,000-foot-wide corridor in the project study area, within which the future four- or six-lane Placer Parkway may be constructed. The ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction, and operation of the Parkway. Although the action taken at Tier 1 on the Placer Parkway Corridor Preservation Project is limited, the underlying project whose effects are studied in this document is the Placer Parkway. To the extent feasible at this early stage, the Tier 1 EIS/EIR addresses the potential effects of construction and operation of the future roadway.

2.1 THE PROJECT STUDY AREA

The project study area is an area of approximately 33,460 acres located in Placer and Sutter counties, with a small section located in Sacramento County (see Figures 1-1 and 1-2). The portion of the study area that is located in Sacramento County is located in the extreme southwest corner of the study area and does not include any of the proposed corridor alignment alternatives. It extends from SR 70/SR 99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego roads.

For the purposes of the analysis the study area is divided into three segments:

- Western Segment: the Western Segment extends from SR 70/99 to Pleasant Grove Road in Sutter County.
- Central Segment: the Central Segment extends from Pleasant Grove Road in Sutter County to approximately 2,300 feet north of Pleasant Grove Creek in Placer County.
- Eastern Segment: the Eastern Segment extends from approximately 2,300 feet north of Pleasant Grove Creek to SR 65 in Placer County.

2.2 CORRIDOR ALTERNATIVES

The following subsections describe the corridor alternatives, which are depicted on Figure 2-1, and are numbered according to location from south to north in the study area.

2.2.1 The No-Build Alternative

Under the No-Build Alternative, the project would not be implemented. A Placer Parkway corridor would not be selected/preserved, and the future Placer Parkway would not be constructed.

2.2.2 Alternative 1 – the Red Alternative

Alternative 1 would extend from SR 70/99 approximately ½ mile north of Riego Road, eastward approximately 1 mile north of Baseline Road to approximately Watt Avenue, proceeding north and transitioning in an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment alternative is 16.2 miles long. This alternative would include six interchanges as described in Section 2.3.3.

2.2.3 Alternative 2 – the Orange Alternative

Alternative 2 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed northeast, then in a northerly direction south of Pleasant Grove Creek, transitioning to an easterly direction before it reaches Sunset Boulevard West, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.4 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.4 Alternative 3 – the Blue Alternative

Alternative 3 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed north along the Sutter/Placer County Line, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.6 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.5 Alternative 4 – the Yellow Alternative

Alternative 4 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.3 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.2.6 Alternative 5 – the Green Alternative

Alternative 5 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 4,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.2 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.3 PARKWAY DESIGN ASSUMPTIONS

Although the Parkway would be designed and construction-level impacts analyzed during Tier 2, for the purpose of this report and the Tier 1 EIS/Program EIR, several assumptions have been made about potential design and configuration concepts. These assumptions would be subject to further development and refinement, and specific decisions about design of the roadway would be made during the Tier 2 process. For example, the number, location, and design of over-crossings would be determined at the time of final Parkway design, in consultation with local jurisdictions. The following sections outline assumptions for the future roadway.

Preliminary costs estimates for the Parkway range from $600 to $650 million (2005 dollars). This includes costs for right-of-way, design, construction, and environmental mitigation for the four- to six-lane facility. The funding situation has spurred interest in exploring other more creative funding options.

These include a county-wide sales tax, more developer contributions, and tolling facilities. The Technical Report and Tier 1 EIS/Program EIR do not make any assumptions about funding sources.

2.3.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane facility. A preliminary conceptual cross section (see Figure 2-2) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/Program EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

2.3.2 Conceptual Roadway Elevation

As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on either side of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways, or trails.

Throughout the project study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These over-crossings would not connect to the Parkway. Parkway access would be via the interchanges described below.

2.3.3 Interchange Concepts

The analysis assumes that the location of interchanges (see Figure 2-1) is as follows:

- SR 70/99 (at ½ mile north of Riego Road or at Sankey Road)
- One or two locations to be determined in southern Sutter County
- Fiddyment Road
- Foothills Boulevard
- SR 65 at Whitney Ranch Parkway

The following discussion outlines concepts and assumptions for the six interchanges that could potentially serve Placer Parkway.

2.3.3.1 Western Segment

Within the Western Segment of the Parkway, a high-speed, freeway-to-freeway type interchange would connect the Parkway with SR 70/99 at one of following potential locations depending on the project alternative (see Section 2.2). Placer Parkway would terminate at SR 70/99.

- **Placer Parkway/SR 70/99 Interchange at North of Riego Road.** This alternative concept uses "braided" ramps to eliminate weaving problems or conflicts with the future SR 70/99 at Riego Road interchange being developed by Sutter County and Caltrans.

- **Placer Parkway/SR 70/99 Interchange at Sankey Road.** Under this alternative concept, the existing two-lane Sankey Road would be realigned to the south of Placer Parkway and the proposed freeway-to-freeway interchange, extending from approximately ¼ mile west of SR 70/99 to approximately ¼ mile east of the Union Pacific railroad tracks. There would be no direct access to SR 70/99 or Placer Parkway from the realigned Sankey Road.

Depending on the final alignment selected, one or two additional interchanges would also be located in south Sutter County. Conceptual locations are identified for purposes of this Tier 1/Program analysis (see Figure 2-1). The actual location of these interchanges would be developed in the Tier 2 phase, based on Sutter County requirements.

2.3.3.2 Central Segment

Within the Central Segment of the Parkway, there would not be any access proposed as part of the project in the 7-mile segment between Fiddyment Road and Pleasant Grove Road. Please see Section 2.4 regarding a potential connection to a future extension of Watt Avenue (Figure 2-3) which could be proposed and constructed by others in the Central Segment; such an interchange is not part of the Placer Parkway.

2.3.3.3 Eastern Segment

Within the Eastern Segment of the Parkway, a signalized high-speed freeway-to-freeway and local access interchange would connect the Parkway to SR 65 at Whitney Ranch Parkway (Figure 2-1). From SR 65 eastward Placer Parkway would terminate and become Whitney Ranch Parkway east of the SR 65 exit ramp intersection. Traffic signals would be provided at the exit ramp terminals. This interchange would be approximately 1 mile north of a planned SR 65/Sunset Boulevard interchange and 1.2 miles south of the existing Twelve Bridges interchange.

As part of this interchange, auxiliary lanes would be required on SR 65 in both directions to enhance traffic operations on the north side of the future SR 65/Sunset Boulevard interchange. The southbound SR 65 exit-ramp at Sunset Boulevard is being designed to accommodate an additional auxiliary lane required for the future Placer Parkway/Whitney Ranch Parkway interchange to minimize the reconstruction of this ramp in the future. Within the Eastern Segment of the Parkway, from SR 65 westward, two interchanges with local roadways would be constructed, one at Foothills Boulevard and one at Fiddyment Road, as depicted on Figure 2-1.

The future interchange on Placer Parkway at Fiddyment Road would be located near the existing intersection of Fiddyment Road and Sunset Boulevard West. To provide acceptable traffic operations, additional distance needs to be provided between the Fiddyment Road/Sunset Boulevard West intersection and the Fiddyment Road/Placer Parkway westbound off-ramp intersection. Therefore, Sunset Boulevard West will need to be realigned to the north as it nears Fiddyment Road.

2.3.4 Landscaping Concept

For the purposes of this environmental analysis, preliminary landscaping concepts have been developed for Placer Parkway. These are entirely conceptual and would be subject to further refinement during the Tier 2 environmental process. It is anticipated that landscaping would be used to reflect local topography and vistas in the study area and complement the varying character of land adjacent to the Parkway corridor. Landscape design would vary within the Parkway's three segments depending on corridor width and type and density of surrounding land uses. Landscaping would be used within the median and the Parkway buffer zone to enhance the aesthetics of the Parkway, and would be used to provide screening, and enhance local and long-distance views. Where appropriate, more concentrated plantings would be considered to buffer the Parkway from future adjacent land uses that may be incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Landscape design would likely include a mix of compatible native and non-native plants that may require some irrigation. Wherever possible, native plant species would be used in line with Caltrans policy. Where possible and depending on availability, feasibility and cost, recycled water would be used for irrigation.

During a future design phase, lighting elements would be designed for safety and would consider the proposed landscaping plan in order to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower-voltage lighting, and proposing lighting fixtures that conform with the visual character of the area).

2.4 POTENTIAL WATT AVENUE INTERCHANGE

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 2-3). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/Program EIR. However, the connection of Placer Parkway to a potential Watt Avenue extension could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/Program EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges with Placer Parkway.

2.5 AGENCY PERMITS AND APPROVALS

The Proposed Action would preserve a preferred corridor for a future transportation facility. In the future, permits and approvals would be obtained from appropriate agencies prior to construction of the Parkway. These permits and approvals may include specific design or mitigation requirements that would be incorporated into the project.

2.6 SUBSEQUENT TIER 2 INFORMATION

As noted earlier, the design and construction of Placer Parkway — including its interchanges and over-crossings, and ancillary features such as stream crossings, safety devices, stormwater management structures, and similar improvements — would be evaluated in a subsequent Tier 2 environmental review process, once a corridor has been identified. Chapter 10 provides more detailed information regarding Tier 2 studies.

3.0 REGULATORY SETTING

3.1 CLEAN WATER ACT

The Clean Water Act is a 1977 amendment to the Federal Water Pollution Control Act of 1972, which establishes the basic structure for regulating discharges of pollutants to waters of the United States. Section 303 of the Clean Water Act (CWA) requires states to adopt water quality standards.

The State Water Resources Control Board (SWRCB) and Regional Water Quality Control Boards (RWQCBs) regulate activities in "waters of the United States" through Section 401 of the CWA . A 401 Certification will be necessary to obtain a 404 permit for construction activities that would impact "waters of the United States".

The U.S. Army Corps of Engineers (USCOE) regulates the placement of fill or dredged materials that affect waters of the United States, which include stream courses and jurisdictional wetlands (wetlands that are designated and regulated under the CWA). The USCOE regulates these activities under the authority of Section 404 of the Clean Water Act. The USCOE would regulate any development that affects jurisdictional wetlands. As part of the 404 permit, coordination with U.S. Fish and Wildlife Service (USFWS) would be required.

3.2 THE PORTER-COLOGNE WATER QUALITY CONTROL ACT OF 1969

The Porter-Cologne Water Quality Control Act (Porter-Cologne) is the principal law governing water quality regulation in California. This statute established the SWRCB and the nine RWQCBs, which are charged with implementing its provisions. Porter-Cologne establishes a comprehensive program for the protection of water quality and the beneficial uses of water. It applies to surface waters, wetlands, and groundwater and to both point and nonpoint sources. Porter-Cologne is found in the California Water Code beginning with Section 13000. In addition, Title 23 of the California Code of Regulations (CCR) contains administrative and regulatory elements of water quality and quantity management in California. The SWRCB was formed in 1967 when the State Water Rights Board and the SWQCB were merged by the State Legislature, based on the realization that decisions affecting water quality and water rights are inseparable. Under its dual legal authority, the SWRCB allocates rights to the use of surface water and, together with the nine RWQCBs, protects water quality in all waters of the state.

The study area is located within Region 5 — the Central Valley River Basin RWQCB. The SWRCB provides program guidance and oversight, allocates funds, and reviews RWQCB decisions. The RWQCBs have responsibility for individual permitting, inspection, and enforcement actions within each of nine hydrologic regions.

Porter-Cologne also incorporates many provisions of the Clean Water Act (CWA) such as delegation to the SWRCB and RWQCBs of the National Pollutant Discharge Elimination System (NPDES) permitting program.

3.3 NPDES STORMWATER DISCHARGE PERMITS

Surface water quality is regulated by the NPDES, developed by the U.S. Environmental Protection Agency (U.S. EPA) in accordance with Section 303 of the CWA. In the state of California, the SWRCB administers the NPDES program, with implementation and enforcement by the RWQCBs. The NPDES program, designed to protect surface water quality, is applicable to all discharges to waters of the United States, including stormwater discharges associated with municipal drainage systems, construction activities, industrial operations, and "point sources" (such as wastewater treatment plant discharges and other direct discharges to water bodies).

The California SWRCB Water Quality Order 99-08-DWQ: The NPDES General Permit for Stormwater Discharges Associated With Construction Activity (General Permit) authorizes a general permit for stormwater discharges associated with construction activities that disturb one or more acre of land. Construction activities subject to the permit include cleaning, grubbing, grading, stockpiling, and excavation activities. The General Permit requires submittal of a Notice of Intent (NOI) to comply with the permit and the development of a Stormwater Pollution Prevention Plan (SWPPP) that must address the following:

- Plans for implementation of structural and operational Best Management Practices (BMPs) to prevent and control impacts to surface water during construction;
- Inspection and maintenance of BMPs throughout all phases of construction;
- Monitoring of runoff quality during all phases of construction; and
- A plan for preventing and controlling post-construction impacts to runoff quality.

The Central Valley RWQCB (CVRWQCB) Order 5-00-175 "Waste Discharge Requirements General Order for Dewatering and Other Low Threat Discharges to Surface Waters" addresses potential discharges of low water quality–threat wastewater. Such discharges include: (1) short duration (four months or less) or (2) low flow (average dry weather discharge does not exceed 0.25 million gallons per day). Types of discharges covered by this permit include: (1) well development water; (2) construction dewatering; (3) pump/well testing; (4) pipeline/tank pressure testing; (5) pipeline/tank flushing or dewatering; (6) condensate; (7) water supply system; and (8) miscellaneous dewatering and low-threat discharges.

In 1999, the SWRCB issued an NPDES permit (Order No. 99-06-DWQ, CAS0000003) that regulates stormwater discharges from Caltrans facilities. The permit requires Caltrans to comply with the requirements of the Construction General Permit and regulates stormwater discharges from Caltrans rights-of-way both during and after construction. The permit requires Caltrans to maintain and implement an effective Stormwater Management Plan (SWMP) that identifies and describes BMPs used to control the discharge of pollutants to waters of the United States. Stormwater discharges from Caltrans facilities must meet water quality standards through implementation of permanent and temporary (construction) BMPs and other measures.

In April 2003, the SWRCB adopted an NPDES Phase II General Permit for the Discharge of Stormwater from small municipal separate storm sewer systems (MS4s) to provide NPDES permit coverage to municipalities that were not covered under the NPDES Phase I Rule for municipalities serving more than 100,000 people. Placer County and portions of Sutter County are designated within the NPDES Phase II General Permit. Under this permit, stormwater discharges shall not cause or contribute to an exceedance of water quality standards contained in a Statewide Water Quality Control Plan, the California Toxics Rule (CTR) or the applicable RWQCB Basin Plan. The applicable Basin Plan for the project area is the Water Quality Control Plan for the Sacramento River and the San Joaquin River Basins (CVRWQCB, 1998). The Basin Plan establishes water quality objectives, and implementation programs to meet stated objectives and to protect the beneficial uses of water in the basin, in compliance with the Clean Water Act and the state Porter-Cologne Water Quality Control Act.

The SWRCB regulates activities that could result in adverse impacts to groundwater quality. Policies and regulations promulgated by the SWRCB (either under its CWA authority or state-derived authority) are implemented and enforced by the CVRWQCB. Groundwater-related activities governed by NPDES permits or Waste Discharge Requirements (WDRs) issued by the CVRWQCB include aquifer reinjection, reclaimed water irrigation, and siting and design of waste management facilities (including wastewater treatment plants). The CVRWQCB also oversees local implementation of underground storage tank management programs and other programs related to prevention and control of groundwater impacts.

In general, SWRCB policy prohibits degradation of groundwater quality, and in cases where impacts occur, the CVRWQCB typically requires restoration of impacted aquifers such that residual concentrations do not exceed the U.S. EPA's Maximum Contaminant Levels (MCLs) for drinking water. In cases where the aquifer is hydraulically connected to a surface water body, water quality criteria for fresh water aquatic habitats may be imposed as standards for cleanup and restoration efforts.

3.4 CALIFORNIA LAKE AND STREAMBED ALTERATION PROGRAM

The California Department of Fish and Game's (CDFG's) Lake and Streambed Alteration Program (California Fish and Game Code Section 1600-1607) requires any project that will substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake or use materials from a streambed to notify the CDFG before beginning the project. Notification is generally required for any project that will take place in or in the vicinity of a river, stream, lake, or their tributaries. This includes rivers or streams that flow at least periodically or permanently through a bed or channel with banks that support fish or other aquatic life and watercourses having a surface or subsurface flow that support or have supported riparian vegetation.

3.5 LOCAL REGULATIONS

Sutter and Placer counties each have local regulations relevant to water quality.

3.5.1 Sutter County

Sutter County is responsible for reviewing and approving development plans within the unincorporated areas of the county. The Sutter County General Plan (Sutter County, 1996) contains specific goals and policies intended to minimize potential impacts to water quality.

Goal 3.D	To collect and dispose of stormwater in a safe and efficient manner.
Goal 4.A	To preserve and protect the water resources of the County.
4.A-1	The County shall require development setbacks from all water courses.
Goal 4.B	To protect wetland and riparian areas through Sutter County.
4.B-2	The County shall discourage direct discharge of surface runoff into wetland areas. New development shall be designed in such a manner that pollutants and siltation will not significantly affect wetlands.

Sutter County has developed Design Standards to regulate and guide the design and preparation of plans for construction of streets, highways drainage facilities.

Sutter County has a Grading and Erosion Prevention Ordinance that specifies permitting requirements and establishes design standards for drainage and erosion/sediment control. Grading plans must be designed to address long-term erosion and sediment control, and must include measures to be implemented to control erosion and prevent offsite discharge of sediments during construction activities such as grading and stockpiling of soils. An erosion and control plan showing all facilities and measures to be implemented to control erosion and prevent offsite discharge of sediment must be submitted for review and approval by the Public Works Director.

3.5.2 Placer County

Placer County is responsible for reviewing and approving development plans within the unincorporated areas of the county. The Placer County General Plan (Placer County, 2005) contains specific goals and policies intended to minimize potential impacts associated with water quality.

Goal 4.E To collect and dispose of stormwater in a manner that least inconveniences the public, reduces potential water-related damage, and enhances the environment.

4.E.10 The County shall strive to improve quality of runoff from urban and suburban development through use of appropriate and feasible mitigation measures including, but not limited to, artificial wetlands, grassy swales, infiltration/sedimentation basins, riparian setbacks, oil/grease separators, and other best management practices.

4.E.14 The County shall require projects that have significant impacts on the quantity and quality of surface water runoff to allocate land as necessary for the purpose of detaining post-project flows and/or for the incorporation of mitigation measures for water quality impacts related to urban runoff.

Goal 6.A To protect and enhance the natural qualities of Placer County's streams, creeks and groundwater.

Placer County's Grading and Erosion Prevention Ordinance (Article 15.48) (Placer County, 2006) regulates grading to avoid pollution of watercourses with hazardous materials, nutrients, sediments, or other earthen materials generated on or caused by surface runoff and to ensure that the intended use of a graded site is consistent with the Placer County General Plan and other Placer County ordinances, including the Zoning Ordinance, Flood Damage Prevention Ordinance (Article 15.52), Environmental Review Ordinance (Chapter 18 Placer County Code), and applicable chapters of the California Building Code. The Placer County Land Development Manual (LDM) provides details on developing and designing erosion/sediment control features and contains a storm drainage section that supplements the Stormwater Management Manual. The relevant elements of the LDM's storm drainage section must also be included in a stormwater management project. Grading plans must be designed to address long-term erosion and sediment control, and must include measures to be implemented to control erosion and prevent offsite discharge of sediments during construction activities such as grading and stockpiling of soils. An erosion and control plan showing all facilities and measures to be implemented to control erosion and prevent offsite discharge of sediment must be submitted for review and approval by the Public Works Director.

4.0 AFFECTED ENVIRONMENT

This section describes the existing conditions with respect to water quality. The hydrologic setting is based on existing available data, maps, and reports.

4.1 HYDROLOGY

The study area is located within the Sacramento River Basin, which is bounded by the Sierra Nevada mountains to the east, the Coast Ranges to the west, the Cascade Range and Trinity Mountains to the north, and the Delta-Central Sierra area to the south. The Sacramento River is the principal stream in the basin. Its major tributaries are the Pit and McCloud rivers, which join the Sacramento River from the north, and the Feather and American rivers, which are tributaries from the east.

The study area is located primarily in Sutter and Placer counties (Figure 1-1). A small portion of the study area is in Sacramento County; however, none of the proposed Parkway corridors are within Sacramento County. As shown on Figure 4-1, the majority of the study area is east of the Natomas Basin and is within the watersheds of Pleasant Grove Creek, Curry Creek, and the Natomas East Main Drainage Canal (a.k.a. Steelhead Creek). A small portion of the study area in the northeastern corner is within the Auburn Ravine watershed.

The existing topography of the study area is relatively flat. The area generally slopes from east to west, from elevation 165 feet above mean sea level (msl) in the northeastern corner to less than elevation 10 feet on the western edge within the Natomas Basin. In general, soils within the study area are categorized as hydrologic soil groups C and D, with C soils having zones of hardpan layers occurring less than 4 feet below ground surface (Quad Knopf, 2001). Localized areas with hydrologic soil groups A and B may be present, especially along Pleasant Grove Creek.

4.1.1 Natomas Basin

The western portion of the study area (approximately 23 percent) is located within the Natomas Basin (see Figure 4-1). The Natomas Basin is defined as land in Sacramento and Sutter counties bounded by the Sacramento River on the west and south, the Cross Canal on the north, the American River on the south and the Pleasant Grove Creek Canal and the Natomas East Main Drainage Canal on the east. The basin includes 53,000 acres and is about 15 miles long from north to south and about 6 miles wide from west to east (EDAW, 2005). Land in the basin is generally flat with elevations from 10 to 25 feet above msl, with some localized areas up to elevation 40 feet.

The Natomas Basin is completely enclosed by levees that prevent natural drainage out of the basin. All storm runoff must be collected and pumped out. Drainage within the basin has relied on the agricultural fields to hold runoff and act as de facto detention storage facilities. As agricultural land becomes urbanized with pavement and buildings replacing fields, peak runoff and the volume of storm runoff are increased. City/County of Sacramento, Reclamation District No. 1000 (RD 1000), and Sutter County have all established guidelines for drainage and flood control within the Natomas Basin.

4.1.2 Pleasant Grove Creek Watershed

Pleasant Grove Creek (see Figure 4-1) discharges to the Pleasant Grove Creek Canal, which conveys flow north to the Cross Canal and ultimately to the Sacramento River near Verona, California. The Pleasant Grove Creek watershed has a total drainage area of approximately 47 square miles upstream of the Cross Canal (CH2M Hill, 1993). Approximately 30 percent of the study area is within the Pleasant Grove Creek watershed.

Pleasant Grove Creek historically drained along its natural courses to the Sacramento River. RD 1001 was formed in 1911 and constructed a canal/levee system to reclaim lands east of the Feather River from flooding. The Pleasant Grove Creek Canal intercepts flow from Pleasant Grove Creek as well as flow from Curry Creek and flow from the Howsley tributaries north of Pleasant Grove Creek.

There are no long-term continuous streamflow measurements for Pleasant Grove Creek. A previous study evaluated potential increases in flooding due to development within the watershed. As part of these studies, flood hydrographs for Pleasant Grove Creek and its tributaries were developed in accordance with Placer County's Stormwater Management Manual. For the 1993 existing conditions, the 100-year peak flow for Pleasant Grove Creek was estimated to be on the order of 10,000 cubic feet per second (cfs) (CH2M Hill, 1993).

4.1.3 Curry Creek Watershed

Curry Creek (see Figure 4-1) also discharges to the Pleasant Grove Creek Canal. The total area of the Curry Creek watershed upstream of the Cross Canal is approximately 17 square miles (CH2M Hill, 1993). Approximately 29 percent of the study area is within the Curry Creek watershed.

There are no long-term continuous streamflow measurements for Curry Creek. A previous study evaluated potential increases in flooding due to development within these watersheds. As part of these studies, flood hydrographs for these creeks were developed in accordance with Placer County's Stormwater Management Manual. For the 1993 existing conditions, the 100-year peak flow for Curry Creek was estimated to be on the order of 1,000 cfs (CH2M Hill, 1993).

4.1.4 Auburn Ravine Watershed

Only a small portion of the study area, approximately 4 square miles in the northeastern corner, is within the Auburn Ravine watershed (see Figure 4-1). This portion of the study area drains to Orchard Creek, which is a tributary to Auburn Ravine.

The Auburn Ravine watershed totals approximately 79 square miles and slopes from east to west, ranging in elevation from 1,600 feet in the Sierra Nevada foothills near Auburn, California, to 30 feet near Sutter County (Placer County, 2002). Orchard Creek has a watershed of approximately 12 square miles (EIP, 1997). It originates east of the study area, near Sierra College Boulevard in the Twelve Bridges area. Orchard Creek flows westward under Fiddyment Road north of the study area and then joins Auburn Ravine.

The East Side Canal intercepts flow from Auburn Ravine, as well as other creeks farther north — Coon Creek, Bunkham Slough, Markham Ravine and King Slough — and then joins with the Pleasant Grove Creek Canal. Flows from both the East Side Canal and Pleasant Grove Canal combine to flow into the Natomas Cross Canal, where it is ultimately discharged into the Sacramento River.

There are no long-term continuous streamflow measurements for Auburn Ravine or Orchard Creek. The estimated peak flows for Auburn Ravine at the Cross Canal during the winter range from a few hundred cfs to more than 17,000 cfs for a 100-year storm event (Placer County, 2002).

Flows in Auburn Ravine are augmented by water imported from the Yuba, Bear, and American River watersheds, discharges from wastewater treatment facilities and irrigation water. Winter streamflows are comprised primarily of storm runoff supplemented by discharge from wastewater treatment facilities. During the summer months, when natural flows are low due to little or no rainfall, streamflows consist primarily of irrigation water deliveries and powerhouse discharges. Based on regulated streamflow data from the Nevada Irrigation District's gauge in Auburn Ravine below SR 65 for the period 1985 through

1997, average regulated streamflows vary from 117 cfs in January to 30 cfs in October (City of Lincoln, et al., 1998).

4.1.5 Natomas East Main Drainage Canal Watershed

The Natomas East Main Drainage Canal (NEMDC) watershed is approximately 180 square miles, of which 55 percent is drained by Dry Creek located south of the study area (DWR, 2003a). Approximately 14 percent of the study area is within the NEMDC watershed, specifically within the Steelhead Creek portion. Steelhead Creek drains the southern portion of the study area to the canal/creek, which then conveys the flow towards the south. The drainage area of the Steelhead Creek portion of the NEMDC is estimated to be approximately 9 square miles. NEMDC ultimately discharges via pumping into the Sacramento River.

There are no long-term continuous streamflow measurements for Steelhead Creek. Water levels in the canal at the El Camino Avenue bridge were measured from late summer/fall 2001 to June 2002. Stage measurements ranged from 12.47 to 25.55 feet, with the median value at 13.28 feet (DWR, 2003a).

4.2 WATER QUALITY

4.2.1 Introduction

Water quality affects the human and the natural environment, including fisheries, wildlife, recreation, and human health. Surface water quality can generally be characterized by surrounding land uses. The historical land use in the study area has been agricultural, primarily grazing and pasture. Typical constituents that would be expected in runoff from pasturelands would include nitrogen, phosphorus, and coliform bacteria. With recent urbanization in the study area, additional constituents that would be expected include oil, grease, metals, pesticides, and herbicides. Typical concentrations of chemical indicators of non-point–source pollutants according to land use that could be expected in stormwater runoff are summarized in Table 4-1. Water quality degradation from non-point–source pollutants is primarily the result of stormwater runoff carrying pollutants from the land surface to the receiving waters. If stormwater runoff from rural and urban areas contains excessive levels of pollutants (e.g., pesticides, herbicides, hydrocarbons); this can result in adverse effects on aquatic-dependent wildlife and fisheries.

In the study area, the urban/commercial uses that may contribute to non-point–source pollution include automobiles (tires, oil leaks, brake linings, catalytic converters), the improper use and disposal of chemicals (pesticides, fertilizers, herbicides, paints, paint thinners, solvents, petroleum chemicals), erosion of unprotected surfaces, structural surfaces (street pavement, galvanized pipes, roofing materials, wood preservatives), and solid waste (litter and debris, vegetative matter, pet droppings) (James M. Montgomery, 1992).

Stormwater runoff originating within the study area drains to Steelhead Creek, Pleasant Grove Creek, Curry Creek or Auburn Ravine, which are tributaries to the Sacramento River. This river is a primary source of water for the City of Sacramento as well as for the Sacramento-San Joaquin Delta and is important as a source of domestic water and for recreation, fisheries and wildlife habitats (James M. Montgomery, 1992). Key beneficial uses of the receiving waters are designated as municipal, domestic, and agricultural supply, recreation, and freshwater habitat (CVRWQCB, 1998); these beneficial uses depend, in part, on maintaining existing water quality. None of the creeks within the study area are on the RWQCB's 2002 list of designated impaired streams (i.e., the Section 303(d) list); however, the downstream section of the Sacramento River between Knights Landing and the Delta, approximately 16 miles long, is designated as an impaired stream for diazinon (agricultural source), mercury (abandoned mine source) and other toxicity from unknown sources (CVRWQCB, 2003). In 2005, the RWQCB prepared to delist diazinon from the

Section 303(d) list for this segment of the Sacramento River (RWQCB, 2005a; RWQCB, 2005b) because applicable water quality standards for this pollutant are not exceeded based on available data.

Table 4-1
Typical Concentrations of Non-Point–Source Pollutants in Stormwater

Land Use	Biological Oxygen Demand (pounds/acre/year)	Suspended Solids (pounds/acre/year)	Total Phosphorus (pounds/acre/year)	Total Nitrogen (pounds/acre/year)
Residential	24	545	0.32	4.0
Commercial	98	745	0.75	9.0
Recreation	1.3	420	0.06 to 0.2	2.3 to 4.4
Cropland, pasture and unused rural land	2.1 to 30	420 to 10,000	0.09 to 0.64	0.9 to 23
Source: EIP Associates, 2004.				

Water monitoring studies for the Sacramento River indicate that the river's water quality is generally of high quality (Quad Knopf, 2006). The water quality is primarily affected by land use practices within the watershed and associated urban runoff, stormwater discharges, agricultural runoff, effluent discharge from wastewater treatment plants, and acid mine drainage from abandoned mines. Certain priority pollutants (e.g., trace metals and pesticides) have been detected in the Sacramento River at levels above state water quality objectives; however, most monitored constituents, with the exception of some metals, typically meet water quality objectives. As a raw municipal water source, total dissolved solids (TDS), total organic carbon (TOC), and pathogen levels are of concern for the Sacramento River, but are currently at acceptable regulatory levels (Quad Knopf, 2006).

4.2.2 Natomas Basin

There are no streams within the Natomas Basin. Water is conveyed through the area via a system of canals. No water quality data are available for these canals.

4.2.3 Pleasant Grove Creek Watershed

Water quality sampling was conducted to support the Pleasant Grove/Curry Creek Ecosystem Restoration Plan (Foothill Associates, 2005). The results from quarterly sampling conducted from spring 2004 through spring 2005 at several locations within the Pleasant Grove Creek watershed indicate the following potential concerns related to water quality for the creek:

- Water temperature during summer ranged from 20.8°C to 25.0°C (69.4°F to 77°F), exceeding the 20°C (68°F) criteria set in the Basin Plan;
- Dissolved oxygen (DO) during summer was below the 5.0 milligrams per liter (mg/L) criteria set in the Basin Plan. Low flows, and the resulting stagnation and increased water temperatures, contributed to these low DO values; and
- Elevated levels of coliform and *Escherichia coli* (E. coli), which may be attributed to wildlife.

4.2.4 Curry Creek Watershed

Water quality sampling of Curry Creek was conducted quarterly from spring 2004 through spring 2005 at several locations within the Curry Creek watershed (Foothill Associates, 2005). The results, which are

similar to those for Pleasant Grove Creek, indicate the following potential concerns related to water quality:

- Water temperature during summer ranged from 20.8°C to 25.0°C, exceeding the criteria of 20°C set in the Basin Plan;
- DO during summer was below the 5.0 mg/L criteria set in the Basin Plan. Low flows, and the resulting stagnation and increased water temperatures, contributed to these low DO values;
- Elevated levels of coliform and E. coli, which may be attributed to wildlife; and
- Elevated levels of turbidity and total suspended solids.

4.2.5 Auburn Ravine Watershed

The Auburn Ravine/Coon Creek Ecosystem Restoration Plan (Placer County, 2002) contains preliminary data on heavy metals and a number of other constituents for Auburn Ravine. Cadmium, copper, and zinc were present at some times of the year at levels exceeding the California Toxic Rule objectives for aquatic life; however, other studies show that heavy metals did not exceed California Toxic Rule standards. In Auburn Ravine, the only metal that exceeds the standards at 50 mg/L hardness criterion is copper.

4.2.6 NEMDC Watershed

NEMDC, also known as Steelhead Creek, is a potentially significant cumulative source of urban loads of drinking water contaminants to the Sacramento-San Joaquin Delta. Water quality monitoring was performed from 1997 to June 2002 (DWR, 2003a). The monitoring site was on the NEMDC at the El Camino Avenue Bridge, just below the confluence with Arcade Creek. This location includes drainage from the entire 180-acre watershed, which includes drainage from the upper NEMDC area above the Dry Creek/NEMDC confluence, Dry Creek, Robla/Magpie Creeks, and Arcade Creek. The California Bay – Delta Authority (formerly CALFED) specifically identified the NEMDC as a priority site for assessment of sources and loads of drinking water contaminants of concern, and, therefore conducted the water quality investigation as part of the Municipal Water Quality Investigations (MWQIs) Urban Sources and Loads Project. Results indicated the following:

- TDS levels for water samples from NEMDC ranged from 58 to 338 mg/L and were higher overall than Sacramento area urban runoff, although the range of values was similar;
- Electrical conductivity (EC) was relatively high and ranged from 81 to 561 micrograms per liter (μg/L);
- Bromide levels were detected at levels above the Bay-Delta program target of concern of 0.05 mg/L for drinking water sources. Bromide levels averaged 0.054 mg/L, with a high value of 0.11 mg/L;
- Combined nitrate values were very high, often exceeding the MCL (10 mg/L as nitrogen). Of the total 64 combined samples, 22 exceeded the MCL, with high values of 22.8 mg/L and 16.3 mg/L; and
- Diazinon was detected in 9 of 14 samples ranging from <0.01 μg/L to 0.19 μg/L. These results are not unexpected due to the historically high concentrations and the level of concern about this pesticide in the Arcade Creek watershed.

5.0 POTENTIAL DIRECT IMPACTS

Potential impacts to water quality were evaluated through a quantitative comparison of the potential impact of each of the corridor alignment alternatives to relevant parameters affecting water quality. The criteria used in this analysis were developed to allow comparison of potential impacts to water quality associated with each of the corridor alignment alternatives. The focus of this Tier 1 analysis was to identify potential impacts that differentiate between proposed alternatives. For example, the measurement of impervious area quantifies the magnitude of that resource in the watersheds that would be potentially impacted by the project. An alternative that has more impervious area would potentially contribute more runoff and more pollutants. Comparison of the magnitude of impervious area for each alternative is a quantitative approach to comparing the relative potential impact of the various alternatives.

The grading involved in construction of the Parkway would decrease vegetative cover and increase the potential for soil erosion, and thereby could cause a temporary increase in suspended solids in runoff and local receiving waters. Surfaces disturbed during construction would be paved or vegetated and the potential for erosion would be very low after construction has been completed. In addition to impacts from erosion, impacts to runoff water quality during construction could potentially result from leaks or spills of fuel or hydraulic fluid used in construction equipment; outdoor storage of construction materials; or spills of paints, solvents, or other potentially hazardous materials commonly used in construction.

During operation, the Parkway would increase the overall amount of impervious surface in the study area, thereby increasing runoff. The most common contaminants in highway runoff are heavy metals, inorganic salts, aromatic hydrocarbons, and suspended solids that accumulate on the road surface as a result of regular highway operation and maintenance activities. Ordinary operations and the wear and tear of vehicles result in the dropping of oil, grease, rust, hydrocarbons, rubber particles, and other solid materials on the highway surface. These materials are washed off the highway during rain events. Receiving surface waters are susceptible to contamination from these sources (FHWA, 1999). Additionally, pollutants would tend to be flushed from impervious surfaces where they accumulate (e.g., paving) into drainage conveyances. Stormwater runoff from road surfaces and interchanges would be expected to contain oils, grease, and debris.

As stated in the Fact Sheet for Caltrans' NPDES Permit (SWRCB, 1999), discharges of stormwater from the Caltrans owned rights-of-way, properties, facilities, and activities, including stormwater management activities in construction, maintenance, and operation of state-owned highways within the State of California, have been shown to be contributors of pollutants to waters of the United States. As such, the discharge of stormwater may be causing or threatening to cause violations of water quality objectives. The quality and quantity of these discharges vary considerably and are affected by hydrology, geology, land use, season, and sequence and duration of hydrologic events. Pollutants occur in both the stormwater discharges and non-stormwater discharges. Pollutant sources from Caltrans rights-of-way, properties, facilities, and activities include motor vehicles, highway maintenance, construction site runoff, maintenance facility runoff, illegal dumping, spills, and landscaping care. Pollutant categories include metals (such as copper, lead, and zinc), synthetic organics (petroleum products and pesticides), sediment, nutrients (nitrogen and phosphorus fertilizers), debris, oxygen demanding substances (decaying vegetation, animal waste, and other organic matter), and other pollutants that may cause aquatic toxicity in the receiving waters.

Table 5-1 summarizes the evaluation criteria considered in the analysis of the corridor alternatives. These are described below.

Table 5-1
Summary of Criteria Used for Evaluation of Alternatives:
Water Quality

Evaluation Criteria	Regulatory Concerns (Potential Impacts)	Quantitative Evaluation Approach	Justification
Amount of Impervious Area	• Increase amount of runoff and amount of pollutants from roadway surface • Increase the potential for erosion during construction activities	Magnitude of area affected; lower value better	Potential increase in impervious area and resultant increase in runoff and pollutants may impact downstream areas; objective is to minimize the increase in impervious area Larger area disturbed during construction increases potential for erosion
	• BMPs required to offset increases in runoff and eliminate discharge of pollutants	Magnitude of area potentially available for BMPs; higher value better	Opportunities to site BMPs (e.g., ability to locate detention basins/swales within the right-of-way to attenuate peak runoff)
Stream Crossings	• Provide discharge point for pollutants to enter stream • Crossing may require streambed alteration • Restriction on construction activities in channels	Number of streams crossed by each alternative; lower number better	Alternative crossing may affect water quality of downstream segments; objective is to minimize the number of streams potentially affected Streambed alteration requires permit from CDFG Placement of fill in channel requires Section 404 permit
Amount of Watershed Downstream of Stream Crossing	• Increase impacts to downstream reaches	Magnitude of area affected; lower value better	Alternative may affect water quality discharge to stream; objective is to minimize the amount of stream potentially affected, therefore crossing lower in the watershed is preferable
Amount of Wetlands and Vernal Pool Complex Areas Crossed	• Potential for pollutants to be discharged into sensitive areas	Magnitude of area affected; lower value better	Alternative may affect water quality discharge to adjacent wetlands or vernal pool complex areas; objective is to minimize the number of areas potentially affected
Canal Crossings	• Potential for pollutants to enter canal	Number of canals crossed by each alternative; lower number better	Alternative crossing may affect water quality of canal; objective is to minimize the number canals potentially affected

Amount of Impervious Area. The increase in impervious area due to implementation of the project would result in increased peak flows and runoff volumes. Potential pollutants from the paved roadway surfaces would be carried by the increased runoff from the roads to the streams. Highly impervious surfaces create high velocities that easily transport solids or scour contaminants from surfaces. Roadway surfaces, which are impervious, also increase the likelihood for first-flush flows (low flows with high concentration of pollutants) to occur.

With respect to construction activities, the amount of paved area is indicative of the amount of soil that may be disturbed and require erosion controls and stabilization.

Stream Crossings. Stream crossings provide an opportunity for stormwater runoff that may contain pollutants to enter a waterway. Crossings may constrict or block natural streamflows that may result in erosion. Special considerations must be addressed when construction is performed in or near creeks, such as limiting fill placed in creeks and minimizing alteration of streams. Stream crossings in relation to the alternatives and segments are shown on Figure 5-1.

Amount of Watershed Downstream of Crossing. The location of stream crossings in relation to the watershed provides an indication on how much of the creek and watershed may be affected. Discharge of pollutants into the headwaters of a creek would affect the entire creek system, while discharge into the lower reaches would impact less of the system and may benefit from dilution effects of higher flows.

Amount of Wetlands and Vernal Pool Complex Areas Crossed. Ecologically sensitive areas are particularly vulnerable to contamination. Special considerations may be required to prevent discharge of pollutants to these areas from construction activities. Discharge of road runoff that may contain pollutants should not be directed to these areas. Wetlands and vernal pool complex areas in relation to the alternatives and segments are shown on Figure 5-2.

Canal Crossings. Similar to stream crossings described above, roads and bridges that cross canals may discharge pollutants into canals. Special provisions must be implemented at canal crossings to prevent impacts to water quality during construction and operations. Canal crossings in relation to the alternatives and segments are shown on Figure 5-1.

Comparative data were collated and evaluated for each corridor alignment alternative and its segments (i.e., western, central and eastern) using Geographic Information System (GIS) technology. Tables 5-2 and 5-3 summarize the information for each alternative and segment.

5.1 THE NO-BUILD ALTERNATIVE

Under the No-Build Alternative, land for the future construction of the Placer Parkway would not be acquired and the Parkway would not be constructed. No impacts to water quality would occur as a result of the No-Build Alternative.

5.2 ALTERNATIVE 1 – THE RED ALTERNATIVE

5.2.1 Alternative 1 – Western Segment

The Western Segment of Alternative 1 is located entirely within Sutter County. Most of this segment is within the Natomas Basin. The total length of this segment is approximately 15,300 feet along the centerline of the corridor. Three interchanges would be included along this segment, as shown on Figure 2-1.

Amount of Impervious Area. The estimated amount of impervious area associated with this segment is 322 acres (see Table 5-2). Most of this is in the Natomas Basin watershed (316 acres), with the remaining 6 acres in the NEMDC watershed. The amount of impervious area includes the road, shoulder, and interchanges.

Table 5-2
Summary of Corridor Alignment Alternatives: Water Quality Parameters

Alternative	Segment	Length (feet)	Number of Watersheds Traversed	Impervious Area (acres)	Wetlands Crossed (acres)	Vernal Pool Complex Areas Crossed (acres)	Inter-changes (#)	Number of Stream Crossings (#)	Canal Crossings (#)
1	Western	15,300	1	322	0.3	23	3	0	1
	Central	40,600	3	103	15.5	6	0	9	0
	Eastern	29,600	2	321	20.0	94	3	6	0
	Total	85,500	6	745	35.8	123	6	15	1
2	Western	15,300	1	322	0.3	23	3	0	1
	Central	36,400	3	94	10.6	7	0	5	0
	Eastern	29,600	2	321	20.0	94	3	6	0
	Total	81,300	5	737	30.9	124	6	11	1
3	Western	15,300	1	322	0.3	23	3	0	1
	Central	37,500	3	97	11.7	10	0	4	0
	Eastern	29,600	2	321	20.0	94	3	6	0
	Total	82,400	5	740	32.0	127	6	10	1
4	Western	15,300	1	223	0.3	9	2	0	1
	Central	30,600	2	80	8.0	4	0	3	0
	Eastern	29,600	2	321	20.0	94	3	6	0
	Total	75,500	4	624	28.3	107	5	9	1
5	Western	15,300	1	223	0.3	9	2	0	1
	Central	30,100	2	78	7.7	21	0	3	0
	Eastern	29,600	2	321	20.0	94	3	6	0
	Total	75,000	4	622	28.0	124	5	9	1

Notes:

Alternatives and segments are shown on Figures 2-1, 4-1, 5-1, and 5-2. Impervious area includes assumptions for paved road surface, paved shoulders and interchanges. Road surface assumes 6 lanes (three in each direction).

Table 5-3
Summary of Distribution of Watersheds Crossed by Corridor Alignment Alternatives

Alternative	Total Watershed Area [1] (sq. mi.)	Area Downstream of Crossing[1] (sq. mi.)	Area in Corridor [1] (sq. mi.)	Area Upstream of Crossing [1] (sq. mi.)	Percentage of Watershed Downstream of Crossing
Steelhead Creek Watershed					
1	9	2.7	0.7	5.6	48
2	9	1.8	0.6	6.6	27
3	9	1.6	0.3	7.1	21
4	9	0	0	0	0
5	9	0	0	0	0
Curry Creek Watershed					
1	17	10.2	0.5	6.3	63
2	17	8.3	0.5	8.2	52
3	17	3.6	0.8	12.6	26
4	17	1.5	0.9	14.6	14
5	17	1.6	0.8	14.6	14
Pleasant Grove Creek Watershed					
1	47	11	0.3	35.7	24
2	47	11	0.3	35.7	24
3	47	11.1	0.2	35.7	24
4	47	11.1	0.3	35.7	24
5	47	11	0.3	35.7	24
Auburn Ravine Watershed[2]					
1-5	79	0.4	0.2	0	99

Notes:
1. Areas based on information from CH2M Hill (1993).
2. The crossing is the same for all alternatives. Stream crossed is a minor tributary of Auburn Ravine. The total area of this tributary's watershed is approximately 0.6 square mile. The values in the table for area upstream and downstream of the crossing represent the areas within this tributary's watershed.

Stream Crossings. In this part of the study area, the canals have intercepted the former creeks; therefore, there are no creek crossings along this segment. As discussed in the Hydrology and Floodplain Technical Memorandum (URS, 2006), roughly half of the corridor associated with this segment would be within the 100-year floodplain, which is essentially an extensive and flat area.

Amount of Watershed Downstream of Crossing. Since there are no stream crossings within this segment, this criterion is not applicable.

Amount of Wetlands and Vernal Pool Complex Areas Crossed. This segment crosses approximately 0.3 acre of wetlands and approximately 23 acres of vernal pool complex area (see Figure 5-2).

Unless detailed mapping shows otherwise, it appears that the Parkway would not be able to avoid these areas. Special considerations with respect to selection and siting of BMPs may be required to ensure that the wetlands and vernal pool complex areas are not adversely affected by stormwater runoff from the Parkway.

Canal Crossings. This segment would cross the Natomas East Main Drainage Canal. Design of the roadway and crossing would need to include provisions to direct surface water runoff away from the canal and not allow direct discharge into the canal. This would be accomplished with gutters or scupper drains and collection pipes that would convey stormwater runoff to land by gravity flow.

5.2.2 Alternative 1 – Central Segment

The Central Segment of Alternative 1 is located in Sutter and Placer counties. It traverses three watersheds: the Natomas East Main Drainage Canal, Curry Creek, and Pleasant Grove Creek. The total length of this segment is approximately 40,600 feet along the centerline of the corridor. No interchanges are proposed along this segment.

Amount of Impervious Area. The estimated amount of impervious area associated with this segment is 103 acres. Approximately 51, 33, and 19 acres are within the NEMDC, Curry Creek, and Pleasant Grove Creek watersheds, respectively.

The total width of the proposed Parkway corridor is approximately 1,000 feet in the Central Segment. Accounting for the six travel lanes and the Parkway's shoulders leaves approximately 888 feet of unpaved area where BMPs, such as detention basins and swales, could be located either within the median or between the proposed shoulders and the corridor edge.

Stream Crossings. There are nine stream crossings within this segment: four on Steelhead Creek, three on Curry Creek, and two on Pleasant Grove Creek. This segment crosses approximately 7,000 feet of Steelhead Creek longitudinally. Depending on the alignment of the road within the corridor, realignment of this section of Steelhead Creek may be required. Realignment or reconfiguration of this creek would require a Streambed Alteration agreement from CDFG.

The segment crosses Curry Creek and its tributaries in three locations. Within the Pleasant Grove Creek watershed, this segment crosses the main stem of Pleasant Grove Creek and its northern tributary.

Depending on the length of the creek crossing, the creek flows, and whether the crossing is also within the floodplain, the road would either be elevated on a bridge or the creek would be placed in a culvert under the road. BMPs would be incorporated into the road crossing design such that there would be no direct discharge of stormwater runoff into the creek. Discharge from the roadway surface would be collected and conveyed to a location outside of the ordinary high water. The creek crossing would be designed and constructed to minimize the potential impacts to water quality.

Amount of Watershed Downstream of Crossing. The Central Segment of Alternative 1 crosses Steelhead Creek in several locations, all of which are in the lower portion of the watershed. Approximately 38 percent of the watershed is below these stream crossings (see Table 5-3). This segment crosses Curry Creek and its tributaries in three locations within the upper portion of the watershed. The estimated drainage areas above each crossing (southern, middle, and northern crossings), are approximately 4 square miles, 2 square miles, and less than 0.5 square mile, respectively. Approximately 63 percent of the watershed is below these stream crossings (see Table 5-3). In the lower portion of Pleasant Grove Creek watershed, this segment crosses the main stem of Pleasant Grove Creek and its northern tributary. The estimated total drainage area of Pleasant Grove Creek above the proposed Parkway crossing is approximately 30 square miles. The estimated drainage area for the northern

tributary to Pleasant Grove Creek above the Parkway crossing is approximately 5 square miles. Approximately 24 percent of the watershed is below these stream crossings (see Table 5-3).

Amount of Wetlands and Vernal Pool Complex Areas Crossed. This segment crosses approximately 15.5 acres of wetlands and approximately 5.5 acres of vernal pool complex area (see Figure 5-2).

Within the Curry Creek watershed, this segment runs alongside and immediately downstream of a large vernal pool complex area. It is unlikely that stormwater runoff from the roadway would discharge into this area.

A portion of this segment near the northern Pleasant Grove Creek tributary crossing passes through a vernal pool complex area. Depending on the final road alignment within the 1,000-foot corridor, it should be possible to site BMPs and avoid direct discharge of stormwater runoff from the roadway surface to the vernal pool complex area.

Canal Crossings. This segment does not cross any existing canals. Therefore, there would be no potential impacts to canals.

5.2.3 Alternative 1 – Eastern Segment

The Eastern Segment is located entirely within Placer County. Most of this segment is within the Pleasant Grove Creek watershed, with the portion nearest SR 65 within the Auburn Ravine watershed. The total road length of this segment is approximately 29,600 feet along the centerline of the corridor. Approximately 11,600 feet is within the Pleasant Grove Creek watershed and the remaining 8,000 feet is within the Auburn Ravine watershed. Three interchanges would be included along this segment, as shown on Figure 4-1; two of the three interchanges would be within the Pleasant Grove Creek watershed.

Amount of Impervious Area. The estimated amount of impervious area associated with this segment is 321 acres, of which approximately 299 acres are within Pleasant Grove Creek watershed and the remaining 22 acres are within Auburn Ravine. The amount of impervious area includes the road, shoulder, and interchanges.

The total width of the proposed Parkway corridor is approximately 1,000 feet west of Fiddyment Road and approximately 500 feet wide east of Fiddyment Road segment. The corridor includes a 100-foot unpaved median, six travel lanes, and the Parkway's shoulders. BMPs, such as detention basins and swales, could be located within the median. There would also be an opportunity to locate BMPs between the proposed roadway shoulders and the corridor edge (approximately 888 feet of unpaved area west of Fiddyment Road and approximately 388 feet of unpaved area east of Fiddyment Road).

Stream Crossings. Six new stream crossings are within this segment: four on tributaries of Pleasant Grove Creek and two on tributaries of Orchard Creek. All of these crossings are in the headwaters of the creeks; therefore, culverts would be used at these crossings. In addition, this segment includes three existing stream crossings along SR 65. These crossings would require modifications, such as extension of existing culverts, as part of adding the auxiliary lanes.

Amount of Watershed Downstream of Crossing. This segment crosses several tributaries of Pleasant Grove Creek within the headwaters of each tributary. These tributaries join the main stem of Pleasant Grove Creek within the lower portion of the watershed.

Similarly, this segment crosses the tributaries of Orchard Creek at their headwaters. These tributaries join Auburn Ravine in the lower portion of the watershed.

Amount of Wetlands and Vernal Pool Complex Areas Crossed. This segment crosses approximately 16 acres of wetlands and approximately 94 acres of vernal pool complex area (see Figure 5-2). Most of these areas are associated with Pleasant Grove Creek and its tributaries. A small portion is associated with the tributaries of Orchard Creek within the Auburn Ravine watershed.

All three of the Pleasant Grove Creek tributary crossings coincide with vernal pool complex areas. The three Orchard Creek tributary crossings appear to be adjacent to or immediately upstream of the vernal pool complex areas.

Depending on the final road alignment within the 1,000-foot corridor, it should be possible to site BMPs and avoid direct discharge of stormwater runoff from the roadway surface to the vernal pool complex area.

Canal Crossings. This segment does not cross any existing canals. Therefore, there would be no potential impacts to canals.

5.3 ALTERNATIVE 2 – THE ORANGE ALTERNATIVE

5.3.1 Alternative 2 – Western Segment

The Western Segment of Alternative 2 is the same as for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.3.2 Alternative 2 – Central Segment

The Central Segment of Alternative 2 traverses three watersheds: NEMDC, Curry Creek, and Pleasant Grove Creek. The total length of this segment is approximately 36,400 feet along the centerline of the corridor. Approximately 7,500 feet of the corridor is within Sutter County, with the remainder in Placer County. No interchanges are proposed along this segment.

Amount of Impervious Area. The estimated amount of impervious area associated with this segment is 94 acres. Approximately 41, 35, and 19 acres are within the NEMDC, Curry Creek, and Pleasant Grove Creek watersheds, respectively.

The total width of the proposed Parkway corridor is approximately 1,000 feet in the Central Segment. Accounting for the six travel lanes and the Parkway's shoulders leaves approximately 888 feet of unpaved area where BMPs, such as detention basins and swales, could be located either within the median or between the proposed shoulders and the corridor edge.

Stream Crossings. Five stream crossings are within this segment: one on Steelhead Creek, two on Curry Creek, and two on Pleasant Grove Creek. Culverts may be used at smaller creek crossings. Where creek crossings coincide with floodplain crossings, the road would be elevated on a bridge.

Depending on the length of the creek crossing, the creek flows, and whether the crossing is also within the floodplain, the road would either be elevated on a bridge or the creek would be culverted under the road. BMPs would be incorporated into the road crossing design such that stormwater runoff would not discharge directly into the creek. Discharge from the roadway surface would be collected and conveyed to a location outside of the ordinary high water level. The creek crossing would be designed and constructed to minimize the potential impacts to water quality.

Amount of Watershed Downstream of Crossing. The Central Segment of Alternative 2 crosses Steelhead Creek in the lower portion of the watershed. Approximately 27 percent of the watershed is below these stream crossings (see Table 5-3).

This segment crosses Curry Creek and its tributaries in three locations within the middle portion of the watershed. Approximately 52 percent of the watershed is below these stream crossings (see Table 5-3).

Within the Pleasant Grove Creek watershed, this segment crosses the main stem of Pleasant Grove Creek and its northern tributary within the lower portion of the watershed. The estimated total drainage area of Pleasant Grove Creek above the proposed Parkway crossing is approximately 30 square miles. The estimated drainage area for the northern tributary to Pleasant Grove Creek above the Parkway crossing is approximately 5 square miles. Approximately 24 percent of the watershed is below these stream crossings (see Table 5-3).

Amount of Wetlands and Vernal Pool Complex Areas Crossed. This segment crosses approximately 10.6 acres of wetlands and approximately 6.9 acres of vernal pool complex area (see Figure 5-2).

Canal Crossings. This segment does not cross any existing canals. Therefore, there would be no potential impacts to canals.

5.3.3 Alternative 2 – Eastern Segment

The Eastern Segment of Alternative 2 is the same as for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.4 ALTERNATIVE 3 – THE BLUE ALTERNATIVE

5.4.1 Alternative 3 – Western Segment

The Western Segment of Alternative 3 is the same as for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.4.2 Alternative 3 – Central Segment

The Central Segment of Alternative 3 traverses three watersheds: the NEMDC, Curry Creek, and Pleasant Grove Creek. The total length of this segment is approximately 37,900 feet along the centerline of the corridor. Approximately 7,500 feet of the corridor is within Sutter County, with the remainder in Placer County. No interchanges are proposed along this segment.

Amount of Impervious Area. The estimated amount of impervious area associated with this segment is 97 acres. Approximately 23, 58, and 16 acres are within the NEMDC, Curry Creek, and Pleasant Grove Creek watersheds, respectively.

The total width of the proposed Parkway corridor is approximately 1,000 feet in the Central Segment. Accounting for the six travel lanes and the Parkway's shoulders leaves approximately 888 feet of unpaved area where BMPs, such as detention basins and swales, could be located either within the median or between the proposed shoulders and the corridor edge.

Stream Crossings. Four stream crossings are within this segment: one on Steelhead Creek, one on Curry Creek, and two on Pleasant Grove Creek. Culverts or a bridge could be used at the Steelhead Creek crossing. The Curry Creek and Pleasant Grove Creek crossings coincide with floodplain crossings; therefore, the road would be elevated on a bridge.

Depending on the length of the creek crossing, the creek flows, and whether the crossing is also within the floodplain, the road would either be elevated on a bridge or the creek would be placed in a culvert under the road. BMPs would be incorporated into the road crossing design such that stormwater runoff would not discharge directly into the creek. Discharge from the roadway surface would be collected and conveyed to a location outside of the ordinary high water. The creek crossing would be designed and constructed such that the potential impacts to water quality would be less than significant.

Amount of Watershed Downstream of Crossing. The Central Segment of Alternative 3 crosses Steelhead Creek in the lower portion of the watershed. Approximately 21 percent of the watershed is below these stream crossings (see Table 5-3).

This segment crosses Curry Creek and its tributaries in three locations within the lower portion of the watershed. Approximately 26 percent of the watershed is below these stream crossings (see Table 5-3).

Within the Pleasant Grove Creek watershed, this segment crosses the main stem of Pleasant Grove Creek and its northern tributary within the lower portion of the watershed. The estimated total drainage area of Pleasant Grove Creek above the proposed Parkway crossing is approximately 30 square miles. The estimated drainage area for the northern tributary to Pleasant Grove Creek above the Parkway crossing is approximately 5 square miles. Approximately 24 percent of the watershed is below these stream crossings (see Table 5-3).

Amount of Wetlands and Vernal Pool Complex Areas Crossed. This segment crosses approximately 11.7 acres of wetlands and approximately 10.4 acres of vernal pool complex area (see Figure 5-2).

Within the Curry Creek watershed, the corridor runs near, but not adjacent to, a vernal pool complex for approximately 6,000 feet. Along this portion of the corridor, the proposed road would be upstream of the vernal pool complex and Curry Creek. Special considerations with respect to selection and siting of BMPs may therefore be required to ensure that the vernal pool complex area is not adversely affected by stormwater runoff from the Parkway.

Canal Crossings. This segment does not cross any existing canals. Therefore, there would be no potential impacts to canals.

5.4.3 Alternative 3 – Eastern Segment

The Eastern Segment of Alternative 3 is the same as for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.5 ALTERNATIVE 4 – THE YELLOW ALTERNATIVE

5.5.1 Alternative 4 – Western Segment

Most of the Western Segment of Alternative 4 is within the Natomas Basin. The total length of this segment is approximately 14,000 feet along the centerline of the corridor. Two interchanges would be included along this segment, as shown on Figure 4-1.

Amount of Impervious Area. The estimated amount of impervious area associated with this segment is 223 acres.

Stream Crossings. In this part of the study area, the canals have intercepted the former creeks; therefore, there are no creek crossings along this segment. As discussed in the Floodplain Technical Memorandum

(URS, 2006), essentially all of the Western Segment associated with Alternative 4 would be within the 100-year floodplain, which is an extensive area of flat land.

Amount of Watershed Downstream of Crossing. Since there are no stream crossings within this segment, this criterion is not applicable.

Amount of Wetlands and Vernal Pool Complex Areas Crossed. This segment crosses approximately 0.3 acre of wetlands and approximately 9 acres of vernal pool complex area (see Figure 5-2). Unless detailed mapping shows otherwise, it appears that the proposed roadway would not be able to avoid these areas. Special considerations with respect to selection and siting of BMPs may be required to ensure that the wetlands and vernal pool complex areas are not adversely affected by stormwater runoff from the Parkway.

Canal Crossings. This segment would cross the Pleasant Grove Creek Canal. This portion of the road would be elevated on a bridge. The approximate width of the canal at this crossing is on the order of 150 to 200 feet. Design of the roadway and crossing would need to include provisions to direct surface water runoff away from the canal and not allow direct discharge into the canal. This would be accomplished with gutters or scupper drains and collection pipes that would convey stormwater runoff to land by gravity flow.

5.5.2 Alternative 4 – Central Segment

The Central Segment of Alternative 4 traverses two watersheds: Curry Creek and Pleasant Grove Creek. The total length of this segment is approximately 31,200 feet along the centerline of the corridor. Approximately 11,000 feet of the corridor is within Sutter County, with the remainder in Placer County. No interchanges are proposed along this segment.

Amount of Impervious Area. The estimated amount of impervious area associated with this segment is 80 acres. Approximately 60 and 19 acres are within the Curry Creek and Pleasant Grove Creek watersheds, respectively.

The total width of the proposed Parkway corridor is approximately 1,000 feet in the Eastern Segment. Accounting for the six travel lanes and the Parkway's shoulders leaves approximately 888 feet of unpaved area where BMPs, such as detention basins and swales, could be located either within the median or between the proposed shoulders and the corridor edge.

Stream Crossings. Three stream crossings are within this segment: one on Curry Creek and two on Pleasant Grove Creek. The Curry Creek and Pleasant Grove Creek crossings coincide with floodplain crossings; therefore, the road would be elevated on a bridge.

Depending on the length of the creek crossing, the creek flows, and whether the crossing is also within the floodplain, the road would either be elevated on a bridge or the creek would be culverted under the road. BMPs would be incorporated into the road crossing design such that stormwater runoff would not discharge directly into the creek. Discharge from the roadway surface would be collected and conveyed to a location outside of the ordinary high water. The creek crossing would be designed and constructed to minimize potential impacts to water quality.

Amount of Watershed Downstream of Crossing. The Central Segment of Alternative 4 crosses Curry Creek in the lower portion of the watershed. Approximately 14 percent of the watershed is below these stream crossings (see Table 5-3).

Within the Pleasant Grove Creek watershed, this segment crosses the main stem of Pleasant Grove Creek and its northern tributary within the lower portion of the watershed. The estimated total drainage area of Pleasant Grove Creek above the proposed Parkway crossing is approximately 30 square miles. The estimated drainage

area for the northern tributary to Pleasant Grove Creek above the Parkway crossing is approximately 5 square miles. Approximately 24 percent of the watershed is below these stream crossings (see Table 5-3).

Amount of Wetlands and Vernal Pool Complex Areas Crossed. This segment crosses approximately 8 acres of wetlands and approximately 3.7 acres of vernal pool complex area (see Figure 5-2).

Depending on the alignment of the roadway within the corridor, it may be possible to avoid most of the wetlands and vernal pool complex areas. Similar to the Central Segment for Alternative 3, the corridor runs near, but not adjacent to, a vernal pool complex for approximately 6,000 feet within the Curry Creek watershed. Along this along this portion of the corridor, the proposed road would be upstream of the vernal pool complex and Curry Creek. Therefore, special considerations with respect to selection and siting of BMPs may be required to ensure that the vernal pool complex area is not adversely affected.

Canal Crossings. This segment does not cross any existing canals. Therefore, there would be no potential impacts to canals.

5.5.3 Alternative 4 – Eastern Segment

The Eastern Segment of Alternative 4 is the same as for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.6 ALTERNATIVE 5 – THE GREEN ALTERNATIVE

5.6.1 Alternative 5 – Western Segment

The Western Segment of Alternative 5 is the same as for Alternative 4. Therefore, the potential impacts for this segment are the same as discussed for Alternative 4.

5.6.2 Alternative 5 – Central Segment

The Central Segment of Alternative 5 traverses two watersheds: Curry Creek and Pleasant Grove Creek. The total length of this segment is approximately 30,500 feet along the centerline of the corridor. Approximately 11,000 feet of the corridor is within Sutter County, with the remainder in Placer County. No interchanges are proposed along this segment.

Amount of Impervious Area. The estimated amount of impervious area associated with this segment is 78 acres. Approximately 60 and 19 acres are within the Curry Creek and Pleasant Grove Creek watersheds, respectively.

The total width of the proposed Parkway corridor is approximately 1,000 feet in the Central Segment. Accounting for the six travel lanes and the Parkway's shoulders leaves approximately 888 feet of unpaved area where BMPs, such as detention basins and swales, could be located either within the median or between the proposed shoulders and the corridor edge.

Stream Crossings. Three stream crossings are within this segment: one on Curry Creek and two on Pleasant Grove Creek. The Curry Creek and Pleasant Grove Creek crossings coincide with floodplain crossings; therefore, the road would be elevated on a bridge.

Depending on the length of the creek crossing, the creek flows, and whether the crossing is also within the floodplain, the road would either be elevated on a bridge or the creek would be placed in a culvert under the road. BMPs would be incorporated into the road crossing design such that stormwater runoff would not discharge directly into the creek. Discharge from the roadway surface would be collected and

conveyed to a location outside of the ordinary high water. The creek crossing would be designed and constructed to minimize potential impacts to water quality.

Amount of Watershed Downstream of Crossing. The Central Segment of Alternative 5 crosses Curry Creek in the lower portion of the watershed. Approximately 14 percent of the watershed is below these stream crossings (see Table 5-3).

Within the Pleasant Grove Creek watershed, this segment crosses the main stem of Pleasant Grove Creek and its northern tributary within the lower portion of the watershed. The estimated total drainage area of Pleasant Grove Creek above the proposed Parkway crossing is approximately 30 square miles. The estimated drainage area for the northern tributary to Pleasant Grove Creek above the Parkway crossing is approximately 5 square miles. Approximately 24 percent of the watershed is below these stream crossings (see Table 5-3).

Amount of Wetlands and Vernal Pool Complex Areas Crossed. This segment crosses approximately 7.7 acres of wetlands and approximately 21 acres of vernal pool complex area (see Figure 5-2).

A section of the corridor (less than approximately 1,000 feet) runs through a vernal pool complex area within the Curry Creek watershed. Special considerations with respect to selection and siting of BMPs may therefore be required to ensure that the vernal pool complex area is not adversely affected by stormwater runoff from the Parkway.

Canal Crossings. This segment does not cross any existing canals. Therefore, there would be no potential impacts to canals.

5.6.3 Alternative 5 – Eastern Segment

The Eastern Segment of Alternative 5 is the same as for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

5.7 COMPARISON OF ALTERNATIVES

The five alternatives are summarized and ranked in Table 5-4. The No-Build Alternative is not shown on Table 5-4 because no impacts would be associated with this alternative.

Alternative 1 would be the longest route and would have the largest increase in impervious area, while Alternative 5 would be the shortest route and have the least amount of impervious area. The difference between these two alternatives is 123 acres, which is approximately 20 percent. Increased roadway surface increases the volume of runoff, and therefore Alternative 1 would have a greater potential impact to water quality. Three of the alternatives (Alternatives 1, 2, and 3) would have six interchanges, while the other two (Alternatives 4 and 5) would have five. The amount of impervious area associated with the interchanges is included in the amount of impervious area for each alternative.

Alternative 3 has the fewest stream crossings, while Alternative 1 has the most. Alternative 1 crosses Steelhead Creek longitudinally for approximately 7,000 feet; this may require relocation of the creek, or realignment of the corridor. Alternatives 4 and 5 cross Curry Creek lower in the watershed than do Alternatives 1, 2, and 3; therefore, these alternatives would have less potential impacts to the water quality of Curry Creek (i.e., less of Curry Creek would be affected by the project). In addition, Alternatives 4 and 5 avoid Steelhead Creek and thus potentially affect one less watershed and stream than do Alternatives 1, 2, and 3.

Table 5-4
Summary of Alternative Ranking: Water Quality

Alternative	Total Length		Impervious Area		Stream Crossings		Canal Crossings		Watersheds	
	Feet	Rank	Acres	Rank	Number	Rank	Number	Rank	Number	Rank
1	85,500	5	745	5	15	4	1	0	5	2
2	81,300	3	737	3	11	3	1	0	5	2
3	82,400	4	740	4	10	2	1	0	5	2
4	75,500	2	624	2	9	1	1	0	4	1
5	75,000	1	622	1	9	1	1	0	4	1

Alternative	Wetlands Crossed		Vernal Pool Complex Areas Crossed		Number of Interchanges		Amount of Curry Creek Watershed Downstream of Crossing	
	Acres	Rank	Acres	Rank	Number	Rank	Percentage	Rank
1	35.8	5	123	2	6	2	63	4
2	30.9	2	124	3	6	2	52	3
3	32	4	127	4	6	2	26	2
4	28.3	3	107	1	5	1	14	1
5	28	1	124	3	5	1	14	1

Note:
Rankings range from least impact per category (1) to most impact per category (5).

The corridor associated with Alternative 1 traverses the largest amount of wetlands; Alternative 3 traverses the largest amount of vernal pool complex areas. Alternative 5 would cross through the smallest amount of wetlands area and Alternative 4 would traverse the smallest amount of vernal pool complexes. Although they would not cross through a large venal pool complex area, Alternatives 3 and 4 would run nearby and upstream of approximately 6,000 feet of vernal pool complex area.

Therefore, from a water quality perspective, Alternative 1 would represent the corridor with the highest potential to impact water quality and Alternative 5 would represent the corridor with the least potential. However, all alternatives would be designed and constructed with appropriate mitigation to avoid any significant impacts to water quality.

6.0 SECONDARY AND INDIRECT IMPACTS

Recent FHWA, EPA, and Caltrans guidance on growth inducement (Mare Island Accord, 2006) advises that analysis of potential impacts associated with growth should include an evaluation of the effects of growth on resources of concern. The following discussion presents a qualitative evaluation of potential secondary and indirect impacts of Anticipated Growth (see below for definition) on human and environmental resources in the study area.

The Council on Environmental Quality (CEQ) provided clarification of the terminology "indirect impacts" when it issued the National Environmental Policy Act (NEPA) regulation in 1978. Secondary and Indirect impacts are defined as impacts "caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable." Moreover, indirect effects "may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems."

A key term used in this section is "Anticipated Growth." This is defined as the growth that is anticipated in the study area as described in the relevant General Plans and adopted regional forecasts, such as the SACOG Blueprint scenario (as detailed in other sections of this Community Impact Assessment), including additional growth that may occur as a result of major new development proposals that have not yet been formally approved. It is possible that this additional growth may accelerate the rate of buildout in the study area, but it is not ultimately expected to result in any greater levels of development than is presented in adopted regional forecasts.

The following discussion considers secondary and indirect impacts on water quality that may occur as a result of direct impacts associated with the Parkway, and also as a result of anticipated growth. The study area for the analysis of secondary and indirect impacts is shown on Figure 6-1.

6.1 GROWTH INDUCEMENT SCENARIO

NEPA and CEQA both require environmental analyses to consider the effects of a project on growth. Caltrans defines growth inducement as the relationship between a proposed project and growth. This section summarizes the relationship between the Parkway and regional growth, and discusses potential secondary and indirect effects of the project related to growth inducement.

Placer Parkway would be growth inducing, as a component of the rapidly evolving urban matrix in western Placer County. While the project study area is predominately undeveloped at this time, parts of the study area are within local General Plan designations allowing urban growth. In addition, numerous proposals for major new development projects in and around the study area depicted on Figure 6-2 that are currently in various stages of the approval and entitlement process. Portions of the surrounding area (especially northern Sacramento County and southwestern Placer County) have developed very rapidly over the past several decades. This has occurred as a result of many factors, including continuing net population growth statewide, strong employment growth in the Sacramento region, relative housing affordability, and location amenities.

Population and employment growth projections for California and the Sacramento Region in general, and for southwestern Placer County and south Sutter County in particular (described in detail in the Tier 1 EIS/EIR Community Impact Assessment), indicate that that development pressures in the project vicinity will remain relatively intense, irrespective of the Parkway. Between 1950 and 2000, the California population more than tripled. During the same period, population in the six-county SACOG region increased by more than 800 percent (DOF, 2006). Projections and established goals and policies from a wide range of sources, including SACOG, Placer, Sacramento and Sutter counties, and the Cities of

Roseville, Rocklin and Lincoln, confirm that relatively high rates of population and employment growth and housing and commercial development are anticipated in the six-county region by 2050. Between 2000 and 2050, California's population is expected to increase from approximately 34 million to 55 million. During the same time period, SACOG projects that the region's growth will double, from 1.9 million in 2000 to 3.95 million in 2050, with the Roseville-Rocklin-Lincoln area remaining one of the fastest growing areas in the region (Levy and Doche-Boulos, 2005; SACOG, 2006).

Placer Parkway would be growth inducing because it would help support changes in the amount of growth beyond current general plan levels, and could influence the pace and location of some development. It is likely that Placer Parkway could help to implement the various specific development proposals in the study area, since it would serve to relieve traffic congestion associated with these proposals. Furthermore, the Parkway could affect the timing of development in the vicinity of the proposed interchange locations, particularly those proposed near vacant land adjacent to rapidly developing areas or areas now proposed for urban development. However, as the Parkway would be a limited-access road located in an area that is already undergoing extensive and rapid urbanization, its potential to facilitate growth that would not have otherwise occurred is limited. It could result in different land uses, or more intensive land uses, in the vicinity of interchanges where land use plans are still being developed and have not yet been approved. Also, it could hasten the buildout of planned commercial and industrial uses, especially in the Sunset Industrial Area and proposed Placer Ranch Specific Plan area, as well as in the proposed Sutter Pointe Specific Plan area.

In the longer term, improved access provided to lands in the Western and Eastern segments could be a factor in stimulating additional growth and development in areas west of SR 70/99 not protected by the Natomas Basin HCP, or north of the Sutter Pointe Specific Plan area, or north of Sunset Boulevard West in Placer County. Although growth is anticipated in these areas over time (as reflected in SACOG's preferred Blueprint scenario, the Sutter County General Plan, and the City of Lincoln General Plan), such development is not reflected in general plans at present and has not been formally proposed by landowners. By providing improved access to adjacent areas, Placer Parkway could be one of many factors that would encourage growth in these areas sooner than this might otherwise occur.

The factors influencing growth in the region are complex. Placer Parkway is one of several major urban development proposals in the region. While the Parkway would contribute to regional growth, including growth beyond the level identified in current general plans, it is not feasible to quantify the amount of its contribution. A single new transportation facility such as the Parkway is only one of the many factors contributing to regional growth, and it is speculative to assign a particular quantity of growth to any one factor.

Furthermore, several factors serve to limit the likely effect of the Parkway on growth, including the following:

- No interchanges are proposed for any areas that are not already approved or proposed for development;
- All approved and proposed residential development that has not already been built is projected to be built out prior to 2020, when the Parkway is proposed to open; and
- Real estate market pressures in the area have been and continue to be intense without the Parkway, and local government jurisdictions have been supportive of processing development applications in spite of anticipated regional transportation challenges.

It is unlikely that the choice of one Placer Parkway alternative over another would substantially change expected patterns of growth and development in the project study area and the surrounding region. In the Western Segment, all corridor alignment alternatives would provide new access to an area that is

currently undeveloped farmland, but that is proposed for mixed use urban development. The three more southerly alignments (Alternatives 1, 2, and 3) would provide two interchanges in the Sutter Pointe Specific Plan area, while the more northerly alignments (Alternatives 4 and 5) would provide only one interchange in this area, approximately one mile farther north of the more southerly alignments in the Western Segment. Since none of the alternative alignments would include any intersections in the Central Segment, there would be little difference in growth inducement effects among the alternatives in this segment. In the Eastern Segment, two interchanges are proposed within the existing Sunset Industrial Area Plan, in an area proposed for the Placer Ranch Specific Plan. While these interchanges would provide new access to a currently undeveloped area, this area is planned for growth. In the Eastern Segment all alternatives would follow an identical alignment, so there would be no differences in growth inducement effects among the alternatives.

A future connection at Watt Avenue could be growth inducing, because it would provide major new regional access to a portion of the project study area that is currently rural and undeveloped, although both conceptual interchange locations are now surrounded by formal development proposals or land controlled by development interests. A Watt Avenue connection is not proposed as part of the Placer Parkway project.

6.2 SECONDARY AND INDIRECT EFFECT EVALUATION

6.2.1 No-Build Alternative

Under the No-Build Alternative, land for the Parkway would not be acquired and the Parkway would not be constructed. There would not be any secondary or indirect impacts on water quality under the No-Build Alternative.

6.2.2 Build Alternatives

Secondary and indirect impacts on water quality could occur as a result of anticipated growth and also as a result of direct impacts associated with the Parkway.

Anticipated growth would result in the creation of additional impervious surfaces and increased run-off in the study area that would most likely not have occurred in the absence of such growth. This would have adverse impacts on surface water quality in the study area. These impacts would be direct impacts of other projects not associated with Placer Parkway, and would be required to be analyzed as part of independent environmental review. Although it is not feasible to perform a detailed evaluation of these projects at this stage as specific design details are not known, potential impacts are taken into account in the Placer Parkway 2040 Cumulative analysis (see Section 7.2). This analysis evaluates a 2040 cumulative scenario, which is considered to be an appropriate projection of future development. This scenario includes full-residential build-out in Placer County west of Sierra College Boulevard, including general plan areas and major developments, and employment and population growth in line with SACOG forecasts. It assumes levels of growth and development will occur at the higher end of a potential feasible range and therefore represents a reasonable maximum development scenario for which cumulative and secondary and indirect impacts have been analyzed.

Although it is not possible to predict with any certainty where increased run-off will occur, it is reasonable to assume that secondary and indirect impacts associated with reduction in pervious land cover and increased run-off, either from the construction of the Parkway or as a result of growth induced by the Parkway, could adversely affect water quality. This could occur in a number of ways:

- Increased non-point source water pollution of surface water bodies through increased run-off from new developments;

- Impacts on aquatic flora and fauna as a result of degraded water quality and increased sedimentation; or
- Additional contamination of surface water bodies associated with new stream crossings required by new developments.

Secondary and indirect impacts are required to be mitigated through the NPDES Phase II General Permit for the Discharge of Stormwater.

7.0 CUMULATIVE IMPACTS

7.1 CUMULATIVE IMPACT SCENARIO

Analysis of cumulative impacts is required under the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). Cumulative impacts result when the effects of an action are added to or interact with other effects in a particular place and within a particular time. It is the combination of these effects, and any resulting environmental degradation, that are the focus of cumulative impact analysis. The CEQ's regulations (CEQ, 1987) explicitly state that cumulative impacts must be evaluated along with the direct and indirect effects of each alternative.

CEQA defines cumulative impacts as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts" (CEQA Guidelines, §15355). Stated another way, "a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the environmental document together with other projects causing related impacts" (CEQA Guidelines, §15130). Although a project may cause an individually limited or individually minor incremental impact that, by itself, is not significant, the increment may be "cumulatively considerable" and thus significant.

FHWA has requested that cumulative conditions for the analysis of project alternatives in the Tier 1 EIS/EIR for Placer Parkway be based on development levels that are 20 years beyond the projected opening of Placer Parkway. For planning purposes, Placer County Transportation Planning Agency (PCTPA) has identified 2020 as the opening year of the Parkway. Cumulative impacts are therefore being evaluated for the year 2040. This 2040 scenario includes the following projects (see Figure 6-2):

- Full build-out of all residential land in Placer County west of Sierra College Boulevard, including current general plan areas and the following major development proposals in West Placer County:
  - The Creekview and Sierra Vista Specific Plan areas in Roseville's Memorandum of Understanding (MOU) Remainder Area
  - The Sphere of Influence (SOI) expansion areas of Lincoln
  - The Placer Vineyards, Regional University and Community, and Placer Ranch Specific Plans in unincorporated Placer County
  - The Curry Creek Community Plan area
- Growth in retail employment in Placer County that balances the growth in residential development by matching SACOG's countywide estimate of about 0.32 employee per dwelling unit from their 2025 forecasts.
- Growth in total employment levels in Placer County that balances the growth in residential development by matching SACOG's 1.3 employees per dwelling unit from their 2025 forecasts.
- Full build-out of the residential development in the proposed Sutter Pointe Specific Plan area along with a non-residential development level that balances the residential development in that area.

- Estimated 2040 developments in all other portions of SACOG's six-county region based on assuming a constant rate for the development growth between 2005 levels and the 2050 Preferred Blueprint scenario for each of SACOG's traffic analysis zones (TAZs).

7.2 CUMULATIVE IMPACTS EVALUATION

The cumulative development scenario would result in development of a large portion of the study area and adjacent areas. This would result in an increase in impervious services and loss of water features such as streams, wetlands and vernal pools. The combined effects of increased areas of impervious surfaces associated with multiple projects, with the potential for the paved roadway surfaces to carry increased runoff from the roadway to the study area streams, could exacerbate adverse water quality impacts associated with individual projects through a corresponding increase in the volume and rate of runoff due to reduced percolation of surface water. Additionally, construction in, across, and/or over streams, wetlands and vernal pools, and canals has the potential to degrade water quality. The potential adverse impacts on water quality associated with this development would contribute to cumulative impacts to water quality in the study area.

Impacts associated with Placer Parkway include an increase in impervious area potentially resulting in increased peak flows and runoff volumes. The amount of impervious area associated with Placer Parkway would be roughly one square mile (ranging from approximately 0.98 square mile for Alternative 5 to approximately 1.2 square miles for Alternative 1). While this is a very small amount compared to the total area of the watersheds and the project's contribution to peak flows and volumes in the creeks would be expected to be small, when combined with potential upstream flow increases, the cumulative impacts on water quality could still be significant.

Mitigation strategies have been identified to reduce these impacts to less-than-significant levels. These include compliance with NPDES requirements during project construction and operations that require projects to develop and implement a Stormwater Pollution Prevention Plan; BMPs to prevent erosion, control runoff, reduce roadway and vehicle pollutants from entering watercourses; and prevent pollutants from being discharged off site. Other strategies include avoiding impacts by design (i.e., strategies to limit impacts from construction activities, and site planning and design features to avoid impacts) and implementation of Best Management Practices. Also, the requirements of the Pleasant Grove Creek/Curry Creek Watershed Management Groups and the Natomas Basin Habitat Conservation Plan would be identified and addressed in Tier 2.

In addition, Sutter County and Placer County General Plan policies and programs are intended to offset the potential direct and cumulative water quality problems that may arise from development. New developments are required to detain onsite drainage such that the rate of runoff is maintained at pre-development levels. Because peak runoff rates from new development would be maintained at pre-development levels, increase in channel erosion and sedimentation are not expected to occur. Given this regulatory environment, the relatively minor amount of impervious surface associated with Placer Parkway in comparison to the overall cumulative development scenario, and with development of the mitigation strategies identified in this report into enforceable mitigation measures, Placer Parkway's incremental contribution to cumulative impacts related to water quality would not be cumulatively considerable. Therefore, Placer Parkway's cumulative impacts associated with water quality would be less than significant.

The Sutter County and Placer County General Plan policies and programs are intended to offset the potential direct and cumulative flooding and water quality problems that may arise from development. New developments are required to detain onsite drainage such that the rate of runoff is maintained at pre-development levels. Because peak runoff rates from new development would be maintained at pre-

development levels, there would be no increases in peak flows. Both Sutter and Placer counties have ordinances that limit construction in floodplains, Given the specific policy directives of the General Plans, the project would have less than cumulatively considerable contributions to peak flows and floodplains. Although the amount of impervious area associated with the proposed Parkway would be approximately 1 square mile (ranging from approximately 0.98 square mile for Alternative 5 to approximately 1.2 square mile for Alternative 1), this is a very small portion of the total area of watershed and the project's contribution to peak flows and volumes in the creeks would be expected to be small and not cumulatively significant.

Construction activities must be performed in accordance with the NPDES General Permit for Construction Activities. New developments are required to detain onsite drainage such that the rate of runoff is maintained at pre-development levels. Assuming that the specific policy directives of the Community Plan are implemented, cumulative impacts related to water quality are not expected to occur.

8.0 WATT AVENUE INTERCHANGE

As shown on Figure 2-3, two general locations are proposed for the Watt Avenue interchange. Because the configuration of the interchanges would not likely change by location, the increase in impervious surface would be similar for all locations. The estimated amount of additional impervious area associated with the interchanges is approximately 65 acres. The first location for the interchange, associated only with Alternative 1 (Option One), would be located near and potentially cross Curry Creek. The other Watt Avenue interchange locations, which are associated with Alternative 1 (Option Two) and Alternatives 2 through 5, would be placed outside of the Pleasant Grove Creek floodplain limits and would not cross the creek; therefore, the potential impacts to water quality would be less for these options.

9.0 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION STRATEGIES

Table 9-1 summarizes the mitigation strategies to be considered for the project. Local, state, and federal agencies require the development of practical mitigation measures in response to the impacts of construction activities and ongoing project operations that discharge sediment and other undesirable elements to existing waterways. The measures considered for Placer Parkway have been categorized as standard conditions (SCs) and project design features (PDFs). SCs include the regulatory requirements dictated by local, state and/or federal mandates. These include the required compliance with NPDES permit requirements, as well as county ordinances (e.g., erosion and grading ordinance). PDFs include measures that can be incorporated into the design of the project to avoid, minimize, or reduce potential environmental impacts.

Table 9-1
Potential Mitigation Measures to be Considered in Tier 2
for Impacts to Surface Water Hydrology and Floodplains

Category	Measure
SC	• Meet Sutter County, Placer County, and RD 1000 requirements for siting and design of facilities • Comply with the water quality objectives of the Basin Plan through compliance with the NPDES Phase II General Permit and/or Caltrans NPDES Permit for the Discharge of Stormwater • Comply with the NPDES General Construction Activity Stormwater Permit; includes preparation and implementation of an SWPPP • Comply with the applicable county ordinances that require Erosion and Grading Plans • Comply with the applicable Caltrans and county NPDES Stormwater Permits; includes preparation and implementation of a WQMP
PDF	• Limit disturbance during construction to minimize impacts • Locate the alternative to avoid or minimize impacts to streams and ecologically sensitive areas (e.g., wetlands and vernal pool complex areas) • Design features to avoid impacts to water quality • Incorporate appropriate BMPs (e.g., provide appropriate detention and use vegetation to provide opportunities for particulate and pollutant settlement)

Notes:

BMP = Best Management Practice
MM = mitigation measure
PDF = project design feature
SC = standard condition
WQMP = Water Quality Management Plan

Based on identified impacts described above, the following key strategies for mitigation have been preliminarily identified and are discussed in further detail:

- Comply with NPDES requirements (construction and operations);
- Avoidance by design (Caltrans design guidance, consider future development in design);
- Implement Caltrans/Placer County/Sutter County BMPs;
- Identify and address, as needed, requirements of Pleasant Grove Creek/Curry Creek Watershed Management Groups; and

- Identify and address, as needed, Natomas Basin Habitat Conservation Plan requirements.

9.1 COMPLY WITH NPDES REQUIREMENTS (CONSTRUCTION AND OPERATIONS)

9.1.1 NPDES Requirements for Construction Activities

The General Permit authorizes a general permit for stormwater discharges associated with construction activities that disturb one or more acre of land. The General Permit requires submittal of an NOI to comply with the permit and the development of an SWPPP for construction activities. The SWPPP must describe BMPs, including erosion controls, sediment controls, and other controls to prevent stormwater from affecting offsite surface water bodies. The SWPPP must also include a stormwater monitoring program.

Each county has and enforces a Stormwater Ordinance and a Land Grading and Erosion Control Ordinance. These ordinances require construction sites to obtain a grading permit and implement erosion and sediment control measures to prevent adverse water quality and sedimentation impacts to existing drainage systems.

If the project involves discharge or places fill material into navigable water or wetlands, an application for a Section 404 permit must be submitted to the USCOE. This permit is required to ensure that discharge will not violate water quality standards.

If the project requires realignment of streams, which may include installation of culverts in streams, a Streambed Alteration agreement must be obtained from CDFG.

In the event that during detailed design, the need arises for dewatering during construction, the project would need to file an application for the Dewatering and Low Threat Discharges to Surface Waters Permit, Order No. 5-00-175 (NPDES CAG995001).

9.1.2 NPDES Requirements for Operations

As a major transportation project, the project must comply with the Caltrans statewide NPDES permit (SWRCB, 1999) and its Stormwater Management Plan (Caltrans, 2003b).

Pursuant to the Phase II NPDES General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems, the project also must incorporate long-term post-construction BMPs and monitoring to protect water quality and control runoff. Projects in Placer County must currently comply with these requirements. The portion of the study area within Sutter County is currently exempt from these requirements, but as development in the area progresses, would be expected to comply as well. Placer County is currently working with Sacramento County to prepare new water quality standards and a design manual for new projects in the Sacramento County and South Placer County regions. The design manual will provided guidance for selecting, designing, installing, and maintaining post-construction stormwater quality control measures. The new standards and guidelines would apply to roads that consist of 5 or more acres of impervious surface. To comply with federal and state CWA requirements, local agencies may be required to adhere to Low Impact Development (LID) principles in order to protect water quality in the interest of fish and wildlife. LID strategies that integrate BMPs to protect water quality may also reduce runoff quantity.

9.2 AVOIDANCE BY DESIGN

Design guidance can be found in various Caltrans documents, in particular the Project Planning and Design Guidelines (Caltrans, 2003a). To reduce the environmental impacts of highways and bridges on water quality, the following construction, site planning, and design practices should be considered.

Limit Impacts from Construction Activities

- Limit temporary disturbance to minimum areas necessary for construction;
- Restore disturbed areas to pre-project conditions;
- Stabilize disturbed soil areas to prevent erosion after construction; and
- Limit construction activities in or near creeks, including limiting amount of fill placed in creeks, wetlands or vernal pool complex areas.

Site Planning to Avoid Impacts

- Avoid or minimize stream crossings if possible;
- Align roadway within the corridor to decrease impervious cover by reducing the area of pavement or number of road miles, if possible;
- Provide sufficient setback distances in accordance with Caltrans and County requirements between the highway right-of-way and wetlands or riparian areas;
- Locate highways and bridges away from sensitive areas and establish buffer zones where possible; and
- Locate the alternative as low in the watershed as possible, to minimize the area affected.

Design Project Features to Avoid Impacts

- Design project features (e.g., culverts, drainage systems, and bridges) to avoid increasing flow velocities that may cause or contribute to downstream erosion and consider Low Impact Development (LID) principles where appropriate;
- Design project features to avoid direct discharge of roadway runoff that may contain pollutants into streams and other sensitive sites (e.g., wetlands and vernal pool complex areas);
- Disconnect and infiltrate runoff using structural runoff controls, such as vegetated swales; and
- Incorporate appropriate BMPs; e.g., provide appropriate detention and use vegetation to provide opportunities for particulate and pollutant settlement (see Section 9.3).

Additional guidance on these measures can be found in Caltrans' Stormwater Quality Handbook (Caltrans, 2003a), U.S. EPA's National Management Measures to Control Nonpoint Source Pollution from Urban Areas (U.S. EPA, 2005), and other similar publications.

9.3 IMPLEMENT BMPs

The Caltrans Project Planning and Design Guidelines (Caltrans, 2003a) Statewide Stormwater Management Plan (Caltrans, 2003b), and other Caltrans reference documents identify permanent and temporary BMPs that have been approved for statewide application. The BMPs fall into four categories: (1) design pollution prevention BMPs, (2) treatment BMPs, (3) construction site BMPs, and (4) maintenance BMPs. These BMPs must be considered during the planning and design process.

Permanent BMPs include both design pollution prevention and treatment BMPs. Design pollution prevention BMPs are permanent measures to improve stormwater quality (e.g., reduce erosion, manage

non-stormwater discharges, etc.) after construction is completed. These BMPs that should be considered for incorporation, as appropriate, into the design of Placer Parkway are listed below.

Consideration of Downstream Effects Related to Potentially Increased Flow

- Incorporate BMPs that address the first flush. Studies (Stenstrom and Kayhanian, 2005) have shown that BMPs are generally more effective in treating higher concentrations than lower concentrations. Therefore, selecting and applying BMPs to the first runoff, when concentrations are higher, will be a more effective strategy for two reasons: (1) more contaminated runoff is being treated and (2) the BMPs are likely to have higher removal efficiencies;
- Direct runoff from bridges to an onshore treatment system. Runoff can be conveyed via scupper drains and collection pipes or gutters onto the shore, from which it would be sent to a retention pond or other runoff treatment feature. The topography and approach slope at some bridge locations might preclude design of gravity flow collection and conveyance systems;
- Incorporate BMPs that will settle out particulates. Studies by Caltrans (e.g., Caltrans, 2003c) have found that the majority of the metals present in runoff are found in the particulate form; and
- Incorporate BMPs that will prevent downstream erosion.

Preservation of Existing Vegetation

- Existing vegetation should be preserved to the extent practical.

Concentrated Flow Conveyance Systems

- Incorporate features to eliminate or reduce concentration of discharge and thereby reduce erosion. Features could include ditches, berms, dikes and swales; overside drains; flared culvert end sections; and outlet protection/velocity dissipation devices.

Slope/Surface Protection Systems

- Incorporate vegetated surfaces and/or provide pavement to eliminate potential for erosion. The use of vegetation to cover soil areas should be maximized since vegetated surfaces prevent erosion, promote infiltration (which reduces runoff), and remove pollutants from stormwater.

Types of treatment BMPs that could be used to reduce the discharge of specific pollutants that may be associated with the project are summarized in Table 9-2.

9.4 IDENTIFY AND ADDRESS, AS NEEDED, PLEASANT GROVE CREEK/CURRY CREEK WATERSHED MANAGEMENT GROUPS' REQUIREMENTS

The Pleasant Grove/Curry Creek Ecosystem Restoration Plan (ERP) (Foothill Associates, 2005) addresses resource management and land use in the Pleasant Grove and Curry Creek watersheds and is intended to guide future planning, restoration, and land use management activities in the watersheds. Objectives from the ERP that may be relevant and should be considered during planning, design, and construction of Placer Parkway include the following:

Objective 3.1 Implement a regular program of water quality monitoring to characterize ambient conditions and to identify both the source (point and non-point) and constituent of discharges into surface waters.

Table 9-2
Pollutants of Concern and Applicable Treatment BMPs

Pollutant	Biofiltration Systems	Infiltration Basin	Detention Devices	Dry Weather Flow Diversions	Coarse Solids Removal Devices	Traction Sand Traps
Total Suspended Solids	✔	✔	✔	✔		✔
Nutrients		✔		✔		
Pesticides		✔		✔		
Particulate Metals	✔	✔	✔	✔		
Dissolved Metals		✔		✔		
Pathogens		✔		✔		
Litter	✔	✔	✔	✔	✔	
Biochemical Oxygen Demand		✔		✔		
Total Dissolved Solids		✔		✔		
Source: Caltrans, 2002.						

Objective 5.2 Protect, enhance or recreate natural riparian processes, particularly hydrology and associated high water events, to promote the natural cycle of channel movement and sediment deposition that create a mosaic of riparian vegetation types.

Objective 6.3 Integrate meaningful ecosystem protection and restoration opportunities with the development review and approval process to encourage low impact development and transportation planning.

Objective 6.4 Provide adequate enforcement of stormwater and other water quality regulations to protect any sensitive surrounding habitats from adverse impacts.

Objective 8.1 Control discharges into and human activities adjacent to the creeks to prevent unhealthy levels of anthropogenic bacteria.

Objective 8.2 Implement measures to prevent discharge of urban runoff containing contaminants (e.g., herbicides/pesticides, nutrients, and hydrocarbons) from existing and new development and roads.

Objective 8.3 Prevent excess sediment by controlling upland and channel erosion associated with increased runoff due to development of loss of stabilizing vegetation.

9.5 IDENTIFY AND ADDRESS, AS NEEDED, NATOMAS BASIN HABITAT CONSERVATION PLAN'S REQUIREMENTS

The purpose of the Natomas Basin Habitat Conservation Plan (NBHCP) (City of Sacramento et al., 2003) is to promote biological conservation in conjunction with economic and urban development within the basin. The goal of the NBHCP is to preserve, restore, and enhance habitat values while allowing urban development to proceed according to local land use plans. The NBHCP provides requirements regarding buffers between development and specific resource areas (e.g., garter snake habitat, wetlands, etc.),

grading and construction activity restrictions, management of vegetation control along ditches and canals, and application of herbicides and pesticides. Because pollutants such as petroleum compounds in urban runoff have been observed to have adverse effects on the giant garter snake and its food supply, stormwater runoff from the Parkway should not be discharged directly into habitat areas.

10.0 ANALYSES TO BE UNDERTAKEN IN TIER 2

The following technical studies will need to be completed as part of Tier 2.

- Prepare Stormwater Data Report (SWDR) that summarizes the stormwater quality issues of the project. Guidelines for the SWDR and its accompanying checklists are provided in Caltrans' Project Planning and Design Guide (Caltrans, 2002). For Tier 2, the SWDR and the checklists will be preliminary, since not all information will be available. The SWDR is updated as the project proceeds. The SWDR summarizes the information from the following checklists:

    1. Checklist SW-1 – Site Data Resources. This checklist includes the following categories for data collection: topographic, hydraulic, soils, climatic, and water quality.

    2. Checklist SW-2 – Stormwater Quality Issues Summary. This checklist includes existing background information on water quality and potential sensitive receiving waters or valuable habitats.

    3. Checklist SW-3 – Measures for Avoiding or Reducing Potential Stormwater Impacts. This checklist provides direction to the project designer on measures that should be considered to avoid or reduce potential stormwater impacts.

- Prepare Stormwater Quality Assessment (SWQA). This identifies applicable stormwater regulations and stormwater impacts to be mitigated. It also identifies the receiving water discharges, and evaluates the potential project-related stormwater impacts on the receiving water quality. Caltrans is preparing detailed information regarding the preparation of the SWQA; these guidelines will be available in the SWQA Guidance Document, Volume 5 of the Caltrans Standard Environmental Reference (web site http://www.dot.ca.gov/ser).

- Select applicable BMPs to be considered for design based on Caltrans and county guidance and considering needs of the Pleasant Grove/Curry Creek ERP and NBHCP. Guidelines for BMP selection and its accompanying checklists are provided in Caltrans' Project Planning and Design Guide (Caltrans, 2002). For Tier 2, BMP selection will be preliminary, since not all information will be available and will be refined as the project proceeds. BMPs should be selected based on the information presented in the SWDR and SWQA. The analysis should include reviewing and completing the following Caltrans decision trees and checklists:

    1. Design Pollution Prevention Decision Tree DPP-1
    2. Checklist DPP-1, Design Pollution Prevention BMPs
    3. Treatment Decision Tree T-1
    4. Checklist T-1, Treatment BMPs
