AIR QUALITY
TECHNICAL MEMORANDUM
PLACER PARKWAY CORRIDOR PRESERVATION
TIER 1 EIS/PROGRAM EIR

1.0 INTRODUCTION

1.1 TIER 1 EIS/PROGRAM EIR

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

1.2 CORRIDOR SELECTION AND PRESERVATION

The concept for the Placer Parkway is over a decade old. Placer County's 1994 General Plan depicts a "plan line" for it. Two planning studies helped to refine the concept:

- DKS Associates, 2000, Placer Parkway Interconnect Study/Conceptual Plan
- DKS Associates, 2001, Project Study Report (Project Development Support) for Placer Parkway

Placer Parkway is cited as a high-priority regional transportation project by the Sacramento Area Council of Governments (SACOG) 2025 Metropolitan Transportation Plan and the 2027 Placer County Regional Transportation Plan. The project vicinity and surrounding area include some of the fastest growing communities in the Sacramento region. A number of large urban development proposals are being considered by Sutter and Placer counties. New development is expected to add a significant amount of residential, commercial, industrial, and educational uses.

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included representatives from planning and public works departments of all affected cities and counties, environmental, business, agricultural, development, and homeowner interests (the Study Advisory Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report will analyze these five corridor alternatives along with a No-Build Alternative.

Other potential transportation modes such as bus rapid transit may be developed in the corridor in the future, although they are not proposed as part of the current project. The width of the corridor for Placer Parkway is to vary from approximately 500 feet in the Eastern and Western segments to approximately 1,000 feet in the Central Segment. Depending upon the alternative, the corridor's length ranges from a minimum of 14.2 miles to a maximum of 16.2 miles. The selected corridor would contain the roadway, including the median, travel lanes, shoulder, associated access ramps and a no-development buffer zone.

Corridor acquisition may not be completed until after Tier 2, as funding becomes available. Portions of the selected corridor would be preserved as a no-development buffer zone. The buffer would be maintained as a zone where development is either not permitted or is severely restricted. This is intended to restrict access to the proposed interchanges, protect the rural character of agriculturally designated areas in the vicinity of the Parkway as far as possible subject to future development, and maximize opportunities to incorporate adjacent sensitive areas. It is intended that the buffer would be owned and managed in the future to achieve these objectives. For subsequent Tier 2 (project-level) environmental reviews, the size of this buffer zone could be considered flexible for agriculturally designated land undergoing urban development. In the Tier 2 environmental review, the specific buffer size and location would be determined. This determination would be based on performance standards on a case-by-case basis, depending on the land use needs of future approved development, and taking into account the primary objective of restricting future access to the Parkway.

Project proponents are considering employment of several land management and control mechanisms to ensure that the buffer would be effectively maintained as an area where development would either not be permitted, or where construction of any additional access onto the Parkway would not be allowed. These mechanisms could include land use controls, land purchase/leases, general plan amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, urban growth boundaries, etc. "Layering" or using several of these methods would provide more assurance that the buffers would be permanent, or at least more difficult to undo.

1.3 TECHNICAL MEMORANDUM OBJECTIVE

This Air Quality Technical Memorandum has been prepared to support the Tier 1 Environmental Impact Statement/Program Environmental Impact Report. It presents a Tier 1/Program level assessment of potential impacts related to air quality for five corridor alternatives and the No-Build Alternative as described in Chapter 2.

Prior to preparing the Tier 1/Program air quality analysis, a technical memorandum describing the air quality methodology and approach for the air quality analysis for Placer Parkway Corridor Preservation project and its Tier 1 Environmental Impact Statement/Program Environmental Impact Report was submitted to Caltrans' staff, Mr. Japtej Gill, on January 27, 2006, for approval. The memorandum was approved by Mr. Gill on February 2, 2006 (Gill, 2006). In addition, the evaluation considered guidance from the FHWA Environmental Checklists for Draft and Final Environmental Documents (FHWA, 1998a; FHWA, 1998b).

This report is organized as follows:

Chapter 2: The Proposed Action
Chapter 3: Regulatory Setting
Chapter 4: Affected Environment
Chapter 5: Potential Direct Impacts
Chapter 6: Secondary and Indirect Impacts
Chapter 7: Cumulative Impacts
Chapter 8: Avoidance, Minimization and/or Mitigation Strategies
Chapter 9: Analyses to be Undertaken in Tier 2
Chapter 10: References

This report also includes figures and tables, which show the project location, each build alternative, and pertinent technical information prepared to evaluate the build alternatives.

Throughout this document, the Placer Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

2.0 THE PROPOSED ACTION

The Proposed Action for the Placer Parkway Corridor Preservation Project is to select and preserve a 500- to 1,000-foot-wide corridor in the study area, within which the future four- or six-lane Placer Parkway may be constructed. The ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction, and operation of the Parkway. Although the action taken at Tier 1 on the Placer Parkway Corridor Preservation Project is limited, the underlying project whose effects are studied in this document is the Placer Parkway. To the extent feasible at this early stage, the Tier 1 EIS/EIR addresses the potential effects of construction and operation of the future roadway.

2.1 THE PROJECT STUDY AREA

The study area is an area of approximately 33,460 acres located in Sutter and Placer counties, with a small section located in Sacramento County (see Figures 1-1 and 2-1). The portion of the study area in Sacramento County is located in the extreme southwestern corner of the study area and does not include any of the proposed corridor alignment alternatives. The study area extends from SR 70/SR 99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego Roads.

For the purposes of the analysis the study area is divided into three segments:

- Western Segment: the Western Segment extends from SR 70/99 to Pleasant Grove Road in Sutter County.
- Central Segment: the Central Segment extends from Pleasant Grove Road in Sutter County to approximately 2,300 feet north of Pleasant Grove Creek in Placer County.
- Eastern Segment: the Eastern Segment extends from approximately 2,300 feet north of Pleasant Grove Creek to SR 65 in Placer County.

2.2 CORRIDOR ALTERNATIVES

The following subsections describe the corridor alignment alternatives, which are depicted on Figure 2-1, and are numbered according to location from south to north in the study area.

2.2.1 The No-Build Alternative

Under the No-Build Alternative, the project would not be implemented. A Placer Parkway corridor would not be selected/preserved, and the future Placer Parkway would not be constructed.

2.2.2 Alternative 1 – the Red Alternative

Alternative 1 would extend from SR 70/99 approximately ½ mile north of Riego Road, eastward approximately 1 mile north of Baseline Road to approximately Watt Avenue, proceeding north and transitioning in an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment alternative is 16.2 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.3 Alternative 2 – the Orange Alternative

Alternative 2 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed northeast, then in a northerly direction

south of Pleasant Grove Creek, transitioning to an easterly direction before it reaches Sunset Boulevard West, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.4 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.4 Alternative 3 – the Blue Alternative

Alternative 3 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed north along the Sutter/Placer County Line, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.6 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.5 Alternative 4 – the Yellow Alternative

Alternative 4 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.3 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.2.6 Alternative 5 – the Green Alternative

Alternative 5 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 4,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.2 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.3 PARKWAY DESIGN ASSUMPTIONS

Although the Parkway would be designed and construction-level impacts analyzed during Tier 2, for the purpose of this report and the Tier 1 EIS/Program EIR, several assumptions have been made about potential design and configuration concepts. These assumptions would be subject to further development and refinement, and specific decisions about design of the roadway would be made during the Tier 2 process. For example, the number, location, and design of over-crossings would be determined at the time of final Parkway design, in consultation with local jurisdictions. The following sections outline assumptions for the future roadway.

Preliminary costs estimates for the Parkway range from $600 to $650 million (2005 dollars). This includes costs for right-of-way, design, construction and environmental mitigation for the four- to six-lane roadway. The funding situation has spurred interest in exploring other more creative funding options. These include a county-wide sales tax, more developer contributions, and tolling facilities. The Technical Report and Tier 1 EIS/EIR do not make any assumptions about funding sources.

2.3.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally

in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane roadway. A preliminary conceptual cross section (see Figure 2-2) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

2.3.2 Conceptual Roadway Elevation

As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on both sides of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways, or trails.

Throughout the project study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These over-crossings would not connect to the Parkway. Parkway access would be via the interchanges described below.

2.3.3 Interchange Concepts

The analysis assumes that the location of interchanges (see Figure 2-1) is as follows.

- SR 70/99 (at ½ mile north of Riego Road or at Sankey Road)
- One or two locations to be determined in southern Sutter County
- Fiddyment Road
- Foothills Boulevard
- SR 65 at Whitney Ranch Parkway

The following discussion outlines concepts and assumptions for the six interchanges that could potentially serve Placer Parkway.

2.3.3.1 Western Segment

Within the Western Segment of the Parkway, a high-speed, freeway-to-freeway type interchange would connect the Parkway with SR 70/99 at one of following potential locations depending on the project alternative (see Section 2.2). Placer Parkway would terminate at SR 70/99.

- **Placer Parkway/SR 70/99 Interchange at North of Riego Road.** This alternative concept uses "braided" ramps to eliminate weaving problems or conflicts with the future SR 70/99 at Riego Road interchange being developed by Sutter County and Caltrans.

- **Placer Parkway/SR 70/99 Interchange at Sankey Road.** Under this alternative concept, the existing two-lane Sankey Road would be realigned to the south of Placer Parkway and the proposed freeway-to-freeway interchange, extending from approximately ¼ mile west of SR 70/99 to approximately ¼ mile east of the Union Pacific railroad tracks. There would be no direct access to SR 70/99 or Placer Parkway from the realigned Sankey Road.

Depending on the final alignment selected, one or two additional interchanges would also be located in south Sutter County. Conceptual locations are identified for purposes of this Tier 1/Program analysis (see Figure 2-1). The actual location of these interchanges would be developed in the Tier 2 phase, based on Sutter County requirements.

2.3.3.2 Central Segment

Within the Central Segment of the Parkway, there would not be any access proposed as part of the project in the 7-mile segment between Fiddyment Road and Pleasant Grove Road. Please see Section 2.4 regarding a potential connection with a future extension of Watt Avenue (Figure 2-3) which could be proposed and constructed by others in the Central Segment; such an interchange is not part of Placer Parkway.

2.3.3.3 Eastern Segment

Within the Eastern Segment of the Parkway, a signalized high-speed freeway-to-freeway and local access interchange would connect the Parkway to SR 65 at Whitney Ranch Parkway (Figure 2-1). From SR 65 eastward Placer Parkway would terminate and become Whitney Ranch Parkway east of the SR 65 exit ramp intersection. Traffic signals would be provided at the exit ramp terminals. This interchange would be approximately 1 mile north of a planned SR 65/Sunset Boulevard interchange and 1.2 miles south of the existing Twelve Bridges interchange.

As part of this interchange, auxiliary lanes would be required on SR 65 in both directions to enhance traffic operations on the north side of the future SR 65/Sunset Boulevard interchange. The southbound SR 65 exit-ramp at Sunset Boulevard is being designed to accommodate an additional auxiliary lane required for the future Placer Parkway/Whitney Ranch Parkway interchange to minimize the reconstruction of this ramp in the future. Within the Eastern Segment of the Parkway, from SR 65 westward, two interchanges with local roadways would be constructed, one at Foothills Boulevard and one at Fiddyment Road, as depicted on Figure 2-1.

The future interchange on Placer Parkway at Fiddyment Road would be located near the existing intersection of Fiddyment Road and Sunset Boulevard West. To provide acceptable traffic operations, additional distance needs to be provided between the Fiddyment Road/Sunset Boulevard West

intersection and the Fiddyment Road/Placer Parkway westbound off-ramp intersection. Therefore, Sunset Boulevard West will need to be realigned to the north as it nears Fiddyment Road.

2.3.4 Landscaping Concept

For the purposes of this environmental analysis, preliminary landscaping concepts have been developed for Placer Parkway. These are entirely conceptual and would be subject to further refinement during the Tier 2 environmental process. It is anticipated that landscaping would be used to reflect local topography and vistas in the study area and complement the varying character of land adjacent to the Parkway corridor. Landscape design would vary within the Parkway's three segments depending on corridor width and type and density of surrounding land uses. Landscaping would be used within the median and the Parkway buffer zone to enhance the aesthetics of the Parkway, and would be used to provide screening and enhance local and long-distance views. Where appropriate, more concentrated plantings would be considered to buffer the Parkway from future adjacent land uses that may be incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Landscape design would likely include a mix of compatible native and nonnative plants that may require some irrigation. Wherever possible, native plant species would be used in line with Caltrans policy. Where possible and depending on availability, feasibility and cost, recycled water would be used for irrigation.

During a future design phase, lighting elements would be designed for safety and would consider the proposed landscaping plan to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower-voltage lighting, and proposing lighting fixtures that conform with the visual character of the area).

2.4 POTENTIAL WATT AVENUE INTERCHANGE

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 2-3). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/EIR. However, an interchange between Placer Parkway and a potential Watt Avenue extension could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/Program EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges with Placer Parkway.

2.5 AGENCY PERMITS AND APPROVALS

The Proposed Action would preserve a preferred corridor for a future transportation facility. In the future, permits and approvals would be obtained from appropriate agencies prior to construction of the Parkway. These permits and approvals may include specific design or mitigation requirements that would be incorporated into the project.

2.6 SUBSEQUENT TIER 2 INFORMATION

As noted earlier, the design and construction of Placer Parkway—including its interchanges and over-crossings, and ancillary features such as stream crossings, safety devices, stormwater management structures, and similar improvements—would be evaluated in a subsequent Tier 2 environmental review.

3.0 REGULATORY SETTING

3.1 FEDERAL AND STATE AIR QUALITY STANDARDS

Federal and state governments have each established standards for ambient air quality. The U.S. Environmental Protection Agency (U.S. EPA) has established primary and secondary National Ambient Air Quality Standards (NAAQS) that specify allowable ambient concentrations for criteria pollutants under the provisions of the Clean Air Act (CAA). Primary NAAQS are established at levels necessary, with an adequate margin of safety, to protect the public health, including the health of sensitive populations such as asthmatics, children, and the elderly. Similarly, secondary NAAQS specify the levels of air quality determined appropriate to protect the public welfare from any known or anticipated adverse effects associated with air contaminants. Allowable ambient concentrations are set for the following criteria pollutants: ozone (O_3), respirable particulate matter (PM_{10}), fine particulate matter ($PM_{2.5}$), carbon monoxide (CO), nitrogen dioxide (NO_2), lead (Pb), and sulfur dioxide (SO_2). Table 3-1 summarizes the NAAQS for these pollutants. The 8-hour O_3 and $PM_{2.5}$ standards listed in the table were promulgated in 1997, but were challenged in the courts. In 2002, the courts upheld these two standards. The U.S. EPA made final designations for the 8-hour O_3 standards on April 15, 2004, and final designations for the new federal $PM_{2.5}$ standards in December 2004. Currently, the U.S. EPA and the states are working together to develop air quality plans to achieve compliance with these standards, where needed.

The U.S. EPA, under the provisions of the CAA, requires each state with regions that have not attained the NAAQS to prepare a State Implementation Plan (SIP), detailing how these standards are to be met in each local area. The SIP is a legal agreement between each state and the federal government to commit resources to improving air quality. It serves as the template for conducting regional and project-level air quality analysis. The regional analysis is performed by the appropriate Metropolitan Planning Organization (MPO) and the project-level analysis by the project sponsor. The SIP is not a single document, but a compilation of new and previously submitted plans, programs, district rules, state regulations, and federal controls. Areas designated as serious non-attainment are required to achieve attainment by June 15, 2013. The California Air Resources Board (CARB), which is part of the California Environmental Protection Agency, is the lead agency for developing this SIP. Local air districts and other agencies prepare Air Quality Attainment Plans (AQAPs) or Air Quality Management Plans (AQMPs) and submit them to CARB for review and approval.

In 1976, the California Legislature adopted the Lewis Air Quality Management Act, which created Air Quality Management Districts (AQMDs) and Air Pollution Control Districts (APCDs). Though separate from federal actions, the creation of AQMDs/APCDs became an integral part of transportation conformity, which is described below. CARB oversees activities of the APCDs and regional AQMDs. The AQMDs and APCDs promulgate the SIPs for achieving cleaner air quality on a region-by-region basis and provide technical assistance to the MPO and project sponsor for regional and project-level air quality analyses.

The CAA requires that no MPO approve any transportation plan, program, or project that does not conform to a SIP. The concept of transportation conformity was introduced in the CAA of 1977, which included a provision to ensure that transportation investments conform to a state's air quality plan for meeting the federal air quality standards. Conformity requirements were made substantially more rigorous in subsequent CAA amendments (Transportation Conformity: A Basic Guide for State and Local Officials: www.fhwa.dot.gov/ENVIRONMENT/conformity/basic1gd.htm). Revisions in 1990 require that transportation plans, programs, and projects must conform to the purpose of the SIP. This was accomplished by the development of the Transportation Conformity Rule (40 Code of Federal Regulations (CFR) Parts 51 and 93) in 1993. This rule established the criteria and procedures by which the FHWA, the Federal Transit Administration (FTA), and MPO entities determine the conformity of federally funded or approved highway and transit plans, programs, and projects to SIP provisions.

Table 3-1
Federal and State Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[1]		Federal Standards[2]		
		Concentration[3]	Method[4]	Primary[3,5]	Secondary[3,6]	Method[7]
Ozone (O_3)	1 hour	0.09 ppm (180 µg/m^3)	Ultraviolet Photometry	–	Same as Primary Standard	Ultraviolet Photometry
	8 hours	0.070 ppm (137 µg/m^3)		0.08 ppm (157 µg/m^3)[8]		
Respirable Particulate Matter (PM_{10})	24 hour	50 µg/m^3	Gravimetric or Beta Attenuation	150 µg/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m^3		50 µg/m^3 (see footnote #9)		
Fine Particulate Matter ($PM_{2.5}$)	24 hours	No Separate State Standard		65 µg/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m^3	Gravimetric or Beta Attenuation	15 µg/m^3		
Carbon Monoxide (CO)	8 hours	9 ppm (10 mg/m^3)	Non-Dispersive Infrared Photometry (NDIR)	9 ppm (10 mg/m^3)	None	Non-dispersive Infrared Photometry (NDIR)
	1 hour	20 ppm (23 mg/m^3)		35 ppm (40 mg/m^3)		
	8 hours (Lake Tahoe)	6 ppm (7 mg/m^3)		–	–	–
Nitrogen Dioxide (NO_2)	Annual Arithmetic Mean	0.03 ppm (57 µg/m^3)	Gas Phase Chemilumi-nescence	0.053 ppm (100 µg/m^3)	Same as Primary Standard	Gas Phase Chemiluminescence
	1 hour	0.18 ppm (338 µg/m^3)		–		
Lead[10]	30-day Average	1.5 µg/m^3	Atomic Absorption	–	–	–
	Calendar Quarter	–		1.5 µg/m^3	Same as Primary Standard	High Volume Sampler and Atomic Absorption
Sulfur Dioxide (SO_2)	Annual Arithmetic Mean	–	Ultraviolet Fluorescence	0.030 ppm (80 µg/m^3)	–	Spectro-photometry (Pararosaniline Method)

Notes:

µg/m^3 = micrograms per cubic meter; mg/m^3 = milligrams per cubic meter; ppm = parts per million

1. California standards for ozone, carbon monoxide (except Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, suspended particulate matter—PM_{10}, $PM_{2.5}$, and visibility reducing particles, are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
2. National standards (other than ozone, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration in a year, averaged over 3 years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m^3 is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over 3 years, are equal to or less than the standard. Contact U.S. EPA for further clarification and current federal policies.
3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
4. Any equivalent procedure which can be shown to the satisfaction of CARB to give equivalent results at or near the level of the air quality standard may be used.
5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
6. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
7. Reference method as described by U.S. EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the U.S. EPA.
8. New federal 8-hour ozone and fine particulate matter standards were promulgated by the U.S. EPA on July 18, 1997. In 2006, the U.S. EPA approved these standards, set attainment designation for all areas within the United States, and required non-attainment areas to develop attainment strategies.
9. Due to lack of evidence linking health problems to long-term exposure to coarse particle pollution, the agency revoked the annual PM_{10} standard in 2006 (effective December 17, 2006).
10. CARB has identified lead and vinyl chloride as "toxic air contaminants" with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

CARB oversees activities of local air quality management agencies, and is responsible for incorporating AQAPs and AQMPs from local air districts into the SIP for U.S. EPA approval. CARB also maintains air quality monitoring stations throughout the state in conjunction with local air districts. Data collected at these stations are used by CARB to classify air basins as being in "attainment" or "non-attainment" with respect to each pollutant and to monitor progress in attaining air quality standards.

CARB has promulgated ambient air quality standards for O_3, PM_{10}, $PM_{2.5}$, CO, NO_2, SO_2, and Pb that are more stringent than the U.S. EPA's standards, as shown in Table 3-1. In 2002, CARB revised the state annual PM_{10} standard and established an annual $PM_{2.5}$ standard. These standards went into effect on July 7, 2004. On April 17, 2006, the Office of Administrative Law approved amendments to the regulations for the state ambient air quality standard for O_3. Those amendments establish a new 8-hour average O_3 standard of 0.070 part per million (ppm), not to be exceeded, and revoking the existing 1-hour O_3 standard of 0.09 ppm. CARB has also developed standards for sulfates, hydrogen sulfide (H_2S), visibility reducing particulates, and vinyl chloride. Counties and metropolitan areas are classified as being in attainment or non-attainment with respect to federal and state ambient pollutant standards. An area's classification is determined by comparing actual monitored air pollutant concentrations with state and federal standards. More than 200 air monitoring stations are located in California and are part of the State and Local Air Monitoring Network. These stations are operated by CARB, APCDs or AQMDs, private contractors, and the National Park Service (NPS). Areas that do not have sufficient data for a determination are given an "unclassified" designation and are not considered to be non-attainment.

The California CAA requires that each area exceeding the state ambient air quality standards for O_3, CO, SO_2, and NO_2 must develop a plan aimed at achieving those standards (California Health and Safety Code 40911). California Health and Safety Code Section 40914 requires air districts to design a plan that achieves an annual reduction in district-wide emissions of 5 percent or more, averaged every consecutive three-year period. To satisfy this requirement, the AQMDs and APCDs have to develop and implement air pollution reduction measures, which are described in their AQAP/AQMP outlining strategies for achieving the state ambient air quality standard for any criteria pollutants for which the region is classified as non-attainment. The AQAP/AQMP outlines both stationary and mobile emission source control measures and emphasizes Transportation Control Measures (TCMs) and Indirect Source Control Measures to reduce mobile source emissions. These measures are also incorporated into the SIP to satisfy federal requirements.

It should be noted that in addition to criteria pollutants, hazardous air pollutants (HAPs) and toxic air contaminants (TACs) are also regulated. TACs are a subset of HAPs (i.e., TACs are also HAPs, but not all HAPs are TACs). HAPs and TACs are regulated on a case-by-case basis by the local AQMD/APCD. HAPs and TACs are typically emitted from stationary sources such as manufacturing or industrial facilities, internal combustion engines (stationary and mobile), and small area sources (such as solvent usage). As such, local rules and regulations limit the amount of HAPs and TACs emitted from stationary sources through the air permit application process. Facilities exceeding the air permitting exemption thresholds may be required to meet restrictions such as operating hours and annual operating limits, install air pollution control systems, and conduct a health risk assessment (HRA). The results of the HRA have to show that nearby sensitive receptors exposed to HAPs and TACs emitted from the facility will not have an increase in carcinogenic risks or detrimental acute or chronic noncancer health effects. HAPs and TACs are not expected to be emitted from any stationary sources associated with the operation of the Parkway, therefore, they will not be analyzed or discussed in this document. However, it should be noted that certain TACs are emitted from mobile sources (i.e., motor vehicles), known as mobile source air toxics (MSATs), which also present health concerns.

MSATs are classified as such to distinguish the originating sources (i.e., mobile versus stationary). MSATs are released as part of vehicle exhaust emissions and include acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde, diesel particulate matter, and diesel exhaust organic gases (FHWA, 2006a).

Prolonged exposure to MSATs may cause cancer and/or other serious health effects, such as reproductive problems and birth defects. Such effects are also influenced by other variables, such as distance between sources of MSAT and sensitive receptors. For the purpose of future Tier 2 analysis, MSATs are the HAP of concern. Air toxics analysis is a continuing area of research and many questions remain unanswered. (FHWA, 2006). Because of the emerging state of the science, guidance manuals and protocols to assess air quality impacts are currently being developed by various regulatory agencies (e.g., Sacramento Air Quality Management District (SMAQMD), FHWA, CARB). A brief overview of each document is discussed below. The MSATs assessment for Placer Parkway will be conducted as part of the Tier 2 environmental analysis.

SMAQMD recently developed a document, *Recommended Protocol for Evaluating the Location of Sensitive Land Uses Adjacent to Major Roadways, Version 1.0* (2007a), which was endorsed by their Board of Directors on January 25, 2007. Although it was endorsed, this is a draft document and may be modified during its final phases. This screening document is used to determine whether there is a potential for detrimental health effects from living near a major roadway. In addition, if the protocol shows undesirable results, then it recommends the next step be taken, which is to conduct a detailed health risk assessment (HRA) using an air dispersion model approved by the regulating agency. The SMAQMD protocol is a preliminary screening tool for land use decision makers for approving or denying the siting of residential projects or other sensitive land uses in close proximity (i.e., less than 500 feet) to a high traffic volume roadway (i.e., more than 100,000 annual average daily trips [AADT] [urban]; more than 50,000 AADT [rural]). Because the exact location of the corridor and preferred alignment are not known at this time, any necessary HRA will be conducted in the Tier 2 analysis.

To determine the type of air quality analysis required from exposure to MSATs, FHWA produced a guidance document, *Interim Guidance on Air Toxics in NEPA Documents* (FHWA, 2006d). The document provides general guidance that will enable the project developer to identify what type of analysis is required for the Parkway (i.e., No Analysis, Qualitative Analysis, or Quantitative Analysis). Depending on the type of analysis required, the prototype language for the No Analysis would be inserted into the document, otherwise, a Qualitative or Quantitative Analyses will be prepared according to the instructions specified in the guidance document. Similarly, without an exact corridor location and alignment, this type of analysis cannot be conducted until the Tier 2 analysis.

CARB also produced a document, *Air Quality and Land Use Handbook: A Community Health Perspective* (California Environmental Protection Agency/CARB, 2005a) which presents general information regarding potential detrimental health effects to sensitive receptors (e.g., residences, hospitals, day care centers) located less than 500 feet from a major roadway (i.e., > 100,000 daily vehicle trips). This document was consulted for this Technical Memorandum.

3.2 NATIONAL, REGIONAL, AND LOCAL REGULATIONS

3.2.1 National Regulations

In 2005, the President signed into law the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU). SAFETEA-LU is based on concepts and foundations in previous bills, Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) and the Transportation Equity Act for the 21st Century (TEA-21), which were created to meet the transportation needs within the United States. SAFETEA-LU addresses issues such as safety to reduce highway fatalities, reduce traffic congestion, improve efficiency in freight movement, increase intermodal connectivity, and protecting the environment. In addition to promoting federal surface transportation programs, state and local transportation decision makers are provided more flexibility for solving transportation problems in their communities.

SAFETEA-LU continues the TEA-21 concept of guaranteed funding for highway projects, which includes provisions to set aside federal funds to improve interregional transportation, address regional needs, and improve freight transportation. The fundamental provisions in the Act are aimed at reducing congestion, which in turn will save time and fuel, decrease vehicle emissions, lower transportation costs, allow more predictable and consistent travel times, and provide safer highways. Other provisions in the Act allow for Metropolitan Planning Organizations to coordinate with statewide transportation planning and achieve the same basic goals. Placer Parkway would potentially reduce traffic congestion, improve efficiency in freight movement, and increase intermodal connectivity.

3.2.2 Regional Regulations

The Transportation Conformity Rule (Section 3.1) requires a regional emissions analysis to be performed by the MPO for projects within its jurisdiction, unless exempt. The regional emissions analysis includes all projects listed in the Regional Transportation Plan (RTP) and the Regional Transportation Improvement Program (RTIP). The RTP is a planning document spanning at least a 20-year period and the RTIP implements it in 2-year increments. The RTP is updated every 2 to 3 years or amended to reflect any changes, such as new projects. Both the RTP and the RTIP must support an affirmative conformity finding to obtain FHWA approval. Projects that are included in the regional analysis are listed in the RTIP and referenced in the RTP. Projects listed in an approved RTP and RTIP that have met the conformity requirement for regional emissions analysis are considered to be conforming to the SIP.

PCTPA is the regional transportation planning agency for Placer County—exclusive of the Lake Tahoe Basin. PCTPA has the responsibility for the development and adoption of the Placer County RTP and the Placer County RTIP. Sacramento Area Council of Governments (SACOG) has the responsibility for development and adoption of the Metropolitan Transportation Plan (MTP) and Metropolitan Transportation Improvement Program (MTIP). SACOG also has the responsibility for making findings of conformity required under Section 176 of the CAA within the designated federal ozone non-attainment area. Under the terms of a Memorandum of Understanding (MOU) between PCTPA and SACOG, entered into in 1993, and amended in 2001, PCTPA submits the Placer County RTP for inclusion into the SACOG MTP. By doing so, the Placer County RTP is assessed for conformity along with the MTP by SACOG and submitted to the FHWA and Federal Transit Administration (FTA) for review and approval. Hence, if the MTP is approved for conformity by the FHWA and FTA, then all projects listed in the RTP are also considered conforming to the SIP. At the Tier 1 level, the Parkway is exempt from the requirements of the Transportation Conformity Rule. FHWA will make a project-level conformity determination on the Parkway in the Tier 2 EIS/EIR, at which time the Parkway would be included in the RTP for Placer County and SACOG's MTP, and would therefore conform with the SIP.

3.2.3 Local Regulations

The proposed project is located in Sutter and Placer counties, where air quality is regulated by the local regulatory agencies, Feather River Air Quality Management District (FRAQMD), and Placer County Air Pollution Control District (PCAPCD), respectively. FRAQMD also has jurisdiction over Yuba County. Although the project study area overlaps into Sacramento County, where air quality is regulated by SMAQMD, the project is not geographically located within Sacramento County. Therefore, SMAQMD's rules and regulations are not applicable or enforceable at the project site. As such, only general air quality data for Sacramento County will be discussed in this document. The analysis recognizes that air pollutants will inevitably transport back and forth between county and air basin boundaries. The amount and type of pollutants transported is dependent on meteorological conditions, day of the week (i.e., weekday versus weekend), and seasonal activities. During the transporting process, certain pollutants can contribute substantially to total air pollutant concentrations in the receiving region. In the Sacramento Valley Air Basin (SVAB), air quality is affected by air pollutants transported from the San Francisco Bay Area Air Basin (SFBAAB) in addition to emissions from within the Sacramento Valley and Mountain

Counties Air Basins. Similarly, air pollutants from SVAB contribute to air quality problems downwind in the San Joaquin Valley Air Basin and also upwind in the northern parts of the SVAB. Consequently, adjacent air basins with transporting pollutants must take into account local impacts to air quality from transport and local emissions as well as the impact of emissions to downwind areas.

FRAQMD and PCAPCD implement and enforce air quality regulations within their jurisdiction to reduce air pollutants in order to meet the federal and state AAQS. Through the California Environmental Quality Act (CEQA) review process, both agencies developed criteria pollutant significance thresholds for land use projects that generate air pollutants. These thresholds apply to both short-term (i.e., construction) and long-term (i.e., operation) air pollutant emissions. Projects with the potential to generate emissions exceeding the thresholds are considered to have a significant impact on air quality. If the project's emissions exceed any of the significance criteria, then feasible mitigation measures have to be implemented to reduce air quality impacts to a level considered less than significant. Tables 3-2 and 3-3 present the significance thresholds for criteria pollutants emitted from proposed projects located within FRAQMD and PCAPCD jurisdictions, respectively. Volatile organic compounds (VOCs) and reactive organic gases (ROGs) are terms used to describe the same category of pollutants and are used interchangeably throughout this section to correspond with terminology used by different regulatory agencies. VOC is a "newer" terminology to describe gases emitted from certain solids or liquids, whereas ROG is an "older" terminology used to describe the same type of gases.

Table 3-2
FRAQMD Significance Thresholds
Sutter and Yuba Counties

Pollutant	Significance Thresholds (lb/day)
ROG	25
NO_X	25
PM_{10}	80
Source: FRAQMD, 1998.	

Table 3-3
PCAPCD Operational and Significance Thresholds
Placer County

Pollutant	Cumulative Operational Thresholds (lb/day)	Significance Thresholds (lb/day)
ROG	10	82
NO_X	10	82
SO_2	N/A	136
PM_{10}	N/A	82
CO	N/A	550
Source: Backus, 2006.		

Table 3-3 presents two sets of thresholds: Cumulative Operational Thresholds and Significance Thresholds. Cumulative Operational Thresholds are used by PCAPCD to calculate monetary fees

required to be paid by the project developer to reduce overall Placer County pollutants for attainment purposes. Total fees are based on the difference between the thresholds and a proposed project's operational summer emissions, i.e., after all feasible and applicable mitigation measures have been implemented. Summer emissions are used to evaluate fees as winter emissions are not considered to be properly representative of most common or typical conditions due to use of heating equipment during the winter season. Significance thresholds are used to determine whether construction and operation of a proposed project will create air quality impacts considered to be significant. If a project is deemed to have significant air quality impacts, then all feasible mitigation measures must be implemented to reduce impacts to a level considered less than significant or to the maximum extent possible.

Sutter and Placer counties contribute to improved air quality through strategic land use and development planning, and coordination with adjacent counties to avoid conflicts with the goals of the APCD/AQMD to meet federal and state AAQS. The Sutter and Placer County General Plans include county-wide goals and policies aimed at improving air quality, as follows:

- Sutter County
  - Goal 4.I: To protect, maintain and improve the air quality in Sutter County; and
  - Goal 4.J: To integrate air quality planning with the land use and transportation planning process.

- Placer County
  - Goal 6.F: To protect and improve air quality in Placer County; and
  - Goal 6.G: To integrate air quality planning with the land use and transportation planning process.

4.0 AFFECTED ENVIRONMENT

This chapter describes the existing air quality conditions for the potential affected study area in Sutter County, Placer County, and northern Sacramento County. The ambient air quality setting is based on existing available data and reports available at the air districts' websites (FRAQMD, 2006a, b, and c; PCAPCD, 2006a and b; Sacramento County, CARB, 2006c).

The boundaries of the project study area were defined by traffic engineers to limit the traffic analysis to areas that are potentially affected by the operation of Placer Parkway. According to data provided in the traffic report, the implementation of the Parkway would change travel behaviors, redistribute traffic, and alleviate traffic congestion at various locations within the AFA and TASA. Therefore, the air quality study area is the same as the traffic analysis study area (i.e., AFA and TASA) and includes portions of Sutter County, Placer County, and a very small portion of northern Sacramento County. Air pollutants emitted can be dispersed to other areas within the region or outside the region because dispersion of air pollutants is highly dependent on local meteorological conditions. Dispersion conditions for the general project area are described in the next section. Air quality within the project study area is regulated by local government agencies, FRAQMD, PCAPCD, and the SMAQMD.

4.1 CLIMATE AND TOPOGRAPHY

The proposed project is located in the Sacramento Valley Air Basin (SVAB) (Figure 4-1), within southern Sutter County the southwestern portion of Placer County, and northern Sacramento County. The Sacramento Valley Air Basin includes Tehama, Glenn, Butte, Colusa, Yolo, Sutter, Yuba, Sacramento, and Shasta Counties as well as portions of Solano County and that portion of Placer County that lies west of Range 9 East—approximately 3 miles east of Auburn. Weather patterns throughout the SVAB are, in part, affected by the geography. SVAB is bounded by the North Coast Ranges to the west, the Northern Sierra Nevada Mountains to the east, and the Cascade Range to the north. The area within the ranges and mountains is relatively flat. The Carquinez Strait breaches the Coast Range, exposing the middle portion of the SVAB to the influence of Pacific Coast marine weather. This geography channels winds through the Sacramento Valley, but inhibits dispersion of pollutant emissions in portions of the valley. Typically, marine air enters the SVAB through the Carquinez Strait and transports pollutants out of the valley to the north. However, conditions can lead to the prevailing winds circling back south, particularly between July and September, elevating pollution levels in the SVAB. This marine influence can result in pollutants being carried from the San Francisco Bay Area and Sacramento regions to western Placer County and contributing to smog formation.

As the meteorological conditions within the region transport pollutants to and from adjacent regions, the California Clean Air Act (CCAA or Act) requires CARB to assess the contribution of ozone and ozone precursors from upwind regions on ozone concentrations that violate the state ozone standard in downwind areas. The Act also directs CARB to establish mitigation requirements for upwind districts designed to mitigate their impact on downwind districts. CARB originally established mitigation requirements in 1990, which are contained in Title 17, California Code of Regulations, Sections 70600 and 70601. These regulations were amended in 1993 and more recently in 2003. CARB adopted amendments on May 22, 2003, which were approved by the Office of Administrative Law on December 4, 2003, and became effective on January 3, 2004. These amendments added two new requirements for upwind districts. These amendments require upwind districts to (1) consult with their downwind neighbors and adopt "all feasible measures" for ozone precursors and (2) amend their "no net increase" thresholds for permitting so that they are equivalent to those of their downwind neighbors no later than December 31, 2004. The amendments clarify that upwind districts are required to comply with the mitigation requirements, even if they attain the state ozone standard in their own district, unless the mitigation measures are not needed in the downwind district.

The climate of the SVAB is Mediterranean in character, with mild, rainy winter weather from November through March, and hot, dry weather from May through September. January temperatures in the SVAB area range from an average low in the 30s (°F) to an average high in the 50s (°F). July temperatures range from an average low in the 50s (°F) to an average high in the 90s (°F). These high temperatures, combined with low humidity, produce hot, dry summers that contribute to the buildup of O_3, a major constituent of smog. Smog is a mixture of pollutants (i.e., dust, smoke, chemical fumes), principally ground-level ozone, produced by chemical reactions in the air involving smog-forming chemicals. A major portion of smog-forming chemicals comes from burning of petroleum-based fuels such as gasoline in mobile sources (i.e., automobile, truck, bus, and other vehicle exhausts). Other smog-forming chemicals, VOCs, are found in products such as paints and solvents. Smog can harm health, damage the environment, obscuring visibility and contributing to a number of respiratory problems.

The climatological station closest to the study area with historical temperature data is the Sacramento Federal Aviation Administration (FAA) Airport station, which is located approximately 17 miles to the south-southwest of the site. The monthly average temperature recorded between 1941 and 2005 at the Sacramento FAA Airport station ranges from 37.9ºF in January to 92.8ºF in July. January and December are typically the coldest months in the Sacramento area, with July and August being the hottest. Average rainfall measured in the Sacramento area varied from 2.11 inches in November to 1.12 inches or less between April and October, with an average annual total of 17.30 inches.

Ambient air quality is generally affected by climatological conditions, the topography of the air basin, the type and amounts of pollutants emitted, and, for some pollutants, sunlight. The following subsection discusses types of air pollutants, health effects, and existing air quality levels within the air quality study area.

4.2 COMPLIANCE WITH AIR QUALITY STANDARDS IN THE STUDY AREA

The Sacramento Metropolitan Area (SMA) comprised of Sacramento, Yolo and parts of Placer (including the study area), Sutter, El Dorado, and Yuba counties, is designated as severe non-attainment for the 8-hour average O_3 NAAQS. The air districts within the SMA, created under the Lewis Air Quality Management Act in California in 1976, have worked together to develop the 2003 Sacramento Area Regional Ozone Attainment Plan to satisfy the SIP requirement. This Attainment Plan identifies source controls and trip reduction strategies. This attainment strategy requires reductions of approximately 38 percent of ROG (see Section 3.2.3 for definition) and 40 percent of nitrogen oxide (NO_X) (O_3 precursors) relative to 1990 baseline emissions, and relies heavily on mobile source NO_X reductions as mobile sources generate the majority of regional NO_X emissions. While the federal 1-hour O_3 standard has been revoked, the air districts will continue to implement the existing control strategies and continue to strategize new control measures to meet the new 8-hour O_3 standard. Efforts are currently underway to develop and submit an 8-hour O_3 attainment plan by June 2007. Currently, the attainment date for the Sacramento region with the 8-hour O_3 standard is June 15, 2013.

Air monitoring stations are collecting ambient air data at designated locations throughout Sutter and Placer counties. The ambient data from all these stations are used by the U.S. EPA and CARB to determine attainment or non-attainment with federal and state AAQS, respectively. For reference purposes, monitoring data collected from the air monitoring stations in the study area located in Sutter and Placer counties are provided in Tables 4-1, 4-2, and 4-3 with the locations illustrated in Figure 4-2. In addition, the federal and state air quality designations for Placer, Sutter, and Sacramento counties are presented in Tables 4-4 through 4-6.

Placer Parkway is considered to be a regionally significant project for the purposes of air quality. The definition of regionally significant project under 40 CFR 93.101 is a transportation project (other than an exempt project) that is on a facility which serves regional transportation needs (such as access to and from the area outside of the region; major activity centers in the region, major planned developments such as new retail malls, sports complexes, etc., or transportation terminals as well as most terminals themselves) and would normally be included in the modeling of a metropolitan area's transportation network, including at a minimum all principal arterial highways and all fixed transit facilities that offer an alternative to regional highway travel.

In addition to the attainment or non-attainment designation, the U.S. EPA also uses an "unclassified" designation to classify areas that do not have sufficient data to support a designation of attainment or non-attainment. If sufficient data become available, these areas will be redesignated. An area could be designated as "unclassified/attainment" based on federal standards, but could also be designated as "non-attainment" based on state standards (e.g., $PM_{2.5}$). The reason for this difference is the more stringent standards imposed by the State of California. Therefore, an area may meet the federal standard, but not the state standard.

4.2.1 Ozone

O_3 is a colorless gas that has a pungent odor and causes eye and lung irritation, visibility reduction, and crop damage. A primary constituent of smog, O_3 is formed in the atmosphere in the presence of sunlight by a series of chemical reactions involving oxides of nitrogen (NO_X) and ROG. Because these reactions occur on a regional scale, O_3 is considered a regional air pollutant. Industrial fuel combustion and motor vehicles are primary sources of NO_X and ROG. As shown in Tables 4-1 through 4-3, O_3 concentrations in the project area consistently exceed federal and state ambient air quality standards. Sutter, Placer, and Sacramento counties are located in a non-attainment region known as the Sacramento Federal Nonattainment Area that includes all of Sacramento and Yolo counties, and portions of El Dorado, Placer (western Placer County), Sutter, and Yuba counties.

4.2.2 Particulate Matter

Particulate matter is generally composed of particles in the air such as dust, soot, aerosols, fumes, and mists. Of particular concern are inhalable particulates that have aerodynamic diameters of 10 micrometers or less (PM_{10}). A subgroup of these particulates is fine particulates (particles with aerodynamic diameters less than 2.5 micrometers ($PM_{2.5}$), which have very different characteristics, sources, and potential health effects. $PM_{2.5}$ is generally emitted from activities such as industrial combustion, vehicle exhaust, and residential wood-burning stoves and fireplaces. $PM_{2.5}$ is also formed in the atmosphere when gases such as SO_2, NO_X, and volatile organic compounds emitted by combustion activities are transformed by chemical reactions in the air. PM_{10} affects breathing and the respiratory system and, in particular, can damage lung tissue, and contribute to cancer and premature death. Separate standards for $PM_{2.5}$ were established in 1997 because these smaller particles can penetrate deeper into the human respiratory tract and potentially increase detrimental health effects.

$PM_{2.5}$ concentrations measured at the Roseville monitoring station have not exceeded federal PM_{10} 24-hour and annual average standards over the past 3 years. However, the state PM_{10} 24-hour standard was exceeded in 2003 and the annual average standard was exceeded in 2003 and 2004. The last exceedance of the state annual average $PM_{2.5}$ standard was in 2002. As of January 2006, Sutter, Placer, and Sacramento counties are federally designated as unclassifiable/attainment for $PM_{2.5}$. With regard to the state standard, Sutter County is designated as unclassified for $PM_{2.5}$ and Placer and Sacramento counties are designated as non-attainment for $PM_{2.5}$.

4.2.3 Carbon Monoxide

CO is an odorless, colorless gas that can impair the transport of oxygen in the bloodstream, aggravate cardiovascular disease and cause fatigue, headache, confusion, and dizziness. CO forms through incomplete combustion of fuels in vehicles, wood stoves, industrial operations, and fireplaces. In Placer County, vehicular exhaust is a major source of CO. CO tends to dissipate rapidly into the atmosphere and consequently is generally a concern at the local level, particularly at major road intersections.

CO concentrations at the Roseville and North Highlands monitoring station have been well below federal and state 1-hour and 8-hour average standards. Sutter and Placer counties are designated as unclassified/attainment for federal CO standards and attainment for state CO standards. Sacramento County is classified as attainment for both federal and state CO standards.

4.2.4 Nitrogen Dioxide

NO_2 is a brownish, highly reactive gas that can irritate the lungs, cause pneumonia, and lower the resistance to respiratory infections. NO_X, which includes NO_2, is a key precursor to O_3. NO_X forms when fuel is burned at high temperatures, and is primarily emitted by transportation sources and stationary fuel combustion sources such as electric utility and industrial boilers.

Tables 4-1 through 4-3 show that measured concentrations of NO_2 in the project area have consistently remained well below the federal and state standards. With similar trends throughout the region (and state), the area is well within federal and state NO_2 standards.

4.2.5 Sulfur Dioxide

SO_2 is a colorless acidic gas with a strong odor. High concentrations of SO_2 affect breathing and may aggravate existing respiratory and cardiovascular disease. SO_2 is also a primary contributor to acid deposition, which causes acidification of lakes and streams and can damage trees, crops, building materials, and statues. In addition, sulfur compounds in the air can contribute to visibility impairment. The major source category for SO_2 is fuel-burning equipment combusting fossil fuels. Table 4-2 shows

that measured concentrations of NO_2 at the North Highlands monitoring station have consistently remained well below the federal and state standards. SO_2 is not measured at the Roseville or Pleasant Grove monitoring stations. The air basin is designated as unclassified/attainment for federal and attainment for state standards. Sulfur oxides (SO_X) include SO_2 and other oxides of sulfurs and are reported in this analysis as equivalent to SO_2.

4.2.6 Mobile Source Air Toxics

MSATs are released as part of vehicle exhaust emissions and include acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde, diesel particulate matter, and diesel exhaust organic gases (FHWA, 2006a). Prolonged exposure to MSATs may cause cancer and/or other serious health effects, such as reproductive problems and birth defects. Such effects are also influenced by other variables, such as distance between sources of MSAT and sensitive receptors. The extent of potential health effects of MSATs can only be determined by conducting a detailed health risk assessment (HRA) to assess carcinogenic risks and acute and chronic noncancer health effects. Currently, the "tools and techniques for assessing project-specific health impacts from MSATs are limited" (FHWA, 2006). FHWA has prepared guidance on when and how to analyze MSATs in the NEPA process: *Interim Guidance on Air Toxic Analysis in NEPA Documents*, February 3, 2006. During a Tier 2 air quality analysis, the MSATs section will identify what category the Placer Parkway falls under (i.e., No Analysis, Qualitative Analysis, or Quantitative Analysis) and use the prototype language or provide the data analysis as specified in the guidance document.

As previously mentioned, Placer Parkway is geographically located within Sutter and Placer counties, therefore, it is not subject to any other air district's rules and regulations. However, because FRAQMD and PCAPCD are relatively small air districts, they sometimes rely on other air districts' guidelines to supplement the needs of their district. This is a common and accepted practice among air districts within the State of California. Because MSAT assessment is an emerging science, guidance manuals and protocols to assess air quality impacts are currently in the development stage. For instance, SMAQMD recently developed a draft document, *Recommended Protocol for Evaluating the Location of Sensitive Land Uses Adjacent to Major Roadways, Version 1.0*, January 2007, which was endorsed by their Board of Directors on January 25, 2007.

Similar to the CARB and FHWA documents (i.e., Cal-EPA/CARB, 2005 and FHWA, 2006d), the SMAQMD protocol serves as a screening tool for land use decision makers for approving or denying the siting of residential projects or other sensitive land uses in close proximity (i.e., < 500 feet) to a high traffic volume roadway (i.e., > 100,000 AADT [urban]; > 50,000 AADT [rural]). The screening tool is developed by assessing carcinogenic health risks from inhalation of diesel particulate matter (DPM). Only DPM is assessed because it is the dominant pollutant when compared with other MSATs of concern. The method does not consider multi-pathway exposures (e.g., ingestion, absorption) as they are not the dominant factors in assessing carcinogenic effects from exposure to MSATs. Based on this presumption, the method focuses on local meteorological data, traffic volume, and roadway elevation. Local meteorological data are used to determine whether the proposed development is located upwind or downwind of the roadway. Daily traffic volume and percentage of diesel vehicles determines DPM emissions, and roadway elevation determines dispersion of DPM. The protocol provides "look-up" tables for land use decision makers to determine whether the sensitive land uses may be affected due to proximity to the high traffic roadway and whether it is located upwind or downwind of the roadway in question (SMAQMD, 2007a, 2007b).

Currently, daily vehicle traffic for Placer Parkway in 2040 is estimated to range between 40,300 and 71,700, depending on the build alternative. The estimated daily vehicle traffic is well below the 100,000 AADT thresholds for urban areas. The use of only a single project parameter does not reveal all other potential air quality impacts; therefore, it is recommended that the relevant lead agency examine other locational and project-specific findings and use those in conjunction with daily traffic volumes prior to

approving or denying the siting of sensitive land uses near the Parkway once an alignment within a corridor is selected. In addition, Placer Parkway will include a no-development buffer zone, varying generally between 500 and 1,000 feet. This buffer will maintain at least a 500-foot distance from sensitive receptors or land uses. Thus, the 500-foot distance recommendation in the referenced documents will be included as part of the project.

In addition, the U.S. EPA and FHWA have developed a guidance document, *Transportation Conformity Guidance for Qualitative Hot-spot Analyses in $PM_{2.5}$ and PM_{10} Nonattainment and Maintenance Areas* (2006), to help state and local agencies meet the final rule's hot spot analysis requirements. Within this document is a protocol to determine whether a "new" roadway is a Project Of Air Quality Concern (POAQC) (i.e., whether it will create undesirable concentration of $PM_{2.5}$ (DPM) emitted from diesel trucks). To determine whether a "new" roadway project is a POAQC, data such as existing traffic volume, build-out traffic volume, diesel truck volumes, among other parameters are required. Currently, Placer and Sutter counties are designated as unclassified/attainment for federal PM_{10} and $PM_{2.5}$ standards and therefore do not require any hot-spot analyses. However, if the attainment designations are changed prior to the approval of the Placer Parkway project, then the applicable hot-spot analyses shall be conducted during the Tier 2 analysis to assess MSAT impacts.

4.3 EXISTING EMISSIONS SOURCES

Pollutants that affect air quality are generated from both man-made and natural sources. Man-made sources of emissions are generally divided into three types: stationary, area-wide, and mobile sources. The contributions of these source categories vary from region to region. CARB maintains an emissions inventory to determine the sources and quantities of air pollution generated within the state's counties and air basins. Tables 4-7 through 4-9 present a summary of the estimated 2005 pollutant emission data for the Sacramento Valley portion of Sutter, Placer, and Sacramento counties, respectively. Similar data for Sacramento County are presented in Table 4-9. Mobile sources are the largest contributors to the ROG, CO, NO_X, and SO_X emission inventory, but are minor contributors to the PM_{10} and $PM_{2.5}$ emission inventories.

Table 4-7

5.0 POTENTIAL DIRECT IMPACTS

5.1 ANALYSIS FRAMEWORK

The analysis of air quality impacts in this Technical Memorandum has been prepared for three analysis years:

- Existing Conditions (2005)
- A future opening year (2020), and
- A future cumulative year (2040).

These three analyses years are used to place Placer Parkway in the context of future expected conditions. The description of existing conditions establishes the base year from which future conditions for both the build alternatives and a No-Build Alternative can be projected. The assessment of existing conditions typically entails direct observation, the collection of primary and secondary data, and, in some cases, mathematical models or computer simulation. The analysis of the future No-Build Alternative utilizes the existing condition as a base year and adds known or expected changes to arrive at a reasonable estimate of the future. In the analysis of the No-Build Alternative, projects proposed, planned or under construction are considered, as are growth factors and other less quantifiable changes (see Chapter 6 for indirect and secondary effects discussion). The future build alternatives are then compared to the future No-Build Alternative, in both 2020 and 2040, to assess air quality impacts associated with the operation of the Parkway.

Vehicle Miles of Travel (VMT) data reported in the transportation analysis for Placer Parkway (DKS Associates, 2007) for each alternative for 2020 and 2040 were used to estimate mobile/vehicle emissions from each alternative. The traffic analysis developed the 2020 and 2040 VMT data based on existing conditions that are reflected in a travel forecasting tool for the Sacramento region (Sacramento Metropolitan Travel Demand Model or SACMET). Additionally, all build alternatives have been evaluated with and without a potential future interchange with Watt Avenue in 2020 and 2040. This potential future interchange is not proposed as part of the project (see Section 2.4).

VMT data and associated pollutant emissions for existing conditions in Sutter County, Placer County, and Sacramento County are presented. These data were derived from the Rate-of-Progress Plan EIR. While these data were not prepared as part of the traffic analysis for the project, they can be considered generally representative of existing conditions in the study area.

A calendar year 2027 discussion is also included to demonstrate that the project is part of a conforming metropolitan transportation plan. The planning horizon for the most recent metropolitan transportation plan ends in 2027 (see Section 5.6 for additional information).

5.2 EMISSION ESTIMATION AND IMPACT EVALUATION METHODOLOGY

Emissions associated with the long-term future operation of Placer Parkway have been estimated using CARB's EMFAC2002 mobile emissions model using input parameters such as projected VMT on the five build alternatives for 2020 and 2040. In addition to the assessment of these alternatives, the operation of a potential additional interchange at Watt Avenue has also been analyzed.

To accurately estimate regional emissions using VMT data as input parameters into the BURDEN option of the EMFAC2002 model, vehicle population and speed distributions among vehicles were adjusted according to methods utilized by CARB. The vehicle population adjustment method prescribed in the document, *Recommended Methods for Use of EMFAC2002 to Develop Motor Vehicle Emissions Budgets and Assess Conformity* (CARB, 2003), and the speed distribution adjustments described in the document,

Assessment 562: Sacramento Ozone Nonattainment Area ROG and NO_X Emissions for Rate of Progress Plan (Cal-EPA/CARB, 2005) were used for all the Parkway alternatives, including the No-Build Alternative. These methods are consistent with CARB's standard approach to estimating regional mobile source emissions.

The significance of air quality impacts is determined by quantifying the pollutants generated from each build alternative and comparing them to the No-Build Alternative to determine the net increase or decrease of pollutants. The difference is then compared to FRAQMD and PCAPCD pollutant thresholds (see Tables 3-2 and 3-3) to determine whether the alternative will have significant air quality impacts. Alternatives with an increase in pollutants exceeding the thresholds are considered to have significant air quality impacts. Please see Chapter 8 for a discussion of mitigation strategies to reduce the amount of pollutants associated with the Parkway.

The quantities of air pollutants emitted from each build alternative were estimated using the VMT data provided by DKS Associates as input data for the EMFAC2002 mobile emission factor model. The BURDEN option of the model was used to estimate daily pollutant emissions generated based on the daily VMT traveled. The quantity of pollutants emitted is directly correlated to the amount of VMT (i.e., the higher the VMT, the more pollutants emitted). The model output is in units of tons per day rounded to the nearest hundredth of a ton. It therefore lacks the resolution necessary to describe the actual differences of certain pollutants (e.g., ROG, SO_X, and PM_{10}) among alternatives with relatively minor differences in VMT (less than 0.5 percent). Therefore, minor differences in VMT may not result in identifiable differences in the quantity of pollutants shown on the tables presented later in this chapter. The emission rate is converted to pounds per day for all of the tables in this document to make comparison easier.

In addition to the VMT data, vehicle-hour delay (VHD) data are used to qualitatively assess air quality impacts. VHD, as defined in the Transportation Technical Report (DKS Associates, 2007) as the additional travel time that vehicles would take to travel on a roadway segment beyond the time that it would take under a given level of service (LOS) threshold. LOS is a qualitative measure of traffic flow based on a number of factors such as speed, travel time, traffic interruptions, freedom to maneuver, safety, driving comfort, and convenience. An increase of VHD is associated with a longer travel time resulting from an increase in traffic volumes and a decrease in travel speeds. Conversely, a decrease of VHD is associated with a shorter travel time due to a decrease in traffic volumes and an increase in travel speeds. The quantities of pollutants emitted are directly correlated to travel speed (EMFAC2002 model manual). At speeds less than 65 mph, vehicles traveling at lower speeds emit larger quantities of pollutants than vehicles traveling at higher speeds. Therefore, a decrease in VHD (or vehicles traveling at a higher speed with less traffic congestion) correlates to a reduction in pollutants emitted.

5.2.1 Construction Impact Evaluation Methodology

In the analysis of potential impacts on air quality, construction impacts are generally considered as short-term effects and operational impacts are considered as long-term effects. This Tier 1/Program level of review focuses on the selection and acquisition of a corridor for the future Placer Parkway. Site-specific data are not available to calculate construction emissions; therefore, potential air quality impacts from construction activities associated with Placer Parkway can only be broadly evaluated. Based on the project description (Chapter 2), the area that is estimated to be used during construction could be up to 1,473 acres in size (16.2 miles long and 750 feet wide [assuming an average between the proposed 500- to 1,000-foot corridor width]). Depending on the construction timeline, a substantial amount of pollutants could be generated from the construction of Placer Parkway.

The Road Construction Emissions Model, Version 5.2, created by the Sacramento Metropolitan Air Quality Management District, was used to estimate the amount of construction emissions that would be

generated during site grading activities. Site grading activities would be expected to generate the greatest amount of air pollutants. For the purposes of this evaluation, it is assumed that site grading would occur at three different areas along the proposed Parkway corridor. The following data were entered into the model:

- 9 – Dozers
- 3 – Excavator
- 15 – Scrapers
- 9 – Signal Boards
- 3 – Water Truck
- A maximum of 15 acres could be disturbed at any one time on any given day

The modeled daily pollutant emission estimates are as follows:

Table 5-1
Estimated Amount of Pollutants Emitted During Site Grading Activities (lbs/day)

Description	ROG (lb/day)	CO (lb/day)	NO_X (lb/day)	PM_{10} (lb/day)
Site Grading	84	363	387	97
FRAQMD Thresholds (lbs/day)	25	None	25	80
Exceed FRAQMD Threshold (Yes/No)?	Yes	Not Applicable	Yes	Yes
PCAPCD Thresholds (lbs/day)	82	550	82	82
Exceed PCAPCD Threshold (Yes/No)?	Yes	No	Yes	Yes

Based on the assumptions described above, daily construction emissions would exceed PCAPCD and FRAQMD thresholds for ROG, NOx and PM_{10}. This would be a short-term significant impact on air quality. Construction activities would have to be reduced substantially to be considered less than significant. These limitations, which would include restrictions on quantities of construction equipment in use at any one time, and limits to acres of land permitted to be disturbed, could unreasonably extend the project construction period, which could result in cost implications and unnecessary delay.

Construction emissions would result from construction equipment exhaust and fugitive dust generated from grading activities. These emissions would likely include criteria pollutants and diesel particulate matter (DPM). Therefore, to minimize emissions from construction activities, mitigations consistent with FRAQMD's and PCAPCD's regulations for fugitive dust control and best construction management practices would be implemented. For example, FRAQMD has a Best Available Mitigation Measures Construction Activity Plan (FRAQMD, 2006c) that must be adhered to during construction activities.

The likelihood that the implementation of mitigations would reduce overall emissions from construction activities to a less-than-significant level cannot be evaluated until project-specific data are available. Details of mitigation strategies for construction activities of similar types of roadway projects are provided in Chapter 8. A detailed analysis of construction emissions will be conducted during the Tier 2 analysis.

5.2.2 Operational Impact Evaluation Methodology

5.2.2.1 Introduction

It is generally expected that when a major new transportation project, such as Placer Parkway, is introduced into a heavily congested travel corridor, people's route choices and the mode and origin/destination of trips in that corridor are likely to be affected. A new or widened regional transportation corridor could "induce" travel and increase VMT within the region that is in close proximity to the proposed project by allowing people to travel farther in the same amount of time. Placer Parkway would have an impact on travel patterns across south/west Placer County, south Sutter County and north Sacramento County. While some roadway segments near proposed interchanges would have increases in VMT associated with the Parkway, especially on the state routes, a larger number of local roadway segments would have decreases in VMT.

The Transportation Technical Report (DKS Associates, 2007) provides peak-hour VMT data for the No-Build Alternative and Alternatives 1 through 5, along with scenarios with and without a Watt Avenue interchange. The transportation analysis comprised two distinct study areas, as described below:

- Transportation Analysis Study Area (TASA). The area where the travel model shows "significant" changes in traffic volumes, although the percentage of roadways that would be affected by the Placer Parkway decreases on the TASA's fringes (Figure 5-1).

- Analysis Focus Area (AFA). A portion of the TASA that is closer to the Parkway build alternatives. It represents the area where most of the transportation benefits of a future Placer Parkway would occur.

Because Placer Parkway would have an impact on travel patterns in a fairly large area, the traffic study area was defined based on an evaluation of the changes in traffic volumes. It covers the area where the travel model shows "significant" changes in traffic volumes, although the percentage of roadways that would be affected by Placer Parkway decreases on the fringes of that area. Although this air quality analysis assesses the significance of air quality impacts associated with pollutants emitted from mobile sources (i.e., motor vehicles) within the traffic study area (i.e., both TASA and AFA), it should be noted that air quality impacts could extend beyond the traffic study area because meteorological conditions such as prevailing wind could transport air pollutants to other areas within the SVAB.

5.3 EXISTING CONDITIONS ANALYSIS (2005)

The existing major roadways that would be located adjacent to Placer Parkway are SR 65 and SR 70/99, with I-5 and I-80 serving as the regional links between these two state routes. Use of these routes includes commuters traveling to work and school, and trucks transporting goods in and out of the region. A transportation corridor such as Placer Parkway has been proposed for over a decade with the ultimate goal of reducing anticipated congestion on the local and regional transportation system, that is, improving the LOS and accommodating the high levels of future growth projected in the region and advancing economic development goals in south Sutter County and southwestern Placer County. Data in the Placer Parkway traffic analysis indicate that portions of SR 65 and I-80 currently do not meet traffic operating standards and are therefore considered unacceptable. SMAQMD's Rate-of-Progress Plan EIR provides VMT data and vehicle emissions data for the Sacramento Valley portion of Placer County and Sutter County for 2005 (see Figure 4-1 and Table 5-2). These data are consistent with the on-road vehicle emissions inventory data presented earlier in Section 4.3. These data were not developed specifically from a traffic analysis in the Placer Parkway TASA or AFA.

Table 5-2
VMT and Criteria Pollutant Emissions for Year 2005

Location	VMT	ROG (lbs/day)	CO (lbs/day)	NO_X (lbs/day)	PM_{10} (lbs/day)
Sutter County	444,939	9,400	8,800	1,620	60
Placer County[1]	8,032,866	12,520	114,840	18,600	760
Sacramento County	32,319,034	56,240	519,360	105,280	3,740

Source: Data are from Appendix C of the DEIR Sacramento Regional Non-Attainment Area 8-Hour Ozone Rate-of-Progress Plan, Sacramento Metropolitan AQMD, September 2005. Data are also from Table 3 of the Sacramento Regional Nonattainment Area, 8-Hour Ozone Rate-of-Progress Plan Final Report, February 2006.

Note:
1. VMT data and pollutant data are for the Sacramento Valley portion of Placer County.

Based on a qualitative evaluation consistent with a Tier 1 analysis, the Placer Parkway traffic analysis for the 2005 Existing Plus Project conditions concluded that the project alternatives would result in similar but smaller changes in travel patterns in the Transportation Analysis Study Area in 2005 than in 2020. That is, the project alternatives would:

- Increase traffic volumes (VMT) on some roadway segments near proposed interchanges along the proposed project. These increases would likely be less than those under 2020 conditions.
- Result in decreases in traffic volumes on a larger number of local roadway segments in south Sutter County and southwestern Placer County. These decreases would likely be less than those under 2020 conditions.
- Have a lower traffic volume on Placer Parkway than 2020 conditions.

Based on these findings, because the traffic volumes for the Existing Plus Project conditions would increase vehicle volumes only at a few roadway segments and decrease volumes at a much larger number of local roadways, the air quality impacts under Existing Plus Project conditions would be potentially less than under 2020 conditions.

5.4 FUTURE ANALYSIS (2020) CONDITIONS

Travel demand in the study area will be influenced by growth in population and employment in the six-county Sacramento region, but especially by growth in south Sutter County, south/west Placer County, and northern Sacramento County. For planning purposes, PCTPA identified 2020 as the opening year of this facility. Based on discussions with the project's Technical Advisory Committee (TAC), the transportation analysis of project alternatives was conducted for the future development scenario consisting of a 2020 "Opening Year" scenario that reflects 2020 development levels based primarily on current general plans (Transportation Technical Report – Section 4.4 (DKS Associates, 2007).

Compared to the No-Build Alternative, all of the build alternatives would decrease VMT on many arterial/collector roadway segments in western Roseville, unincorporated portions of west Placer County, and unincorporated portions of south Sutter County, but would also cause increases in traffic volumes on the following roadway segments:

- SR 70/99 south of the projected Placer Parkway connection;
- SR 65 north of the projected Placer Parkway connection;
- Rocklin's Whitney Ranch Parkway and the future Valley View Parkway; and

- Some roadways near future Placer Parkway interchanges.

The Transportation Technical Report analysis concluded that, compared to the No-Build Alternative, all the build alternatives would:

- Increase the total VMT in the TASA;
- Reduce the VMT on congested roadways, especially in the AFA. For each alternative, the scenarios with a Watt Avenue interchange would provide a larger reduction in VMT on congested roadways than without one; and
- Significantly reduce VHD within the TASA and especially in the AFA. Vehicle delay would be lower for scenarios with a Watt Avenue interchange than without one. As discussed in Section 5.2, lower VHD can be correlated to lower quantities of air pollutants emitted from vehicles. VHD data in the traffic report show that a Watt Avenue connection would reduce travel time from 5.3 percent to 7.5 percent within the TASA. It would reduce travel time by approximately 32.3 to 35.5 percent within the AFA.

The following discussion presents the analysis of potential air quality impacts based on the Parkway traffic analysis. Although not proposed as part of the project, the effect of a potential future Watt Avenue interchange was also evaluated. Emissions associated with a Watt Avenue interchange were quantified using the VMT data from the traffic analysis.

5.4.1 No-Build Alternative

Future conditions under the No-Build Alternative were quantified using projected VMTs for the study area. These projections assumed vehicle movement within the region, without Placer Parkway, using SR 65, I-80, I-5, SR 70/99, and other viable arterial roads that provide connections within the TASA. VMT data and associated air pollutants are presented in Table 5-3.

Table 5-3
VMT and Criteria Pollutant Emissions for No-Build Alternative in 2020[1,2]

Description	VMT	ROG (lbs/day)	CO (lbs/day)	NO_X (lbs/day)	PM_{10} (lbs/day)	SO_X (lbs/day)
No-Build Alternative	17,725,900	8,900	68,320	9,880	1,440	160

Notes:

1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutant emissions are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.
3. Although the model does not calculate $PM_{2.5}$ emissions, to ensure a conservative approach $PM_{2.5}$ emissions can be assumed to be the same as PM_{10} for the purposes of the analysis.

5.4.2 Alternative 1 – the Red Alternative

Alternative 1 was analyzed with and without a Watt Avenue interchange. The Watt Avenue scenario was analyzed with two options — a south interchange (Option 1) and a north interchange (Option 2) (see Figure 2-3).

Total emissions under these scenarios in 2020 are presented in Table 5-4. The percentage difference in emissions between these three Alternative 1 scenarios and the No-Build Alternative is presented in Table 5-5.

Table 5-4
VMT and Criteria Pollutant Emissions for Alternative 1 and the No-Build Alternative in 2020

Description	VMT	ROG (lbs/day)	CO (lbs/day)	NO_X (lbs/day)	PM_{10} (lbs/day)	SO_X (lbs/day)
No-Build Alternative	17,725,900	8,900	68,320	9,880	1,440	160
Alternative 1	17,846,974	8,960	68,640	9,940	1,440	180
Alternative 1 with Watt Avenue interchange Option 1	17,907,399	8,980	68,960	9,980	1,460	180
Alternative 1 with Watt Avenue interchange Option 2	17,890,925	8,980	68,960	9,980	1,460	180

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

Table 5-5
Percentage Change in VMT and Criteria Pollutant Emissions Between Alternative 1 and the No-Build Alternative in 2020

Description	VMT (%)	Emissions Increase Over No-Build Alternative (%)				
		ROG	CO	NO_X	PM_{10}	SO_X
Alternative 1	(+0.68)	0.67	0.47	0.61	0.00	12.50
Alternative 1 with Watt Avenue interchange Option 1	(+1.02)	0.90	0.73	1.01	1.39	12.50
Alternative 1 with Watt Avenue interchange Option 2	(+0.93)	0.90	0.94	1.01	1.39	12.50

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

Compared to the No-Build Alternative, Alternative 1 would:

- Increase VMT by 0.68 percent. All other alternatives would also increase VMT over the No-Build Alternative.
- Increase emissions by less than 1 percent, except for SO_X. All other alternatives would have similar increases.

- Both Watt Avenue interchange scenarios would have greater VMT and emissions than Alternative 1. An Option 1 (closer to Baseline Road) interchange would increase VMT and CO slightly more than Option 2 (north).

5.4.3 Alternative 2 – the Orange Alternative

Alternative 2 was analyzed with and without a Watt Avenue interchange. Total emissions for both of these scenarios are presented in Table 5-6. The percentage difference in emissions between these two scenarios and the No-Build Alternative is presented in Table 5-7.

Table 5-6
VMT and Criteria Pollutant Emissions for Alternative 2 and the No-Build Alternative in 2020[1,2]

Description	VMT	ROG (lbs/day)	CO (lbs/day)	NO_X (lbs/day)	PM_{10} (lbs/day)	SO_X (lbs/day)
No-Build Alternative	17,725,900	8,900	68,320	9,880	1,440	160
Alternative 2	17,875,272	8,960	68,740	9,960	1,460	180
Alternative 2 with Watt Avenue interchange	17,924,204	9,000	68,880	9,980	1,460	180

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

Table 5-7
Percentage Change in VMT and Criteria Pollutant Emissions Between Alternative 2 and the No-Build Alternative in 2020[1,2]

Description	VMT (%)	Emissions Increase Over No-Build Alternative (%)				
		ROG	CO	NO_X	PM_{10}	SO_X
Alternative 2	(+0.84)	0.67	0.61	0.81	1.39	12.50
Alternative 2 with Watt Avenue interchange	(+1.12)	1.12	0.82	1.01	1.39	12.50

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

Compared to the No-Build Alternative, Alternative 2 would:

- Increase VMT by 0.84 percent. All other alternatives would also increase VMT over the No-Build Alternative.

- Increase emissions by less than 1 percent, except for PM_{10} and SO_X. All other alternatives would have similar increases.

- The Watt Avenue interchange scenario would have greater VMT and emissions than Alternative 2. All other alternatives with a Watt Avenue interchange would have similar increases.

5.4.4 Alternative 3 – the Blue Alternative

Alternative 3 was analyzed with and without a Watt Avenue interchange. The emissions estimated for both scenarios are presented in Table 5-8 with the percentage increase in emissions between these two scenarios and the No-Build Alternative presented in Table 5-9.

Table 5-8
VMT and Criteria Pollutant Emissions for Alternative 3 and the No-Build Alternative in 2020[1,2]

Description	VMT	ROG (lbs/day)	CO (lbs/day)	NO_X (lbs/day)	PM_{10} (lbs/day)	SO_X (lbs/day)
No-Build Alternative	17,725,900	8,900	68,320	9,880	1,440	160
Alternative 3	17,888,226	8,980	68,780	9,960	1,460	180
Alternative 3 with Watt Avenue interchange	17,924,204	9,000	68,860	9,980	1,460	180

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

Table 5-9
Percentage Change in VMT and Criteria Pollutant Emissions Between Alternative 3 and the No-Build Alternative in 2020[1,2]

Description	VMT (%)	Emissions Increase Over No-Build Alternative (%)				
		ROG	CO	NO_X	PM_{10}	SO_X
Alternative 3	(+0.92)	0.90	0.67	0.81	1.39	12.50
Alternative 3 with Watt Avenue interchange	(+1.08)	0.90	0.79	1.01	1.39	12.50

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

Compared to the No-Build Alternative, Alternative 3 would:

- Increase VMT by 0.92 percent – the greatest of all the alternatives, but still less than a 1 percent increase. All other alternatives would also increase VMT over the No-Build Alternative.

- Increase emissions by less than 1 percent, except for PM_{10} and SO_X. All other alternatives would have similar increases.

- The Watt Avenue interchange scenario would have greater VMT and emissions than Alternative 3. All other alternatives with a Watt Avenue interchange would have similar increases.

5.4.5 Alternative 4 – the Yellow Alternative

Alternative 4 was analyzed with and without a Watt Avenue interchange. Total emissions for both scenarios are presented in Table 5-10. The increase in emissions between these two scenarios and the No-Build Alternative is presented in Table 5-11.

Table 5-10
VMT and Criteria Pollutant Emissions for Alternative 4 and the No-Build Alternative in 2020[1,2]

Description	VMT	ROG (lbs/day)	CO (lbs/day)	NO_X (lbs/day)	PM_{10} (lbs/day)	SO_X (lbs/day)
No-Build Alternative	17,725,900	8,900	68,320	9,880	1,440	160
Alternative 4	17,871,573	8,960	68,720	9,960	1,460	180
Alternative 4 with Watt Avenue interchange	17,913,320	8,980	68,840	9,980	1,460	180

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

Table 5-11
Percentage Change in VMT and Criteria Pollutant Emissions Between Alternative 4 and the No-Build Alternative in 2020[1,2]

Description	VMT (%)	Emissions Increase Over No-Build Alternative (%)				
		ROG	CO	NO_X	PM_{10}	SO_X
Alternative 4	(+0.82)	0.67	0.59	0.81	1.39	12.50
Alternative 4 with Watt Avenue interchange	(+1.06)	0.90	0.76	1.01	1.39	12.50

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

Compared to the No-Build Alternative, Alternative 4 would:

- Increase VMT by 0.82 percent. All other alternatives would also increase VMT over the No-Build Alternative.
- Increase emissions by less than 1 percent, except for PM_{10} and SO_X. All other alternatives would have similar increases.
- The Watt Avenue interchange scenario would have greater VMT and emissions than Alternative 4. All other alternatives with a Watt Avenue interchange would have similar increases.

5.4.6 Alternative 5 – the Green Alternative

Alternative 5 was analyzed with and without a Watt Avenue interchange. Total emissions for both of these scenarios are presented in Table 5-12. The percentage increase in emissions between these scenarios and the No-Build Alternative is presented in Table 5-13.

Table 5-12
VMT and Criteria Pollutant Emissions for Alternative 5 and the No-Build Alternative in 2020[1,2]

Description	VMT	ROG (lbs/day)	CO (lbs/day)	NO_X (lbs/day)	PM_{10} (lbs/day)	SO_X (lbs/day)
No-Build Alternative	17,725,900	8,900	68,320	9,880	1,440	160
Alternative 5	17,874,270	8,960	68,720	9,940	1,460	180
Alternative 5 with Watt Avenue interchange	17,900,678	8,980	68,820	9,980	1,460	180

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

Table 5-13
Percentage Change in VMT and Criteria Pollutant Emissions Between Alternative 5 and the No-Build Alternative in 2020[1,2]

Description	VMT(%)	Emissions Increase Over No-Build Alternative (%)				
		ROG	CO	NO_X	PM_{10}	SO_X
Build – Alternative 5	(+0.84)	0.67	0.59	0.61	1.39	12.50
Build – Alternative 5 with Watt Avenue interchange	(+0.99)	0.90	0.73	1.01	1.39	12.50

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

Compared to the No-Build Alternative, Alternative 5 would:

- Increase VMT by 0.84 percent. All other alternatives would also increase VMT over the No-Build Alternative.

- Increase emissions by less than 1 percent, except for PM_{10} and SO_X. All other alternatives would have similar increases.

- The Watt Avenue interchange scenario would have greater VMT and emissions than Alternative 5. All other alternatives with a Watt Avenue interchange would have similar increases.

5.4.7 Comparison of Alternatives

Potential impacts on air quality could occur during construction of Placer Parkway due to mobile-source pollutant emissions from construction vehicles and equipment. Impacts could also occur during operation through generation of mobile-source pollutants from vehicles. The Parkway would generate an increase in VMTs, which is typically associated with an increase of vehicle exhaust pollution. The comparison of VMT and operational emissions for all alternatives without the potential Watt Avenue interchange is shown in Table 5-14.

Table 5-14
Comparison of VMT and Operational Emissions for Build Alternatives in 2020[1]

Description	VMT	Emissions (lbs/day)				
		ROG	CO	NO_X	PM_{10}	SO_X
No-Build Alternative	17,725,900	8,900	68,320	9,880	1,440	160
Total Emissions Increase Over No-Build Alternative (lbs/day)						
Alternative 1	17,846,974	60	320	60	0	20
Alternative 2	17,875,272	60	420	80	20	20
Alternative 3	17,888,224	80	460	80	20	20
Alternative 4	17,871,573	60	400	80	20	20
Alternative 5	17,874,270	60	400	60	20	20
FRAQMD Significance Thresholds		***25***	***None***	***25***	***80***	***None***
PCAPCD Significance Thresholds		***82***	***550***	***82***	***82***	***136***

Note:
1. The net increase in emissions is calculated based on the comparison with the No-Build Alternative.

All build alternatives exceed the FRAQMD significance thresholds for ROG and NO_X, therefore, the project will have significant air quality impacts for these two pollutants under the FRAQMD thresholds. None of the build alternatives exceed the PCAPCD significance thresholds, therefore, under these thresholds, the project is considered to have less-than-significant air quality impacts. Since there will be a significant unavoidable adverse air quality impact, albeit only under one of the air district's thresholds, the impact is still substantial.

As shown in Table 5-14, Alternative 1 and Alternative 3 generate the least and most amount of pollutants, respectively. Hence, the implementation of Alternative 1 can be considered to have fewer air quality impacts when compared with the other four build alternatives. Conversely, implementation of Alternative 3 will generate the most air pollutants and potentially create the greatest air quality impacts. However, a comparison shows that most increases in criteria pollutants between Alternative 3 and the No-Build Alternative can be considered negligible. The incremental increase is approximately 0.8 percent for ROG, 0.6 percent for CO, 0.9 percent for NO_X, 1.3 percent for PM_{10}, and 12.5 percent for SO_X. The incremental increase, in percentage, is quantified by dividing the amount increased by the total amount

generated in the No-Build alternative. Incremental increases, in percentages, for other build alternatives will either be lower than or the same as Alternative 3. Although SO_X shows the highest increase, it should be noted that the amount of sulfur emitted correlates to the amount of sulfur in the fuel (i.e., a reduction in sulfur content in fuel will result in a lower amount of sulfur emitted.) Within California, ultra-low sulfur fuel (i.e., 15 ppm sulfur content) has been available for on-road vehicles since September 1, 2006. Therefore, sulfur emissions from vehicles are expected to be substantially lower in the future.

Additional Factors Affecting Air Quality

As fuel and vehicle technology improves over the next decade, vehicle emissions increases can be expected to be lower than the projections presented in Table 5-14; as this is already accounted for in the analysis model, these impacts are likely overstated.

The transportation analysis for Placer Parkway shows that the operation of Placer Parkway would alleviate traffic congestion on many arterial roadways within the TASA and AFA. Reducing traffic congestion would increase travel speed, which would reduce overall vehicle exhaust emissions (i.e., vehicle emissions are linearly correlated with travel speed). Historical and current studies and testing of vehicles show that lower travel speed results in emission of greater quantities of pollutants than vehicles traveling at higher speed (EMFAC2002, 2003).

Similarly, the Parkway would reduce VHD within the TASA and AFA, and would alleviate traffic congestion, reduce travel time, and increase average travel speed, resulting in reduced emissions (see Tables 5-15 and 5-16). While improved travel speed and reduced travel time are expected to reduce emissions, these reductions were not quantified because there are insufficient data at this Tier 1 level. To quantify pollutants from VHD, extremely detailed travel data would be required, such as travel speed for every type of vehicle for every hour in a day and the exact travel route. However, these factors related to reduced traffic congestion would likely reduce the emissions associated with the increase of VMTs. It is not known whether this reduction would reduce impacts related to air quality pollutant emissions to a less-than-significant level.

In addition to the increase in vehicle emissions, there would be an increase in emissions from the use of electricity or alternative power sources to operate traffic signals at on- and off-ramps and to power the lighting system along the corridor. The increase of these emissions may not occur within the region because electricity could be generated from another location beyond the study area (e.g., in another part of the state or in another state altogether). The level of emissions from these sources is negligible as traffic signals use a relatively small amount of energy in comparison to vehicle fuel consumption and lighting will be the minimum amount needed for safety purposes in accordance with Caltrans standards.

5.5 MOBILE SOURCE AIR TOXIC EMISSIONS

In addition to criteria pollutants, HAPs, and TACs, mobile source air toxics (MSATs) also present health concerns. MSATs are released as part of vehicle exhaust emissions and include acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde, diesel particulate matter (DPM), and diesel exhaust organic gases (FHWA, 2006a). Prolonged exposure to MSATs may cause cancer and/or other serious health effects, such as reproductive problems and birth defects. Such effects are also influenced by other variables, such as distance between sources of MSAT and sensitive receptors. The extent of potential health effects of MSATs from a particular project can only be determined quantitatively by conducting a detailed health risk assessment (HRA) to assess carcinogenic risks and acute and chronic noncancer health effects. The Placer Parkway HRA will be conducted as part of the Tier 2 environmental analysis.

Table 5-15
Estimated Vehicle Hours of Delay within Transportation Analysis Study Area (TASA)

LOS	Facility Type	Estimated 2020 Vehicle Hours of Delay (3-Hour AM and 3-Hour PM Commute Periods[1])

DPM is a primary contributor to carcinogenic health effects. The majority of DPM is emitted by heavy-duty trucks (i.e., 4 and 5 axles). Therefore, annual average daily traffic (AADT) data, including vehicle fleet mix (i.e., truck percentage) and existing vehicle data from nearby corridors are used to project the number of heavy-duty 4- and 5-axle trucks that will be traversing on Placer Parkway. Current data in the Transportation Technical Report projected AADT on Placer Parkway to be between approximately 40,300 and 71,700 vehicles in 2040 (DKS Associates, 2007). The AADT projection was derived from Caltrans traffic data for nearby transportation corridors (i.e., SR 65 and SR 99) that are considered to be representative of Placer Parkway (DKS Associates, 2007), with approximately 10 percent to 15 percent being trucks. In addition, existing Caltrans data on nearby transportation corridors show that more than half of the truck traffic (i.e., 61 percent) will be heavy-duty 4- and 5-axle trucks.

Taking the average value of AADT (i.e., ~56,000 vehicles per day), the average percentage of total traffic numbers comprised of truck traffic (i.e., 12.0 percent), the percentage of trucks that are heavy-duty 4- and 5-axle trucks, and the assumption that all 4- and 5-axle trucks operate on diesel fuel, it is estimated that approximately 4,100 diesel trucks will be traversing Placer Parkway on a daily basis. DPM emitted from these trucks has the potential to have detrimental health effects on sensitive receptors. Because of the proximity of the Parkway to existing and proposed developments, the *Air Quality and Land Use Handbook: A Community Health Perspective, April 2005* (California Environmental Protection Agency/CARB, 2005) was consulted to assess the potential impact of trucks using the Parkway on sensitive receptors in the study area. Such receptors include residences, schools, daycare centers, playgrounds, and medical facilities. The Air Quality Handbook recommends a distance of at least 500 feet between sensitive receptors and edge of roadways with daily vehicle traffic volumes exceeding 50,000. In traffic-related studies quoted in the CARB document, risks of other adverse health effects were identified within a distance of 1,000 feet, with greatest risks occurring within 300 feet. California freeway studies in the same CARB document show about a 70 percent drop-off in particulate pollution levels at 500 feet.

Ongoing MSAT exposure studies by scientists revealed that children living near busy transportation corridors (i.e., > 50,000 AADT) have increased risk of contracting respiratory ailments such as asthma and decreased lung functions. These respiratory ailments could continue well into early adulthood and may weaken their immune system and leave them vulnerable and more susceptible to other lung-related illnesses (e.g., pneumonia, infections). These studies also revealed that children living near large transportation corridors have similar health effects as children living in communities with the highest pollution levels (Lancet, 2007).

Unlike the criteria pollutants, MSATs are not subjected to national ambient air quality concentration standards. Similarly, states are not required to achieve an identified level of air toxics in the ambient air nor identify air toxics reduction measures in the SIP. Reduction of MSATs is a cooperative effort between federal and local reduction strategies. The Clean Air Act provides the U.S. EPA with authority to establish and regulate emission standards for engines and vehicles. The State of California also has the right to adopt its own emission regulations, which are often more stringent than the federal rules. To reduce mobile source emissions, mandatory and incentive-based programs are developed in conjunction with new engine emission regulations; additional emission testing requirements (i.e., Supplemental Emission Test [SET], Not-to-Exceed [NTE] limits); and limiting fuel sulfur content. These programs are implemented by all levels of government: federal, state, and local (Dieselnet, 2007).

To further reduce MSATs, in February 2007, U.S. EPA issued a final rule, *Control of Hazardous Air Pollutants from Mobile Sources: Final Rule to Reduce Mobile Source Air Toxics*, to reduce MSATs from mobile sources. The rule would lower benzene content in gasoline; reduce exhaust emissions from passenger vehicles operated at cold temperatures (i.e., < 75°F); and reduce emissions that evaporate from, and permeate through, portable fuel containers (OTAQ, 2007).

Even with the project's 500- to 1,000-foot-wide corridor widths, potential air toxic impacts could differ among the project's corridor alignment alternatives, depending on the roadway alignment within the selected corridor and its distance from existing/future sensitive receptors. Because the precise location of the alignment in any of the corridor alignment alternatives cannot be determined at this time, and the precise layout and location of future developments in the vicinity of the Parkway are not yet known, it is not possible to differentiate between build alternatives at the Tier 1 level of analysis with respect to air toxics. However, using the FHWA Interim Guidance (FHWA, 2006), some general statements can be made. Based on the projected ADT of 40,300 to 71,700 in 2040, Placer Parkway would most likely be characterized as a project with a low potential for MSAT emissions (ultimate traffic level less than 150,000 ADT). According to the FHWA Interim Guidance, the amount of MSATs emitted would be proportional to the VMT (assuming the fleet mix is the same for each alternative). The VMT differences between the alternatives, compared to the No-Build, vary from 0.68 percent to 0.92 percent, and are all less than a 1 percent increase over No-Build, as shown earlier in this section. Thus, it is expected there would be no appreciable difference in overall MSAT emissions among the various alternatives. "Also, regardless of the alternative chosen, emissions will likely be lower than present levels in the design year as a result of EPA's national control programs that are projected to reduce MSAT emissions by 57 to 87 percent from 2000 to 2020" (FHWA, 2006). In addition, as described earlier, the project will result in a decrease in vehicle hours of delay compared to the No-Build Alternative. As noted in the FHWA Interim Guidance, projects that result in increased travel speeds (travel occurring in less congested conditions) will reduce emissions of certain MSATs. Detailed analysis would be performed during the Tier 2 analysis for the Parkway, as determined appropriate at that time.

5.6 YEAR 2027 – CONFORMITY YEAR

The Transportation Conformity Rule (see Section 3.1) requires a regional emissions analysis to be performed by the Metropolitan Planning Organization (MPO) for projects within its jurisdiction, unless exempt. The regional emissions analysis includes all projects listed in the Regional Transportation Plan (RTP) and the Regional Transportation Improvement Program (RTIP) (see Section 3.2 for details).

The Placer County RTP is assessed for conformity along with the MTP by SACOG and submitted to the U.S. EPA for review and approval. Hence, if the MTP is approved for conformity by the FHWA and FTA, then all projects listed in the RTP are also considered conforming to the SIP. The Placer Parkway project was included in the MTP prepared in 2002, which had a 2025 planning horizon (MTP 2025).

In 2006, SACOG prepared an updated MTP for the SACOG region. This MTP updated the MTP 2025 and extended the planning horizon to 2027. The current MTP (MTP 2027) includes the Placer Parkway project.

As required by CEQA, SACOG evaluated the potential environmental impacts of MTP 2027. The environmental work for MTP 2027 analyzed each environmental impact category identified in the Environmental Impact Report for the MTP 2025 to determine whether there was a potentially different level of impact or a more severe impact in the MTP 2027 than in the MTP 2025. This analysis concluded that under the MTP 2027 there were no new significant impacts, nor were there any impacts that were more severe than that identified in the MTP 2025.

SACOG prepared an Addendum to the MTP 2025 EIR, which was adopted by the SACOG Board on March 16, 2006. Air Quality Conformity determinations were also approved by the SACOG Board on the same date. The MTP 2027 was submitted to FHWA on April 7, 2006 for approval. The conformity findings for the MTP 2027 were approved by the FHWA on April 20, 2006. Therefore, the 2027 MTP is considered to be conforming to the SIP, as are projects identified in the MTP 2027 such as the Placer Parkway project.

Most recently, SACOG is in the process of developing the 2035 MTP, which is a 28-year plan for improving transportation within the six-county region (i.e., El Dorado, Placer, Sacramento, Sutter, Yolo, and Yuba counties). In addition to the city- and county-designated transportation projects listed in the 2035 MTP, federal funding proposed for the 2035 MTP will also be used for transit, roads, neighborhood improvements, bike trails, and other transportation–related projects. Development of the 2035 MTP pro-actively links land use, air quality, and transportation needs. The development process includes the following steps:

1. Identify a list of transportation improvement projects to best meet the region's needs;
2. Prepare technical analyses of each feasible project from previous MTP and drop the less-qualified projects;
3. Prepare the draft MTP with four alternatives for discussion;
4. Solicit, address, and incorporate public input into draft MTP and review of environmental documents associated with the MTP;
5. Drop any other projects deemed non-feasible;
6. Recombine projects into Preferred Alternative and one or two additional alternatives;
7. Finalize Draft MTP with Embedded Metropolitan Transportation Improvement Program;
8. Distribute for Public Review and address comments; and
9. Adopt MTP.

6.0 SECONDARY AND INDIRECT IMPACTS

Recent FHWA, U.S. EPA, and Caltrans guidance on growth inducement (Mare Island Accord, 2006) advises that analysis of potential impacts associated with growth should include an evaluation of the effects of growth on resources of concern. The following discussion presents a qualitative evaluation of potential secondary and indirect impacts of Anticipated Growth (see below for definition) on human and environmental resources in the study area.

The Council on Environmental Quality (CEQ) provided clarification of the terminology "indirect impacts" when it issued its National Environmental Policy Act (NEPA) regulation in 1978. Secondary and indirect impacts are defined as impacts "caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable." Moreover, indirect effects ". . .may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems."

A key term used in this section is "Anticipated Growth." This is defined as the growth that is anticipated in the study area as described in the relevant General Plans and adopted regional forecasts, such as the SACOG Blueprint scenario (as detailed in the Community Impact Assessment), including additional growth that may occur as a result of major new development proposals that have not yet been formally approved. It is possible that this additional growth may accelerate the rate of buildout in the study area, but it is not ultimately expected to result in any greater levels of development than is presented in adopted regional forecasts.

The following discussion considers secondary and indirect impacts on air quality that may occur as a result of direct impacts associated with the Parkway as well as a result of anticipated growth, and associated changes in traffic patterns. The study area for the analysis of secondary and indirect impacts is shown on Figure 6-1.

6.1 GROWTH INDUCEMENT SCENARIO

NEPA and CEQA both require environmental analyses to consider the effects of a project on growth. Caltrans defines growth inducement as the relationship between a proposed project and growth. This section summarizes the relationship between the Placer Parkway Corridor Preservation project and regional growth, and discusses potential secondary and indirect effects of the project related to growth inducement.

While the project study area is predominantly undeveloped at this time, parts of the study area are within local General Plan designations allowing urban growth. In addition, numerous proposals for major new development projects in and around the study area depicted on Figure 6-2 are currently in various stages of the approval and entitlement process. Portions of the surrounding area (especially northern Sacramento County and southwestern Placer County) have developed very rapidly over the past several decades. This has occurred as a result of many factors, including continuing net population growth statewide, strong employment growth in the Sacramento region, relative housing affordability, and location amenities.

Population and employment growth projections for California and the Sacramento Region in general, and for southwestern Placer County and south Sutter County in particular (described in detail in the Community Impact Assessment [Mara Feeney & Associates and North Fork Associates, 2007]), indicate that that development pressures in the project vicinity will remain relatively intense, irrespective of the Parkway. Between 1950 and 2000, the population of California more than tripled. During the same period, population in the six-county SACOG region increased by more than 800 percent (DOF, 2006). Projections and established goals and policies from a wide range of sources, including SACOG, Sutter,

Placer, and Sacramento counties, and the Cities of Roseville, Rocklin and Lincoln, confirm that relatively high rates of population and employment growth and housing and commercial development are anticipated in the six-county region by 2050. Between 2000 and 2050, California's population is expected to increase from approximately 34 million to 55 million. During the same time period, SACOG projects that the region's growth will double, from 1.9 million in 2000 to 3.95 million in 2050, with the Roseville-Rocklin-Lincoln area remaining one of the fastest growing areas in the region (Levy and Doche-Boulos, 2005; SACOG, 2006c).

Placer Parkway would be growth inducing because it would help support changes in the amount of growth beyond current general plan levels, and could influence the pace and location of some development. It is likely that Placer Parkway could help to implement the various specific development proposals in the study area, since it would serve to relieve traffic congestion associated with these proposals. Furthermore, the Parkway could affect the timing of development in the vicinity of the proposed interchange locations, particularly those proposed near vacant land adjacent to rapidly developing areas or areas now proposed for urban development. It could result in different land uses, or more intensive land uses, in the vicinity of interchanges where land use plans are still being developed and have not yet been approved. Also, it could hasten the buildout of planned commercial and industrial uses, especially in the Sunset Industrial Area and proposed Placer Ranch Specific Plan area, as well as in the proposed Sutter Pointe Specific Plan area.

In the longer term, improved access provided to lands in the Western and Eastern segments could be a factor in stimulating additional growth and development in areas west of SR 70/99 not protected by the Natomas Basin Habitat Conservation Plan, or north of the Sutter Pointe Specific Plan area, or north of Sunset Boulevard West in Placer County. Although growth is anticipated in these areas over time (as reflected in SACOG's preferred Blueprint scenario, the Sutter County General Plan, and the City of Lincoln General Plan), such development is not reflected in general plans at present and has not been formally proposed by landowners. By providing improved access to adjacent areas, Placer Parkway could be one of many factors that would encourage growth in these areas sooner than this might otherwise occur.

The factors influencing growth in the region are complex. The Parkway is one of several major urban development proposals in the region. While Placer Parkway would contribute to regional growth, including growth beyond the level identified in current general plans, it is not feasible to quantify the amount of its contribution. A single new transportation facility such as the Parkway is only one of the many factors contributing to regional growth, and it is speculative to assign a particular quantity of growth to any one factor.

Furthermore, several factors serve to limit the likely effect of the Parkway on growth, including the following:

- No interchanges are proposed for any areas that are not already approved or proposed for development;
- All approved and proposed residential development that has not already been built is projected to be built out prior to 2020, when the Parkway is proposed to open; and
- Real estate market pressures in the area have been and continue to be intense without the Parkway, and local government jurisdictions have been supportive of processing development applications in spite of anticipated regional transportation challenges.

It is unlikely that the choice of one Placer Parkway build alternative over another would substantially change expected patterns of growth and development in the project study area and the surrounding region. In the Western Segment, all corridor alignment alternatives would provide new access to an area that is

currently undeveloped farmland, but that is proposed for mixed use urban development. The three more southerly alignments (Alternatives 1, 2, and 3) would provide two interchanges in the Sutter Pointe Specific Plan area, while the more northerly alignments (Alternatives 4 and 5) would provide only one interchange in this area, approximately 1 mile farther north of the more southerly alignments in the Western Segment. Since none of the alternative alignments would include any intersections in the Central Segment, there would be little difference in growth inducement effects among the alternatives in this segment. In the Eastern Segment, two interchanges are proposed within the existing Sunset Industrial Area Plan, in an area proposed for the Placer Ranch Specific Plan. While these interchanges would provide new access to a currently undeveloped area, this area is planned for growth. In the Eastern Segment all alternatives would follow an identical alignment, so there would be no differences in growth inducement effects among the alternatives.

A future interchange at Watt Avenue could be growth inducing, because it would provide major new regional access to a portion of the project study area that is currently rural and undeveloped, although both conceptual interchange locations are now surrounded by formal development proposals or land controlled by development interests. A Watt Avenue interchange is not proposed as part of the Placer Parkway project.

The following secondary and indirect effects discussion considers impacts on air quality that may occur as a result of direct impacts associated with the Parkway, and also as a result of changes in traffic patterns as a result of anticipated growth.

6.2 SECONDARY AND INDIRECT EFFECT EVALUATION

Anticipated growth could result in secondary and indirect impacts on air quality that have not been evaluated in this Technical Study. Although the extent of such impacts cannot be determined at this Tier 1/Program level of environmental analysis, it is likely that this would be affected by a range of factors, such as type of growth (e.g., type of development [residential, commercial, industrial]), speed of growth (i.e., is rate of growth in-line with the regional projection and applicable General Plan), and viability of growth (i.e., is it temporary or permanent).

It is possible that this could result in regionally significant air quality impacts depending on whether growth occurs within the region or within the city limits or the Sphere of Influence of the cities of Roseville, Rocklin, Loomis, and Lincoln. If such growth was considered in the General Plan, then associated air quality impacts will have been taken into account in the SIP. If such growth is not accounted for in the General Plan, then it would be non-conforming to the SIP and may affect the goals of the local AQMP, which is to attain the AAQS.

6.2.1 No-Build Alternative

If Placer Parkway were not constructed, land would not be acquired for the Parkway and the Parkway would not be constructed. There would not be any secondary or indirect impacts on air quality under the No-Build Alternative.

6.2.2 Build Alternatives

Construction and operation of the Parkway and Parkway-induced growth could result in secondary impacts on air quality.

Anticipated growth would be expected to generate additional traffic in the study area that would most likely not have occurred in the absence of such growth. New traffic patterns and increased traffic volumes could adversely affect air quality, particularly if this results in additional congestion on roads in

the study area. These impacts would be direct impacts of other projects not associated with Placer Parkway, and would be required to be analyzed as part of independent environmental review.

Although it is not feasible to perform a detailed evaluation of these projects at this stage as specific design details are not known, potential impacts are taken into account in the Placer Parkway 2040 Cumulative analysis (see Section 7.2). This analysis evaluates a 2040 cumulative scenario, which is considered to be an appropriate projection of future development. This scenario includes full residential build-out in Placer County west of Sierra College Boulevard, including general plan areas and major developments, and employment and population growth in line with SACOG forecasts. It assumes levels of growth and development will occur at the higher end of a potential feasible range, and therefore represents a reasonable maximum development scenario for which cumulative and secondary and indirect impacts have been analyzed.

Although it is not possible to predict with any certainty where congestion associated with anticipated growth might occur, it is reasonable to assume that pollutant emissions associated with such congestion could adversely affect air quality. This could occur in a number of ways:

- Increased risk of adverse health effects on humans residing in areas affected by poor air quality;
- Impacts on pollution-sensitive wildlife species, such as lichens; and
- Contribution to climate change associated with higher levels of atmospheric carbon dioxide (CO_2) generated from vehicle emissions.

Similar secondary impacts could also occur as a result of emissions from construction vehicles and equipment during the construction of the Parkway, and through generation of mobile-source pollutants from vehicles using the Parkway. Conversely, the operation of the Parkway would reduce traffic congestion on numerous streets within the project study area, reduce travel time, and increase travel speed, which could potentially offset the increase in criteria pollutants.

6.2.3 Greenhouse Gases

Greenhouse gases (GHG) are chemical compounds found in the earth's atmosphere, and which can affect the temperature of the earth's surface. Many are naturally occurring compounds such as water vapor, carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), and ozone (O_3). Synthetic compounds that are also classed as GHG include chlorofluorocarbons (CFCs), halogenated fluorocarbons (HFCs), and partially halogenated chlorofluorocarbons (HCFCs). GHGs are emitted from numerous commercial and industrial processes, with major sources of emissions resulting from burning of fossil fuels such as petroleum, coal, and natural gas, and vehicular exhaust emissions.

Additionally, gases referred to as "ozone precursors" (i.e., CO, NO_X, and nonmethane volatile organic compounds [NMVOCs]) can indirectly influence the formation and destruction of ozone, which itself has a direct radiative force. Greenhouse gases absorb the sun's radiation, and increased levels can inhibit the Earth's natural ability to radiate energy back to space, thereby, allowing less heat to escape and creating a "greenhouse effect." This greenhouse effect results in warming of the earth's surface and the lower atmosphere. Global warming is defined as an average increase in the temperature of the atmosphere near the earth's surface and the lowest part of the atmosphere, which can contribute to changes in global climate patterns. Climate change is any significant change in measures of climate (such as temperature, rainfall patterns, snow and ice cover, sea level, or wind, lasting for an extended period (decades or longer) (U.S. EPA 2007a and b). For purposes of this EIS/EIR, global warming, climate change and the greenhouse effect are used interchangeably. The greenhouse effect has worsened over the last 50 years due to anthropogenic activities (California Climate Change Portal, 2005). While this view is widely held, there is not universal agreement on the effect of human activities on climate change. Natural factors and natural processes are also sources of climate change (U.S. EPA, 2007a and b).

In California, transportation activities averaged approximately 59 percent of the total CO_2 emissions from fossil fuel combustion in California between 1990 and 1999. CO_2 emissions remained relatively constant during the 1990s, with approximately 200 million metric tons of CO_2 emitted annually. Within the transportation sector, motor gasoline consumption accounted for the greatest portion of emissions, with 36 percent of CO_2 emissions from fossil fuel combustion in 1999 (California Climate Change Portal, 2005).

On September 27, 2006, the Governor of California signed Assembly Bill 32 (AB32), the Global Warming Solutions Act, to reduce GHG emissions in California. The goals of AB32 are to reduce GHG to year 2000 levels by 2010; and to 1990 levels by 2020. Executive Order S-3-05 includes an additional reduction goal: 80 percent below 1990 levels by 2050. Provisions within AB32 provide CARB with the authority and responsibility to develop and enforce a GHG reduction program. By January 1, 2008, CARB will determine what the statewide greenhouse gas emissions level was in 1990, and approve a statewide greenhouse gas emissions limit that is equivalent to that level, to be achieved by 2020. The inventory would rely on data from existing and projections for future mobile, area, and stationary emission sources. Mobile data are readily available from CARB and MPOs. To procure GHG data from other sources, CARB would develop GHG reporting requirements for major industries and use growth projection data provided in General Plans.

6.2.3.1 GHG Analysis Under CEQA and NEPA

This Tier 1 EIS/EIR addresses project GHG emissions to the extent feasible at this time. There are no accepted thresholds for significance or magnitude relative to GHG emissions. Thus, there is no consistent means of determining whether project impacts, to the extent they can be identified, will make a "significant" or "substantial" contribution to greenhouse gases. In addition, global warming is a cumulative, world-wide environmental phenomenon, but there are no established mitigation measures that can be identified as reasonably sure to address and reduce the global problem. Measures that will reduce an individual project's GHG emissions have been identified, and it is expected that additional technological solutions will be available in the future (see the Findings and Declarations of AB 32, referencing the investment in the development of innovative and pioneering technologies to assist California in reaching the 2020 limit on GHG emissions). However, there is no way to correlate an individual project's impacts or reductions on this global phenomenon.

AB 32 does not directly amend CEQA. Instead, it provides for creation of a greenhouse gas emissions program, as described above. Under AB 32, CARB will implement GHG emissions reductions on a timetable that involves multiple steps, leading to regulations on or before January 1, 2011, that will become operative on January 1, 2012. Until that time, the potential source characterization of, and significance of emissions related to, new infrastructure will not be known, and numeric thresholds of significance cannot be established.

Factually, the carbon footprint of a roadway derives from a variety of sources, some of which are already subject to other requirements to achieve reductions in greenhouse gases. For example, California Executive Order S-01-07, signed January 18, 2007, establishes a low carbon fuel standard with a statewide goal of reducing the carbon intensity of California's transportation fuels by at least 10 percent by 2020. The relationship of project impacts, as mitigated by compliance with current requirements, and AB 32 reduction requirements that are yet to be established, are not known.

Direct impacts on climate change from a roadway are difficult to determine because infrastructure does not constitute a separate source of greenhouse gas emissions, distinct from overall emissions in the area. Potential cumulative incremental climate change impacts related to urban development, including infrastructure, cannot be discerned with a high degree of certainty. This Tier 1 EIS/EIR assesses the project's greenhouse gas emissions to the extent feasible. The assessment of impacts incorporates many

assumptions and generalized formulas. Impacts may be substantially overstated because of these limitations.

In making CEQA findings, CEQA provides that an agency can find that a mitigation measure is "within the responsibility and jurisdiction of another public agency and have been, or can and should be, adopted by that other agency" (Public Resources Code section 21081(a)(2)). Greenhouse gas emissions resulting from tailpipe emissions are not within SPRTA's jurisdiction; they are the responsibility of the state and federal government. Thus, there is an argument that CEQA does not require the mitigation of these impacts on a project-by-project basis by SPRTA.

Under NEPA, all relevant and reasonable mitigation measures that could improve the project are to be identified, "even if they are outside the jurisdiction of the lead agency … and thus would not be committed as part of the ROD" (40 Most Asked Questions Concerning CEQ's NEPA Regulations, Question 19b, 1986). In the case of GHG, relevant and reasonable mitigation measures are within the jurisdiction of several state and federal agencies.

The California Climate Action Registry (CCAR) is authorized to establish methodologies to quantify greenhouse gas emissions (SB 1771 (Sher) 2000, and amended in 2001 by SB 527). CCAR publication "General Reporting Protocol, Version 2.2," March 2007 limits calculations of greenhouse gas emissions to those operations or facilities owned or controlled by the entity responsible for the emissions (Part II, Chapter 2). This statutorily authorized methodology recognizes that an entity cannot be responsible for emissions that it does not control. Once Placer Parkway is opened, SPRTA will not own the vehicles that use the road, and SPRTA will not control the vehicles in any way that could translate to the ability to reduce greenhouse gas emissions.

6.2.3.2 Construction Impacts

GHG would be generated during construction and operation of the Parkway. Construction activities would likely result in unavoidable and temporary increase of GHG, based on current, readily available construction equipment technology, which is likely to be improved to reduce GHG emissions by the time the project is constructed in approximately 2020. This Tier 1 analysis does not provide a construction level of clearance and, due to the level of detail available at this time, there is no project-specific data (e.g., construction timeline, equipment type and quantity), by which GHG associated with construction activities can be analyzed in this Tier 1 document.

6.2.3.3 Operational Impacts

GHG associated with the Parkway can only be preliminarily quantified at this time, based on the information available. Data such as VMT, traffic volume, vehicle fleet mix, LOS, vehicle operating time, net change in travel time, and fuel consumption for all affected roadways are integral to an accurate estimation of GHG emissions. However, because this is a Tier 1 analysis analyzing alternative corridors, and not a specific roadway alignment, not all data is available for the Tier 1 analysis. Therefore, GHG emissions from operation of the Parkway were estimated using only VMT data. VMT data estimated for the Parkway using traffic data for the No-Build and build alternatives were used as input parameters into the EMFAC2002 model. Currently, an accurate method to quantify the magnitude of CO_2 emissions emitted from vehicle exhausts does not exist because of all the different additives in fuel (e.g., ethanol, methyl tertiary-butyl ether, and feedstock). The additives affect the oxidation capability of carbon in fuel during combustion and there is not a complete conversion of all carbon to CO_2 (OTAQ, 2005). Because the EMFAC2002 model only provides CO_2 data, it was assumed that all fuel carbon would oxidize during combustion and convert to CO_2 emissions emitted from vehicles, and that these are directly converted to GHG. This is a conservative approach and results in an overestimate of GHG because not all of the fuel carbon would be converted.

CO_2 emission's were quantified using the EMFAC2002 model with VMT for the No-Build and build alternatives as model input. Compared to the No-Build Alternative, CO_2 emissions would increase by a maximum of 1.37 percent in 2020 and 2.02 percent in 2040. This increase does not account for emission reduced due to the decrease in travel time, faster traveling speed, and less congested roadways (i.e., VHD) related to project implementation.

The differences in travel time for each impacted roadway segment, LOS, vehicle trip data, and average travel speed on similar segments can be used to calculate the amount of GHGs generated from the No-Build and build alternatives when that information is available in the future. These detailed calculations will be conducted in the Tier 2 analysis. The amount of CO_2 emissions from vehicles are directly correlated with VMT, therefore, an increase in VMT would result in an increase of GHG/CO_2 emissions. Based solely on this factor, the alternatives with the greatest VMT would contribute the most GHG emissions. However, these emissions are expected to be offset by reductions in travel in congested conditions. Using only VMT data to quantify CO_2 emissions for all the build alternatives is conservative, and overestimates impacts because it does not account for all the congestion relief and travel time reductions associated with the Parkway. Project benefits such as reduction of VMT on congested roadways within the AFA and the reduction of VHD within the TASA and AFA would further reduce CO_2 emissions and potentially show negligible or beneficial differences between the No-Build and build alternatives. Vehicle hours of delay reductions are shown in Tables 5-15 and 5-16, but have not been incorporated into the CO_2 calculations at this time because they are based on rough estimates of speeds that will be refined at Tier 2. Nevertheless, the tables provide an indication of the general magnitude of reduction in vehicle hours of delay, which would reduce the emissions from the slight increase in vehicle miles traveled.

Since there are no thresholds for determining the level of climate change impact from the emissions described above, it is appropriate to evaluate potential impacts based on an assessment of the project's compliance with applicable regional planning and air quality policies. CO_2 emissions emitted from motor vehicles are currently unregulated. However, to meet clean air goals, other mobile air pollutants are regulated. As such, the Clean Air Act's conformity process establishes the link between transportation and air quality planning processes. Conformity is a way to ensure that federal funding and approval are only granted to transportation activities that are consistent with air quality goals. While the focus of approved conforming transportation activities is to reduce the amount of criteria air pollutants, reductions in energy use and other objectives of conforming projects will also reduce CO_2 emission. Federal, state, and local transportation planning goals and policies also focus on transportation system management programs to reduce congestion through improving traffic flow. Promoting efficient travel movement and various travel demand management programs (i.e., ride sharing, transit, and pedestrian and bicycle programs) will minimize the aggregate number of single occupancy trips and miles traveled. The ancillary benefits of these transportation programs also reduce greenhouse gas emissions. As previously described in Sections 3.1 and 3.2.2, Placer Parkway is included in the RTIP, which has been determined to conform with the SIP.

As described in Chapter 1, Introduction, Placer Parkway is consistent with, and included in, the SACOG Blueprint. Caltrans recognizes regional integrated planning and transportation programs such as the SACOG Blueprint, as an important component of reducing fuel use, and related GHGs. For example, the December 2006 report "Climate Action Program at Caltrans" published by Caltrans/Business, Transportation, and Housing Agency references Regional Blueprint planning as one component of Caltrans' strategy to reduce GHG emissions from transportation (see Climate Action Program at Caltrans, pp. 6, 8-9). Thus, Placer Parkway is a component of the SACOG Blueprint, and as such, is consistent with established policies and methods to reduce GHGs. Other strategies to reduce GHG could consist of landscaping, as described in Section 2.2.5, using energy-efficient light bulbs for lighting systems, and additional design features that would reduce overall energy use.

7.0 CUMULATIVE IMPACTS

7.1 CUMULATIVE IMPACT SCENARIO

Analysis of cumulative impacts is required under NEPA and CEQA. Cumulative impacts result when the effects of an action are added to or interact with other effects in a particular place and within a particular time. It is the combination of these effects, and any resulting environmental degradation, that are the focus of cumulative impact analysis. The Council on Environmental Quality's regulations (CEQ, 1987) explicitly state that cumulative impacts must be evaluated along with the direct and indirect effects of each alternative.

CEQA defines cumulative impacts as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts" (CEQA Guidelines, §15355). Stated another way, "a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the environmental document together with other projects causing related impacts" (CEQA Guidelines, §15130). Although a project may cause an individually limited or individually minor incremental impact that, by itself, is not significant, the increment may be "cumulatively considerable" and thus significant.

FHWA has requested that cumulative conditions for the analysis of project alternatives in the Tier 1 EIS/EIR on the Parkway be based on development levels that are 20 years beyond the projected opening of Placer Parkway. For planning purposes, PCTPA has identified 2020 as the opening year. Cumulative impacts are therefore being evaluated for 2040. This 2040 scenario includes the following projects (see Figure 6-2):

- Full build-out of all residential land in Placer County west of Sierra College Boulevard, including current general plan areas and the following major development proposals in west Placer County and south Sutter County:
  - The Creekview and Sierra Vista Specific Plan areas in Roseville's Memorandum of Understanding (MOU) Remainder Area
  - The Sphere of Influence (SOI) expansion areas of Lincoln
  - The Placer Vineyards, Regional University, and Placer Ranch Specific Plans in unincorporated Placer County
  - The Curry Creek Community Plan area
- Growth in retail employment in Placer County that balances the growth in residential development by matching SACOG's countywide estimate of about 0.32 employee per dwelling unit from their 2025 forecasts.
- Growth in total employment levels in Placer County that balances the growth in residential development by matching SACOG's 1.3 employees per dwelling unit from their 2025 forecasts.
- Full build-out of the residential development in the Sutter Pointe Specific Plan area along with a non-residential development level that balances the residential development in that area.
- Estimated 2040 developments in all other portions of SACOG's six-county region based on assuming a constant rate for the development growth between 2005 levels and the 2050 Preferred Blueprint scenario for each of SACOG's traffic analysis zones (TAZs).

7.2 CUMULATIVE IMPACT EVALUATION

The cumulative development scenario would result in development of a large portion of the study area and adjacent areas. This would result in an increase in vehicular emissions and other air pollutants associated with increased residential, commercial, educational, and industrial development.

Without the Parkway, traffic volumes are expected to increase by up to 100,000 vehicles per day on portions of SR 65 and SR 70/99. Growth in population and employment in the six-county Sacramento region, and especially growth in south/west Placer County, south Sutter County, and north Sacramento County will influence travel demand in and around the study area. Within the study area roadways, the increase in vehicles per day is expected to range from 2,700 vehicles on portions of Brewer Road to as much as 51,400 more vehicles on Pleasant Grove Boulevard east of Woodcreek Oaks Boulevard.

All of the build alternatives would increase the total VMT in the study area and would reduce vehicle hours of delay, as compared to the 2040 No-Build scenario. Based on the increase in traffic associated with this level of development (DKS Associates, 2007), the combined air quality impacts from both the Parkway and other projects would be cumulatively significant.

The Parkway transportation analysis indicates that a comparison between the No-Build Alternative and build alternatives in 2040 would decrease traffic on many arterial/collector roadway segments in western Roseville, unincorporated portions of west Placer County and unincorporated portions of south Sutter County. While all of the build alternatives would decrease traffic volumes on many roadway segments, they would all cause increases in traffic volumes on the following:

- SR 70/99 south of the Placer Parkway connector
- SR 65 north of the Placer Parkway connector
- Rocklin's Whitney Ranch Parkway and the future Valley View Parkway
- Some roadways near future Placer Parkway interchanges

The Parkway transportation analysis summarized VMT data in 2040 for the roadways that would operate at LOS F for one hour, two hours and for three or more hours and concluded that:

- Compared to the No-Build Alternative, all build alternatives would increase the total VMT in the TASA
- Compared to the No-Build Alternative, all build alternatives would reduce the VMT on congested roadways, especially in the AFA. For each alternative, the scenarios with a Watt Avenue interchange would provide a larger reduction in the VMT on congested roadways than without this interchange.

In 2040, Placer Parkway is expected to be fully operational as a six-lane facility (some portions may remain at four lanes depending on traffic volumes). Similar to the 2020 conditions, 2040 VMT data were used as input parameters into the EMFAC2002 model to estimate criteria pollutants emitted for each alternative. The study area for air quality cumulative impacts is the TASA and AFA.

7.2.1 No-Build Alternative

Emissions from the No-Build Alternative were quantified using projected VMTs for the study area assuming vehicle movement within the region traverses between the two state routes using I-80, I-5, and other viable arterial roads that provide connections within the Transportation Analysis Study Area. VMT and associated emissions for 2040 are presented in Table 7-1. The No-Build Alternative includes anticipated emissions associated with traffic generated by the other projects in the cumulative development scenario expected to be developed in the study area by 2040.

Table 7-1
VMT and Criteria Pollutant Emissions for No-Build Alternative in 2040

Description	VMT	ROG (lbs/day)	CO (lbs/day)	NO_X (lbs/day)	PM_{10} (lbs/day)	SO_X (lbs/day)
No-Build Alternative	25,983,131	6,060	44,260	4,960	2,100	240

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

7.2.2 Alternative 1 – the Red Alternative

The analysis includes three Alternative 1 scenarios: Alternative 1 without a Watt Avenue interchange (the proposed project), and Alternative 1 with two potential Watt Avenue interchanges (see Figure 2-3). Construction of a Watt Avenue interchange is not a part of the project, although it could be constructed by others as a separate project, subject to its own environmental review. A Watt Avenue interchange would generate additional VMT in the study because it would potentially serve future development areas.

Alternative 1 would provide two interchanges within the Sutter Pointe Specific Plan area in addition to a connection to SR 70/99 north of Riego Road. It would provide two interchanges within the Placer Ranch Specific Plan area, and an interchange with SR 65 at Whitney Ranch Parkway.

Total estimated emissions for all Alternative 1 scenarios are presented in Table 7-2.

Table 7-2
VMT and Criteria Pollutant Emissions for Alternative 1 in 2040

Description	VMT	ROG (lbs/day)	CO (lbs/day)	NO_X (lbs/day)	PM_{10} (lbs/day)	SO_X (lbs/day)
No-Build Alternative	25,983,131	6,060	44,260	4,960	2,100	240
Alternative 1	26,424,662	6,160	44,680	5,040	2,120	260
Alternative 1 with Watt Avenue interchange Option 1	26,524,214	6,180	44,780	5,060	2,140	260
Alternative 1 with Watt Avenue interchange Option 2	26,595,959	6,200	44,820	5,080	2,140	260

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

Compared to the No-Build Alternative, Alternative 1 would:

- Increase VMT by 1.7 percent
- Increase ROG by 1.7 percent
- Increase CO by 1.0 percent
- Increase NO_X by 1.6 percent
- Increase PM_{10} by 1.0 percent
- Increase SO_X by 8.3 percent

Under Alternative 1, either Watt Avenue interchange option would increase VMT, ROG, CO, and NO_X as compared to the Parkway. Emissions of SO_X would be similar. An Option One interchange (close to Baseline Road) would increase VMT, ROG, CO, NO_X, and PM_{10} more than would Option Two.

7.2.3 Alternative 2 – the Orange Alternative

Table 7-3 presents estimated pollutant emission information for Alternative 2, as well as with a Watt Avenue interchange (see Figure 2-3). Interchanges would be similar to Alternative 1.

Table 7-3
VMT and Criteria Pollutant Emissions for Alternative 2 in 2040

Description	VMT	ROG (lbs/day)	CO (lbs/day)	NO_X (lbs/day)	PM_{10} (lbs/day)	SO_X (lbs/day)
No-Build Alternative	25,983,131	6,060	44,260	4,960	2,100	240
Build – Alternative 2	26,477,729	6,180	44,740	5,060	2,120	260
Build – Alternative 2 with Watt Avenue interchange	26,569,226	6,200	44,760	5,060	2,120	260

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

Compared to the No-Build Alternative, Alternative 2 would:

- Increase VMT by 1.9 percent
- Increase ROG by 2 percent
- Increase CO by 1.1 percent
- Increase NO_X by 2 percent
- Increase PM_{10} by 1.0 percent
- Increase SO_X by 8.3 percent

Under Alternative 2, a Watt Avenue interchange would increase VMT, ROG, CO, NO_X, and PM_{10} as compared to the proposed project. Emissions of SO_X would be similar.

7.2.4 Alternative 3 – the Blue Alternative

Table 7-4 presents estimated pollutant emission information for Alternative 3, as well as with a Watt Avenue interchange (see Figure 2-3). Interchanges would be similar to Alternative 1.

Compared to the No-Build Alternative, Alternative 3 would:

- Increase VMT by 1.9 percent
- Increase ROG by 2 percent
- Increase CO by 1.1 percent
- Increase NO_X by 2 percent
- Increase PM_{10} by 1.0 percent
- Increase SO_X by 8.3 percent

Under Alternative 3, a Watt Avenue interchange would increase VMT, ROG, CO, NO_X, and PM_{10} as compared to the proposed project. Emissions of SO_X would be similar.

Table 7-4
VMT and Criteria Pollutants for Alternative 3 in 2040

Description	VMT	ROG (lbs/day)	CO (lbs/day)	NO_X (lbs/day)	PM_{10} (lbs/day)	SO_X (lbs/day)
No-Build Alternative	25,983,131	6,060	44,260	4,960	2,100	240
Build – Alternative 3	26,488,169	6,180	44,760	5,060	2,120	260
Build – Alternative 3 with Watt Avenue interchange	26,548,787	6,200	44,800	5,060	2,140	260

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

7.2.5 Alternative 4 – the Yellow Alternative

Table 7-5 presents estimated pollutant emission information for Alternative 4, as well as with a Watt Avenue interchange (see Figure 2-3). Alternative 4 would provide one interchange within the proposed Measure "M" Area in addition to a connection to SR 70/99 north of Riego Road. It would provide two interchanges within the Placer Ranch Specific Plan area, and an interchange with SR 65 at Whitney Ranch Parkway.

Table 7-5
VMT and Criteria Pollutant Emissions for Alternative 4 in 2040

Description	VMT	ROG (lbs/day)	CO (lbs/day)	NO_X (lbs/day)	PM_{10} (lbs/day)	SO_X (lbs/day)
No-Build Alternative	25,983,131	6,060	44,260	4,960	2,100	240
Alternative 4	26,482,450	6,180	44,760	5,060	2,120	260
Alternative 4 with Watt Avenue interchange	26,546,653	6,200	44,820	5,060	2,140	260

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

Compared to the No-Build Alternative, Alternative 4 would:

- Increase VMT by 1.9 percent
- Increase ROG by 2 percent
- Increase CO by 1.1 percent
- Increase NO_X by 2 percent
- Increase PM_{10} by 1.0 percent
- Increase SO_X by 8.3 percent

Under Alternative 4, a Watt Avenue interchange would increase VMT, CO, NO_X, and PM_{10} as compared to the proposed project. Emissions of ROG and SO_X would be similar.

7.2.6 Alternative 5 – the Green Alternative

Table 7-6 presents estimated pollutant emission information for Alternative 5, as well as with a Watt Avenue interchange (see Figure 2-3). Interchanges would be similar to Alternative 4.

Table 7-6
VMT and Criteria Pollutant Emissions for Alternative 5 in 2040

Description	VMT	ROG (lbs/day)	CO (lbs/day)	NO_X (lbs/day)	PM_{10} (lbs/day)	SO_X (lbs/day)
No-Build Alternative	25,983,131	6,060	44,260	4,960	2,100	240
Alternative 5	26,461,066	6,180	44,720	5,060	2,120	260
Alternative 5 with Watt Avenue interchange	26,533,413	6,180	44,800	5,060	2,140	260

Notes:
1. VMT data are from the Placer Pkwy VMT – 5mph Spds Bin – (values).xls, March 21, 2007, prepared by DKS Associates for this project.
2. Pollutants are calculated using the Burden option in CARB's EMFAC2002 model and project-specific VMT data.

Compared to the No-Build Alternative, Alternative 5 would:

- Increase VMT by 1.8 percent
- Increase ROG by 2.0 percent
- Increase CO by 1.0 percent
- Increase NO_X by 2 percent
- Increase PM_{10} by 1.0 percent
- Increase SO_X by 8.3 percent

Under Alternative 5, a Watt Avenue interchange would increase VMT, ROG, CO, and NO_X as compared to the proposed project. Emissions of PM_{10} and SO_X would be similar.

7.3 SUMMARY OF CUMULATIVE IMPACTS

Potential impacts to air quality could occur during construction of Placer Parkway as a result of the generation of pollutants from construction vehicles and equipment as development projects under the 2040 scenario are built along with portions of Placer Parkway. Impacts could also occur through the generation of pollutants from vehicles using Placer Parkway. The new Parkway would generate an increase in VMTs, which is typically associated with an increase of vehicle exhaust pollution. The comparison of VMT and estimated operational emissions for all alternatives excluding the Watt Avenue interchange under the cumulative impact scenario is shown in Table 7-7.

As shown in Table 7-7, the alternatives generating the most air pollutants can be associated with the highest VMT. Alternatives are ranked from the least impact on air quality to the most impact, as follows: No-Build Alternative, Alternative 1, Alternative 5, Alternative 2, Alternative 4, and Alternative 3. However, the increase in criteria pollutants between Alternative 3 and the No-Build Alternative in 2040 shows that most increases in criteria pollutants can be considered negligible. The incremental increase is approximately 2 percent for ROG, 1 percent for CO, 2 percent for NO_X, 1 percent for PM_{10}, and 8.3 percent for SO_X. The incremental increase, in percentage, is quantified by dividing the amount increased by the total amount generated in the No-Build Alternative. Incremental increases, in percentages, for other build alternatives will either be lower than or the same as Alternative 3. Although SO_X shows the highest increase, it should be noted that the amount of sulfur emitted correlates to the

Table 7-7
Operational Emissions from All Alternatives in 2040

Description	VMT	ROG (lbs/day)	CO (lbs/day)	NO_X (lbs/day)	PM_{10} (lbs/day)	SO_X (lbs/day)
No-Build	25,983,131	6,060	44,260	4,960	2,100	240
Alternative 1	26,424,662	6,160	44,680	5,040	2,120	260
Alternative 2	26,477,729	6,180	44,740	5,060	2,120	260
Alternative 3	26,488,169	6,180	44,760	5,060	2,120	260
Alternative 4	26,482,450	6,180	44,760	5,060	2,120	260
Alternative 5	26,461,066	6,180	44,720	5,060	2,120	260
Note: 1. Vehicle emissions are calculated using EMFAC2002 mobile emission factor and methodology prescribed by CARB.						

amount of sulfur in the fuel (i.e., a reduction in sulfur content in fuel will result in a lower amount of sulfur emitted.) Within California, ultra-low sulfur fuel (i.e., 15 ppm sulfur content) has been available for on-road vehicles since September 1, 2006. Therefore, sulfur emissions from vehicles are expected to be substantially lower in the future. The increase of daily emissions from all five alternatives in 2040 relative to the No-Build Alternative is provided in Table 7-8. The PCAPCD and FRAQMD significance thresholds are also presented in this table to determine whether the operation of the alternatives would create significant air quality impacts.

Table 7-8
Comparison of VMT and Operational Emissions from All Alternatives in 2040

Description	VMT	Emissions (lbs/day)				
		ROG	CO	NO_X	PM_{10}	SO_X
No Build Alternative	25,983,131	6,060	44,260	4,960	2,100	240
Total Emissions Increase Over No-Build Alternative (lbs/day)						
Alternative 1	26,424,662	100	420	80	20	20
Alternative 2	26,477,729	120	480	100	20	20
Alternative 3	26,488,169	120	500	100	20	20
Alternative 4	26,482,450	120	500	100	20	20
Alternative 5	26,461,066	120	460	100	20	20
FRAQMD Significant Thresholds		25	None	25	80	None
PCAPCD Significant Thresholds		82	550	82	82	136
Notes: 1. The difference in emissions is calculated based on the comparison with the No-Build Alternative.						

All Watt Avenue interchanges would result in increased emissions as compared with all Placer Parkway alternatives, including the No-Build Alternative.

Under cumulative conditions, incremental emissions associated with all build alternatives relative to the No-Build Alternative would exceed the FRAQMD significance thresholds for ROG and NO_X. All build alternatives would exceed the PCAPCD significance threshold for ROG. Similarly, all build alternatives would exceed the PCAPCD significance threshold for NO_X, with the exception of Alternative 1.

As fuel and vehicle technology improves over the next decade, vehicle emissions can be expected to be lower than those presented in Table 7-8. In addition, emissions associated with the reduction of VHD were not quantified because of lack of detailed data and were not included in Table 7-8. Therefore, the reduction of emissions associated with the reduced VHD could potentially result in lower emissions than the levels reported. Based on the early planning stage of this project, without verifiable and quantifiable data, air quality impacts from the operation of any of these alternatives are considered unavoidable and significant relative to existing significance thresholds.

All Placer Parkway alternatives would increase the total vehicle miles traveled in the traffic study area, and would reduce VHD, as compared to the 2040 No-Build scenario. The air quality analysis shows that Placer Parkway would contribute an additional increment to pollutant emissions to cumulatively significant air quality impacts in 2040. On an overall basis, the Parkway's incremental contribution to significant cumulative air quality impacts would be considerable. Incremental air quality impacts over the No-Build Alternative related to Placer Parkway would be significant and unavoidable.

7.3.1 Greenhouse Gases

GHG associated with the Parkway for 2040 were quantified using the EMFAC2002 model and VMT data for the No-Build and build alternatives. As previously mentioned, it was assumed that all CO_2 emissions emitted from vehicles are directly converted to GHG. Compared with the No-Build Alternative, CO_2 emissions would increase by a maximum of 2.02 percent in 2040.

CO_2 emissions estimated for all the build alternatives are considered to be overly conservative because only VMT data was used and other benefits of the Parkway such as reduction of VMT on congested roadways within the AFA and the reduction of VHD within the TASA and AFA were not included in the calculation of GHG. The inclusion of all the benefits associated with the Parkway would reduce CO_2 emissions for all the build alternatives, and would offset to some extent, or possibly neutralize, GHGs from the build alternatives.

8.0 AVOIDANCE, MINIMIZATION, AND/OR MITIGATION STRATEGIES

During construction of the Parkway, there may be a potential for significant air quality impacts; therefore, as required by FRAQMD and/or PCAPCD, the following mitigation strategies shall be considered during construction activities. All mitigation strategies will be considered in detail during the Tier 2 analysis.

***Mitigation Strategy 1a*:** Within the selected corridor, consider locating the roadway away from sensitive receptors to the extent feasible. If this is not possible, conduct a health risk assessment to determine the potential health effects on the sensitive receptors. If risks exceed the accepted standards, provide mitigation as appropriate to reduce risks to an acceptable level as appropriate, including consideration of relocations if necessary.

***Mitigation Strategy 1b*:** During the development process of Placer Parkway, review environmental reports prepared for development projects that are in close proximity (i.e., 500 feet or less) to the Parkway. As appropriate, PCTPA should request, via comments on such documents, that potential detrimental health risks posed to individual living nearby the corridor are considered, and that cities and counties add policies to their development review process or General Plans that require assessment of air toxics for projects within 500 feet of the selected Parkway corridor. Since Placer Parkway includes a 500- to 1,000-foot no-development buffer zone, any development projects may be at least 500 feet from the roadway and it is possible that no additional assessment would be required.

***Mitigation Strategy 1c*:** Require that, before a city, county, special district or school district approve a project that would place sensitive receptors (e.g., children, the elderly, and hospitals) within 500 feet of the selected corridor, an analysis of potential air toxic contaminants be conducted to determine whether mitigation measures are needed as part of the proposed use, or if the location is not appropriate for such a use. This supplemental analysis would provide the decision makers with information regarding the potential health risks to exposed individuals and allow them to make the proper decision about the proposed development. With the 500- to 1,000-foot no-development buffer zone, this mitigation strategy may not be applicable.

Mitigation Strategy 2: Prepare and implement a dust control plan.

This plan should address the minimum Administrative Requirements found in Section 400 of *District Rule 228, Fugitive Dust* (PCAPCD, 2006b) and Regulation 3.16, *Fugitive Dust Emissions* (FRAQMD, 2006). Consideration should be given to including the following requirements during the Tier 2 environmental evaluation

The contractor shall:

- Keep a hard or electronic copy of *District Rule 228, Fugitive Dust* on site for reference.
- Hold a pre-construction meeting for grading activities covering 20 or more acres to discuss the construction emission/dust control plan, and the District will be invited.
- Suspend all grading operations when fugitive dusts exceed *District Rule 228, Fugitive Dust* limitations. A contractor representative, CARB-certified to perform Visible Emissions Evaluations (VEE), shall routinely evaluate compliance with *District Rule 228, Fugitive Dust.* This requirement for a VEE is for projects grading more than 20 or more acres in size regardless of how many acres are to be disturbed daily. It is to be noted that fugitive dust is not to exceed 40 percent opacity and is not to go beyond the property boundary at any time. If lime or other drying agents are used to dry out wet

grading areas, they shall be controlled so as to not to exceed *District Rule 228, Fugitive Dust limitations*.

- Schedule clearing, grading, and earthmoving activities during periods of low wind speeds and restrict those construction activities during high wind conditions with wind speeds greater than 20 mph average during an hour.

***Mitigation Strategy 3*:** Control dust and prevent dirt from going off site.

Consideration should be given to including the following requirements during the Tier 2 environmental evaluation:

- Apply water to control dust as needed to prevent dust impacts off site. Operational water truck(s), shall be on site, as required, to control fugitive dust.

- Construction vehicles leaving the site shall be cleaned to prevent dust, silt, mud, and dirt from being released or tracked off site. This includes the use of tarpaulins for haul trucks, which travel on public streets.

***Mitigation Strategy 4*:** Control dust from inactive areas.

- Consideration should be given to requiring the contractor to apply approved chemical soil stabilizers, vegetative mats, or other appropriate best management practices to manufacturer's specifications, to all inactive construction areas (previously graded areas which remain inactive for 96 hours).

***Mitigation Strategy 5*:** Control dust on unpaved roads and adjacent public thoroughfares.

Consideration should be given to including the following requirements during the Tier 2 environmental evaluation:

- Spread soil binders on unpaved roads and employee/equipment parking areas and wet broom or wash streets if silt is carried over to adjacent public thoroughfares.

- Reduce speeds on unpaved roads to 15 mph or lower (this speed must be posted).

***Mitigation Strategy 6*:** Provide FRAQMD and PCAPCD with a list of construction equipment and anticipated construction timeline.

- The prime contractor shall submit to the District a comprehensive inventory (i.e., make, model, year, emission rating) of all the heavy-duty off-road equipment (50 horsepower or greater) that will be used an aggregate of 40 or more hours for the construction project. The project representative shall provide the District with the anticipated construction timeline, including start date, and name and phone number of the project manager and onsite foreman. The contractor shall provide a plan for approval by the District demonstrating that the heavy-duty (> 50 horsepower) off-road vehicles to be used in the construction project, including owned, leased and subcontractor vehicles, will achieve a project wide fleet-average of 20 percent NO_X reduction and 45 percent particulate reduction compared to the most recent CARB fleet average. The District should be contacted for average fleet emission data. Acceptable options for reducing emissions may include use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, and/or other options as they become available. During smog season (May through October), the construction period shall be

lengthened so as to minimize the number of vehicles and equipment operating at the same time. Contractors can access the SMAQMD's website (SMAQMD, 2006) to determine whether their off-road fleets meet the requirements listed in this measure.

***Mitigation Strategy 7*:** Maintain construction equipment and vehicles.

- Construction equipment exhaust emissions shall not exceed District *Rule 202 Visible Emission* limitations. Operators of vehicles and equipment found to exceed opacity limits are to be immediately notified and the equipment must be repaired within 72 hours. An applicant representative that is CARB-certified to perform VEE shall routinely evaluate project-related off-road and heavy-duty on-road equipment emissions for compliance with this requirement.

***Mitigation Strategy 8*:** Minimize idling time for diesel-power equipment.

- Keep idling time to 5 minutes or less for all diesel-power equipment.

Mitigation Strategy 9: Use alternative power source (e.g., power poles) and fuel to operate equipment instead of using diesel-powered equipment.

- Use existing power sources (e.g., power poles) or clean fuel generators rather than temporary diesel power generators. If existing sources are not available, low sulfur fuel is to be used for diesel power generators. Use alternative fuel such as aqueous or emulsified diesel fuel for all equipment to reduce NO_X and diesel exhaust emissions.

***Mitigation Strategy 10*:** No open burning of removed vegetation.

- No open burning of removed vegetation is allowed during infrastructure improvements. Vegetative material shall be chipped and delivered to waste to energy facilities, or to an appropriate disposal site.

***Mitigation Strategy 11*:** Strategic placement of trees near roadways, as part of the previously described Landscaping Concept for the Parkway.

- Strategic placement of trees near roadways would enhance pollutant dispersal and leaf canopy provides shading that reduce diurnal hydrocarbon emissions.

9.0 ANALYSES TO BE UNDERTAKEN IN TIER 2

It should be noted that there is a potential for Placer Parkway to be operated as a toll road. Operating Placer Parkway as a toll road would require additional evaluation of air quality impacts. Toll roads are operated differently from freeways and often do not have to comply with federal regulations (FHWA, 2006b). Air quality impacts associated with toll roads would be associated with changes in traffic patterns within the study area, toll collection plazas, and at on- and off-ramps. If the decision is taken in the future to operate Placer Parkway as a potential toll road, then further analysis would be undertaken at Tier 2.

During the Tier 2 environmental analysis, a detailed air quality assessment will be conducted for all roadway alternatives identified within the selected corridor alternative alignment. The air quality analysis will include the following tasks:

- Construction activities – Impacts from construction activities will be evaluated by quantifying construction emissions and comparing them to the PCAPCD and FRAQMD significance thresholds to determine whether the increase in emissions would be considered significant, and if so, what mitigation measures can be implemented to reduce the air quality impacts from construction.

- CO hot spot analysis – To determine whether the proposed project would create a CO hot spot, the air quality analysis shall adhere to the procedures for preparing a screening analysis as provided in Appendix A of the document, *The Transportation Project-Level Carbon Monoxide Protocol*, University of California Davis, December 1997. If necessary, detailed modeling shall be conducted using the CALINE4 or CAL3QHCR model and corresponding emission factors from the latest version of the EMFAC model (e.g., EMFAC2007.)

- PM_{10} and $PM_{2.5}$ hot spots analyses – Currently, Placer and Sutter counties are designated as unclassified/attainment for federal PM_{10} and $PM_{2.5}$ standards and therefore do not require any PM_{10} and $PM_{2.5}$ hot-spot analyses. However, if the attainment designations are changed prior to the approval of the Parkway, then the applicable hot-spot analyses shall be conducted during the Tier 2 analysis to assess MSAT impacts. If required, the analyses shall follow guidelines provided in the document, *Transportation Conformity Guidance for Qualitative Hot-Spot Analyses in PM2.5 and PM10 Nonattainment and Maintenance Areas*, U.S. EPA and FHWA, March 29, 2006. In addition, a project-level analysis determination will include a finding of whether the project is a "Project Of Air Quality Concern" (POAQC). If applicable, detailed mitigation measures would be provided to reduce air quality impacts.

- Mobile Source Air Toxics (MSAT) Analysis – Using guidance provided in the document, *Interim Guidance on Air Toxic Analysis in NEPA Documents*, FHWA, February 3, 2006, the air quality analysis will identify what category the Placer Parkway falls under (i.e., No Analysis, Qualitative Analysis, or Quantitative Analysis) and use the prototype language or provide the data analysis as specified in the guidance document. In addition, SMAQMD's protocol, *Recommended Protocol for Evaluating the Location of Sensitive Land Uses Adjacent to Major Roadways,* as adjusted for local meteorological conditions, shall be discussed and recommendations provided for potential siting of sensitive land uses located in close proximity (i.e., < 500 feet) to the Parkway. As previously described, the project includes a 500- to 1,000-foot no-development buffer zone, and that design element may eliminate the need for further quantitative MSAT analysis, but, the need for MSAT analysis will be evaluated in Tier 2.

- Airborne Asbestos Impacts – Because the "preferred" alignment has not been identified, the air quality analysis will also include reviewing geological maps and pertinent asbestos documents such as *Relative Likelihood For the Presence of Naturally Occurring Asbestos in Placer County, California*, Department of Conservation California Geological Survey, 2006, to determine whether the proposed project is located in a Naturally Occurring Asbestos area. In addition, the document will also discuss the potential asbestos exposure if the proposed project requires demolition or renovation of existing building and bridges. These structures shall be checked for asbestos prior to construction activities. If applicable, the analysis will cite CARB's Air Toxics Control Measures (ATCM) for Construction, Grading, Quarrying, and Mining Operations dated July 29, 2002 (CARB, 2006d) and local agencies requirements.

- Health risk assessment – If required, PCTPA will be prepared to assess cancer risks and non-carcinogenic hazards for sensitive receptors (e.g., existing residences) located near the proposed project.

- If required, a more detailed analysis of greenhouse gases.

- Placer Parkway may be operated as a toll road. As such, the operation of a tolled versus non-tolled facility differs in terms of impacts and benefits. Therefore, the tolled alternatives shall analyze the air quality impacts associated with issues such as diverted traffic volumes, traffic congestions during peak hours; ingress and egress to the toll road/lane; and impact associated with a toll plaza.

Title : Placer County 2020 Annual - NO BUILD Refined Speed Bin
Version : Emfac2002 V2.2 Sept 23 2002 ** WIS Enabled **
Run Date : 3/26/2007 19:25:51
Scen Year: 2020 -- Model Years: 1975 to 2020
Season : Annual
Area : Placer (LT)
I/M Stat : No I and M program in effect
Emission Tons Per Day

June 2007

SUMMARY OF FINDINGS

The Federal Highway Administration (FHWA) and the California Department of Transportation (Caltrans), in conjunction with the South Placer Regional Transportation Authority (SPRTA), propose to identify and preserve or acquire right-of-way for a future Placer Parkway, which would link State Route (SR) 65 in Placer County to SR 70/99 in Sutter County (Maps 1 and 2). The FHWA is the federal lead agency for the National Environmental Policy Act (NEPA), and SPRTA is the lead agency for the California Environmental Quality Act (CEQA). The project is using federal funding and is therefore subject to review under the January 2004 *Programmatic Agreement (PA) (Appendix A) among the Federal Highway Administration, the Advisory Council on Historic Preservation, the California State Historic Preservation Officer, and the California Department of Transportation Regarding Compliance with Section 106 of the National Historic Preservation Act, as it Pertains to the Administration of the Federal-Aid Highway Program in California* (Section 106 PA).

This report documents the results of an archaeological resources investigation conducted for the Parkway Corridor Preservation project (Placer Parkway), the proposed preservation of a transportation right-of-way (ROW) through Sutter and Placer Counties, California (Figure 1-1). SPRTA and FHWA propose to preserve the ROW for a new or upgraded east-west connector between SR 65 and SR 70/99 serving cities and unincorporated areas across south Sutter County and southwestern Placer County.

URS Corporation (URS) prepared this Archaeological Survey Report (ASR) to document archaeological resource identification efforts in the Area of Potential Effects (APE) in accordance with applicable sections of the National Historic Preservation Act (NHPA) and the implementing regulations of the Advisory Council on Historic Preservation (ACHP).

As outlined in the Programmatic Agreement for the Parkway project, the ASR investigation consisted of background and archival research, contact with the Native American Heritage Commission (NAHC) and members of the local Native American community as identified by the NAHC, intensive pedestrian reconnaissance of the common alignment of the Parkway corridor alternative alignments, and the development of a predictive model to assess the relative archaeological sensitivity of the project alternatives.

No archaeological resources were identified in the common alignment portion of the Parkway project's APE. The predictive model for the alignment alternatives of the APE ranked the corridors for their relative archaeological sensitivity using environmental factors known to influence past human activity in the study area. This analysis determined that Alternative 1 is the most archaeologically sensitive alignment, followed in descending order by Alternative 3, Alternative 2, Alternative 4, and Alternative 5. Based on this analysis, Alternative 5 is the least sensitive alignment in terms of potential archaeological resources.

ARCHAEOLOGICAL SURVEY REPORT
PLACER PARKWAY CORRIDOR PRESERVATION
TIER 1 EIS/PROGRAM EIR

1.0 INTRODUCTION

1.1 TIER 1 EIS/PROGRAM EIR

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

1.2 CORRIDOR SELECTION AND PRESERVATION

The concept for the Parkway is over a decade old. Placer County's 1994 General Plan depicts a "plan line" for it. Two planning studies helped to refine the concept:

- DKS Associates, 2000, Placer Parkway Interconnect Study/Conceptual Plan
- DKS Associates, 2001, Project Study Report (Project Development Support) for Placer Parkway

Placer Parkway is cited as a high-priority regional transportation project by the Sacramento Area Council of Governments (SACOG) 2025 Metropolitan Transportation Plan and the 2027 Placer County Regional Transportation Plan. The project vicinity and surrounding area include some of the fastest growing communities in the Sacramento region. A number of large urban development proposals are being considered by Placer and Sutter counties. New development is expected to add a significant amount of residential, commercial, industrial, and educational uses.

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included

representatives from planning and public works departments of all affected cities and counties, environmental, business, agricultural, development, and homeowner interests (the Study Advisory Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report will analyze these five corridor alternatives along with a No-Build Alternative.

Other potential transportation modes such as bus rapid transit may be developed in the corridor in the future, although they are not proposed as part of the current project. The width of the corridor for Placer Parkway is to vary from approximately 500 feet in the Eastern and Western segments to approximately 1,000 feet in the Central Segment. Depending upon the alternative, the corridor's length ranges from a minimum of 14.2 miles to a maximum of 16.2 miles. The selected corridor would contain the roadway, including the median, travel lanes, shoulder, associated access ramps and a no-development buffer zone.

Corridor acquisition may not be completed until after Tier 2, as funding becomes available. Portions of the selected corridor would be preserved as a no-development buffer zone. The buffer would be maintained as a zone where development is either not permitted or is severely restricted. This is intended to restrict access to the proposed interchanges, protect the rural character of agriculturally designated areas in the vicinity of the Parkway as far as possible subject to future development, and to maximize opportunities to incorporate adjacent sensitive areas. It is intended that the buffer would be owned and managed in the future to achieve these objectives. For subsequent Tier 2 (project-level) environmental reviews, the size of this buffer zone could be considered flexible for agriculturally designated land undergoing urban development. In the Tier 2 environmental review, the specific buffer size and location would be determined. This determination would be based on performance standards on a case-by-case basis, depending on the land use needs of future approved development, and taking into account the primary objective of restricting future access to the Parkway.

Project proponents are considering employment of several land management and control mechanisms in order to ensure that the buffer would be effectively maintained as an area where development would either not be permitted, and where construction of any additional access onto the Parkway would not be allowed. These mechanisms could include land use controls, land purchase/leases, general plan amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, urban growth boundaries, etc. "Layering" or using several of these methods would provide more assurance that the buffers would be permanent, or at least more difficult to undo.

1.3 TECHNICAL STUDY OBJECTIVE

This Archaeological Survey Report has been prepared to support the Environmental Impact Statement/ Program Environmental Impact Report. It presents a Tier 1/Program level assessment of potential impacts related to archaeological resources for five corridor alternatives and the No-Build Alternative as described in Chapter 2.

The scope of work performed for this report is based on the Caltrans Local Assistance Procedures Manual (Caltrans, 2006), as modified for purposes of Tier 1/Program analysis by agreement of Caltrans and the Caltrans Environmental Handbook (Caltrans, 2004) on preparing an archaeological survey. In addition, the evaluation considered guidance from the Federal Highway Administration (FHWA), Environmental Checklists for Draft and Final Environmental Documents (FHWA, 1998a; FHWA, 1998b).

This report is organized as follows:

Chapter 2 The Proposed Action
Chapter 3 Sources Consulted
Chapter 4 Background

Chapter 5 Inventory Methods
Chapter 6 Study Findings and Conclusions
Chapter 7 References

This report also includes figures and tables, which show the project location, each build alternative, and pertinent technical information prepared to evaluate the build alternatives.

Throughout this document, the Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

2.0 THE PROPOSED ACTION

The Proposed Action for the Placer Parkway Corridor Preservation Project is to select and preserve a 500- to 1,000-foot-wide corridor in the project study area, within which the future four- or six-lane Placer Parkway may be constructed. The ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction, and operation of the Parkway. Although the action taken at Tier 1 on the Parkway Corridor Preservation Project is limited, the underlying project whose effects are studied in this document is the Parkway. To the extent feasible at this early stage, the Tier 1 EIS/EIR addresses the potential effects of construction and operation of the future roadway.

2.1 THE PROJECT STUDY AREA

The project study area is an area of approximately 33,460 acres located in Placer and Sutter counties, with a small section located in Sacramento County (see Figures 1-1 and 2-1). The portion of the study area in Sacramento County is located in the extreme southwestern corner of the study area and does not include any of the proposed corridor alignment alternatives. It extends from SR 70/SR 99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego roads.

For the purposes of the analysis the study area is divided into three segments:

- Western Segment: the Western Segment extends from SR 70/99 to Pleasant Grove Road in Sutter County.
- Central Segment: the Central Segment extends from Pleasant Grove Road in Sutter County to approximately 2,300 feet north of Pleasant Grove Creek in Placer County.
- Eastern Segment: the Eastern Segment extends from approximately 2,300 feet north of Pleasant Grove Creek to SR 65 in Placer County.

2.2 CORRIDOR ALTERNATIVES

The following subsections describe the corridor alternatives, which are depicted on Figure 2-1, and are numbered according to location from south to north in the study area.

2.2.1 The No-Build Alternative

Under the No-Build Alternative, the project would not be implemented. A Placer Parkway corridor would not be selected/preserved, and the future Placer Parkway would not be constructed.

2.2.2 Alternative 1 – the Red Alternative

Alternative 1 would extend from SR 70/99 approximately ½ mile north of Riego Road, eastward approximately 1 mile north of Baseline Road to approximately Watt Avenue, proceeding north and transitioning in an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment alternative is 16.2 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.3 Alternative 2 – the Orange Alternative

Alternative 2 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed northeast, then in a northerly direction

south of Pleasant Grove Creek, transitioning to an easterly direction before it reaches Sunset Boulevard West, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.4 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.4 Alternative 3 – the Blue Alternative

Alternative 3 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed north along the Sutter/Placer County Line, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.6 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.5 Alternative 4 – the Yellow Alternative

Alternative 4 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.3 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.2.6 Alternative 5 – the Green Alternative

Alternative 5 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 4,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.2 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.3 PARKWAY DESIGN ASSUMPTIONS

Although the Parkway would be designed and construction-level impacts analyzed during Tier 2, for the purpose of this report and the Tier 1 EIS/Program EIR, several assumptions have been made about potential design and configuration concepts. These assumptions would be subject to further development and refinement, and specific decisions about design of the roadway would be made during the Tier 2 process. For example, the number, location, and design of over-crossings would be determined at the time of final Parkway design, in consultation with local jurisdictions. The following sections outline assumptions for the future roadway.

Preliminary costs estimates for the Parkway range from $600 to $650 million (2005 dollars). This includes costs for right-of-way, design, construction, and environmental mitigation for the four- to six-lane facility. The funding situation has spurred interest in exploring other more creative funding options. These include a county-wide sales tax, more developer contributions, and tolling facilities. The Technical Report and Tier 1 EIS/Program EIR do not make any assumptions about funding sources.

2.3.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane facility. A preliminary conceptual cross section (see Figure 2-2) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/ Program EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

2.3.2 Conceptual Roadway Elevation

As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on either side of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways or trails.

Throughout the project study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These over-crossings would not connect to the Parkway. Parkway access would be via the interchanges described below.

2.3.3 Interchange Concepts

The analysis assumes that the location of interchanges (see Figure 2-1) is as follows.

- SR 70/99 (at ½ mile north of Riego Road or at Sankey Road)

- One or two locations to be determined in southern Sutter County
- Fiddyment Road
- Foothills Boulevard
- SR 65 at Whitney Ranch Parkway

The following discussion outlines concepts and assumptions for the six interchanges that could potentially serve the Parkway.

2.3.3.1 Western Segment

Within the Western Segment of the Parkway, a high-speed, freeway-to-freeway type interchange would connect the Parkway with SR 70/99 at one of following potential locations depending on the project alternative (see Section 2.2). Placer Parkway would terminate at SR 70/99.

- **Placer Parkway/SR 70/99 Interchange at North of Riego Road.** This alternative concept uses "braided" ramps to eliminate weaving problems or conflicts with the future SR 70/99 at Riego Road interchange being developed by Sutter County and Caltrans.

- **Placer Parkway/SR 70/99 Interchange at Sankey Road.** Under this alternative concept, the existing two-lane Sankey Road would be realigned to the south of Placer Parkway and the proposed freeway-to-freeway interchange, extending from approximately ¼ mile west of SR 70/99 to approximately ¼ mile east of the Union Pacific railroad tracks. There would be no direct access to SR 70/99 or Placer Parkway from the realigned Sankey Road.

Depending on the final alignment selected, one or two additional interchanges would also be located in south Sutter County. Conceptual locations are identified for purposes of this Tier 1/Program analysis (see Figure 2-1). The actual location of these interchanges would be developed in the Tier 2 phase, based on Sutter County requirements.

2.3.3.2 Central Segment

Within the Central Segment of the Parkway, there would not be any access proposed as part of the Project in the 7-mile segment between Fiddyment Road and Pleasant Grove Road. Please see Section 2.4 regarding a potential connection to a future extension of Watt Avenue (Figure 2-3) which could be proposed and constructed by others in the Central Segment; such an interchange is not part of the Parkway.

2.3.3.3 Eastern Segment

Within the Eastern Segment of the Parkway, a signalized high-speed freeway-to-freeway and local access interchange would connect the Parkway to SR 65 at Whitney Ranch Parkway (Figure 2-1). From SR 65 eastward Placer Parkway would terminate and become Whitney Ranch Parkway east of the SR 65 exit ramp intersection. Traffic signals would be provided at the exit ramp terminals. This interchange would be approximately 1 mile north of a planned SR 65/Sunset Boulevard interchange and 1.2 miles south of the existing Twelve Bridges interchange.

As part of this interchange, auxiliary lanes would be required on SR 65 in both directions to enhance traffic operations on the north side of the future SR 65/Sunset Boulevard interchange. The southbound SR 65 exit-ramp at Sunset Boulevard is being designed to accommodate an additional auxiliary lane required for the future Placer Parkway/Whitney Ranch Parkway interchange to minimize the reconstruction of this ramp in the future. Within the Eastern Segment of the Parkway, from SR 65

westward, two interchanges with local roadways would be constructed, one at Foothills Boulevard and one at Fiddyment Road, as depicted on Figure 2-1.

The future interchange on Placer Parkway at Fiddyment Road would be located near the existing intersection of Fiddyment Road and Sunset Boulevard West. To provide acceptable traffic operations, additional distance needs to be provided between the Fiddyment Road/Sunset Boulevard West intersection and the Fiddyment Road/Placer Parkway westbound off-ramp intersection. Therefore, Sunset Boulevard West will need to be realigned to the north as it nears Fiddyment Road.

2.3.4 Landscaping Concept

For the purposes of this environmental analysis, preliminary landscaping concepts have been developed for Placer Parkway. These are entirely conceptual and would be subject to further refinement during the Tier 2 environmental process. It is anticipated that landscaping would be used to reflect local topography and vistas in the study area and complement the varying character of land adjacent to the Parkway corridor. Landscape design would vary within the Parkway's three segments depending on corridor width and type and density of surrounding land uses. Landscaping would be used within the median and the Parkway buffer zone to enhance the aesthetics of the Parkway, and would be used to provide screening and enhance local and long-distance views. Where appropriate, more concentrated plantings would be considered to buffer the Parkway from future adjacent land uses that may be incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Landscape design would likely include a mix of compatible native and non-native plants that may require some irrigation. Where possible and depending on availability, feasibility and cost, recycled water would be used for irrigation.

During a future design phase, lighting elements would be designed for safety and would consider the proposed landscaping plan in order to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower-voltage lighting, and proposing lighting fixtures that conform with the visual character of the area).

2.4 POTENTIAL WATT AVENUE INTERCHANGE

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Parkway via a new interchange (see Figure 2-3). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/Program EIR. However, the connection of Placer Parkway to a potential Watt Avenue interchange could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/Program EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges with Placer Parkway.

2.5 AGENCY PERMITS AND APPROVALS

The Proposed Action would preserve a preferred corridor for a future transportation facility. In the future, permits and approvals would be obtained from appropriate agencies prior to construction of the Parkway. These permits and approvals may include specific design or mitigation requirements that would be incorporated into the project.

2.6 SUBSEQUENT TIER 2 INFORMATION

As noted earlier, the design and construction of Placer Parkway — including its interchanges and over-crossings, and ancillary features such as stream crossings, safety devices, stormwater management structures, and similar improvements — would be evaluated in a subsequent Tier 2 environmental review process, once a corridor has been identified.

3.0 SOURCES CONSULTED

3.1 SUMMARY OF METHODS AND RESULTS

The study area for Placer Parkway encompasses a total area of 35,443.31 acres within Sutter and Placer counties, California (Figure 2-1). The study area encapsulates all of the original alignment alternatives from which the current corridor and alternatives were derived. The total acreage of the current alternative corridors combined is 3,987.65 acres.

The archaeological records search for the initial Parkway screening exercise was conducted in June 2003 and included the entire study area as well as areas within a ¼-mile radius of the study area boundary. Because the archaeological records for Sutter County are housed separately from those in Placer and Sacramento counties, two separate record searches were conducted for the project. For Sutter County, a record search request was submitted to the Northeast Information Center (NEIC) of the California Historical Resources Information System (CHRIS). The record search was conducted by the staff of the NEIC (File #D03-28) and was delivered to URS on June 30, 2003. A similar request was sent to the North Central Information Center (NCIC) of the CHRIS for the Placer and Sacramento County components of the project. The record search was conducted by the staff of the NCIC (File No. PLA-03-57/SAC-03-44) and delivered to URS on June 12, 2003.

The record searches at the NCIC and NEIC included searches of archaeological site and historic property files, the National and California Registers of Historic Places, the Historic Property Data File for their respective counties, California Historic Landmarks, California Points of Historic Interest, Caltrans Local Bridge Survey, and historic General Land Office Maps.

The records search results were used to develop corridor alignment alternatives routed to avoid and/or minimize potential impacts to various resources including historic and prehistoric archaeological sites. As such, no previously identified archaeological sites occur within the corridors subject to the current investigation. The corridor alignment alternatives selection process was also used to locate, to the extent possible given other environmental constraints, the corridor alignment alternatives within areas previously subjected to archaeological inventory. Previous archaeological inventory studies that include lands bisected by the project include:

- Cultural Resources Unlimited, 1992. *A Cultural Resources Study for Sutter Bay Project, Sutter County, California*.
- Cultural Resources Unlimited, 1994. *A Cultural Resources Study for the Twelve Bridges/State Route 65 Interchange and Freeway Widening, Placer County, California*.
- Cultural Resources Unlimited, 1994. *A Preliminary Cultural Resources Review for the Twelve Bridges/SR 65 Interchange and Widening, Placer County, California*.

- Wesson, A. and B. Hatoff, 2001. *Roseville Energy Facilities Cultural Resources. Appendix J-1*. URS Corporation.

- Wiant, Wayne, 1982. *Archaeological Reconnaissance of the Proposed Roseville Bypass Project*. California Department of Transportation.

Because the screening process was used to avoid historic and prehistoric archaeological sites, none of these efforts resulted in the identification of archaeological sites within the corridor alignment alternatives.

Since the record search and screening efforts were conducted, three additional studies have been conducted that include tracts of land traversed by the common alignment alternatives (see Section 5.2). These studies were completed for the Amoruso Property (ECORP, 2006), the Placer Ranch Project (Hale, 2004), Reason Farms Retention Basin (URS, 2002), and the SR 65 Widening Project (Norton, 1998). Given the recent dates of completion of these surveys, in agreement with Caltrans, the common corridor alignment alternative through these parcels was not re-inventoried for archaeological resources. None of these efforts identified archaeological resources within any of the project alignment alternatives.

This section briefly describes the known archaeological sites identified in the record search for the Tier 1 Archaeological Survey Report.

CA-PLA-136

Unfortunately, the site record for CA-Pla-136 on file at the NCIC is difficult to read due to the poor quality of the reproduction (the whereabouts of the original is unknown). It appears that the site was identified in April of 1960, and at the time of recordation contained a milling slab (i.e., metate) and possibly two handstones (i.e., manos).

CA-PLA-137

URS Corporation recorded this site with historic resources in 2001. The site was originally recorded by Mott in 1961. A subsequent attempt to relocate this resource by URS Corporation in the location plotted on the master maps at the NCIC has proved unsuccessful. Heavy grass cover obscured native soils during the survey. Surface vegetation was scraped back in several locations within the area mapped as Locus B, revealing dark-colored sand, but no cultural material. The original site form indicates that artifacts including a metate and several manos and pestles had been unearthed due to plowing on both the northern and southern sides of Pleasant Grove Creek.

CA-PLA-138H

Derr describes CA-PLA-138H as a prehistoric site with fragments of ground stone (bowl mortar), pestle fragments, mano fragments, a possible chopper, some core tools, and flakes (two obsidian, too small to date/source) as well as fire-fractured rock. The 515-meter by 60-meter site area (at an elevation of 90 to 95 feet) was slated for development as of 1999, when it was recorded (it was previously recorded in 1994). Note: although identified in the record search, this site is outside of the Parkway study area.

CA-PLA-147

CA-PLA-147, recorded in 1999 by Derr, is described as a site with a scatter of prehistoric artifactual materials. Artifactual materials observed include preform mano, metate, and complete mano, located in the northern, central, and western portions of the site, as well as flaked fragments of basalt and slate, located in the northwestern area. Remarks on the site record state that the 35-meter by 50-meter site was

thought to have been intensively used during prehistoric times, and there is a possibility that at a greater depth, burials may be present. Currently, there are signs of disturbance, and artifacts that were previously identified are missing.

CA-PLA-429

Recorded by Peak and Associates in 1994, CA-PLA-429 is described as an area with two prehistoric artifacts located on the surface: one bifacially shaped mano fragment, and one basalt debitage fragment. The site was originally recorded in 1981 when Foothill found two chopping tools, basalt flakes, and fire-cracked rocks (one shaped pestle midsection, one percussion-flaked cobble tool). Note: although identified in the record search, this site is outside of the Parkway study area.

CA-PLA-730H

Peak and Associates recorded this site in 1989. The historic site is described as part of the foundation for the old Pleasant Grove School. The foundation is made of unmodified rough rocks in a rectangular shape. The cornerstone on the northeast is missing. In addition to the foundation, the site also contains a depression, 3 feet by 4 feet, which may have been a privy pit. The privy pit is located 7 feet from the foundation.

CA-PLA-944H

Dan Osanna recorded CA-PLA-944H in 1999. The site is 110 feet by 140 feet, with an elevation of 87 feet. The site contains a concrete barn foundation (in the middle of a cultivated field) comprised of four parallel foundation walls. The foundation walls are 92 feet long. Approximately 90 feet from the barn foundation is a small well casing and pumphouse foundation. The pumphouse foundation is shaped in a "U," and the 1-foot-diameter well casing is surrounded by a concrete foundation (4 feet on each side). Additional elements identified include barbed wire fragments, metal strapping, and tin sheeting.

CA-PLA-945H

Recorded by Dan Osanna and Ric Windmiller in 1999, the 110-foot by 65-foot site has an elevation of 84 feet, and is located in a plowed field next to Baseline Road. The site consists of a scatter of historic trash. Artifacts include ceramic fragments glazed brown, bottle fragments of clear glass, and earthenware fragments of white ironstone. The age of the historic trash is estimated to be between 1848 and 1914.

CA-PLA-968H

Recorded by PAR in 2001, the historic site contains a depression (reportedly the site of a well) with fragments of a windmill. In addition, there are fragments of white improved earthenware, glass, and metal. Farther away (approximately 490 meters) there are fragments of three windmills (may be related to the site). The age of the resources is circa late 1930s. The site is 92 feet above mean sea level and is 145 feet by 100 feet. The site has a low degree of integrity, because 95 percent of the windmill remains have been removed and the well has collapsed.

CA-PLA-969H

Discovered in 2001 by PAR, the resources present on the 77-meter by 43-meter site, with an elevation of 100 feet, are as follows: a set of concrete footings (66 set in six rows); a water spigot with adjoining concrete foundation, and a structure foundation (three sections) and an in situ piece of machinery. The resources are historic, circa 1953. The site is located on a working ranch (formerly a turkey ranch) and has been disturbed by livestock activity.

CA-PLA-974H

Derr recorded this site in 1991, encompassing an area 22 feet by 17 feet at an elevation of 140 feet. The site contains historic artifacts; namely, an animal feeding station with feed troughs (though the troughs are unconfirmed). The troughs appear to be moved, and one cement trough is broken. There is also a well, and electrical power source, mostly likely for a pump. The record notes that the site does not appear to be disturbed. Note: although identified in the record search, this site is outside of the Parkway study area.

CA-PLA-975H

The site was recorded by Derr in 1991, and is stated to be historic. The 5-foot by 5-foot site has an elevation of 145 feet. Artifacts on the site include an iron pipe (upright in soil) that is 10 inches in diameter, located within a depression. The record states this is probably a well that extends approximately 16 feet deep and 28 inches above ground. There is no water inside. The metal is ¼-inch-thick and has vertical breaks/slits in various locations. The site appears undisturbed. Note: although identified in the record search, this site is outside of the Parkway study area.

CA-PLA-977H

CA-PLA-977H, recorded in 1995 by PAR, is described as a historic farm complex with the following elements: a residential foundation (wood remnants and rusted stove); concrete foundation (three-sided) with pieces of lumber and siding/roofing (metal); a fallen windmill (metal) with troughs, concrete footings and pads; and a concrete pad with wood posts, lumber, and siding/roofing (metal). The 863-foot by 250-foot site has an elevation of 108 feet and is bisected by a barbed wire fence and wood post. The historic site is dated between 1880 and 1945. The site has been impacted by livestock, target shooting, and damage from the wind.

CA-PLA-I086H

Recorded in 1989 by Kosta & Ruskin, this historic site is 40 meters by 30 meters with an elevation of 115 feet, and contains mixed scatter surrounding two leaved willows. The artifacts stated in the record are as follows: fencing (barbed wire); tractor leaf-spring; porcelain doll hand and arm; fragments of glass bottles, ceramics, handpainted porcelain, unglazed stoneware, and earthenware; a variety of metal (nails, stakes, chain link, buttons); and roofing slate.

CA-PLA-I087H

Kosta & Ruskin recorded this historic site in 1989. The 20-meter by 30-meter site, with an elevation of 125 feet, consists of a historic water well with a small scatter of mixed historic fragments. The artifacts include fragments of an aqua culinary bottle (gothic style), shards of bottles (alcohol beverage types); square nails; and fragments of white earthenware vessels. The site has been disturbed by plowing.

CA-PLA-1104

CA-PLA-l104, recorded in 1989 by Kosta & Ruskin is described as a scatter of groundstone/lithic and associated discoloration of soil on a 58-meter by 56-meter site with an elevation of 100 feet. This discoloration may result from the presence of subsurface midden deposits. The prehistoric artifacts are as follows: groundstone mano, groundstone fragment, andesite flake (primary), projectile point fragment (mid-section), primary flake (silica cemented conglomerate composed of small siliceous gravels), and primary flake (fine-grained quartzite).

CA-PLA-1126H

Recorded by Derr in 1999, CA-PLA-1126H is a historic site located on a ranch. The historic site contains a house (known to exist in the 1940s), driveway, well, and small barn, along with a larger barn and related foundations. The foundations are all that remains; there are several small piles of broken foundation from the house. Note: although identified in the record search, this site is outside of the Parkway study area.

P-31-001215

PAR Environmental Services, Inc., recorded the site in 2001. The historic site has foundation and structure pads dating from the 1930s. The site has an imbedded post (the top is missing), metal fragments scattered, two can lids, burnt wood fragments, as well as clear and aqua-colored glass bottle fragments. The base of a clear bottle has an angular "G" over a "C" embossed on it, which is stated in the record to be the maker's mark.

P-31-001216

PAR recorded this site in 2001, which is comprised of privy pits and trash scatters, in a farm's dump, adjacent to a dirt road. The site has a shallow, water-filled area, where fenceposts and bales of barbed wire have been tossed. There are approximately 150 fenceposts and five types of barbed wire (both modern and historic types). In addition, there is part of a windmill (made of pipes) nearby. Approximately 100 meters north are scattered auto tires (about 10) and a metal wheel rim. Approximately 200 meters north are additional barbed wire bales. South of the site (approximately 200 meters) is an oil drum.

P-31-001217

Recorded in 2001 by PAR, the site has a scatter of debris along the drainage bed of the Pleasant Grove Creek. Historic artifacts were observed among modem pieces of debris, snagged by nearby trees. The artifacts are fragments and are listed as follows: solarized bottle glass (one), olive glass bottle (one), bright green bottle glass (one), aqua glass bottle (multiple), clear glass bottle (multiple), porcelain (one), and white improved earthenware (10+).

P-31-001218

Recorded by PAR in 2001, P-31-001218 is a site with three historic windmill components, comprised of fragments of a wooden beam with steel or iron braces or clamps. The other fragments include large metal supports (mostly pipe and L-shaped beams). South of the metal fragments are the remains of a section of fence that ran east-west. The three windmill components are located close to a dirt road, and may be related to the Fiddyment 2 site (nearby).

REF 3

The site was recorded in 2002 by URS Corporation. The site is comprised of a concrete structural foundation and several pieces of abandoned farm machinery and equipment. The foundation is situated to the south of a grove of black locusts and a single elm and approximately 220 feet south on an unmarked dirt road. Portions of the concrete foundation are intact at its northern and southern perimeters. The portion of the foundation at the southwestern comer is 2.5 feet in height and 4 inches thick, and is capped at its northernmost edge by a piece of wood with round nails. The portion of foundation marking the northern perimeter is 30 feet in length. Concrete debris is scattered just beyond the northern boundary of the foundation. Post-field research indicates the age of the resources range from 1882 to 1931.

Although a number of archaeological resources have been identified in the larger study area as evidenced in the record search data provided above, the general archaeological sensitivity of the current archaeological APE for both prehistoric and historic archaeological resources is low. This supposition is based on the fact that while resources have been identified, relatively few archaeological sites have been identified given the total acreage of land subjected to archaeological survey.

Furthermore, given that the current project APE (see Section 5.1 and also Appendix B) was designed to both avoid known archaeological resources as well as maximize, to the extent possible given other environmental constraints, the placement of the corridors within lands previously subjected to archaeological inventory efforts, the likelihood of archaeological resources within the current APE is reduced.

3.2 SUMMARY OF OTHERS WHO WERE CONSULTED

A request for a review of the Sacred Lands File was sent to the Native American Heritage Commission (NAHC) on May 27, 2003.

A search of the Sacred Lands File by the staff of the NAHC did not indicate the presence of Native American cultural resources in the immediate study area. A letter from the NAHC reporting these findings as well as providing a list of local Native American individuals and organizations was sent to URS on June 6, 2003, and is included, with responses, as Appendix C.

Other sources of information consulted for the Parkway cultural resources investigations included the Placer County Historical Society, Lincoln Arts and Culture Foundation, Roseville Historical Society, Community Memorial Museum, Placer County Museum, Sutter County Historical Society, and Rocklin Historical Society.

3.3 SUMMARY OF NATIVE AMERICAN CONSULTATION

On three occasions (June 16, 2003, October 13, 2003, and March 6, 2006) letters requesting information and comment were sent to the Native American individuals identified on the NAHC contact list for Placer, Sacramento, and Sutter counties. In addition to the letters, telephone calls were made in August of 2003 notifying, when possible, these same individuals about the project. The list provided by the NAHC comprised:

- Harvey Angle, Chairperson, Enterprise Rancheria of Maidu Indians
- Rose Enos
- David Keyser, United Auburn Indian Community of the Auburn Rancheria
- Joe Marine
- Jeff Murray, Cultural Resources Manager Shingle Springs Band of Miwok Indians
- Martha Noel, Maidu Elders Organization
- Sam Starkey, United Auburn Indian Community of the Auburn Rancheria
- Christopher Suehead, Cultural Representative Todd Valley Miwok-Maidu Cultural Foundation
- Jessica Tavares, Chairperson, United Auburn Indian Community of the Auburn Rancheria

On October 21, 2003 a response was received from Greg Baker, Tribal Administrator, United Auburn Indian Community of the Auburn Rancheria (Auburn Rancheria). Mr. Baker requested that a copy of the technical report be provided to the United Auburn Indian Community of the Auburn Rancheria. The

letter also instructed URS Corporation to contact Dr. Shelley McGinnis of Analytical Environmental Services (AES). No other responses were received.

Contact with was made Dr. McGinnis and a decision was made to hold a formal meeting between representatives of the Auburn Rancheria, South Placer Regional Transportation Authority (SPRTA), the Federal Highway Administration (FHWA), Caltrans, and URS Corporation. This meeting was held on January 9, 2004 and was used to provide the Auburn Rancheria with project specifics including levels of effort for the Tier 1 investigation as well as potential avenues of investigation during Tier 2.

4.0 BACKGROUND

4.1 ENVIRONMENTAL SETTING

The study area is comprised of 35,443.31 acres of an irregular shape, bounded by SR 65 near Rocklin on the east and SR 70/99 in the west (Figure 1-1). Baseline Road is adjacent to part of the southern boundary and Sunset Boulevard along the north. The majority of the study area is located in western Placer County. A substantial area is in eastern Sutter County, and a small portion is in northern Sacramento County.

The Sacramento Valley through which the current project passes can be characterized as a low-elevation flatland bisected by river channels, creeks, and sloughs. The region cannot, however, be described as topographically featureless. Four types of topography are recognized within the Sacramento Valley: (1) low hills and dissected alluvial uplands; (2) low alluvial plains and fans; (3) floodplains and natural levees; and (4) flood basins.

The westernmost portion of the study area is located within a 100- or 500-year floodplain and is predominately in rice cultivation, which results in areas that are submerged in shallow water during all or part of the year. The central portion of the study area is comprised of a patchwork of seasonally flooded habitat and drier annual grasslands/agricultural areas, which are either dry-farmed, irrigated for crops, or used for livestock grazing. As the study area approaches the foothills of the Sierra-Nevada Mountains in the eastern portion of the study area, habitat is almost entirely comprised of grassland, some of it cultivated. Scattered throughout the entire study are various wetlands and vernal pool complexes.

The following habitat types are present in the project study area:

Cultivated Rice Fields and Other Seasonally Flooded Habitat. Rice fields in the study area have frequently been leveled and terraced to facilitate seasonal inundation necessary to cultivate rice. Fields are typically inundated during the growing season from late May to early August. Some fields may be flooded again during the winter months to attract waterfowl. Native vegetation is typically excluded from cultivated rice fields. Many species of migratory waterfowl may congregate in rice fields during the winter, depending on flooding cycles and management practices. Such species include snow goose (*Chen caerulescens*), greater white-fronted goose (*Anser albifrons*), northern shoveler (*Anas clypeata*), and bufflehead (*Bucephala albeola*). The habitat also supports giant garter snake (*Thamnophis gigas*), a federal and state-listed threatened species, and ruddy duck (*Oxyura jamaicensis*).

Other Agricultural Habitats. Non-irrigated pasture and/or irrigated croplands comprise the majority of other agricultural habitats in the study area. These may include a mix of perennial grasses and legumes that may be used for grazing of livestock, or seed-producing grasses such as barley, rye and wheat that are planted in the fall and harvested in the spring. Many species of birds and rodents have adapted to use these habitats, and as a result larger birds of prey (hawks, falcons) also use these areas for hunting.

Annual Grassland. Annual grassland is comprised of upland areas that have not been previously cultivated. Typical species include ryegrass (*Lolium* sp.), barley (*Hordeum* sp.), ripgut brome (*Bromus diandrus*), and filaree (*Erodium* sp.). Grassland provides habitat for wildlife species such as western meadowlark (*Sturnella neglecta*), red-tailed hawk (*Buteo jamaicensis*), killdeer (*Charadrius vociferous*), western fence lizard (*Sceloporus occidentalis*), voles (*Microtus* sp.), deer mice (*Peromyscus maniculatus*), coyote (*Canis latrans*), and other species. Annual grasslands are often associated with vernal pools, as discussed below.

Vernal Pools and Other Seasonal Wetlands. Vernal pool complexes are areas that contain vernal pools of varying sizes and densities. They are seasonal flooded depressions that are underlain with a subsurface

layer that limits water infiltration. The seasonal ponding and drying associated with vernal pools supports a unique community of plants and animals. Vernal pool vegetation is dominated by species such as coyote thistle (*Eryngium vaseyi*), popcorn flower (*Plagiobothrys stipitatus*), downingia (*Downingia pusilla*), quaking grass (*Briza minor*) and buttercup (*Ranunculus bonariensis*). Invertebrates, including listed vernal pool fairy shrimp (*Branchinecta lynchi*) and vernal pool tadpole shrimp (*Lepidurus packardi*) may occupy vernal pools and other seasonal wetlands in the project study area.

Two types of vernal pools occur in Placer County: northern hardpan vernal pools, and northern volcanic mudflow vernal pools (Brussard, 1999). The average pool size of northern volcanic mudflow types is typically small (<100 m^2), the pools are irregularly spaced and do not form large pool complexes. These pools have characteristically shallow soils, <30 cm deep, and are underlain by impervious mudflow welded tuff. They have a "flashy hydrology," filling and refilling many times over the wet season. Northern hardpan pools are typically found in complexes in areas of hummocky ground on old terraces above the recent river floodplains and below the foothills. These pools are often larger than northern volcanic mudflow pool, and can be more than 1 acre. They have a less flashy hydrology, with pools remaining filled longer than volcanic mudflow vernal pools.

Seasonal and/or Perennial Stream. These habitats are contained within the ordinary high water mark of seasonal or perennial streams, creeks, or rivers. There are four such stream systems in the study area: Pleasant Grove Creek, Orchard Creek, Curry Creek, and Steelback Creek. Each of these creeks has multiple branches and/or tributaries. In places, stream features have been converted to channelized irrigation ditches, which is common in areas developed for agricultural purposes. Channel conditions within the study area are generally degraded.

Prior to development within the watershed, Pleasant Grove Creek and its tributaries were seasonal streams, however, summer flows are now maintained by irrigation runoff. Pleasant Grove Creek has the largest drainage network within the study area. It originates in the far Eastern Segment of the study area and flows westward, where it terminates in the Pleasant Grove Creek Drainage Canal. Sections of Pleasant Grove Creek in the Central Segment are surrounded by well developed riparian forest, as described in the Riparian Woodland section, below. Fish species likely to occur in Pleasant Grove Creek include California roach (*Lavinia symmetricus*), Sacramento sucker (*Catostomus occidentalis*) smallmouth bass (*Micropterus dolomieui*) and spotted bass (*Micropterus punctulatus*).

Orchard Creek, a tributary to Auburn Ravine, is located in the northeastern corner of the study area. It flows westward under Fiddyment Road north of the study area and then joins Auburn Ravine. Curry Creek has several tributaries that originate in the southeastern corner of the study area and flow to the west; the creek intersects the Pleasant Grove Creek Drainage Canal, and terminates in the Western Segment of the study area. Recent field observations indicate that at least some areas of Curry Creek and its tributaries have been channelized and embanked to the edge of the channel and that there is a lot of fine sediment depositing in the channel.

A fourth stream system, Steelhead Creek, exists south of Curry Creek. It originates near the southern edge of the study area and terminates into the Natomas East Main Drainage Canal.

Riparian Woodland. Riparian woodland borders most of the central part of Pleasant Grove Creek. Less developed (fewer large trees) riparian areas occur adjacent to tributaries of Pleasant Grove Creek and limited areas of Curry Creek. Typical woody species include Goodding's willow (*Salix gooddingii*), Fremont cottonwood (*Populus fremontii*), and valley oak (*Quercus lobata*). Large trees in or adjacent to riparian areas are considered habitat for state listed Swainson's hawk. Understory riparian vegetation containing elderberry bushes (*Sambucus* species) is considered habitat for federally threatened Valley elderberry longhorn beetles (*Desmocerus californicus dimorphus*). The well-developed riparian woodland supports a high diversity of resident and migratory bird species, such as scrub jay (*Aphelocoma*

coerulescens), black-crowned night heron (*Nycticorax nycticorax*), ruby-crowned kinglet (*Regulus calendula*), Wilson's warbler (*Wilsonia pusilla*), Lincoln's sparrow (*Melospiza lincolnii*), great horned owl (*Bubo virginianus*), and Bullock's oriole (*Icterus bullockii*).

Wetlands. Freshwater marsh habitats are characterized by saturated or periodically flooded soils that support some combination of rushes (*Juncus* spp.), sedges (*Cyperus* spp.), cattail (*Typha* spp.) and bulrush (*Scirpus* spp.). Bird species such as mallard (*Anas platyrhynchos*), American widgeon (*Anas americana*) and red-winged blackbirds (*Agelaius pheoniceus*) can be found in freshwater marsh habitat throughout the study area.

4.2 CULTURAL SETTING

4.2.1 Ethnography

The study area is within the ethnographic territory of the Nisenan, one of three Maiduan speaking tribelets inhabiting the northeastern half of the Sacramento Valley and the adjoining western slopes of the Sierra Nevada. Also known as the Southern Maidu, the Nisenan inhabited the five named villages in the general vicinity of the project area: *Pichiku* near present day Roseville; *Bamuma* near present day Lincoln and *Wollok; Leuch;* and *Wishuna* along the eastern edge of the Sacramento River (Wilson and Towne, 1978: Figure 1).

Ethnographic data on the Nisenan have been presented within several original works specifically focused upon them (Beals, 1933; Faye, 1923; Gifford, 1927; Kroeber, 1929; Littlejohn, 1928; Ritter and Schulz, 1972; Uldall and Shipley, 1966); however, the primary reference is found within Kroeber's (1925) overview of California Indians. A synthesis of Nisenan ethnography has been written by Wilson and Towne (1978), who also compiled a bibliography devoted to general Maidu ethnography (1972). An early account of Nisenan life is found within Powers' (1877) study of California Indians.

The Nisenan were the southernmost of three groups (Konkow, Nisenan, and Maidu) who spoke a Maiduan language. Maiduan is one of California's four Penutian languages, the others being Wintuan, Utian, and Yokutsan. Ethnographic groups speaking non-Maiduan Penutian languages within California include the Wintu, Nomlaki, and Patwin (Wintuan), the Costanoan and the Miwok (Utian), and the Yokuts (Yokutsan) (Shipley, 1978:82-85).

The Nisenan specifically inhabited the area within the American, Bear, Yuba, and lower Feather River watersheds. The region is bordered by the Sierran Crest on the east and by the Sacramento River on the west. The northern boundary is ill-defined due to linguistic and cultural similarities between the Nisenan and their northern neighbors, the Konkow. The southern boundary is also vaguely defined, being situated somewhere between the American and Cosumnes Rivers (Kroeber, 1925; Levy, 1978; Riddell, 1978; Wilson and Towne, 1978).

As stated above, within the general vicinity of the study area, the Nisenan inhabited a village near Roseville (*Pichiku*), another near Lincoln (*Bamuma*) and three along the eastern edge of the Sacramento River (*Wollok*, *Leuchi*, and *Wishuna*). It is unknown whether these were permanent settlements, although references describe them as "major villages" (Wilson and Towne, 1978, Figure 1). Nisenan villages varied considerably in size, with a large village containing from 40 to 50 houses and more than 500 people. A typical settlement within the lowland areas of the Nisenan territory would be situated upon natural rises along the major rivers and streams (Kroeber, 1925:395; Powers, 1877:316; Wilson and Towne, 1978:388). Structures occurring within major villages would include brush shelters, sweat house(s), acorn granaries, a dance house, as well as the above mentioned houses (Kroeber, 1925:407-409; Wilson and Towne, 1978:388-389).

The principal subsistence activities of the Nisenan were hunting, fishing, and the gathering of wild plants. Subsistence practices relied upon a large variety of food sources, rather than being dependent on a limited number of staples. Typical of California groups, acorns from various species of oak were eaten, as were the nuts from bull and sugar pine, and buckeye. Other plants consumed included wild fruits and berries, various seeds, roots, and bulbs. Most animal species were eaten with the exception of canine species, grizzly bears, vultures, amphibians, and reptiles (Kroeber, 1925:409-411; Wilson and Towne, 1978:389-390).

The Nisenan were organized similarly to many California Indians in that a certain territory was identified as belonging to a group and that group recognized themselves as a unit (i.e., tribelet). Several affiliated villages may have occurred within the tribelet territory. Each village, and often a group of allied villages, had a headman, whose duty was to advise the members of the community. No larger levels of political organization occurred beyond these village affiliations (Kroeber, 1925:396-398; Wilson and Towne, 1978:393).

Warfare, though rare, did occur. Fighting is known to have occurred between Nisenan tribelets as well as with non-Nisenan peoples. Generally, conflict occurred following trespass or similar territorial violations. An example of inter-tribelet conflict involved Nisenan from the Roseville area in the 1820s. Evidently, men from the Auburn/Nevada City area were killed in the Roseville vicinity. The hatred and distrust between these peoples lasted for several years, as evidenced by the report that the Nisenan attributed an epidemic in 1833 to bad air, sent to the valley by revengeful hill dwelling shamans (Wilson and Towne, 1978:388 citing Payen, 1961:23; Wilson, 1957-1963).

The Nisenan were affected little by the Spanish and Mexican incursions into California's interior (Wilson and Towne, 1978:396). They were, however, greatly impacted by the above mentioned epidemic, which ravaged parts of California during the 1830s. Believed to have been brought by fur trappers, this pestilence often killed the population of entire villages. It is estimated that 75 percent of the population died as a result of the epidemic, with many of the survivors retreating to mountain locations (Cook, 1955).

The Nisenan who survived the epidemic were among the California groups most affected by the Gold Rush of 1849. It was within Nisenan territory that John Marshall discovered gold at Coloma in 1848. Soon afterwards, hoards of fortune seekers descended upon Nisenan and adjoining territories. Within a short span of time, the lands of the Nisenan were overrun and the wholesale killing of Nisenan by whites began (Chartkoff and Chartkoff, 1984:279-282; Powers, 1877:317; Wilson and Towne, 1978:396).

In the early 1870s the Nisenan adopted the religious cults that swept through much of northern California following the inception of the Ghost Dance by the Paviotso near Walker Lake, Nevada in 1868. Unlike northwestern California, where the cults persisted well into the twentieth century, the Nisenan abandoned the movement in the 1890s (Du Bois, 1939; Kroeber, 1932).

4.2.2 Prehistory

The study area lies directly adjacent to one of the most intensively archaeologically studied areas in California, the Sacramento/San Joaquin River Delta and adjoining sections of the Sacramento and San Joaquin Valleys. Beginning in the last decade of the nineteenth century, avocational archaeologists recovered thousands of artifacts from numerous sites in the Delta vicinity. A general synthesis of these early works is found in Schenk and Dawson (1929).

The next series of excavations in the general region were conducted by student crews from Sacramento Junior College (SJC). Beginning in 1931, various sites adjacent to the Cosumnes River and Deer Creek confluence were excavated. Joined a few years later by crews from the University of California (UC), the

SJC archaeologists continued their excavations within the Delta region. These efforts culminated in the milestone works of Lillard and Purves (1936) and Lillard, Heizer, and Fenenga (1939), both of which identified a sequence of cultural change within the Delta and adjacent vicinities.

The cultural sequence identified by Lillard and his colleagues (1936; 1939) contained three cultural periods (Early, Intermediate/Transitional, Late), which were based upon changes observed within the mortuary patterns and grave furniture recovered from their sample of sites. Lillard, Heizer, and Fenenga (1939) believed that the sequence represented a single cultural progression, the Early Period evolving into the Transitional Period, the Transitional Period evolving into the Late Period.

As more archaeological work was conducted within central California during the 1940s and 1950s, the cultural sequence developed by Lillard and his colleagues (1936; 1939) was refined and expanded to accommodate the additional data. The most significant of these revisions was Beardsley's (1954) Temporal and Areal Relationships in Central California Archaeology, in which the Central California Taxonomic System (CCTS) was formally developed.

As archaeologists in central California attempted to incorporate their data into the CCTS, the limitations of Beardsley's system became apparent. Alterations to the CCTS began appearing in the literature of the discipline, with the doctoral dissertation of Fredrickson (1973) being of the most consequence.

After many debates and numerous revisions, the cultural sequence for the central California region, first defined by Lillard and his colleagues (1936; 1939), currently stands as follows:

4.2.2.1 Windmiller Pattern (ca. 3000 B.C. – 500 B.C.)

The artifact assemblage characteristic of this cultural manifestation includes a variety of flaked stone, ground stone, baked clay, and shell items reflecting exploitation of diverse subsistence resources and acquisition of materials from distant geographic areas through trade. The burial pattern of Windmiller cemeteries and grave plots is unique in that virtually all of the interments are ventrally extended, with the head oriented to the west. The primary exception to this burial pattern is that aged females were buried in a flexed position. Social stratification can be inferred from the burial practices of Windmiller peoples. Males appear to generally have higher status than females, as evidenced in their deeper and artifactually richer graves. Social status may have been at least partially inherited, for some female, child, and infant burials contained elaborate grave furniture, while others lacked such wealth (Moratto, 1984:201-207).

4.2.2.2 Berkeley Pattern (ca. 500 B.C. – A.D. 500)

The Berkeley Pattern represents a gradual shift in adaptation and material culture that appears to have originated within the San Francisco Bay region. The subsistence practices of Berkeley peoples differs from that of the Windmiller peoples in that the use of acorns for food seems to have increased dramatically. The reliance on acorns is evidenced in the increase in mortars and pestles recovered from Berkeley Pattern sites. Other differences in material culture include the occurrence of an extensive bone tool kit, unique knapping techniques, and certain types of shell beads and pendants within Berkeley Pattern sites. Burial practices of Berkeley peoples also differed from those of Windmiller Pattern sites. No longer were corpses placed into graves extended towards the west. Instead, Berkeley Pattern burials are flexed with variable orientation (Moratto, 1984:207-211).

4.2.2.3 Augustine Pattern (ca. A.D. 500 – A.D. 1880)

The Augustine Pattern reflects local innovation in technology, as well as the incorporation of new developments with traits of the Berkeley Pattern. The artifact assemblages of Augustine Pattern sites indicate an increased reliance on hunting, gathering, and fishing. Acorns appear to have become

particularly important. Many burials continue to be flexed, however, cremation becomes the mortuary practice for high-status burials. Extensive trade networks developed to accommodate the resource and social needs of the burgeoning populations (Moratto, 1984:211-214).

4.2.3 History

Although it was not until after the discovery of gold at Sutter's Mill in 1848 that Euro-American people began entering the region en masse, the general area was visited by non-native peoples prior to that year. Gabriel Moraga, under the flag of Spain, led an expedition from Mission San Jose up to the Cosumnes and Feather Rivers in 1808. In 1813, Jose Arguello reached the Cosumnes River, where he battled a band of hostile Miwok. Narciso Duran and Luis Arguello left San Francisco in 1817 and passed through the region on their expedition. Arguello is credited with naming the Feather River, his El Rio de Las Plumas (Beck and Haase, 1974; McGowan, 1961).

Following the Spanish entrance, this region of California was visited by American trappers looking for new areas to exploit. Beck and Haase (1974) indicate that Jedediah Smith, Joseph Walker, and Ewing Young passed through the region on their journeys through California.

Captain John Sutter was granted his roughly 1,000 square mile "New Helvetia" ranch near present day Sacramento in 1839. It was from Sutter's Mill, near present day Coloma, that John Marshall discovered gold in 1848. Soon afterwards the famous gold rush began and the region became quickly populated with prospectors, entrepreneurs, and others seeking easy fortunes (Bean, 1977; Lavender, 1972; McGowan, 1961).

Local histories following on from Marshall's gold discovery for Placer and Sutter counties and Reclamation District 1000 are presented below.

4.2.3.1 Sutter County Portion of the APE

One of the smaller counties in the state, Sutter County is situated in the heart of the Sacramento and Feather River valleys. Settlement patterns in the southernmost portion of Sutter County followed a similar development pattern as southwestern Placer County. As unsuccessful miners staked out homesteads and started farming the region's grasslands, small hamlets were established in the outer regions of the county (Yuba City and Marysville, 2006).

One such community in the vicinity of the study area was Pleasant Grove, located 20 miles southeast of Yuba City. Initially known as Gouge Eye, the town of Pleasant Grove developed in the late 1860s around Charles Bishop's general store, at the present day intersection of Howsley and Pleasant Grove roads. When the post office was constructed in 1867, Gouge Eye was renamed Pleasant Grove Creek, which was later shortened to its present name in 1875. The town grew quickly in the early years, and by the late 1880s included shoemaker, doctor, town hall, barber, fraternal organizations like the Pleasant Grove Odd Fellows, a hotel, salon, blacksmiths, and general store. Early settlers included Ephraim Johnson, who purchased a 240-acre farm in 1878 just south of Pleasant Grove (south of the present day intersection of Pleasant Valley and Sankey roads and outside of the architectural APE) where he constructed a residence. Over the years he added 440 acres to his property, farming wheat, oats and barley on this land as well as more than 3,000 acres of leased land. By the mid 1880s, the town included a population of 100 people living on large farms. Grain, primarily wheat, and livestock formed the principal crops during this period, which continued into the first half of the twentieth century, while rice became an important crop in later years. Unlike the fruit regions of the county to the north and southeast, the area within the APE remained rooted in the production of grain throughout the twentieth century (Wagner, 2006; Crawford and Hurd, 1935; Lowe et al., 1990:59).

4.2.3.2 Placer County Portion of the APE

Placer County was created in 1851 from portions of Sutter and Yuba counties, two of California's original counties. Bordered by Sacramento County to the south, Lake Tahoe to the east, and Bear River to the north, many of the county's communities owe their origins to the gold rush. Nevertheless, in the southwestern portion of the county, or "the valley," gold was never found in any quantity, so beginning in the 1850s, former miners staked out homesteads and started farming the region's undulating grasslands (Davis, 1975:11,15; 1964). Even with gold mining as the major industry in the county through the 1880s, in the area around Roseville and Lincoln, farming continued to be the economic mainstay, along with timber harvesting. Bypassed by gold prospectors on their way to the goldfields, local farmers quickly built up large land holdings in the area (Abeloe, 1966:265).

One of the first areas to be settled in the vicinity of the study area was the Dry Creek District, which extends east, south and west of present-day Roseville, followed by Pleasant Grove District (located northwest of Roseville, extending west to Sutter County) where Stephen A. Boutwell, William Dunlap and others acquired large tracts of land (Davis, 1975:19; 1964:1-2). Local farmers quickly built up large land holdings along the various creeks that flow west into the American Basin. Called the "plains" by early prospectors on their way to the goldfields, early settlers came to the area in the 1850s. The region was eventually named the Pleasant Grove District after the creek which passed through. The Fiddyment family also settled in this district in 1856 when Elizabeth Jane Fiddyment and her young son, Walter F. Fiddyment Jr., joined her family on their large farm. Mrs. Fiddyment went on to become a large landholder, reportedly owning more than 13,000 acres in Placer County, while her son turned to raising sheep and cattle. The Fiddyment family maintained a strong presence in the region, expanding their holdings and improving their ranch complexes. Walter eventually became one of the largest grain and stock ranchers in the county, while his sons and grandsons went into the poultry business on the family land (Davis, 2002:10; U.S. Census Bureau, 1870; PAR Environmental Services, Inc., 2001; EIP Associates, 2004:4.8-3 through 4.8-6).

To the northeast of the Fiddyments, a New England farmer, George Whitney, settled on 180 acres about 3 miles northeast of present-day Rocklin in 1857. In this unoccupied and open land he established the Spring Valley Ranch, also known as the Whitney Ranch, where he successfully bred sheep. Between 1861 and 1873 he acquired numerous parcels of land, some under the Pre-emption Law of 1841, some former homesteaded lands purchased outright, and some from the Southern Pacific Railroad, ranging in size from 40 to 2,000 acres. The Whitney Ranch grew to encompass more than 20,000 acres of land in the Sacramento Valley, 2,000 acres of land at the confluence of the Feather and Sacramento Rivers (in Sutter County), 15,000 acres of private land within Tahoe National Forest, and grazing rights for sheep on 50,000 acres of railroad and government land. In addition to stock raising, the Whitney Ranch also produced wheat, with 1,200 acres in production in 1872. After 1875, Whitney's son, Joel Parker Whitney, began cultivating all available grain land on the ranch, eventually planting more than 8,000 acres of wheat. The ranch exported its grain crops and livestock from Whitney Station (located near the present day intersection of Sunset and Industrial boulevards), 3 miles west of the Whitney Ranch (Thompson and West, 1882:246-47; Donaldson, 1958:C2-3).

The construction and development of the railroad industry in the 1860s and 1870s played a significant role in the development of the region. The construction of the California Central Railroad (CCRR), an 18½-mile line that would linkup the cities of Marysville and Sacramento by means of a connection with Sacramento Valley Railroad, and later the Central Pacific Railroad, which was absorbed into Southern Pacific railway system, led to the establishment of Lincoln and Roseville (Tuturo, 2004:262-263; Lardener and Brock, 1924:1043; Thompson and West, 1882:273; Hart, 1978:363; Davis, 1975:29). Agriculture remained first in the region's economy into the twentieth century, with Roseville eventually becoming the shipping and trading center for southern Placer County. Despite this, the area's population remained low,

even after the construction of the state highway (LRN 3) from Sacramento (through Roseville) to Lincoln in 1909 (Caltrans, no date; California Highway Commission, 1922:201; Department of Public Works, California Highway Commission, 1922).

While agricultural production continues to be an important land use in southwestern Placer County, the region began undergoing extensive development following World War II as the accelerated growth rate in the greater Sacramento metropolitan area began impacting surrounding communities. The completion of SR 65 in the westernmost portion of the APE in 1971, and the growth of Lincoln, Roseville and Rocklin that began in the 1960s, has impacted the rural character of western Placer County. Suburban housing and commercial developments just south of the project area and industrial development dating from the late 1960s along Industrial Boulevard occupy much of the land that was once open range. Since 1980 new employment centers have been established in an emerging area of high-tech companies locating along the SR 65 corridor, and many new commercial and residential developments have been constructed.

4.2.3.3 Reclamation District 1000

In the forty-year period from 1870 to 1910, Sutter, Placer and other mid-valley counties remained sparsely populated and some actually declined in population. A completely new pattern emerged between 1910 and 1930 as large numbers of new settlers came to the Sacramento Valley, many attracted by improved flood control systems, irrigation, and the promising development of fruit and nut orchards. Unlike wheat farming or dairying, orchard culture provided a viable family income from relatively small parcels of land. Agrarian visionaries foresaw vast parts of the region populated with small prosperous farms living on 10- to 20-acre farms. Through reclamation and irrigation of the Sacramento Valley during the late nineteenth and early twentieth centuries, the number of people and individual farms expanded tremendously in the fruit growing regions of Sutter and Yuba counties during this period (McGowan, 1961:1; Jelinek, 1924:55-58, 61-63).

With the influx of population in Sutter County in the late nineteenth century, the state sought to control seasonal flooding while promoting agriculture in the American Basin. Great strides had already been made with construction of a series of levees, river gauges to monitor water levels and the establishment reclamation districts. The region had been devastated by major floods in 1861-1862 and again in 1875, and while the government had severely restricted hydraulic mining in the mid 1880s, the region was still vulnerable to damage from mining debris and flooding. Use of much of the land in the southernmost portion of the county was limited to seasonal grazing and some farming on higher ground, and for fishing and hunting (USGS, 1892, 1910a, 1910b; Dames & Moore, 1995:40-41; Gordon, 1988:68-70). New reclamation efforts in the first decade of the twentieth century spurred the state legislature to create Reclamation District No. 1000 (RD 1000) in 1911. It later became part of the Sacramento Valley Flood Control Project. Located in northeastern Sacramento and southern Sutter counties, this district consisted of an area of approximately 55,130 acres, located east of the Sacramento River and extending to the Western Pacific Railroad tracks (currently part of the Southern Pacific). It included drainage canals, pumps, levees, ditches, pumping plants and a system of roads. After drainage and construction of levees, the Natomas Consolidated Company land surveyed and subdivided the land.

Part of the construction included the Natomas East Main Drainage Canal, which is crossed by the western ends of all of the project's alternatives reaching SR 70/99. To promote RD 1000 by demonstrating land productivity, Natomas Consolidated leased large acreage blocks for wheat and grain crop production, thus establishing a pattern of large acreage, single-crop land use. The company also built a 60-mile network of roads across RD 1000 to provide access to drainage canals for construction and maintenance, as well as to serve farm roads to parcels within the district's various subdivisions. This network was originally comprised of dirt roads (roughly two lanes wide) that the Natomas Company graded. Most of these roads were paved with macadam or concrete during the 1920s and 1930s. They generally followed the township

and section survey lines and the drainage canals to form large regularly spaced grids in the landscape (Dames & Moore, 1995:29-32, 40-41, 62, and 99; Bonte, 1931:181 and 183; USGS, 1994, 1953a; Commissioner of Public Works, 1905; House Document Number 81, 1911). Despite these improvement efforts, selling land in the district was a slow process into the 1940s (Dames & Moore, 1995:14).

5.0 INVENTORY METHODS

5.1 INTRODUCTION

Because the current undertaking consists only of the preservation of a transportation ROW, the archaeological APE for this Tier 1 investigation consists of the area within the boundaries of the corridor alignment alternatives. Furthermore, because the project has yet to be designed, the APE is currently limited to the ground surface only and there is no vertical APE. An APE encompassing areas that potentially would be disturbed by construction activity, as well as areas that potentially would be used for construction excavation, will be developed and assessed in Tier 2.

The APE for the project is depicted on Figure 5-1 (sheets 1 through 4). The approved APE is provided in Appendix B.

In accordance with stipulation of the Parkway PA (Appendix A), only the alignment common to all build alternatives (Figure 5-2) was subject to archaeological pedestrian reconnaissance. The common alignment occurs primarily in the Eastern Segment of the study area, although a small section of common alignment also is found in the eastern extent of the Central Segment.

As depicted in Figure 2-1, the remaining portions of the APE are comprised of a series of interconnected corridor alternatives. Archaeological issues in these corridors, as agreed upon by the signatories and concurring parties of the PA, were addressed through the use of environmental factors including length of stream corridor, area above floodplain, and area of farm land to rank the archaeological sensitivity of the project alternatives. The results of the ranking efforts would then be used in the Tier 1 EIS/EIR.

The ASR study consisted of background and archival research, contact with the Native American Heritage Commission (NAHC) and local Native American groups and individuals identified by the NAHC, an intensive archaeological pedestrian reconnaissance of the previously unsurveyed portion of the common alignment where access had been secured, and the development and use of a predictive model based on environmental factors to assess the relative archaeological sensitivity of the project alternatives.

The majority of the common alignment has been previously investigated in the recent past. As depicted on Figure 5-2, the corridor bisects a number of areas currently under environmental review for other development project proposals. Environmental review of these projects has included archaeological investigations, and the results of these investigations have been used in this report to characterize the baseline conditions of the corridor analysis.

Mark R. Hale, URS Senior Project Archaeologist, prepared this Archaeological Survey Report (ASR) to document cultural resources identification efforts in the project's Area of Potential Effect (APE). Pedestrian archaeological reconnaissance was led by URS Senior Project Archaeologist Mr. Hale. Mr. Hale holds a B.A. in Anthropology from the University of California, Berkeley, and has completed his course work, completed his research, and defended his thesis for an M.A. in cultural resources management from Sonoma State University. He has more than 20 years of professional experience in conducting and managing cultural resources. Project oversight was provided by Mr. Brian Hatoff (URS Senior Archaeologist). Mr. Hatoff received both his B.A. and his M.A. in Anthropology from the University of California, Davis; is a Registered Professional Archaeologist, and has more than 30 years of professional experience in California and the Great Basin.

5.2 COMMON ALIGNMENT

As mentioned above, an agreement between FHWA, OHP, Caltrans, and SPRTA states that only the "common alignment" of the Parkway need be physically inventoried for archaeological resources for

preparation of the Tier 1 EIS/EIR. The common alignment occurs primarily in the Eastern Segment of the study area; however, a portion also occurs in the eastern portion of the Central Segment (Figure 5-2).

Given the recent dates of archaeological surveys on several parcels through which the common alternative passes, with Caltrans approval, some parcels were not reinventoried for archaeological resources. These parcels are:

- Amoruso Property (Brookfield) (ECORP Consulting 2006)
- Placer Ranch (Hale, 2004)
- Reason Farms Retention Basin (Hale, 2002)
- SR 65 Widening Project (Norton, 1998)

Prior to the initiation of field efforts, letters requesting access were sent to relevant landowners. Figure 5-2 identifies the parcels found within the common alignment. Landowners did not respond to request for access to conduct surveys on two properties: Macor Incorporated Property APN.017-061-044 and Whitney Industrial Park APN.017-061-045. It should be noted, however, that although access to these two parcels has not been secured for the current effort, the majority of both had been previously inventoried with negative results (Derr, 1997; McGowan Seldner, 1985). Furthermore, based on past surveys within the immediate vicinity of these parcels (see Section 3.0), the overall archaeological sensitivity of these parcels is low. This supposition is based on the fact that intensive archaeological surveys have for the most part proved negative.

The survey corridor, comprised of parcels within the common alignment, was subjected to an archaeological pedestrian reconnaissance following the guidelines proposed by King (1978). Specifically, the previously unsurveyed portions of the common alignment where access had been secured were visually inspected using 20-meter (66-foot) parallel transects.

In general, ground visibility within the surveyed are of the common alignment was poor. At the time of the survey, dense growth of grasses obscured the ground surface. To help alleviate the situation, in areas where non-agricultural vegetation obscured the ground surface, approximately 20 cm by 20 cm patches were occasionally cleared with hand tools or footwear to increase ground visibility. Attention was focused on potential vernal pools and alongside minor drainages, rodent burrow spoils, vehicle tracks, recently graded exposures, and erosion gullies. Recently excavated and graded areas adjacent to the survey area were also inspected (i.e., Sunset Boulevard extension).

5.3 ALTERNATIVES

5.3.1 Predictive Model

As indicated previously, signatories to the PA agreed that only the common alignment of the Parkway needed to be inventoried for archaeological resources prior to the preparation of the Tier 1 EIS/EIR. The portion of the archaeological APE outside of the common alignment consists of the remaining five interconnected corridor alignment alternatives described in Chapter 2. The draft PA outlines that a predictive model would be used to assess the various alternatives for their relative archaeological sensitivity. These data could then be used in the Tier 1 EIS/EIR to make conclusions about potential impacts to archaeological resources.

For the current investigation, the predictive model is a GIS-based application that assesses the relative sensitivity of each alternative corridor based on various, common environmental factors known to influence past human activity in the project vicinity. This is based on the assumption (see Bettinger, 1977) that:

> "… culture systems are adaptations to their environments, and, as such, their subsistence and settlement patterns are structured to fit the existing patterns of regional resource distribution."

Although some, including Bettinger, have used such models to predict site locations and/or densities within a given area with varying levels of success, this was not attempted herein for it is believed that there is insufficient data at this time to make more than general statements of archaeological sensitivity for the current APE. In fact, Bettinger warns that:

> "Predicting the density of archaeological sites is a difficult proposition at best. Frequently the information necessary for the proper computations is unavailable, requiring more assumptions than are desirable" (Bettinger, 1977:222).

It should also be noted that the corridor chosen for preservation would ultimately be subjected to intensive pedestrian reconnaissance during Tier 2.

The environmental factors used in this investigation are those known to influence (either attract or deter) past human activity in the study area based on archaeological evidence, ethnographic data, and historic land-use information.

As the project's corridor alignment alternatives are located in relatively close proximity to each other, the environmental setting does not differ significantly between alternatives. For this reason many commonly used environmental factors such as slope and exposure cannot effectively differentiate between alignments. Further complicating matters is the fact that environmental conditions in the study area were significantly altered in the twentieth century. Vast tracts were reclaimed, stream courses altered, and wetlands were drained to create valuable farmland. Riparian vegetation was removed in order to increase sunlight to farmlands. As such, it should be noted herein, that the modeling in this report was based on available data. It should also be noted that environmental factors were not ranked and calculations were not adjusted based on the corridors' lengths.

Given the basic human need for water, within the Sacramento Valley as elsewhere in the world, both prehistoric and historic settlement tended to intensify around perennial water sources. Besides providing direct sustenance to human populations, water also provides sustenance to both plant and animal resources used by human populations.

The majority of previously recorded prehistoric sites within the region are situated along the perennial watercourses that flow toward the Sacramento and American Rivers (as well as along these two major waterways). Prior to the construction of the levees and diversion canals that were constructed in the early part of the twentieth century, local hydrology was well suited to support a myriad of floral and faunal species important to the diet of prehistoric populations and the ethnographic Nisenan. Many previously investigated archaeological sites in the region, including those where only surface observations were possible, have produced faunal remains from riparian-adapted species. Similarly, baked clay net weights with impressions of tule wrapping have been noted in site collections, providing evidence for use of this plant by native populations. The presence of bone and antler fishhooks, harpoon toggles, fish spears, and net weights of stone and clay among sites in the region also attest to the importance of water–based resources.

Early historic populations likewise tended to focus settlement near perennial waterways. In fact, many early historic homesteads were placed atop prehistoric deposits as evidenced by numerous multi-component archaeological deposits as well as the non-native vegetation including palm, olive, black walnut, English walnut, plum, peach, apricot, apple, pomegranate, and various citrus often noted on archaeological site forms from the region.

Given the above circumstances, proximity to stream courses clearly elevates sensitivity in the study area. The total length in miles of existing stream course within each corridor alignment alternative was thus one factor used to assess the archaeological sensitivity of the project alternatives. A similar approach of using length of stream corridor (converted to "fish miles") was used in the landmark study by Baumhoff (1963) to analyze prehistoric settlement. It should be noted, however, that there is currently no evidence that any of the streams bisecting the current APE historically supported runs of anadromous fish (GANDA, 2006).

Proximity to perennial stream courses can also provide insight into the issue of buried archaeological resources (i.e., those with no surface manifestation). Buried archaeological resources are of concern as it is well recognized that natural cycles of soil erosion and deposition have buried archaeological resources, often deeply (Meyer and Rosenthal, 1997; Rosenthal and Meyer, 2004a, 2004b). Implementation of a project with ground-disturbing activities could inadvertently expose such a resource, possibly resulting in both unanticipated impacts and project delays.

Assessment of the potential for the current project to encounter buried archaeological deposits is somewhat problematic given that the project has not yet been designed. As described previously, the project consists of selecting and preserving a corridor for the future Placer Parkway. During Tier 2, when specific project components can be analyzed, the issue of buried archaeological resources can be addressed more intensively.

For this Tier 1 analysis, the total length of stream course is also used to rank the likelihood of each alternative to contain buried archaeological resources. As indicated by Rosenthal (2005) distance to water has proven to be an important predictor of archaeological site locations throughout central California" and as such, it is adjacent to areas of surface water that they focus their geoarchaeological investigations. For this study, it is assumed that the greater the total length of stream corridor within an alternative, the greater the potential for the presence of buried archaeological resources as well as those exhibiting surface manifestations.

Although other water-oriented environmental features, including wetlands, vernal pools, and riparian habitat, may have once drawn both prehistoric and historic populations, for purposes of the current analysis it was determined that the current altered distribution in the region prevented the meaningful use of such features as determinants of archaeological sensitivity.

Although the presence of water is a natural draw for both prehistoric and historic populations, this can also present an obstacle to settlement in areas where the risk of flooding is high. The majority of previously recorded prehistoric and pre-reclamation-era historic archaeological sites in the region are situated above historic floodplains including such areas as natural levees along the watercourses, upon "high spots" within natural floodplains, and in the uplands above the floodplains. This pattern is apparently driven by the human preference for inhabiting high, dry ground located in close proximity to water.

As current reclamation, irrigation, and flood control efforts have drastically altered the natural flood patterns, the use of current flood mapping data (e.g., 100-, 200-, and 500-year floods) is of limited value. For example, most prehistoric and pre-reclamation historic archaeological sites would have received little impact from flooding prior to the construction of dams and levees on the Sacramento and American Rivers and their respective tributaries. Today, however, seasonal flooding routinely inundates many sites. In this region, this is perhaps most evident in the large number of sites recorded along Dry Creek near Roseville. These sites become flooded when water backs up because it is restricted through the Natomas East Main Drainage Canal.

As a means to identify pre-reclamation floodplains, historic sources were consulted. Pre-reclamation reports and maps (Commission of Engineers, 1904; Commissioner of Public Works, 1895; Hall, 1887)

reveal that the margin of the floodplain prior to the reclamation and flood control projects of the historic and modern eras was located at approximately 30 feet above mean sea level. Based on available GIS-ready FEMA topographic data, an elevation of 33 feet (i.e., 10 meters) above mean sea was determined to be the approximate break between floodplain and non-floodplain. The total amount of acreage at or above this elevation was used for the assessment of general archaeological sensitivity of the alternative corridors

As much of the study area was converted to agricultural use following the reclamation efforts of the early twentieth century, it was determined that identifying those areas potentially most attractive to agricultural pursuits would be an appropriate avenue of investigation. As developed land was avoided during the screening process, however, the project alternatives are comprised nearly entirely of agricultural lands, including both dry and irrigated farming, and grazing. Although grazing has and continues to occur in the study area it is a much less intensive agricultural pursuit than the raising of crops (farming), which is more likely to remain physically evident over time.

The California Department of Conservation (CDC) has classified soils in terms of their desirability as farmland. Several categories are recognized and mapped, including Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and Farmland of Local Importance. In addition to these, both Grazing and Urban Built-up lands are also mapped. Using these available data, total acreage of farmland was tabulated to assess the archaeological sensitivity of the project alternatives.

Environmental data were entered into URS' Geographical Information System (GIS) using ArcGIS 8.3 software, which consists of the following modules: ArcMap, ArcCatalog, and ArcToolbox. The development of a GIS for the project involved a series of tasks, including collection of spatial data from a variety of sources; importation of that data into ArcGIS 8.3; projection of the data into Stateplane Feet NAD 83 Zone II; development of new data from pertinent existing data or input from project team members; creation of metadata for each data layer; map and figure creation displaying the data in a useful manner; data version control and maintenance; and input into an analysis program called Community VIZ by Moore, Iacofano Goltsmith (MIG) and URS Corporation. URS created the figures and numeric data presented below.

Spatial data were collected from a variety of sources. Aerial photography was obtained from AIRPHOTO USA. Images of the project area were taken in April 2001 and again in November 2002. The color images have a 2-foot pixel ground sample distance. The 2002 images are used as the base for most maps. Several existing GIS data layers were gathered from Placer County, Sutter County, Sacramento County, City of Roseville, DKS Associates, North Fork Associates, Sacramento Area Council of Governments (SACOG), CH2M Hill, Federal Emergency Management Agency (FEMA), United State Geological Survey (USGS), U.S. Fish and Wildlife Service (USFWS), California Department of Fish and Game (CDFG), California Historical Resources Information System, and California Department of Conservation. Project team members created some data by aerial photograph interpretation, input from resource specialists, or through analyzing existing data.

Based on the data collected and displayed on maps created through GIS, total land areas were determined (in acres or length) for the environmental factors described above. Specifically, the total length of stream course, the total amount of land above historic floodplain (i.e., equal to or greater than 10-meter [33-foot] elevation), and the total amount of farmland were the environmental factors used to differentiate the archaeological sensitivity of the various corridors.

5.3.2 General Land Office Plat Maps

To further assess the historic archaeological sensitivity of the various project corridors, General Land Office surveyor's plat maps were also consulted. The United States Public Land Survey (USPLS) system

was established in 1785 with the Geographer of the United States as the director. This began the system of subdividing land areas into regular parcels, generally Townships comprised of 36 sections, each section being one square mile. Divisions of these parcels, often 160-acre quarter sections, could then be sold to provide income for the Federal treasury. In May of 1796 the post of Surveyor General was established, who was given the power to deputize surveyors to carry out land surveys. In April of 1812 the General Land Office (GLO) was established within the Department of the Treasury and in 1849 the GLO was reassigned to the Department of the Interior.

In the latter half of the nineteenth century, the GLO was responsible for surveying the largely unsettled lands of the western United States in response of an ever-increasing number of homesteaders. Having the lands surveyed made it easier to locate and legally describe the homesteaded parcels.

The value of GLO plat maps is that they depict historic features that may be represented in the archaeological record. Data retrieved from these maps is used here to complement the environmental parameters discussed in the previous section. It should be noted that although GLO plat maps are valuable tools, their accuracy is somewhat limited. According to the Iowa State University GLO Project "modern surveyors describe the GLO survey as one with low accuracy and lack of precision" (http://www.glo.gis.iastate.edu/pinfo/info_faq.html#21). The web site goes on to say that "probably the most important reason that the surveys were not as concerned with accuracy as surveys are today is because the price of land was low ... Low land prices did not warrant any delay in the survey procedure."

It should also be pointed out that GLO surveyors were only required to survey (i.e., follow) section lines. As such, the surveyors tended to only plot the features they encountered along the section line being followed. This is perhaps most evident in the case for minor roadways where only the section of road crossing the section line is plotted. Although the complete course of some, more major roadways are depicted on GLO maps, this may be simply a case of "plotting" the alignment by drawing a line to connect the sections of road actually encountered (i.e., a case of connecting the dots).

As a means to identify potential historic archaeological resources and thus assess the archaeological sensitivity of the project alternatives, the GLO plat maps (USDI 1855a, 1855b, 1868, 1871) were pieced together to form one map. The Parkway alignments were then overlaid on the composite GLO plat map. Although the accuracy of the GLO maps is limited, by using the section grid lines as reference points a satisfactory overlay can be produced and the location of potential historic archaeological resources identified.

6.0 STUDY FINDINGS AND CONCLUSIONS

As a means to determine the potential effects of the project on archaeological resources, a number of tasks were completed. As previously discussed, these comprised archival research, Native American consultation, a pedestrian reconnaissance of the common corridor alignment alternatives, and the development and use of a predictive model to determine the general archaeological sensitivity of the five corridor alignment alternatives. Because the screening process was used to avoid archaeological sites, no previously recorded historic or prehistoric archaeological sites occur within the APE for the project.

6.1 COMMON CORRIDOR ALIGNMENT ALTERNATIVES

An archaeological survey of previously unsurveyed portions of the common corridor alignment alternative was conducted on June 2-3, 2006. All areas within the archeological APE were subjected to intensive pedestrian survey using transects spaced no more than 20 meters (66 feet) apart.

Prehistoric sites in the general vicinity typically are manifested by darkened midden soils, often with some amount of shell, ground-stone artifacts, fire-affected rock, animal bone, and chips and tools of obsidian and/or cryptocrystalline silicates. Historic–era sites range from remnants of late nineteenth and early twentieth century homesteads including structural remains, trash deposits, privies and cisterns to mid-twentieth century refuse scatters. No prehistoric or historic archaeological materials, evidence of archaeological deposits, or indications of occupation were found on the surface within the APE.

It is Caltrans' policy to avoid cultural resources whenever possible. At this time no further archaeological work is necessary within the common corridor alignment alternatives. The selected corridor alignment alternative will be subjected to pedestrian archaeological inventory during Tier 2 efforts.

6.2 REMAINING CORRIDOR ALTERNATIVE ALIGNMENTS

6.2.1 Predictive Model

Using environmental factors known to both attract and deter past human settlement in the project vicinity, the relative archaeological sensitivity of the remaining corridor alignment alternatives was determined. Specifically, the total length of stream course, the total amount of land above the historic floodplain (i.e., at or above an elevation of 10 meters [33 feet] above msl), and the total amount of farmland were the environmental factors used to determine the archaeological sensitivity of the various corridors.

As depicted in Figure 2-1, each alternative shares some portion of its length with other alternatives. Rather than present the calculations for the portions of each alternative by segment, for ease of analysis and presentation, the data for each alternative have been collapsed and tabulated together (Table 6-1). Data for the Eastern Segment are not included in these calculations, as it comprises the common alignment that was subjected to archaeological pedestrian reconnaissance as described previously.

As can be seen in Table 6-1, Alternative 1 contains the greatest length of stream course, the most acreage above floodplain, and the most acreage of farmland. Using the criteria described above, Alternative 1 is the most archaeologically sensitive alignment alternative. Alternative 3 is the next most archaeologically sensitive alignment, ranking second in both total acreage above floodplain and total acreage of farmland and scoring third in total length of stream course. Alternative 2 follows, ranking second total length of stream course and third for both total land above floodplain and total acreage of farmland. Alternative 4 is next, ranking fourth for all identified criteria. Lastly, Alternative 5 ranks fifth for all categories, making it the least sensitive for archaeological resources.

Table 6-1
Predictive Model for Assessment of Archaeological Sensitivity of Project Alternatives (Excluding Common Alignment)

Alignment	Total Miles of Stream Corridor (Ranking)		Total Acreage Above Floodplain (Ranking)		Total Acreage of Farmland (Ranking)	
Alternative 1	3.0099	(1)	950.8	(1)	1238.4	(1)
Alternative 2	1.2942	(2)	868.8	(3)	1153.10	(3)
Alternative 3	0.9148	(3)	904.7	(2)	1188.1	(2)
Alternative 4	0.7720	(4)	782.4	(4)	953.7	(4)
Alternative 5	0.6906	(5)	778.2	(5)	945.0	(5)
Note: 1 = most sensitive 5 = least sensitive						

The total length of stream corridor, as described previously, can also provide insight to the potential for a corridor to contain buried archaeological deposits. Based on total stream corridor length, it can be predicted that Alternative 1 is the most likely corridor to contain buried archaeological resources while Alternative 5 is the least likely (Table 6-1).

As stated previously, the general archaeological sensitivity of the current archaeological APE for both prehistoric and historic archaeological resources is low. This is based on the fact that while resources have been identified, relatively few archaeological sites have been identified given the total acreage of land subjected to archaeological survey.

6.2.2 General Land Office Plat Maps

The current Placer Parkway project area is situated in lands contained within four Townships, specifically T10N/R4E, T11N/R4E, T11N/R5E, and T11N/R6E. These Townships were mapped by the GLO in 1855 (T11N/R5E, T11N/R6E), 1868 (T11N/R4E), and 1871 (T10N/R4E).

As can be seen on Figure 6-1, the common corridor alignment of Placer Parkway is situated in the northwestern corner of T11N/R6E and passes into the northeastern corner of T11N/R5E in a westerly direction before turning southward towards what is labeled on the plat map as Dry Creek (today's Pleasant Grove Creek). South of the Pleasant Grove Creek crossing (labeled on GLO map as Dry Creek), the corridor begins dividing into the five project alternatives. It is from this point southwestward that the current exercise is focused. The various historic features intercepted by Placer Parkway corridor alignment alternatives are discussed below.

It should be noted herein that various mapping inaccuracies, as discussed in Section 5.2.2, are depicted on Figure 6-1. Perhaps the clearest is along the section line separating Townships T11N/R4E and T11N/R5E. As is quite apparent, the course of Dry Creek and the unnamed road paralleling the north side of the stream on one map do not align with the same features on the adjacent map. A discrepancy of approximately one-quarter mile exists between how these features were mapped on their respective GLO plat maps. Other incongruities include the lack of a connection between the course of Pleasant Grove/Dry Creek between Townships T11N/R5E and T11N/R6E; the course of Slough/Dry Slough, also between Townships T11N/R5E and T11N/R6E; and the numerous sections of road plotted as sections of dashed lines that have neither a beginning nor an end and do not appear to connect to anything. These small sections of road, all occurring in the immediate vicinity of a section line, are prime examples of the surveyor only plotting what was encountered along the section line being followed.

6.2.2.1 Roads

As can be seen on Figure 6-1, the paths of several historic roadways are bisected by the corridor alignment alternatives. Although the common alignment is not part of the sensitivity exercise, it can be seen on Figure 6-1 that the corridor bisects an unnamed road in the northwestern corner of Section 8 of T11N/R6E, as well as another, less fully plotted and also unnamed road in Section 7 of T11N/R6E, and Section 12 of T11N/R5E.

A northwest-to-southeast–trending roadway is intersected by all corridor alignment alternatives as they begin branching out south of Dry Creek in Section 15 of T11N/R5E. This unnamed roadway parallels the south side of Dry Creek, appearing to cross the stream in Section 9 of T11N/R5E). It thus appears that this unnamed road may have crossed Dry Creek at the same location as the Sacramento and Nevada Road discussed below.

Further west, within the central section of the project area, all the alternative corridors also bisect the course of the Sacramento and Nevada Road. The course of the Sacramento and Nevada Road is nearly due north/south across the project area. According to Hoover et al. (1990:259), the Sacramento and Nevada Road was used by freight teams traversing the Sacramento Valley. With the building of the California Central Railroad through this area in the 1860s, staging and teaming along the Sacramento and Nevada Road, as well as elsewhere in the valley, became unnecessary.

Within Township T11N/R4E, another "Road" is plotted in the project area. As depicted, this north-south–trending road appears to go no further south than the northeastern corner of Section 26. This is likely an omission of the GLO surveyor as discussed in Section 5.2.2, as just barely visible in the northeast corner of Section 2 of T10N/R4E is the Marysville Road. It is possible that the Marysville Road extending northward from the GLO plat map of T10N/R4E is the same as the "Road" discussed above. If these sections of plotted road connect, as inferred here, all corridor alternative alignments of the Parkway intersect this potential resource.

What is labeled as a Stage Road is bisected by all of the alternative alignments in the western end of the project area in Township T11N/R4E. Running north to south where the corridor alignment alternatives bisect its path, this Stage Road begins turning to the northwest at the border between Sections 16 and 21. A branch of this unnamed Stage Road extends southeastward, perhaps connecting with the aforementioned Marysville Road.

A number of smaller, unnamed, and not fully plotted road segments occur within or immediately adjacent to various project alternatives. For example, Alternative 1 bisects a small section of road in Sections 33 and 34 of T11N/R5E. Although only a small section of this unnamed road is depicted, it is clearly on a course to intersect the Sacramento and Nevada Road near the course of Alternative 2. Other similar, only partially plotted road segments are depicted in Sections 21 and 22 of T11N/R4E, Sections 24 and 25 of T11N/R4E, Sections 27 and 34 of T11N/R4E, and Sections 35 and 36 of T11N/R4E.

As all alternatives intersect all of the major roads, or at least can be comfortably inferred to intersect them, as well as bisect a number of not fully plotted ancillary roads, no one corridor alternative alignment is more or less archaeologically sensitive then another, based solely upon the roads intersected along their length.

6.2.2.2 "House"

Besides the aforementioned roads, only one other potential historic archaeological resource was identified from the GLO maps within any of the potential corridor alignment alternatives of the Parkway project. Labeled as a "house" on the GLO plat map for Township T11N/R4E, the potential resource is situated in

the southeast quadrant of Section 23 directly within the path of the corridor alignment alternative common to both Alternatives 4 and 5, where it intersects Sankey Road at its easternmost point. No other information is known about the structure other than it was present by 1868. Air photos of this location reveal that the vicinity is currently under cultivation.

Intact remnants of this structure would likely represent an important cultural resource. Unfortunately, this section of the project area has not been previously subjected to an intensive archaeological pedestrian reconnaissance. As such, it is unknown whether remnants of this structure occur within the current APE. The potential presence of this structure elevates the archaeological sensitivity of both Alternatives 4 and 5.

Although a potential historic archaeological resource was identified in Alternatives 4 and 5, elevating the archaeological sensitivity of both of these corridor alignment alternatives, given the limitations in the original GLO mapping and the fact that the area has been plowed, this finding does not outweigh the sensitivity of the alternative corridors as determined in Section 6.2.1.

Federal Highway Administration
650 Capitol Mall, Suite 4-100
Sacramento, CA 958144-4708
Attn: Gary Sweeten

Dear Mr. Fong

The Federal Highway Administration (FHWA) and California Department of Transportation (Caltrans) are working with the Placer County Transportation Planning Agency (PCTPA) on the Placer Parkway Project. PCTPA proposes to identify and acquire right-of-way for the purpose of preserving a corridor for a future Placer Parkway, an east-west connection between State Route (SR) 65 near Lincoln in Placer County and SR 70/99 in southern Sutter County. Our agencies are working together to produce a Tier 1 Environmental Impact Statement (EIS), pursuant to the National Environmental Policy Act (NEPA) that will evaluate several corridor alternatives and will lead to the selection of one corridor for right-of-way preservation.

As a Federal undertaking, this project also requires compliance with Section 106 of the National Historic Preservation Act (NHPA). Pursuant to 36 CFR 800, the regulations implementing Section 106 of the NHPA, we have prepared a draft Programmatic Agreement that will govern Section 106 compliance responsibilities associated with implementing this undertaking. If FHWA agrees with this proposed PA, please forward the attached documentation to the California State Historic Preservation Officer for his review. Caltrans and PCTPA staff are available to meet with the SHPO to explain the undertaking in more detail if that is helpful.

Should you require any additional project information, please contact Erick Wulf at (916) 274-0563 or erick.wulf@dot.ca.gov or Anmarie Medin at (916) 274-584 or anmarie.medin@dot.ca.gov. Thank you in advance for your assistance in this matter.

Sincerely,

Japtej S Gill

JAPTEJ GILL

PROGRAMMATIC AGREEMENT

BETWEEN THE FEDERAL HIGHWAY ADMINISTRATION AND THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER REGARDING IMPLEMENTATION OF THE PLACER PARKWAY PROJECT, PLACER COUNTY, CALIFORNIA

WHEREAS, the Federal Highway Administration (FHWA) and the California Department of Transportation (Caltrans), in cooperation with the Placer County Transportation Planning Agency (PCTPA), propose to identify and acquire right-of-way for the purpose of preserving a corridor for a future Placer Parkway, an east-west connection between State Route (SR) 65 near Lincoln in Placer County and SR 70/99 in southern Sutter County (Undertaking); and,

WHEREAS, the FHWA is preparing a Tier 1 Environmental Impact Statement (EIS), pursuant to the National Environmental Policy Act (NEPA), 42 USC 4321 *et seq,* that will evaluate several corridor alternatives and will lead to the selection of one corridor for right-of-way preservation; and

WHEREAS, given the existing and projected rapid growth in and around the project study area, the FHWA has determined it is vital to identify a corridor as early as feasible so that local jurisdiction planning decisions can consider the future Placer Parkway and before new development reduces corridor options and/or increase right-of-way acquisition costs for the Undertaking; and,

WHEREAS, the FHWA has determined that a phased approach for compliance with Section 106 of the NHPA is appropriate for the Undertaking, such that completion of the identification of historic properties, determinations of specific effects in historic properties, and resolution of any adverse effects will be carried out as part of planning for and prior to the approval of specific Tier 2 undertakings; and,

WHEREAS, the FHWA has consulted with the California State Historic Preservation Officer (SHPO) pursuant to the 1 January 2004 *Programmatic Agreement among the Federal Highway Administration, the Advisory Council on Historic Preservation, the California State Historic Preservation Officer, and the California Department of Transportation Regarding Compliance with Section 106 of the National Historic Preservation Act, as it Pertains to the Administration of the Federal-Aid Highway Program in California* (PA), and where the PA so directs, in accordance with 36 CFR Part 800, the regulations that implement Section 106 of the National Historic Preservation Act (NHPA) (16 U.S.C. 470f), regarding the Undertaking's potential effects on historic properties; and,

WHEREAS, following the completion of Tier 1 EIS, the FHWA, as funding becomes available for design and construction, will conduct Tier 2 environmental studies to analyze the environmental impacts of different alignments within the selected corridor in order to determine the specific transportation facility 'footprint' within the corridor , including project-level compliance with the Section 106 process to determine specific impacts to historic properties as

well as opportunities for avoidance, minimization of harm, and appropriate mitigation, if required, for the Undertaking; and,

WHEREAS, the FHWA desires to enter into a Programmatic Agreement (Agreement) at this time in order to establish a framework for conducting Section 106 consultation for Tier 1 and Tier 2; and,

WHEREAS, Caltrans has participated in consultation and has been invited to be a signatory to this Agreement; and

WHEREAS, PCTPA has participated in consultation and has been invited to be a signatory to this Agreement; and

WHEREAS, the Advisory Council on Historic Preservation (ACHP) has been afforded the opportunity to participate in the Section 106 process and has not elected to participate; and,

WHEREAS, Caltrans, on behalf of the FHWA, has initiated consultation with the Shingle Springs Band of Miwok Indians, Todd Valley Miwok-Maidu Cultural Foundation, Maidu Elders Orgainzation, and Enteprise Rancheria of Maidu Indians, as well as with the following federally-recognized Indian Tribes: United Auburn Indian Community (Tribes).

WHEREAS, the FHWA has involved, and will continue to involve, the public and historic interest groups, as stipulated under NEPA and the NHPA in a manner consistent with the PA and Caltrans' public involvement procedures;

NOW, THEREFORE, the FHWA and the SHPO agree that, upon the FHWA's decision to proceed with the Undertaking, the FHWA shall ensure that the Undertaking is implemented in accordance with the following stipulations in order to take into account the effects of the Undertaking on historic properties; and further agree that these stipulations shall govern the Undertaking and all of its parts until this Agreement expires or is terminated.

STIPULATIONS

The FHWA will ensure that the following stipulations are implemented:

I. DEFINITIONS

The definitions set forth at 36 CFR § 800.16 are applicable throughout this Agreement.

II. TIER 1 PHASED IDENTIFICATION OF HISTORIC PROPERTIES

A. Area of Potential Effects

1. The Undertaking's area of potential effects (APE) for Tier 1 is situated in southwest Placer County, between Highways 65 and 70, north of Baseline Road and south of Sunset Boulevard West (attachment A to this Agreement).

2. If modifications to the Undertaking, subsequent to the execution of this Agreement, necessitate the revision of the APE, Caltrans will consult with the PCTPA, the FHWA, and the SHPO to facilitate mutual agreement on the subject revisions. If Caltrans, the PCTPA, the FHWA, and the SHPO cannot reach such agreement, then the parties of this Agreement shall resolve the dispute in accordance with stipulation VIII.C below. If Caltrans, the PCTPA, the FHWA, and the SHPO reach mutual agreement on the proposed revisions, then Caltrans will submit a final map of the revisions, consistent with the requirements of stipulations VIII.A and XVI.A of the PA, no later than 30 days following such agreement.

B. Phased Identification of Historic Properties

1. Areas Common to all Alternatives/Corridors: the FHWA shall ensure that PCTPA or its consultants inventory properties within the area(s) common to all Tier 1 corridors according to the following specifications:
   a. Archaeological Properties
      (1) Conduct an inventory of archaeological properties where access has been secured in areas that have not previously been surveyed and those areas deemed by Caltrans PQS in need of resurvey because of the age or condition of the previous survey. Archaeological properties will be identified in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms.
   b. Built Environment Properties
      (1) Conduct a limited inventory of built environment properties within the entire Tier 1 APE. Built environment properties that have the potential to meet NRHP Criterion C will be identified and evaluated in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms. Other built environment properties within the APE that meet the age and integrity criteria will be inventoried and evaluated during Tier 2 studies, as provided for in stipulation III of this Agreement.
2. Areas Unique to Specific Alternatives/Corridors: the FHWA shall ensure that PCTPA or its consultants inventory properties within the area(s) unique to specific Tier 1 alternatives/corridors according to the following specifications:
   a. Archaeological Properties
      (1) Complete a records search for the Tier 1 APE and prepare a predictive model utilizing environmental factors and historic land-use data to assess the archaeological sensitivity of the project corridors including potential for buried resources. Segments of Tier 1 alignments/corridors that are not in common will be inventoried for archaeological properties during Tier 2 studies, as provided for in stipulation III of this Agreement.
   b. Built Environment Properties
      (1) Conduct a limited inventory of built environment properties within the entire Tier 1 APE. Built environment properties that have the potential to meet NRHP Criterion C will be identified and evaluated

in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms. Other built environment properties within the APE that meet the age and integrity criteria will be inventoried and evaluated during Tier 2 studies, as provided for in stipulation III of this Agreement.

3. Tier 1 Reporting and SHPO Consultation
   a. The FHWA shall ensure that PCTPA or its consultants prepare documentation of their findings and determinations pursuant to stipulation XVI of the PA. The reports shall be submitted to Caltrans PQS for review and approval.pursuant to stipulation XVI of the PA.
   b. Eligibility determinations shall be submitted to SHPO pursuant to stipulation VIII.C(5) of the PA.

C. Phased Assessment of Effects

1. The FHWA shall assess the potential for Tier 1 of the Undertaking to effect historic properties in accordance with stipulation X of the PA. As Tier 1 is defined as acquisition of property, the FHWA anticipates there will be no adverse effects during Tier 1. The FHWA shall consult with SHPO on the effect finding pursuant to stipulation X of the PA.

III. TIER 2 PHASED SECTION 106 CONSULTATION

A. Area of Potential Effects: The objective of the Tier 1 EIS is to identify and preserve an approximate 500'- to 1,000'-wide corridor for acquisition. The Tier 1 EIS will focus on broad topics such as general location, mode choice, area-wide air quality and land use, and other environmental issues. Once the corridor is selected, the subsequent Tier 2 environmental review, relying on the work from the Tier 1 EIS, will provide a more detailed analysis of the environmental impacts for the future transportation facility alignment alternatives within the selected corridor. Once a Tier 2 preferred alternative is chosen, the FHWA and PCTPA will delimit an APE for the Tier 2 preferred alternative in accordance with stipulation VIII.A of the PA. If subsequent modifications to the APE are necessary, the FHWA shall follow the procedures of stipulation II.A(2) of this Agreement.

B. Phased Identification and Evaluation.

1. Archaeological Properties
   a. The FHWA shall ensure that PCTPA or its consultants conducts a pedestrian reconnaissance of all lands within the final APE for any Tier 2 preferred alternative. Archaeological properties will be identified and evaluated in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms.
2. Built Environment Properties
   a. The FHWA shall ensure that PCTPA or its consultants conducts an inventory of built environment properties within the final APE for any Tier 2 preferred alternative. Built environment properties will be

evaluated for NRHP eligibility in accordance with stipulation VIII.(B) and (C) of the PA, and documented on appropriate DPR 523 inventory forms.

3. Tier 2 Reporting and SHPO Consultation
   a. The FHWA shall ensure that PCTPA or its consultants prepare documentation of their findings and determinations pursuant to stipulation XVI of the PA. The reports will be submitted to Caltrans PQS for review and approval pursuant to stipulation XVI of the PA.
   b. Eligibility determinations shall be submitted to SHPO pursuant to stipulation VIII.C(5) of the PA.

C. **Assessment of Effects.** The FHWA will assess any Tier 2 preferred alternative for its potential to affect historic properties and will consult with the SHPO pursuant to stipulation IX and X of the PA. Should FHWA find that any Tier 2 preferred alternative will result in an adverse effect, FHWA shall consult with SHPO pursuant to stipulation XI of the PA.

D. **Applicable Requirements.** FHWA will conduct the Section 106 process during Tier 2 in accordance with stipulations of the PA and applicable requirements under Section 106 of the National Historic Preservation Act (16 U.S.C. § 470f) and the Section 106 regulations (36 C.F.R. Part 800), including any subsequent amendments thereto. Nothing in this Agreement is intended to supersede or modify any requirement contained in the Section 106 statute or the Section 106 regulations.

E. **Consulting Parties**. During Tier 2, the same party may be designated as a consulting party for more than one alternative. FHWA will ensure comments of all consulting parties are incorporated into the Section 106 consultation process as provided for in all applicable laws.

IV. TIER 2 SECTION 106 COMMITMENTS AND CONCEPTUAL MITIGATION

A. FHWA and PCTPA agree to implement and/or fund the activities listed in this section as part of any Tier 2 environmental studies. Additional commitments may be made, as appropriate, as an outcome of the Section 106 consultation process for any Tier 2 alternative.

B. **Avoidance and Minimization of Impacts**

1. In General. In accordance with the consultation process required under Section 106 and in accordance with other applicable laws, FHWA, PCTPA, and Caltrans will seek ways to avoid, minimize, and mitigate adverse impacts to the environment, including adverse effects to historic properties.
2. Context-Sensitive Solutions. FHWA, PCTPA, and Caltrans will apply the principles of context-sensitive solutions during project development, in accordance with applicable Caltrans policies. In accordance with those principles and where appropriate, FHWA, PCTPA, and Caltrans will develop any Tier 2 alternative with sensitivity to aesthetic values and the historic context, utilizing the services of professionals with experience in areas related to historic preservation.

C. Should implementation of any Tier 2 alternative result in adverse effects to a historic property important solely for its information value (Criterion D), FHWA will ensure a data recovery plan is prepared according to guidance in Attachment 6 of the PA and submitted to the SHPO for review in accordance with stipulation II.C(3) of this Agreement.

D. The FHWA will not authorize the execution of any Undertaking activity that may effect (36 CFR § 800.16(i)) historic properties in the Undertaking's APE prior to the completion of the Section 106 process provided for in this Agreement.

V. NATIVE AMERICAN CONSULTATION

The FHWA has consulted with the Tribes regarding the proposed Undertaking, will continue to consult with the Tribes, and will afford the Tribes, should the Tribe so desire, the further opportunity to more directly and actively participate in the implementation of the Undertaking; Should any specific Tribe desire to participate in this Agreement as herein set forth, the FHWA shall consult with them to reach consensus regarding the manner in which the Tribe may participate in the implementation of this Agreement and the Undertaking, and regarding any time frames or other matters that may govern the nature, scope, and frequency of such participation.

VI. TREATMENT OF HUMAN REMAINS

The Agreement parties agree that human burials and related items discovered during implementation of the terms of this Agreement and of the Undertaking will be treated in accordance with the requirements of § 7050.5(b) of the California Health and Safety Code. If, pursuant to § 7050.5(c) of the Code, the county coroner or medical examiner determines that the human remains are or may be of Native American origin, then the discovery shall be treated in accordance with the provisions of §§ 5097.98(a)-(d) of the California Public Resources Code.

VII. DISCOVERIES AND UNANTICIPATED EFFECTS

If the FHWA determines, after any future construction of the Undertaking has commenced, that the Undertaking will affect a previously unidentified property that may be eligible for the National Register, or affect a known historic property in an unanticipated manner, the FHWA will address the discovery or unanticipated effect in accordance with 36 CFR § 800.13(b)(3). The FHWA at its discretion may hereunder, and pursuant to 36 CFR § 800.13(c), assume any discovered property to be eligible for inclusion in the National Register.

VIII. ADMINISTRATIVE PROVISIONS

A. PROFESSIONAL QUALIFICATIONS AND STANDARDS

1. **Professional Qualifications**. All activities prescribed by stipulations II, III, IV, V, VI, and VII of this Agreement shall be carried out under the authority of the FHWA by or under the direct supervision of a person or persons meeting at a minimum the Secretary of Interior's *Professional Qualifications Standards* (48 FR 44738-39) (PQS) in the appropriate disciplines. However, nothing in this stipulation may be interpreted to preclude the FHWA or any

agent or contractor thereof from using the properly supervised services of persons who do not meet the PQS.

2. **Documentation Standards.** Written documentation of activities prescribed by stipulations II, III, IV, V, VI, and VII of this Agreement shall conform to *Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation* (48 FR 44716-44740) as well as to applicable standards and guidelines established by the SHPO.

3. **Curation and Curation Standards.** The FHWA shall ensure that, to the extent permitted under §§ 5097.98 and 5097.991 of the California Public Resources Code, the materials and records resulting from the activities prescribed by this Agreement are curated in accordance with 36 CFR Part 79. The FHWA will ensure that, to the extent permitted by applicable law and regulation, the views of the Most Likely Descendant(s) are taken into consideration when decisions are made about the disposition of other Native American archaeological materials and records.

B. **CONFIDENTIALITY.** The Agreement parties acknowledge that historic properties covered by this Agreement are subject to the provisions of section 304 of the NHPA, and section 6254.10 of the California Government Code (Public Records Act), relating to the disclosure of archaeological site information and, having so acknowledged, will ensure that all actions and documentation prescribed by this Agreement are consistent with said sections.

C. **RESOLVING OBJECTIONS.**

1. Should any Agreement party object to the manner in which the terms of this Agreement are implemented, to any action carried out or proposed with respect to the implementation of the Agreement, or to any documentation prepared in accordance with and subject to the terms of this Agreement, the FHWA shall immediately notify the other parties to this Agreement of those objections, and shall consult with the objecting party and with the other parties for no more than 14 days to resolve the objection. The FHWA shall reasonably determine when this consultation will commence. If the objection is resolved through such consultation, the action subject to dispute may proceed in accordance with the terms of that resolution. If, after initiating such consultation, the FHWA determines that the objection cannot be resolved through consultation, the FHWA shall forward all documentation relevant to the objection, including the FHWA's proposed response to the objection, to the ACHP, with the expectation that the ACHP will, within thirty (30) days after receipt of such documentation, do one of the following:

   a. advise the FHWA that the ACHP concurs in the FHWA's proposed response to the objection, whereupon the FHWA will respond to the objection accordingly. The objection shall thereby be resolved; or,

b. provide the FHWA with recommendations, which the FHWA will take into account in reaching a final decision regarding its response to the objection. The objection shall thereby be resolved; or,

c. notify the FHWA that the objection will be referred for comment, pursuant to 36 CFR § 800.7(c), and proceed to refer the objection and comment. The FHWA shall take the resulting comment into account, in accordance with 36 CFR § 800.7(c)(4) and section 110(1) of the NHPA. The objection shall thereby be resolved.

2. Should the ACHP not exercise one of the foregoing options within 30 days after receipt of all pertinent documentation, the FHWA may assume the ACHP's concurrence in its proposed response to the objection and proceed to implement that response. The objection shall thereby be resolved.

3. The FHWA shall take into account any ACHP recommendation or comment provided in accordance with section C.1 of this stipulation, with reference only to the subject of the objection. The FHWA's responsibility to carry out all actions under this Agreement not the subject to the objection will remain unchanged.

4. At any time during the implementation of the measures stipulated in this Agreement, should an objection pertaining to such implementation be raised by a member of the public, the FHWA shall notify the Agreement parties in writing of the objection and take the objection into consideration. The FHWA shall consult with the objecting party and, if the objecting party so requests, with the other Agreement parties for no more than fifteen (15) days. Within ten (10) days following closure of this consultation period, the FHWA will render a decision regarding the objection and notify all consulting parties hereunder of its decision in writing. The objection will thereby be resolved. In reaching its decision, the FHWA will take into account any comments from the consulting parties regarding the objection, including the objecting party. The FHWA's decision regarding the resolution will be final.

5. The FHWA shall provide all Agreement parties, the ACHP when the ACHP has issued comments hereunder, and any parties that have objected pursuant to section C.4 of this stipulation, with a copy of its final written decision regarding any objection addressed pursuant to this stipulation.

6. The FHWA may authorize any action subject to objection under section C of this stipulation to proceed after the objection has been resolved in accordance with the terms of section C.

D. **AMENDMENTS:** Any Agreement party may propose that this Agreement be amended, whereupon the Agreement parties will consult for no more than 30 days to consider such amendment. The FHWA may extend this consultation period.

The amendment process shall comply with 36 CFR §§ 800.6(c)(1) and 800.6(c)(7). This Agreement may be amended only upon the written agreement of the signatory parties. If it is not amended, this Agreement may be terminated by either signatory party in accordance with section E of this stipulation.

E. TERMINATION

1. If this Agreement is not amended as provided for in section D.1 of stipulation VIII, above, or if either signatory party proposes termination of this Agreement for other reasons, the signatory party proposing termination shall, in writing, notify the other Agreement parties, explain the reasons for proposing termination, and consult with the other Agreement parties for at least 30 days to seek alternatives to termination. Such consultation shall not be required if the FHWA proposes termination because the Undertaking no longer meets the definition set forth at 36 CFR § 800.16(y).

2. Should such consultation result in an agreement on an alternative to termination, then the parties shall proceed in accordance with the terms of that agreement.

3. Should such consultation fail, the signatory party proposing termination may terminate this Agreement by promptly notifying the other Agreement parties in writing. Termination hereunder shall render this Agreement without further force or effect.

4. If this Agreement is terminated hereunder, and if the FHWA determines that the Undertaking will nonetheless proceed, then the FHWA shall either consult in accordance with 36 CFR § 800.6 to develop a new Agreement, or request the comments of the ACHP, pursuant to 36 CFR Part 800.

F. DURATION OF THE AGREEMENT

1. Unless terminated pursuant to section F of stipulation VIII above, or unless it is superseded by an amended Agreement, this Agreement will be in effect following execution by the signatory parties until the FHWA, in consultation with the other Agreement parties, determines that all of its stipulations have been satisfactorily fulfilled. This Agreement will terminate and have no further force or effect on the day that the FHWA notifies the other Agreement parties in writing of its determination that all stipulations of this Agreement have been satisfactorily fulfilled.

2. The terms of this Agreement shall be satisfactorily fulfilled within twenty (20) years following the date of execution by the signatory parties. If the FHWA determines that this requirement cannot be met, the Agreement parties will consult to reconsider its terms. Reconsideration may include the continuation of the Agreement as originally executed, amendment of the Agreement, or termination. In the event of termination, the FHWA will comply with section

F.4 of stipulation VIII, above, if it determines that the Undertaking will proceed notwithstanding termination of this Agreement.

3. If the Undertaking has not been implemented within twenty (20) years following execution of this Agreement by the signatory parties, this Agreement shall automatically terminate and have no further force or effect. In such event, the FHWA shall notify the other Agreement parties in writing and, if it chooses to continue with the Undertaking, shall reinitiate review of the Undertaking in accordance with 36 CFR Part 800.

G. **EFFECTIVE DATE.** This Agreement will take effect on the date that it has been fully executed by the FHWA and the SHPO.

EXECUTION of this Agreement by the FHWA and the SHPO, its transmittal by the FHWA to the ACHP in accordance with 36 CFR § 800.6(b)(1)(iv), and subsequent implementation of its terms, shall evidence, pursuant to 36 CFR § 800.6(c), that this Agreement is an agreement with the ACHP for purposes of section 110(1) of the NHPA, and shall further evidence that the FHWA has taken into account the effects of the Undertaking on historic properties and has afforded the ACHP an opportunity to comment on the Undertaking and its effects on historic properties.

Appendix C
NAHC Summary of Findings

URS

Debbie Pilas-Treadway
Associate Program Analyst
Native American Heritage Commission
915 Capitol Mall, Room 364
Sacramento, CA 95814

27 May 2003

Dear Ms. Pilas-Treadway,

The Placer County Transportation Planning Agency (PCTPA) has engaged URS Corporation to assist PCTPA in identifying a right-of-way connecting western Placer County and southern Sutter County. This is envisioned as a new 15-mile parkway connecting existing state highways. URS is to identify preliminary alternative alignments and screen them according to technical and environmental criteria; prepare technical studies; prepare a Tier 1 EIS/EIR that will satisfy both Caltrans and FHWA requirements, and provide public outreach support. The environmental review of the project will satisfy both CEQA and NEPA. Our contact with the PCTPA is Mr. Stan Tidman (550 High Street, Suite 107 Auburn, CA 95603). Mr. Tidman can be reached at (530) 823-4033.

Among the tasks to be completed for the initial screening phase of the project are consultation with the Native American Heritage Commission (NAHC) and local Native American groups and individuals. As such, I am requesting any information the NAHC may have regarding properties, features, or materials within the project area that may be of concern to local Native Americans. Attached to this request are two maps. The first is a project map indicating the boundaries of the study area and the second is a map depicting the USGS 7.5' topographic quadrangles in which the study area is located. On this second map, a list of sections, as well as township and range data is included. Any comments you may have regarding this area would be greatly appreciated.

If you have any questions, please feel free to call me directly at (415)-243-3826. Thank you for your cooperation.

Sincerely,

URS

RE: Proposed 15 Mile Parkway Connecting Existing Highways; Sacramento, Placer and Sutter Counties.

Dear Mr. Hale:

A record search of the sacred land file has failed to indicate the presence of Native American cultural resources in the immediate project area. The absence of specific site information in the sacred lands file does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Enclosed is a list of Native Americans individuals/organizations who may have knowledge of cultural resources in the project area. The Commission makes no recommendation or preference of a single individual, or group over another. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated, if they cannot supply information, they might recommend other with specific knowledge. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact me at (916) 653-4038.

Sincerely,

Debbie Pilas-Treadway

The environmental review of the project will satisfy both CEQA and NEPA. Our contact with the PCTPA is Mr. Stan Tidman (550 High Street, Suite 107 Auburn, CA 95603). Mr. Tidman can be reached at (530) 823-4033.

Among the tasks to be completed for the initial screening phase of the project are consultation with the Native American Heritage Commission (NAHC) and local Native American groups and individuals. As such, I am requesting any information you may have regarding properties, features, or materials within the project area that may be of concern to local Native Americans. Attached to this request are two maps. The first is a project map indicating the boundaries of the study area and the second is a map depicting the USGS 7.5' topographic quadrangles in which the study area is located. On this second map, a list of sections, as well as township and range data is included. Any comments you may have regarding this area would be greatly appreciated.

If you have any questions, please feel free to call me directly at (415)-243-3826. Thank you for your cooperation.

Sincerely,

URS

Dear Sam Starkey,

The Placer County Transportation Planning Agency (PCTPA) has engaged URS Corporation to assist PCTPA in identifying a right-of-way connecting western Placer County and southern Sutter County. This is envisioned as a new 15-mile parkway connecting existing state highways. URS is to identify preliminary alternative alignments and screen them according to technical and environmental criteria; prepare technical studies; prepare a Tier 1 EIS/EIR that will satisfy both Caltrans and FHWA requirements, and provide public outreach support. The environmental review of the project will satisfy both CEQA and NEPA. Our contact with the PCTPA is Mr. Stan Tidman (550 High Street, Suite 107 Auburn, CA 95603). Mr. Tidman can be reached at (530) 823-4033.

Among the tasks to be completed for the initial screening phase of the project are consultation with the Native American Heritage Commission (NAHC) and local Native American groups and individuals. This is envisioned as a new 15-mile parkway connecting existing state highways. URS is to identify preliminary alternative alignments and screen them according to technical and environmental criteria; prepare technical studies; prepare a Tier 1 EIS/EIR that will satisfy both Caltrans and FHWA requirements, and provide public outreach support. The environmental review of the project will satisfy both CEQA and NEPA. Our contact with the PCTPA is Mr. Stan Tidman (550 High Street, Suite 107 Auburn, CA 95603). Mr. Tidman can be reached at (530) 823-4033.
>
> Among the tasks to be completed for the initial screening phase of the project are consultation with the Native American Heritage Commission (NAHC) and local Native American groups and individuals. As such, I am requesting any information you may have regarding properties, features, or materials within the project area that may be of concern to local Native Americans. Attached to this request are two maps. The first is a project map indicating the boundaries of the study area and the second is a map depicting the USGS 7.5' topographic quadrangles in which the study area is located. On this second map, a list of sections, as well as township and range data is included. Any comments you may have regarding this area would be greatly appreciated.

Dear Martha Noel,

In June 2003, I requested information you may have regarding properties, features, or materials within the Placer Parkway Corridor Preservation Project study area that may be of concern to local Native Americans. I made follow-up calls concerning this request in August 2003.

We have not been able to confirm that you received our earlier materials, and want to be sure that this information did not go astray. We are interested in obtaining the views and concerns of the local Native American community concerning this proposed project. In the event you no longer retain our original request for information, below is found the text from that original request:

> The Placer County Transportation Planning Agency (PCTPA) has engaged URS Corporation to assist PCTPA in identifying a right-of-way connecting western Placer County and southern Sutter County. This is envisioned as a new 15-mile parkway connecting existing state highways. URS is to identify preliminary alternative alignments and screen them according to technical and environmental criteria; prepare technical studies; prepare a Tier 1 EIS/EIR that will satisfy both Caltrans and FHWA requirements, and provide public outreach support. The environmental review of the project will satisfy both CEQA and NEPA. Our contact with the PCTPA is Mr. Stan Tidman (550 High Street, Suite 107 Auburn, CA 95603). Mr. Tidman can be reached at (530) 823-4033.

Subject: Impact to Cultural Resources on Project Site

Dear Mr. Hale,

We recently received a notification indicating that you are proposing a project that has the potential to impact Native American cultural sites. As you may know, under the California Environmental Quality Act and Section 106 of the National Historic Preservation Act, you are required to consult with Indian tribes that may have cultural affiliations or interest in your project. The United Auburn Indian Community is composed of Miwok and Maidu Indians with an ancestral territory encompassing Placer and Nevada Counties, and surrounding areas. We are concerned about projects that may impact our ancient burial grounds and village sites, and sites that have cultural and religious importance to us.

We request that a qualified archaeologist prepare a report documenting a field survey and records search of your project site before the project is approved. We would like to receive a copy of the report upon its completion. We will then review the report and determine if cultural resources of importance to us may be impacted.

Please contact our environmental consultant, Dr. Shelley McGinnis, of Analytical Environmental Services, at (916) 447-3479 if you have any questions regarding this matter.

Sincerely,

Greg Baker
Tribal Administrator

Subject: Placer Parkway Corridor Preservation Tier 1 EIS/EIR

Dear Mr. Hale,

This letter is in response to your letter dated November 18, 2003. The United Auburn **Indian Community has designated David Zweig of Analytical Environmental Services as** the tribal representative on all environmental and cultural resource issues. Mr. Zweig **would be pleased to meet with you as a representative of UAIC to discuss the proposed** Placer Parkway Corridor Preservation project.

You may contact Mr. Zweig directly to set up a meeting. He can be reached by phone (916-447-3479) or email (dzweig@analyticalcorp.com).

Sincerely,

Greg Baker

Auburn, CA 95603

Dear Rose Enos,

In June and again in October of 2003, I sent out letters requesting information you may have regarding properties, features, or materials within the Placer Parkway Corridor Preservation Project study area that may be of concern to local Native Americans. I made telephone calls following the initial request in August 2003.

Although situated within the same study area, the corridor alignments have been revised slightly from those depicted in the original mailings. As such, I felt it prudent to re-solicit the local Native American community concerning this proposed project. In the event you no longer retain our original request for information, below is found the text from that original request:

> The Placer County Transportation Planning Agency (PCTPA) has engaged URS Corporation to assist PCTPA in identifying a right-of-way connecting western Placer County and southern Sutter County. This is envisioned as a new 15-mile parkway connecting existing state highways. URS is to identify preliminary alternative alignments and screen them according to technical and environmental criteria; prepare technical studies; prepare a Tier 1 EIS/EIR that will satisfy both Caltrans and FHWA requirements, and provide public outreach support. The environmental review of the project will satisfy both CEQA and NEPA. Our contact with the PCTPA is Mr. Stan Tidman (550 High Street, Suite 107 Auburn, CA 95603). Mr. Tidman can be reached at (530) 823-4033.

Dear Joe Marine,

In June and again in October of 2003, I sent out letters requesting information you may have regarding properties, features, or materials within the Placer Parkway Corridor Preservation Project study area that may be of concern to local Native Americans. I made telephone calls following the initial request in August 2003.

Although situated within the same study area, the corridor alignments have been revised slightly from those depicted in the original mailings. As such, I felt it prudent to re-solicit the local Native American community concerning this proposed project. In the event you no longer retain our original request for information, below is found the text from that original request:

> The Placer County Transportation Planning Agency (PCTPA) has engaged URS Corporation to assist PCTPA in identifying a right-of-way connecting western Placer County and southern Sutter County. This is envisioned as a new 15-mile parkway connecting existing state highways. URS is to identify preliminary alternative alignments and screen them according to technical and environmental criteria; prepare technical studies; prepare a Tier 1 EIS/EIR that will satisfy both Caltrans and FHWA requirements, and provide public outreach support. The environmental review of the project will satisfy both CEQA and NEPA. Our contact with the PCTPA is Mr. Stan Tidman (550 High Street, Suite 107 Auburn, CA 95603). Mr. Tidman can be reached at (530) 823-4033.
>
> Among the tasks to be completed for the initial screening phase of the project are consultation with the Native American Heritage Commission (NAHC) and local Native American groups and individuals. As such, I am requesting any information you may have regarding properties, features, or materials within the project area that may be of concern to local Native Americans.

COMMUNITY IMPACT ASSESSMENT
PLACER PARKWAY CORRIDOR PRESERVATION TIER 1 EIS/PROGRAM EIR

1.0 INTRODUCTION

1.1 TIER 1 EIS/PROGRAM EIR

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

1.2 CORRIDOR SELECTION AND PRESERVATION

The concept for the Placer Parkway is more than a decade old. Placer County's 1994 General Plan depicts a "plan line" for it. Two planning studies helped to refine the concept:

- DKS Associates, 2000, Placer Parkway Interconnect Study/Conceptual Plan
- DKS Associates, 2001, Project Study Report (Project Development Support) for Placer Parkway

Placer Parkway is cited as a high-priority regional transportation project by the Sacramento Area Council of Governments (SACOG) 2025 Metropolitan Transportation Plan and the 2027 Placer County Regional Transportation Plan. The project vicinity and surrounding area include some of the fastest growing communities in the Sacramento region. A number of large urban development proposals are being considered by Placer and Sutter Counties. New development is expected to add a significant amount of residential, commercial, industrial, and educational uses.

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included representatives from planning and public works departments of all affected cities and counties, environmental, business, agricultural, development, and homeowner interests (the Study Advisory

Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report will analyze these five corridor alternatives along with a No-Build Alternative.

Other potential transportation modes such as bus rapid transit may be developed in the corridor in the future, although they are not proposed as part of the current project. The width of the corridor for Placer Parkway is to vary from approximately 500 feet in the Eastern and Western segments to approximately 1,000 feet in the Central Segment. Depending upon the alternative, the corridor's length ranges from a minimum of 14.2 miles to a maximum of 16.2 miles. The selected corridor would contain the roadway, including the median, travel lanes, shoulder, associated access ramps and a no-development buffer zone.

Corridor acquisition may not be completed until after Tier 2, as funding becomes available. Portions of the selected corridor would be preserved as a no-development buffer zone. The buffer would be maintained as a zone where development is either not permitted or is severely restricted. This is intended to restrict access to the proposed interchanges, protect the rural character of agriculturally designated areas in the vicinity of the Parkway as far as possible subject to future development, and to maximize opportunities to incorporate adjacent sensitive areas. It is intended that the buffer would be owned and managed in the future to achieve these objectives. For subsequent Tier 2 (project-level) environmental reviews, the size of this buffer zone could be considered flexible for agriculturally designated land undergoing urban development. In the Tier 2 environmental review, the specific buffer size and location would be determined. This determination would be based on performance standards on a case-by-case basis, depending on the land use needs of future approved development, and taking into account the primary objective of restricting future access to the Parkway.

Project proponents are considering employment of several land management and control mechanisms in order to ensure that the buffer would be effectively maintained as an area where development would either not be permitted, and where construction of any additional access onto the Parkway would not be allowed. These mechanisms could include land use controls, land purchase/leases, general plan amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, urban growth boundaries, etc. "Layering" or using several of these methods would provide more assurance that the buffers would be permanent, or at least more difficult to undo.

1.3 TECHNICAL STUDY OBJECTIVE

This Community Impact Assessment has been prepared to support the Tier 1 Environmental Impact Statement/Program Environmental Impact Report. It presents a Tier 1/Program assessment of potential impacts related to land use, farmland, and social and economic conditions for five corridor alignment alternatives and the No-Build Alternative as described in Chapter 2.

This Community Impact Assessment report was prepared in accordance with the guidance presented in the California Department of Transportation (Caltrans) *Environmental Handbook Volume IV* (1997). The scope of work was modified for purposes of Tier 1/Program analysis by agreement of Caltrans. In addition, the evaluation considered guidance from the FHWA (FHWA, 1999a; FHWA, 1999b).

This report is organized as follows:

Chapter 2: The Proposed Action
Chapter 3: Land Use
Chapter 4: Farmland
Chapter 5: Social Conditions
Chapter 6: Economic Conditions
Chapter 7: Growth Inducement

Chapter 8: References

The four sections on land use, farmland, social conditions and economic conditions each contain the following subsections: Regulatory Setting; Affected Environment; Potential Direct Impacts; Secondary and Indirect Impacts; Cumulative Impacts; Potential Watt Avenue Connection; Avoidance, Minimization and/or Mitigation Strategies; and Analyses to be Undertaken in Tier 2. This report also includes figures and tables, which show the project location, each build alternative, and pertinent technical information prepared to evaluate the build alternatives.

1.4 STUDY AREA DEFINITION

The Community Impact Analysis evaluates the area between SR 65 on the east and SR 70/99 on the west, extending from Sunset Boulevard West and Howsley Road on the north to Baseline and Riego roads on the south, as shown on Figure 1-1. The study area is similar to the study area that was identified in the Placer Parkway Interconnect Study/Conceptual Plan that was completed in January 2000. The study area includes portions of five jurisdictions—the City of Rocklin, the City of Roseville, Placer County, Sutter County, and Sacramento County.

1.5 PROJECT DATABASE AND OTHER DATA SOURCES

Environmental screening for Placer Parkway began with the gathering of existing environmental information for the study area in 2003-2004. Consistent with a Tier 1/Program approach, the emphasis was on use of existing electronic data and recent aerial photographs available from local jurisdictions, regulatory agencies, private parties, and the Internet. Field surveys were not conducted, and detailed new data were not generated. Data were collected for the entire study area in order to address any future modifications to alternative alignments.

The data were entered into URS Corporation's Geographic Information System (GIS). The development of a GIS for this project involved a series of tasks, including collection of spatial data from a variety of sources; importation of that data into ArcGIS software; development of new data from pertinent sources and input from project team members; creation of metadata for each data layer; map and figure creation displaying the data in a useful manner; and input into a GIS analysis program, Community VIZ, operated by Moore Iacofano Goltsman, Inc. (MIG), which created the figures and tables of numeric data for use in impact analyses.

Spatial data were collected from a variety of sources. Aerial photography was obtained from AirPhoto USA. Images of the project area were taken in April 2001, November 2002, and April 2004 for use in the analysis, as well as for the production of base maps. Existing GIS data layers for use in the analyses were gathered from Placer County, Sutter County, Sacramento County, City of Roseville, DKS Associates, North Fork Associates, SACOG, CH2M Hill, Federal Emergency Management Agency (FEMA), U.S. Geological Survey (USGS), U.S. Fish and Wildlife Service (USFWS), California Department of Fish and Game (CDFG), and California Department of Conservation.

Local General Plans and other planning documents were consulted in order to identify land use designations and zoning and to establish the project's consistency with local planning goals and policies. The Natural Resources Conservation Service (NRCS) was consulted on the subject of potential farmland impacts and to prepare an inventory of farmlands in the project area. The U.S. Census and other sources of demographic data were used to characterize the study area population. Additional information was derived from field visits, conversations with local planning staff, residents, and business owners, and numerous online sources. Additional information about methods and data sources is provided in subsequent sections of this report, and a complete list of references is provided in Chapter 8.

Throughout this document, the Placer Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

2.0 THE PROPOSED ACTION

The Proposed Action for the Placer Parkway Corridor Preservation Project is to select and preserve a 500- to 1,000-foot-wide corridor in the project study area, within which the future four- or six-lane Placer Parkway may be constructed. The ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction, and operation of the Parkway. Although the action taken at Tier 1 on the Placer Parkway Corridor Preservation Project is limited, the underlying project whose effects are studied in this document is the Placer Parkway. To the extent feasible at this early stage, the Tier 1 EIS/EIR addresses the potential effects of construction and operation of the future roadway.

2.1 THE PROJECT STUDY AREA

The project study area is an area of approximately 33,460 acres located in Placer and Sutter counties, with a small section located in Sacramento County (see Figures 1-1 and 2-1). It extends from SR 70/SR 99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego roads. The portion of the study area in Sacramento County is located in the extreme southwest corner of the study area and does not include any of the proposed corridor alignment alternatives.

For the purposes of the analysis the study area is divided into three segments:

- Western Segment: the Western Segment extends from SR 70/99 to Pleasant Grove Road in Sutter County.
- Central Segment: the Central Segment extends from Pleasant Grove Road in Sutter County to approximately 2,300 feet north of Pleasant Grove Creek in Placer County.
- Eastern Segment: the Eastern Segment extends from approximately 2,300 feet north of Pleasant Grove Creek to SR 65 in Placer County.

2.2 CORRIDOR ALTERNATIVES

The following subsections describe the corridor alternatives, which are depicted on Figure 2-1, and are numbered according to location from south to north in the study area.

2.2.1 The No-Build Alternative

Under the No-Build Alternative, the project would not be implemented. A Placer Parkway corridor would not be selected/preserved, and the future Placer Parkway would not be constructed.

2.2.2 Alternative 1 – the Red Alternative

Alternative 1 would extend from SR 70/99 approximately ½ mile north of Riego Road, eastward approximately 1 mile north of Baseline Road to approximately Watt Avenue, proceeding north and transitioning in an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment alternative is 16.2 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.3 Alternative 2 – the Orange Alternative

Alternative 2 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed northeast, then in a northerly direction south of Pleasant Grove Creek, transitioning to an easterly direction before it reaches Sunset Boulevard West, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.4 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.4 Alternative 3 – the Blue Alternative

Alternative 3 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed north along the Sutter/Placer County Line, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.6 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.5 Alternative 4 – the Yellow Alternative

Alternative 4 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.3 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.2.6 Alternative 5 – the Green Alternative

Alternative 5 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 4,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.2 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.3 PARKWAY DESIGN ASSUMPTIONS

Although the Parkway would be designed and construction-level impacts analyzed during Tier 2, for the purpose of this report and the Tier 1 EIS/Program EIR, several assumptions have been made about potential design and configuration concepts. These assumptions would be subject to further development and refinement, and specific decisions about design of the roadway would be made during the Tier 2 process. For example, the number, location, and design of over-crossings would be determined at the time of final Parkway design, in consultation with local jurisdictions. The following sections outline assumptions for the future roadway.

Preliminary costs estimates for the Parkway range from $600 to $650 million (2005 dollars). This includes costs for right-of-way, design, construction and environmental mitigation for the four- to six-lane facility. The funding situation has spurred interest in exploring other more creative funding options.

These include a county-wide sales tax, more developer contributions, and tolling facilities. The Technical Report and Tier 1 EIS/Program EIR do not make any assumptions about funding sources.

2.3.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane facility. A preliminary conceptual cross section (see Figure 2-2) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/Program EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

2.3.2 Conceptual Roadway Elevation

As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on either side of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways, or trails.

Throughout the project study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These over-crossings would not connect to the Parkway. Parkway access would be via the interchanges described below.

2.3.3 Interchange Concepts

The analysis assumes that the location of interchanges (see Figure 2-1) is as follows.

- SR 70/99 (at ½ mile north of Riego Road or at Sankey Road)
- One or two locations to be determined in southern Sutter County
- Fiddyment Road
- Foothills Boulevard
- SR 65 at Whitney Ranch Parkway

The following discussion outlines concepts and assumptions for the six interchanges that could potentially serve Placer Parkway.

2.3.3.1 Western Segment

Within the Western Segment of the Parkway, a high-speed, freeway-to-freeway type interchange would connect the Parkway with SR 70/99 at one of following potential locations depending on the project alternative (see Section 2.2). Placer Parkway would terminate at SR 70/99.

- **Placer Parkway/SR 70/99 Interchange at North of Riego Road.** This alternative concept uses "braided" ramps to eliminate weaving problems or conflicts with the future SR 70/99 at Riego Road interchange being developed by Sutter County and Caltrans.

- **Placer Parkway/SR 70/99 Interchange at Sankey Road.** Under this alternative concept, the existing two-lane Sankey Road would be realigned to the south of Placer Parkway and the proposed freeway-to-freeway interchange, extending from approximately ¼ mile west of SR 70/99 to approximately ¼ mile east of the Union Pacific railroad tracks. There would be no direct access to SR 70/99 or Placer Parkway from the realigned Sankey Road.

Depending on the final alignment selected, one or two additional interchanges would also be located in south Sutter County. Conceptual locations are identified for purposes of this Tier 1/Program analysis (see Figure 2-1). The actual location of these interchanges would be developed in the Tier 2 phase, based on Sutter County requirements.

2.3.3.2 Central Segment

Within the Central Segment of the Parkway, there would not be any access proposed as part of the project in the 7-mile segment between Fiddyment Road and Pleasant Grove Road. Please see Section 2.4 regarding a potential connection to a future extension of Watt Avenue (Figure 2-3) which could be proposed and constructed by others in the Central Segment; such an interchange is not part of the Placer Parkway.

2.3.3.3 Eastern Segment

Within the Eastern Segment of the Parkway, a signalized high-speed freeway-to-freeway and local access interchange would connect the Parkway to SR 65 at Whitney Ranch Parkway (Figure 2-1). From SR 65 eastward Placer Parkway would terminate and become Whitney Ranch Parkway east of the SR 65 exit ramp intersection. Traffic signals would be provided at the exit ramp terminals. This interchange would be approximately 1 mile north of a planned SR 65/Sunset Boulevard interchange and 1.2 miles south of the existing Twelve Bridges interchange.

As part of this interchange, auxiliary lanes would be required on SR 65 in both directions to enhance traffic operations on the north side of the future SR 65/Sunset Boulevard interchange. The southbound SR 65 exit-ramp at Sunset Boulevard is being designed to accommodate an additional auxiliary lane required for the future Placer Parkway/Whitney Ranch Parkway interchange to minimize the reconstruction of this ramp in the future. Within the Eastern Segment of the Parkway, from SR 65 westward, two interchanges with local roadways would be constructed, one at Foothills Boulevard and one at Fiddyment Road, as depicted on Figure 2-1.

The future interchange on Placer Parkway at Fiddyment Road would be located near the existing intersection of Fiddyment Road and Sunset Boulevard West. To provide acceptable traffic operations, additional distance needs to be provided between the Fiddyment Road/Sunset Boulevard West intersection and the Fiddyment Road/Placer Parkway westbound off-ramp intersection. Therefore, Sunset Boulevard West will need to be realigned to the north as it nears Fiddyment Road.

2.3.4 Landscaping Concept

For the purposes of this environmental analysis, preliminary landscaping concepts have been developed for Placer Parkway. These are entirely conceptual and would be subject to further refinement during the Tier 2 environmental process. It is anticipated that landscaping would be used to reflect local topography and vistas in the study area and complement the varying character of land adjacent to the Parkway corridor. Landscape design would vary within the Parkway's three segments depending on corridor width and type and density of surrounding land uses. Landscaping would be used within the median and the Parkway buffer zone to enhance the aesthetics of the Parkway, and would be used to provide screening and enhance local and long-distance views. Where appropriate, more concentrated plantings would be considered to buffer the Parkway from future adjacent land uses that may be incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Landscape design would likely include a mix of compatible native and non-native plants that may require some irrigation. Wherever possible, native plant species would be used in line with Caltrans policy. Where possible and depending on availability, feasibility and cost, recycled water would be used for irrigation.

During a future design phase, lighting elements would be designed for safety and would consider the proposed landscaping plan in order to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower-voltage lighting, and proposing lighting fixtures that conform with the visual character of the area).

2.4 POTENTIAL WATT AVENUE INTERCHANGE

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 2-3). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/Program EIR. However, the connection of Placer Parkway to a potential Watt Avenue extension could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/Program EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges to Placer Parkway.

2.5 AGENCY PERMITS AND APPROVALS

The Placer Parkway Corridor Preservation project would preserve a preferred corridor for a future transportation facility. In the future, permits and approvals would be obtained from appropriate agencies prior to construction of the Parkway. These permits and approvals may include specific design or mitigation requirements that would be incorporated into the project.

2.6 SUBSEQUENT TIER 2 INFORMATION

As noted earlier, the design and construction of Placer Parkway—including its interchanges and over-crossings, and ancillary features such as stream crossings, safety devices, storm water management structures, and similar improvements—would be evaluated in a subsequent Tier 2 environmental review process once a corridor has been identified. The last subsection of each section in this Community Impact Assessment (CIA) provides more detailed information regarding Tier 2 studies.

3.0 LAND USE

3.1 REGULATORY SETTING

The following sections describe the applicable federal, state, and local agency regulatory framework related to evaluation of land use impacts within the study area.

3.1.1 Federal Regulations

3.1.1.1 FHWA

Applicable federal criteria for analyzing the impact that a transportation project has on the existing land uses are provided by FHWA. The FHWA Technical Advisory – Guidance for Preparing and Processing Environmental (National Environmental Policy Act) and Department of Transportation Act-Section 4(f) documents prepared by the U.S. Department of Transportation, FHWA, 1987, states that:

> This discussion [of land use] should identify the current development trends and the State and/or local government plans and policies on land use and growth in the area which will be impacted by the project.

The guidance recommends that the land use discussion assess the consistency of the alternatives with the comprehensive development plans adopted for the area and (if applicable) other plans used in the development of the transportation plan. The secondary social, economic, and environmental impacts of any substantial, foreseeable, induced development should be presented for each alternative, including adverse effects on existing communities. Where possible, the distinction between planned and unplanned growth should be identified.

3.1.2 State Regulations

3.1.2.1 California Environmental Quality Act

The California Environmental Quality Act (CEQA) was adopted in 1970 with the goal of protecting the environment. "It is the intent of the Legislature that all agencies of the state government which regulate activities of private individuals, corporations, and public agencies which are found to affect the quality of the environment, shall regulate such activities so that major consideration is given to preventing environmental damage, while providing a decent home and satisfying living environment for every Californian" (CEQA, Public Resources Code Section 21000(g)).

This legislative intent is met through the preparation of comprehensive, multi-disciplinary analyses of environmental impacts. The analyses must disclose to decision makers and the public the significant impacts to the environment resulting from the proposed activities, and must identify feasible alternatives and mitigation measures that allow for avoidance or lessening of impacts.

CEQA requires that projects be evaluated for possible effects on the environment. For projects determined to have potentially significant impacts on the environment, CEQA requires preparation of an EIR by the "lead agency," which is the public agency that has the principal responsibility for carrying out or approving the project.

3.1.2.2 California Department of Transportation – Community Impact Assessment Guidance

Caltrans generally prepares a CIA for highway projects that are large, complex, and have the potential to adversely affect people, institutions, neighborhoods, communities, organizations, and larger social and economic systems. These issues are sometimes collectively called socioeconomic impacts. The CIA describes

the socioeconomic impacts that the project may have and proposes measures to avoid, minimize, or mitigate those effects. Guidance for preparing CIAs is contained in *Environmental Handbook Volume 4 – Community Impact Assessments* (Caltrans, 1997). This guidance was followed in preparing this CIA.

3.1.3 General Plans and Policies

The Study area is located within two incorporated cities and three counties; the proposed alternatives traverse Placer and Sutter Counties and the Cities of Rocklin and Roseville. State law requires that each of these jurisdictions adopt "a comprehensive, long-term General Plan for [its] physical development." The General Plan is the official city or county policy document regarding the location of housing, business, industry, roads, parks, and other land uses, protection of the public from noise and other environmental hazards, and for the conservation of natural resources. The legislative body of each city (the City Council) and each county (the Board of Supervisors) adopts zoning, subdivision, and other ordinances to regulate land uses and to carry out the policies of its General Plan.

3.1.3.1 Sutter County General Plan

Land use in the portion of the study area that lies within Sutter County is governed by the Sutter County General Plan. The General Plan contains the following policies that may apply to land use and potential transportation project impacts (see Chapter 4 for discussion of agricultural policies):

1.C-6 Low Density Residential and Residential Estate designated parcels which do not meet the minimum acreage requirement, or exceed the maximum acreage requirement, as specified by the land use policies of the General Plan, may be adjusted by lot line adjustment pursuant to §66412(d) of the Government Code under the following conditions:

a. For any adjustment involving parcels that do not meet the minimum parcel size as identified on the General Plan land use diagram, the size of the smallest resultant parcel shall not be smaller than the size of smallest parcel prior to the lot line adjustment; and

b. No parcel meeting the minimum parcel size as identified on the General Plan land use diagram shall be diminished to a size less than the minimum parcel size as identified on the land use diagram.

E-1 New development that may be incompatible with adjacent uses shall be required to provide buffer zones consistent with County standards to reduce anticipated conflicts with existing and future land uses.

3.1.3.2 Placer County General Plan

The Placer County General Plan currently provides for preservation of right-of-way for Placer Parkway. The Plan shows a generalized location for the Parkway on the Circulation Plan Diagram as a "post-2010" urban arterial. The General Plan Land Use/Circulation Diagrams and Standards policy document (pages 28-30) notes that the planned alignments for these roadways are based on travel demand forecasts and anticipated circulation needs for the year 2040. It notes that the purpose of showing these long-term alignments is to preserve right-of-way for future facilities and plan for their ultimate implementation, and that additional alignment studies and environmental review will be required prior to defining precise alignments that minimize impacts and meet circulation objectives.

The General Plan also contains the following policies that are applicable to land use and related to transportation projects:

1.A.3 The County shall distinguish among urban, suburban, and rural areas to identify where development will be accommodated and where public infrastructure and services will be provided. This pattern shall promote the maintenance of separate and distinct communities.

1.A.4 The County shall promote patterns of development that facilitate the efficient and timely provision of urban infrastructure and services.

1.B.1 The County shall promote the concentration of new residential development in higher-density residential areas located along major transportation corridors and transit routes.

1.H.2 The County shall seek to ensure that new development and public works projects do not encourage expansion of urban uses into designated agricultural areas.

1.K.3 The County shall require that new development in rural areas incorporates landscaping that provides a transition between the vegetation in developed areas and adjacent open space or undeveloped areas.

3.A.5 Through-traffic shall be accommodated in a manner that discourages the use of neighborhood roadways, particularly local streets. This through-traffic, including through truck traffic, shall be directed to appropriate routes in order to maintain public safety and local quality of life.

3.1.3.3 Sacramento County General Plan

The Sacramento County General Plan contains the following policies that are applicable to land use and related to transportation projects:

LU-42 Future Agricultural-Residential development shall be limited to existing developed and infill Agricultural-Residential lands designated on the Land Use Diagram and such additional areas adjacent to existing developed lands to act as a buffer to new urban areas or as a buffer at the Urban Service Boundary as are consistent with LU-43.

LU-69 County departments shall coordinate implementation of electric service delivery, air quality, water supply, transportation, drainage/flood control, solid waste disposal/ recycling, and hazardous waste management plans in conjunction with vested public and quasi-public agencies.

LU-72 The County shall coordinate with regional planning agencies setting land use and environmental policies and programs and cooperate in the implementation of programs consistent with General Plan policy.

LU-73 The County shall consult with state and federal regulatory and resource agencies during initial review of development projects to identify potential environmental conflicts and establish, if appropriate, concurrent application processing schedules.

CI-16 Policy: Sacramento County shall implement a program to buffer land uses from each other and transportation system facilities which is effective, aesthetically pleasing, and minimizes the amount of land lost to buffers.

3.1.3.4 City of Roseville General Plan

The City of Roseville General Plan contains the following policies that are applicable to land use and related to transportation projects:

Circulation

C-1 Coordinate with surrounding jurisdictions to achieve compatible functional classifications for roadways that cross the City's boundaries.

C-3 Work with appropriate agencies to develop measures to reduce vehicular travel demand and vehicle miles traveled and meet air quality goals.

Community Form Policies

3. Coordinate and take a lead role, where feasible, with local state, federal and other jurisdictional agencies on regional issues of importance including but not limited to air quality, transportation, water supply, sewage treatment, solid waste disposal and recycling, flood control, hazardous waste management, resource protection and transit.

4. To the extent feasible, coordinate land use policies and public improvements with neighboring jurisdictions.

Growth Management Policy

8. New development proposals to the west of Fiddyment Road within the County/City Memorandum of Understanding Transition Area shall meet the objectives and terms of the Memorandum of Understanding between the City of Roseville and the County of Placer.

Growth Management – Growth Areas Policy

5. Apply the City's adopted Guiding Principles to any new development proposed in and out of City's corporate boundaries, which is not already part of an adopted Specific Plan or within the infill area:

    1. Any development proposal west of Roseville shall, on a stand-alone basis, have an overall neutral or positive fiscal impact on the City's General Fund Services.

    2. Any development proposal west of Roseville shall include logical growth/plan boundaries and an east to west growth pattern.

    3. Any development proposal west of Roseville shall not conflict with the Pleasant Grove Wastewater Treatment Plant and future Power Generation Facility.

    4. Any development proposal west of Roseville shall maintain the integrity of existing neighborhoods and create a sense of place in new neighborhoods.

    5. Any development proposal west of Roseville shall include a plan to ensure fully funding and maintenance of improvements and services at no cost to existing residents (including increased utility rates). A proposal shall not burden/increase the cost, or diminish the supply and reliability of services.

    6. Any development proposal west of Roseville shall aid in regional traffic solutions and in right of way preservation.

    7. Any development proposal west of Roseville shall secure and provide a new source and supply of surface water and should include reduced water demand through the use of recycled water and other off-sets.

8. Any development proposal west of Roseville shall consider development potential within the entire City/County Memorandum of Understanding Transition Area in the design and sizing of infrastructure improvements.

9. Any development proposal west of Roseville shall aid in resolution of regional storm water retention.

10. Any development proposal west of Roseville shall incorporate mechanisms to ensure new schools are available to serve the residents and shall not impact existing schools.

11. Any development proposal west of Roseville shall include a significant interconnected public open space component/conservation plan in coordination with the City of Roseville/U.S. Fish and Wildlife Service Memorandum of Understanding.

12. Any development proposal west of Roseville shall include a public participation component to keep the public informed and solicit feedback throughout the specific plan process.

13. Any development proposal west of Roseville shall provide a "public benefit" to the City and residents.

(The MOU is discussed in Section 3.1.4.3).

3.1.3.5 City of Rocklin General Plan

The City of Rocklin General Plan contains the following policies that are applicable to land use and related to transportation projects:

LU-16 To coordinate planning with neighboring jurisdictions in order to ensure compatible land uses.

LU-61 To continue to participate in the activities of regional entities as deemed appropriate, such as the Highway 65 Joint Powers Authority, SPRTA, PCTPA, SACOG, the Placer County Flood Control and Water Conservation District, and the landfill authority.

LU-62 To consider the effects of land use proposals and decisions on the South Placer subregion jobs/housing balance.

LU-63 To encourage communication between the County and the cities of Roseville, Loomis, Lincoln, and Rocklin to ensure the opportunity to comment on actions having cross-border implications. To address other community interface issues, including land use compatibility, circulation and access, and development standards.

C-11 To encourage improvements to the existing Federal Interstate and State highway system, and the addition of new routes that would benefit the City of Rocklin.

C-23 To require landscaping and tree planting along major new streets, properties abutting highways/freeways and along existing streets as appropriate.

C-24 To minimize the impact of road construction on the natural terrain and the character of existing neighborhoods.

C-26 To design and phase construction of road improvements to minimize disruption to local residents and traffic, to the extent feasible.

3.1.4 Other Plans and Policies

3.1.4.1 Sunset Industrial Area Plan

The Sunset Industrial Area Plan (SIAP) is a community plan that further refines the goals and policies of the Placer County General Plan for the plan area. SIAP was established to improve opportunities for industrial development in the plan area to attract new industries, retain existing industries, and allow them to expand. In addition, the area was planned to provide facilities that would help all area businesses to thrive. The applicable SIAP policies are listed below:

1.A.7 The Sunset Industrial Area Plan Land Use Diagram shall insure that proposed land uses are compatible with existing or planned adjacent uses, including established industrial firms in both the Sunset Industrial Area and in the surrounding cities.

1.A.8 The County shall permit the development of only agricultural, industrial, or similar compatible land uses around Western Placer Waste Management Authority properties. Residential uses around these properties are not considered a compatible use.

1.A.9 The County shall seek to protect the industrial, commercial, professional, and agricultural uses in the Sunset Industrial Area from encroachment by incompatible uses from the surrounding cities and from unincorporated area development.

1.F.1 The County will seek to provide a broad range of public facilities and services to businesses in the Sunset Industrial Area. Improvements to onsite services include the provision of improved fire protection, circulation improvements, and expanded utility services.

1.F.2 When considering land use changes in the vicinity of the Western Regional Sanitary Landfill and the Western Placer Waste Management Authority Material Recovery Facility operation, the County shall consider these solid waste facilities and operations as the dominant land use in the area. In order to protect these facilities and operations from incompatible encroachment, the County has established buffer zone standards described in Table I-6. The intent of this policy is to prohibit the creation of new parcels for residential use within 1 mile of the solid waste facilities and operations; not to prohibit construction of a residence on an existing legal building site within this area.

2.D.2 Preserve right-of-way for a potential extension of Sunset Boulevard as an east-west facility to link western Placer County with Sutter County and Sacramento County.

3.1.4.2 West Roseville Specific Plan

The WRSP, approved in 2004 and located at the eastern edge of the study area, was determined to be consistent with the goals and policies of the City of Roseville General Plan. The WRSP supplemented the General Plan goals and policies by providing specific direction to reflect conditions unique to the project area as referenced in the City's Land Use Element. The WRSP is specific to its plan area and does not contain any broad regional goals and policies. About 95 percent of the WRSP is included in the "Transition Area" described in the next section.

3.1.4.3 Placer County and City of Roseville Memorandum of Understanding

In 1997, the City of Roseville and Placer County entered into a Memorandum of Understanding (MOU) to promote interagency communication and to foster cooperative land use planning. The MOU applies to a "Transition Area" west of Fiddyment Road and north of Baseline Road. The transition area includes land within the City of Roseville's SOI, including approximately 95 percent of the existing WRSP and three other proposed developments described in Section 3.1.4.1. The MOU specifies requirements for processing development proposals within the Transition Area, including provisions for City-County consultation and review, application submittal, mitigation of impacts and minimum development standards. The transition area includes the proposed *Creekview Specific Plan* area and the proposed *Sierra Vista Specific Plan* area, both of which are located within the Eastern Segment of the study area. The land is largely undeveloped, but development applications are currently under review by the City of Roseville. These plans call for development with land uses to include residential neighborhoods, community commercial, business/professional, light industrial, and industrial land uses. Approval by the Placer County Local Agency Formation Commission would be required for city annexation of the Creekview and Sierra Vista specific plan areas.

3.1.4.4 Placer County Conservation Program: Natural Communities Conservation Plan and Habitat Conservation Plan

In June 2000, the Placer County Board of Supervisors adopted the Placer Legacy Open Space and Agricultural Conservation Program. This program initiated an effort by Placer County to find a comprehensive way to meet state and federal requirements for the state and federal Endangered Species Acts as well as for other federal laws related to wetlands. This has led to the current effort by the Placer County Planning Department to prepare a state Natural Communities Conservation Plan (NCCP) and a Federal Habitat Conservation Plan (HCP). The NCCP/HCP, called the Placer County Conservation Program (PCCP), will be developed in three phases. The first phase will cover western Placer County, including the study area. Phase 2 and Phase 3 will include the areas of the Sierra Nevada. SPRTA intends to be a participating agency in the PCCP for the Parkway.

The PCCP for western Placer County is currently under development. While it is currently unknown how the PCCP will ultimately affect land use within the study area, it is expected that some areas will be recommended for long-term conservation.

3.1.4.5 Natomas Basin Habitat Conservation Plan

In November 1997 (and revised in 2003), Sutter County and the City of Sacramento adopted the Natomas Basin Habitat Conservation Plan (NBHCP). The Natomas Basin is located in the southeastern corner of Sutter County and northwestern area of the City of Sacramento and Sacramento County. The plan was conceptualized to allow economic development while promoting biological resource conservation and sustained agriculture. The plan's overarching goal is to preserve, restore, and enhance habitat values in the Natomas Basin, while allowing urban development to proceed. In order to meet this goal, the preparation of the NBHCP had to satisfy the conditions of regulatory programs administered by the USACE, USFWS, and CDFG. Specifically, the NBHCP is a supporting document for the USFWS Section 10(a)(1)(B) and CDFG Section 2081 permit applications. Section 10(a)(1)(B) of the federal Endangered Species Act and Section 2081 of the Fish and Game Code allow incidental take of endangered or threatened species, subject to permit requirements for federal and state listed species, respectively. The NBHCP established a conservation program to mitigate the potential loss of habitat and the incidental takes of protected species that could result from proposed development in the area.

In order to meet the mitigation requirements of the NBHCP, developers who apply for a building permit within the Natomas Basin must pay a mitigation fee to the Natomas Basin Conservancy. The

Conservancy uses the mitigation fees to acquire, restore, and manage lands that will provide habitat for protected species and maintain agriculture in the Natomas Basin. To date, the Conservancy has acquired 25 properties, and is responsible for managing nearly 4,000 acres of land (Natomas Basin Conservancy, 2006).

3.1.4.6 Placer County Transportation Planning Agency-Regional Transportation Plan

PCTPA is the regional transportation planning agency (RTPA) for Placer County jurisdictions (except for that portion of the county within the Tahoe Regional Planning Agency). PCTPA is responsible for preparing the Placer County Regional Transportation Plan (RTP). The RTP is a long-range (20-year) transportation plan for the regional transportation system including the study area. The RTP also contains the adopted goals, policies, programs, and projects to meet regional mobility needs and satisfy federal air quality standards. The 2027 Placer County RTP includes the following Goal and Policy that pertain to the Placer Parkway:

Goal 1. Highways/Streets/Roadways: Maintain and upgrade a safe, efficient, and convenient countrywide roadway system that meets the travel needs of people and goods through and within the region.

Policy 3. Establish a funding/implementation strategy for the Placer Parkway, a connector between State Route 65 and State Routes 70 and 99, including access to the Interstate 5 corridor in northern Sacramento County and the Sacramento International Airport.

PCTPA is also responsible for preparing the Regional Transportation Improvement Program (RTIP). The RTIP contains the list of projects that will be submitted to the SACOG for incorporation into the Metropolitan Transportation Improvement Program (MTIP). In order to receive federal funding for transportation projects, the federally designated Metropolitan Planning Organization (MPO) must make findings of conformity required under the federal Clean Air Act, within federal ozone non-attainment areas. Therefore, in order for the project to receive federal funding for any phase of development, SACOG must find that the project meets federal Clean Air Act conformity requirements and include the project in its MTIP.

3.1.4.7 Sacramento Area Council of Governments–Metropolitan Transportation Plan

SACOG is responsible for preparing the long-range transportation plan in the six-county area that include: Sacramento, Yolo, Yuba, Sutter, Placer, and El Dorado counties. For this region, a long-range regional transportation plan is required to cover at least a 20-year planning horizon and must be updated every 3 years. The long-range plan is called a Metropolitan Transportation Plan (MTP). The MTP provides a regional vision for surface transportation. The plan is constrained by the funding that the region can reasonably be expected to receive from the state and federal government. If a city, county, or public agency within the SACOG region wants to pursue state or federal transportation monies, the project must be preliminarily evaluated and subsequently included in the MTP. SACOG is currently in the process of updating the MTP for 2030 to reflect the adopted SACOG Blueprint pattern of growth and choices for transportation. Placer Parkway is one of the two proposed regional connectors listed in the MTP.

3.1.4.8 Sacramento Area Council of Governments Blueprint

SACOG recently adopted the Preferred Scenario developed through the Blueprint Transportation and Land Use Study. The Preferred Blueprint Scenario establishes a long-range regional vision for how the six-county SACOG region will manage an anticipated doubling of population by the year 2050. Many of the strategies that were discussed by participants in the Blueprint planning process called for the

implementation of what are known as the Blueprint Planning Principles. The Planning Principles include housing options, compact development, transportation choices, mixed land uses, conservation of natural resources, making better use of existing assets, and quality design.

The Preferred Blueprint Scenario depicts a regional growth pattern through the year 2050 in a manner generally consistent with the Blueprint Planning Principles. Placer Parkway is recognized as an element of the Preferred Scenario, and it is shown as part of the assumed future transportation network in the Preferred Scenario. Specific policies of the plan are not applicable to the Parkway as they focus on "smart growth" and other community design issues that are not directly related to this project. It is described here as an important consideration that is being used to guide land use planning decisions within the study area.

3.2 AFFECTED ENVIRONMENT

Land use within the Placer Parkway study area is the responsibility of several local jurisdictions. These jurisdictions include the Cities of Rocklin and Roseville, as well as the Counties of Placer, Sutter and Sacramento. Approximately 35,454 acres of land are within the study area and the average parcel size is slightly more than 125 acres. Review of existing jurisdictional plans, aerial photographs, GIS data, feedback from local residents and public officials at open houses/public meetings, and field visits were used to determine the existing land uses in the vicinity of the study area that are described below. The information collection involved a coordinated effort between PCTPA, the Placer County Department of Agriculture, the Sutter County Department of Agriculture, and the environmental consulting firms: URS Corporation, Mara Feeney and Associates, and North Fork Associates (NFA).

3.2.1 Current Land Use

Approximately 91 percent of the parcels within the study area support various forms of agriculture, including pasture/grazing land (for cattle or sheep), cultivated agriculture (such as rice production), or other ranchland. Table 3-1, below, shows the distribution of current land uses within the study area (see also Figure 3-1 for the corresponding land use map).

Table 3-1
Acreage and Percentage of Land Use in the Study Area

Land Use	Acreage (acres)	Percentage of Study Area (%)
Rice[1]	14,898	42
Pasture/Idle Farmland	9,405	26.5
Other Cultivated Agriculture	4,233	12
Rural Residential	1,167	3.3
Other[2]	4,656	13
Industrial	549	1.5
Wildlife Preserve	289	0.9
Municipal Facilities	257	0.8

Source: North Fork Associates GIS land use database
Notes:
1. Rice was separated from cultivated agriculture because it is the largest land use in the area.
2. "Other" land uses include a plant nursery, a dog kennel, horse ranches, fish ponds, roads, streams, and railroads.

These land uses were determined through aerial photograph interpretation and site visits and calculated using a GIS land use database. In a few instances, the actual land use was indeterminable due to lack of site access or inability to determine the type of cultivated agriculture due the time of the year. Those land uses are included in the Other Cultivated Agriculture categories in Table 3-1. As described in Chapter 2, five corridor alternatives pass through the three study area segments, the Eastern, Central, and Western segments (see Figure 2-1). The paragraphs below describe the existing land use on a segment-by-segment basis (refer to Section 2.1 for segment boundary descriptions).

Western Segment. The Western Segment includes unincorporated portions of Sutter and Sacramento counties and is 10,402.14 acres in size (29.34 percent of the study area). SR 70/99 runs north to south along the western edge of the segment, while major east-to-west arterials include Riego Road, Sankey Road, and Howsley Road. Other infrastructure in this segment includes the Union Pacific Railroad, which runs north to south in the middle of the segment, as well as a fire station near Sankey Road. Water features in this segment include part of Pleasant Grove Creek, the Steelhead Creek portion of the Natomas East Main Drainage Canal, and scattered vernal pool wetland complexes. As in the Central Segment, the majority of land use in this area is cultivated agricultural land in both Sacramento and Sutter counties. This segment also contains industrial/commercial uses within Sutter County, including the Sysco facility along Pacific Avenue near the intersection of Sankey Road, and an industrial park located south of the Sysco facility. As in the Eastern Segment, these industrial facilities are located near a major highway, in this case SR 70/99, which is approximately 1 mile west. There are also areas of rural residential development located near Pleasant Grove Road within this segment. The land use on parcels within Sacramento County is rice production with scattered rural residences.

Central Segment. The Central Segment encompasses parts of unincorporated Placer and Sutter counties and is the largest of the three segments. It includes 15,292.59 acres (43.13 percent of the study area). The major regional arterial roadways include Baseline Road, Riego Road, Sankey Road, and Pleasant Grove Road. The public land uses existing within this segment include the City of Roseville's Reason Farms Retention Basin near Phillip Road, and a small wildlife preserve near the Brewer Road crossing of Curry Creek. Water-related features in this segment include Steelhead Creek, Pleasant Grove Creek, Curry Creek, Dry Creek, a small water ski park/catfish farm near the intersection of Baseline Road and Locust Road, and various vernal pool and wetland complexes located throughout the segment. The predominant land uses in this segment are agricultural with small enclaves of rural residential (specifically near Baseline and Pleasant Grove Roads). In addition, a small industrial wood fabrication facility is located near the rural residential homes close to the intersection of Baseline and Pleasant Grove Roads.

Eastern Segment. The Eastern Segment is 9,754.17 acres in size (27.51 percent of the study area) and includes areas within the City of Rocklin, the City of Roseville, and unincorporated Placer County. SR 65 and several regional arterial roadways such as Sunset Boulevard, Blue Oaks Boulevard, Pleasant Grove Boulevard, and Baseline Road run through portions of this segment. Large regional facilities and infrastructure in this segment include the Western Regional Sanitary Landfill/Materials Recovery Facility, the Pleasant Grove Wastewater Treatment Plant (PGWWTP), the newly constructed Roseville Energy Park (REP), and Sacramento Municipal Utilities District (SMUD)/Western Area Power Authority (WAPA) power lines, as well as Rio Bravo biomass power plant facility and other existing industrial development along Industrial Boulevard in the Sunset Industrial Area. The three largest streams in this segment include Pleasant Grove Creek, Dry Creek, and Curry Creek, and a small segment of Orchard Creek (a tributary of Auburn Ravine) is located in the northeastern corner of the study area. This segment also contains the largest area of vernal pool and wetland complexes, specifically in the area adjacent to the existing PGWWTP. The current land use in the easternmost portion of this segment is a mixture of

industrial and commercial uses near the SR 65 corridor. Public facilities, including the landfill and the PGWWTP, grazing land or idle farmland, cultivated agricultural land, and a few rural residences are located in the western portion of this segment (Figure 3-1).

3.2.2 Land Use Designations and Zoning

Local jurisdictions retain land use planning authority in the study area. A General Plan is a long-term plan to help guide the physical development within a jurisdiction (see Section 3.1.3, General Plans and Policies). Each local jurisdiction adopts zoning ordinances to regulate proposed development consistent with General Plan land use designations. The General Plans and Zoning Ordinances of each jurisdiction that has land within the study area were reviewed to identify existing land use designations and permitted land uses.

3.2.2.1 Existing General Plan Designations

Figure 3-2 displays the existing designated land use within the study area in relation to the corridor alignment alternatives. The figure shows that the corridor alignment alternatives pass through an area that is generally designated for either agricultural or industrial uses.

3.2.2.2 Existing Zoning

Figure 3-3 illustrates the existing zoning within the study area. Table 3-2 displays the acceptable uses within each zoning district as described in the applicable zoning ordinance by jurisdiction.

3.2.3 Developable Land

The purpose of this section is to assess the amount of land that is not already developed within the study area. The FHWA definitions of land types related to the "developable" category are as follows: developed (land with structures on it), undeveloped (farmland, parkland, or other vacant land), and constrained (land that cannot be developed for environmental or other reasons, e.g., floodplains, wetlands, and preserved parks) (FHWA, 1999c). Developable land does not mean that land is necessarily approved for development by a governing body, although it can be, as in the case of the West Roseville Specific Plan area. Thus, for the purposes of this CIA, developable land is considered to be all land that is neither constrained nor developed.

According to the California Housing and Community Development Department (HCD) report, *Raising The Roof: California Housing Development Projections and Constraints, 1997-2020***,** there are 313,996 acres of developable land in Placer County and 362,981 acres of developable land within Sutter County, for a total of 676,977 acres of developable land within the two counties. The study area encompasses approximately 35,454 acres, most of which are developable. The proposed alternative corridors are predominately undeveloped at this time (with the exception of existing infrastructure like roads, canals, and railroads, as well as limited industrial development near the western and eastern termini). The alternative alignments range between 1,600 to 1,900 acres of land that would be acquired for Placer Parkway. A fraction of a percent (0.24 percent to 0.28 percent) of the developable land in the two counties may be utilized for the Parkway project, or between 4.5 and 5.4 percent of all land within the project study area, depending on alternative.

A network of rural roadways provides access to the potentially developable land within the study area. The roadway classifications are as follows:

Table 3-2
Existing Zoning Within Study Area

Zoning	Acceptable Uses
Sutter County	
General Agricultural District (AG)	The AG District is established to provide areas for general farming, low-density uses, open spaces, and by use permit (Section 1500-1412) limited retail service uses which in the opinion of the Planning Commission support the local agricultural industry. Classification may be applied to rural communities where the predominance of land use is of a general agricultural nature and include commercial kennels or stables and warehouses to store agricultural products.
General Industrial District (M-2)	This classification provides areas for a full range of industrial, manufacturing, and related uses to expand the economic base, employment opportunities. Due to potential high-intensity operational characteristics and features, this district should be located away from residential neighborhoods and other potentially sensitive uses. Classification can include petroleum storage and wholesale, canneries, commercial fruit dryers, all uses in M-1 district, and uses permitted in Section 1500-4912 of the Code.
Light Industrial District (M-1)	This classification is intended to provide suitable areas for low-intensity assembly, processing or manufacturing activities, product distribution, and related activities, all of which do not create nuisance or otherwise unacceptable levels of noise, dust, odor, smoke, bright light or vibration in order to provide for the general welfare. Classification can include building supplies/sales, auto body/painting, auto dismantlers, commercial agricultural processing plants and other uses by permit in Section 1500-4612 of the Code.
Public District (P)	Classification is intended to provide public facilities in which parks, governmental, educational, utility, and other community facilities of a public nature are the principal use. Classification can include cemeteries, fire stations, libraries, community theatres, museums, and any other uses permitted in Section 1500-5912 of the Code.
City of Rocklin	
Planned Development Business Professional (PD-BP)	The BP district allows offices for doctors, lawyers, dentists, accountants and similar occupations where the clientele seeks the services of the office proprietor as opposed to the purchase of a product. The PD zone provides the means for greater creativity and flexibility in environmental design than is provided under the strict application of the zoning and subdivision ordinances, while at the same time protecting the public health, safety and welfare and property values. Various land uses may be combined in a planned development zone including combinations of residential, commercial, industrial, utility, institutional, educational, cultural, recreational and other uses, provided the combination of uses results in a balanced and stable environment.
Planning Preserve (PP)	No specific uses or conditions per Title 17 of the City of Rocklin Zoning Code.
Wetland (W)	W district denotes where the 100-year floodplain, protected wetlands, or other waters of the U.S. are located. Development in this area is scrutinized by State and Federal resource agencies; i.e., the U.S. Army Corps of Engineers and the Regional Water Quality Control Board.
City of Roseville	
Attached Housing (R-3)	The R-3, Attached Housing district is intended for multiple-family housing. The types of land use intended for the R-3 zoning district include apartments, condominiums, townhomes, and similar and related compatible uses. Specifically, this designation allows all principally, conditionally, or administratively permitted uses in Section 19.10.020 of the City of Roseville Zoning Ordinance.

Table 3-2
Existing Zoning Within Study Area
(Continued)

Zoning	Acceptable Uses
Attached Housing Development Standards (R3-DS)	Same as above, with the Development Standard (DS) district as an overlay district which allows modification of the specified development standards in general zone districts. The City Council, in approving a zoning reclassification, may combine the DS district with any zone district to establish or modify any or all development standards.
Business Professional (BP)	To provide locations for a wide variety of office uses that are related to and supportive of each other. Specifically, this designation allows all principally, conditionally, or administratively permitted uses in Section 19.12.020 of the City of Roseville Zoning Ordinance.
Community Commercial (CC)	Intended to serve the principal retail shopping needs of the entire community by providing areas for shopping centers, and other retail and service uses. Specifically, this designation allows all principally, conditionally, or administratively permitted uses in Section 19.12.020 of the City of Roseville Zoning Ordinance.
Community Commercial Special Area (CC-SA)	Same as above with the SA overlaying district; therefore, the development standards provided in the West Roseville Specific Plan shall supersede development standards contained in this title for the underlying zone district. If a standard is not addressed within the applicable specific plan or the ordinance reclassifying the property, it shall be governed by the standards established by the underlying zone district (CC).
General Industrial Special Area (M2-SA)	The M2 district is intended to designate areas suitable for a broad range of industrial uses, including manufacturing, assembly, wholesale distribution, and warehousing. The types of uses permitted can include equipment and materials storage yards, commercial laundries, light industrial uses, printing/publishing, and recycling, dismantling, scrap facilities and all principally, conditionally, or administratively permitted uses in Section 19.14.020 of the zoning ordinance with the SA overlay as described above.
Light Industrial Special Area (M1-SA)	The Light Industrial district is intended to designate areas appropriate for light industrial uses, such as manufacturing, processing, assembly, high technology, research and development and storage uses. The use types permitted within the M-1 district do not include outdoor manufacturing but may include limited outdoor storage and the emission of limited amount of visible gasses, particulates, steam, heat, odor, vibration, glare, dust, and noise. These uses may be compatible operating in relatively close proximity to commercial and residential uses. Specifically, this designation allows all principally, conditionally, or administratively permitted uses in Section 19.14.020 of the City of Roseville Zoning Ordinance with the SA overlaying district described above.
Open Space (OS)	Open Space activities within the Wetland Preserve include activities and management of the area to preserve, recreate and enhance natural resource values such as fish and wildlife habitat, rare and endangered plants, erosion control, and floodwater conveyance. Specifically, this designation allows all principally, conditionally, or administratively permitted uses in Section 19.16.020 of the City of Roseville Zoning Ordinance.
Parks and Recreation (PR)	Applied to both public and private recreation facilities. This is intended to be applied to larger parks especially, but may also be applied to smaller neighborhood facilities when it is important, due to the planned facilities or natural features, to designate the site for park and recreation uses. Specifically, this designation allows all principally, conditionally, or administratively permitted uses in Section 19.16.020 of the City of Roseville Zoning Ordinance.
Public Quasi-Public (P/QP)	Applied to land intended for education, religious assembly, governmental offices, municipal corporation yards, water treatment plants, power generating facilities, and other publicly owned facilities. Specifically, this designation allows all principally, conditionally, or administratively permitted uses in Section 19.16.020 of the City of Roseville Zoning Ordinance.
Public Quasi-Public Special Area (P/QP-SA)	Same as above with the SA overlaying district described above.

Table 3-2
Existing Zoning Within Study Area
(Continued)

Zoning	Acceptable Uses
Single Family Residential Development Standards (R1-DS)	Intended for detached, single-family homes and similar and related uses inclusive of halfplexes. Specifically, this designation allows all principally, conditionally, or administratively permitted uses in Section 19.10.020 of the City of Roseville Zoning Ordinance with the DS overlay described above.
Small Lot Residential Development Standards (RS-DS)	Intended to allow attached or detached single-family dwellings, and similar and related compatible uses. Specifically, this designation allows all principally, conditionally, or administratively permitted uses in Section 19.10.020 of the City of Roseville Zoning Ordinance with the DS overlay described above.
Placer County	
Business Park Design Review (BP-Dc)	BP district designates areas appropriate for the development of a mixture of light industrial, office, and commercial land uses in a campus-like setting. Such uses may include high-technology manufacturing and assembly, warehousing, professional offices, research and development, and commercial uses that are primarily for the support of the employees of other businesses in the district and the businesses themselves. The types of industrial and office land uses that will be appropriate in the zone will be those with most of their employee positions at primary wage earner levels, with salaries comparable to the county's median income level. The land uses allowed in the BP zone district are limited to the following in Section 17.02.050 of the Count Code. Site development in the BP district is characterized by careful attention to attractive building design, landscaping, and less site coverage than in other commercial and industrial districts per the Design Review combining district.
Business Park Design Review Flood Hazard (BP-Dc-FH)	Same as BP-Dc listed above with the Flood Hazard combining district. The FH identifies areas where hazards to life or property exist because of the potential for inundation by a one hundred (100) year frequency flood.
Farm Building Site 20-acre min. (F-B-20)	Farm zones provide areas for the conduct of commercial agricultural operations that can also accommodate necessary services to support agricultural uses, together with residential land uses at low population densities. The following land uses are allowed in the F zone as provided by Section 17.06.030 et seq.: animal husbandry, agricultural processing/production, agricultural sales, and others. In addition, the B combining district is to provide for different parcel sizes in new subdivisions than would otherwise be required by an applicable zone district, based upon special characteristics of the site or area to which the combining district is applied, including but not limited to sensitive environmental characteristics, limited resource capacities, and community character. Lastly, this specific zone requires a 20-acre minimum lot size.
Farm Building Site 80-acre min. (F-B-80)	Same as F-B zones listed above with an 80-acre specific parcel size.
Farm Building Site Development Reserve (F-B-DR)	Same as F-B zone listed above. The DR combining district also provides for the future development of limited residential, commercial or industrial uses in areas that are identified by the general plan (or any community plan adopted, in this case the Sunset Industrial Plan Area) for such uses, but which may not be prepared at the time the district is adopted to accommodate the planned levels of full development until additional infrastructure or resources have been provided, or additional population growth has occurred or may require special treatment as provided for in specific or general plans.
Farm Building Site Development Reserve 80-acre min. (F-B-DR-80)	Same as F-B-DR zone listed above with an 80-acre specific parcel size.

Table 3-2
Existing Zoning Within Study Area
(Continued)

Zoning	Acceptable Uses
Farm Building Site Development Reserve Special Purpose (F-B-DR-SP)	Same as F-B-DR zone listed above with a SP combining district. The SP district allows mineral extraction operations, airports, community sewage treatment plants, and waste disposal facilities and was created to identify specific areas in the vicinity of such uses where land use compatibility issues are of particular importance. When applied to a particular parcel of land, the purpose of the district is to require a discretionary review of the proposed use of that land and to restrict the use of that land to uses that are determined to be compatible with the special use in the vicinity.
Farm Building Site Special Purpose 80-acre min. (F-B-SP-80)	Same as F-B-SP listed above with an 80-acre specific parcel size.
Farm Development Reserve 80-acre min. (F-DR-80)	Same as F-DR-80 listed above.
General Commercial Conditional Use Permit Req. (C2-UP)	The C2 zone is intended to provide areas for the continued use, enhancement, and new development of retail, personal service, entertainment, office, and related commercial uses that will attract patrons from all areas of the community and region. The following land uses are allowed in the C2 zone district as provided by Sections 17.06.030 et seq.: All C1 uses, printing/publishing, recycling centers, auto parts/sales, restaurants, retail stores, medical offices, banking institutions, hotels and motels.
Industrial Park (INP)	The industrial park district is for light industrial uses such as manufacturing, assembly, research and development and similar industrial uses, as well as limited commercial and office uses that are compatible and appropriate along with industrial uses.
Industrial Park Design Review (INP-Dc)	Same uses as listed in IN district above with site development in the industrial park characterized by careful attention to attractive building design, landscaping, and less site coverage than in other commercial and industrial districts per the Design Review combining district. The following land uses are allowed in the IN zone district as provided by Section 17.06.030 et seq.: electric generation plants, electronic component production, petroleum refining, weapons manufacturing, leather and textile manufacturing.
Industrial Park Design Review Flood Hazard (INP-Dc-FH)	Same uses as described above with the FH combining district.
Industrial Design Review (IN-Dc)	The industrial district is intended for a wide range of industrial activities including manufacturing, assembly, wholesale distribution, and storage. The following land uses are allowed in the IN zone district as provided by Sections 17.06.030 et seq.: chemical production/manufacturing, clothing manufacturing, metal and glass manufacturing, paper and plastic recycling production and processing plants. Site development in the IN district is characterized by careful attention to attractive building design, landscaping, and less site coverage than in other commercial and industrial districts per the Design Review combining district.
Neighborhood Commercial Design Review Development Reserve (C1-Dc-DR)	The C1 district is intended to provide areas for small-scale, day-to-day convenience shopping and services for residents of the immediate neighborhood. The following land uses are allowed in the C1 zone district as provided by Sections 17.06.030 et seq.: shopping centers, drive through restaurants, nurseries, grocery/liquor stores, and other convenience stores.

Table 3-2
Existing Zoning Within Study Area
(Continued)

Zoning	Acceptable Uses
Open Space (O)	Open space protects important lands within Placer County by limiting allowable land uses to low intensity agricultural and public recreational uses, with structural development being restricted to accessory structures necessary to support the primary allowed uses, and critical public facilities. The following land uses are allowed in the O zone as provided by Sections 17.06.030 et seq., forestry, grazing, equestrian facilities, campgrounds, ski operations, and temporary events.
Residential Agricultural Building Site Development Reserve 10-acre min. (RA-B-DR-10)	The RA zone is to stabilize and protect the rural residential characteristics of the area to which it is applied and to promote and encourage a suitable environment for family life, including agricultural uses. This area also has the B and DR combining districts described above with a minimum lot area requirement of 10 acres.
Sacramento County	
Agricultural 80-acre min. (AG-80)	General Agriculture uses include the cultivation of the soil for the production and harvesting of crops, the care and breeding of livestock, pastureland, horticulture, dairying, beekeeping, viticulture, and the storage and minor repair of agricultural vehicles and equipment used for the processing and transportation of the products grown on the premises. Hog farms, kennels, and feedlots are excluded. All other uses permitted in Section 130-06 of the Code.
Sources: City of Roseville, City of Rocklin, Placer County, Sacramento County, and Sutter County zoning ordinances.	

Table 3-3
Functional Roadway Classification

County	Roadway	Classification
Sutter County	Pleasant Grove Road	Urban Arterial
	Howsley Road	Rural Collector/Urban Arterial
	Riego Road	Urban Arterial
	Sankey Road	Urban Arterial
Placer County	Fiddyment Road	Urban/Suburban Minor Arterial
	Philip Road	Rural Collector
	Brewer Road	Rural Collector
	Locust road	Local Road
	Whitney Ranch Parkway	Rural Arterial
	Sunset Boulevard	Urban/Suburban Minor Arterial
	Blue Oaks Boulevard	Thoroughfare
	Baseline Road	Thoroughfare
Sources: Placer County General Plan, 1994; Sutter County General Plan, 1996.		

Rural collectors currently serve the largely agricultural area within the project study limits, but are not designed to accommodate heavy amounts of traffic, nor maintain higher rates of speed. Arterials are wider than collector roads and are designed to carry heavier volumes of local traffic and connect to regionally significant roadways such as state highways, including SR 70/99 near the western project boundary and SR 65 near the eastern project boundary. These two highways provide local and regional access, as well as linking the study area to the interregional freeways, I-5 and I-80.

3.2.4 Approved and Proposed Major Developments

Agriculture has long been established as the predominant land use in the study area. However, in recent years, the areas immediately to the northeast, east, south, and southwest of the study area have been undergoing rapid change. The cities of Lincoln, Rocklin, and Roseville have been among the fastest growing in the Sacramento region; and Placer County has consistently been among the top growth counties in the state over the last decade (State of California DOF, 2006b). As a result of regional population growth and increased development adjacent to the study area, development pressure on the land within the study area has intensified. The effect of this increased pressure is indicated by the number of recent major approved and proposed developments described below. Approved developments are those that have received entitlements; proposed developments are those that have been formally presented to local jurisdictions and are in the process of undergoing specific planning and environmental review. In the following sections, the approved and proposed developments were not segregated by alternative or by segment since the developments lie in multiple segments and may be within two or more corridor alignment alternatives. Figure 3-4 displays planned and proposed developments within the study area. It should be noted that proposed developments may change prior to their final adoption and/or approval. In addition, other factors cast uncertainty over how development ultimately will proceed in the study area. For example, FEMA is considering a building moratorium in the Natomas Basin due to concern with

flood hazards in that area, and Placer County's Habitat Conservation Plan could result in additional areas being earmarked for conservation in the study area.

3.2.4.1 Approved Major Developments

West Roseville Specific Plan. The West Roseville Specific Plan (WRSP) area in the City of Roseville is adjacent to the project study area, abutting the alignment of Alternatives 1 and 2 in the Eastern Segment. The WRSP was approved by the Roseville City Council in February 2004 and annexed into the city on August 18, 2004. Table 3-4 shows the 14 different land use categories within the WRSP area by acreage.

Table 3-4
West Roseville Specific Plan Land Uses

Land Use Designation	Area (acres)
Low Density Residential (LDR)	1,354.0
Low Density Residential (Age Restricted)	147.0
Medium-High Density Residential	143.0
High Density Residential	110.0
Light Industrial	74.0
Industrial	34.0
Business Professional	19.0
Community Commercial	48.0
Open Space	670.0
Open Space/Paseo	14.0
Public/Quasi Public	148.0
Park	251.0
Pocket Parks	19.0
Right-of-Way (ROW)	128.0
Total	**3,159.0**
Source: City of Roseville (2004b)	

The WRSP is planned primarily as a residential community with an overall mix and intensity of land uses similar to that found in adjacent portions of the city. The project incorporates a mix of commercial and residential uses into its village center concept, which forms the centerpiece of the planned community. Lands to the north, south, and west of the WRSP consist primarily of agricultural and rural residential uses within unincorporated Placer County. To the east, existing and planned neighborhoods are found in the city's Del Webb and North Roseville Specific Plan areas. The PGWWTP and the REP, and other potential intensive public uses, are adjacent to, and partially surrounded by, the central portion of the WRSP. Industrial and light industrial uses are planned within the area adjacent to these uses to ensure compatibility with the adjacent PGWWTP and are intended to provide employment within the WRSP. A 1,000-foot non-residential buffer surrounds the WRSP to the south, east, and west of the PGWTP. The plan area's employment district has regional access via Blue Oaks Boulevard, Pleasant Grove Boulevard, and West Side Drive, and expands the city's job base and industrial economic development potential.

Sunset Industrial Area Plan. The project would bisect the 1997 SIAP area in unincorporated Placer County in the Eastern Segment of the study area. Development within this area is guided by the Placer County General Plan and the SIAP. The 8,883-acre SIAP area is bounded to the north by the City of

Lincoln, to the east by the City of Rocklin, and to the south by the City of Roseville. West of the SIAP lies a large area of agricultural land within Placer County. The stated goal of the SIAP follows:

> *To improve the opportunities for industrial and other employment-based development in the SIAP in order to attract new industries, retain existing industries, to allow existing industries to expand, and to provide the necessary public and private sector services and facilities for all area employers, businesses, and patrons.*

The SIAP uses six land use designations to guide development within the plan area: Business Park, Industrial, General Commercial, Agriculture, Public Facility, and Open Space. No residential land uses are allowed within the plan area; however, the proposed Placer Ranch Specific Plan (discussed below) lies partially within the SIAP and includes a variety of densities of residential land uses and university land uses. According to the SIAP, the plan area is emerging as an important employment base for residents of South Placer County, North Sacramento, and the foothill communities. The economic development activity within the SIAP is recognized as a critical component of the county's future growth, due to the jobs and revenue that the area is expected to generate. The SIAP identifies additions to the transportation/circulation network in the vicinity that are necessary to serve development within the plan area. While it does not identify the proposed Placer Parkway, the plan identifies circulation improvements to improve access from the west. Table 3-5 identifies the land use designations by acreage in the SIAP.

Table 3-5
Proposed Land Uses for
Sunset Industrial Area Plan

Land Use Designation	Area (acres)
Business Park	892.0
Industrial	3,479.0
General Commercial	49.0
Agriculture	3,503.0
Public Facilities	776.0
Open Space	184.0
Total	**8,883.0**
Source: Placer County, 1997	

3.2.4.2 Proposed Major Developments

Placer Ranch Specific Plan. The Placer Ranch Specific Plan (PRSP) proposes the phased development of a mixture of industrial, commercial, office and professional, residential, and a branch campus of California State University (CSU), Sacramento, on approximately 2,213 acres within the boundaries of the SIAP. All corridor alignment alternatives of the proposed Placer Parkway would bisect the PRSP area. The PRSP has common boundaries with the City of Roseville to the south and is bounded to the north by Sunset Boulevard West. The Western Regional Sanitary Landfill (WRSL) is located north of the PRSP on Athens Avenue. The project proposes approximately 980 acres of residential uses (including campus housing), approximately 290 acres for a university accommodating up to 25,000 students, approximately 9,612,000 square feet of industrial, commercial, office and professional land uses, and approximately 360 acres of institutional land uses (educational, parks, and open space). Roadway rights-of-way account for an additional 380 acres within the PRSP area. Table 3-6 shows proposed acreages by land use type in the Draft PRSP. Both the Placer County General Plan and the SIAP include policies that

establish buffer zones around the WRSL to avoid siting of incompatible land uses in close proximity to the landfill and to provide for future landfill expansion. Development of the site would require amendments to the existing land use designations and policies of the Placer County General Plan and SIAP.

Table 3-6
Proposed Land Uses for Placer Ranch Specific Plan

Land Use Designation	Area (acres)
University	290.0
Residential	980.0
Professional/Commercial	203.0
Roadway Rights-of-Way	380.0
Open Space/Parks/Educational	360.0
Total	**2,213.0**
Source: Placer County, 2005	

Sierra Vista Specific Plan. The proposed Sierra Vista Specific Plan (SVSP) area is located within Roseville's Sphere of Influence (SOI) in unincorporated Placer County. Alternative 1 lies west of this proposed plan area. The development application for the SVSP is being processed by the City of Roseville. The proposed SVSP area is comprised of 1,996 acres located south of the WRSP area and north of Baseline Road within the Eastern Segment of the proposed Placer Parkway study area. Although the SVSP is still in the conceptual stages of planning, the preliminary land use plan includes approximately 420 acres of Low Density Residential, 540 acres of Medium Density Residential, and 123 acres of High Density Residential property. Conceptual plans indicate that the project may also include 77 acres of land designated for Commercial uses and 57 acres designated for Office uses.

Creekview Specific Plan. The 530-acre Creekview Specific Plan (CSP) project site is located within the City of Roseville's SOI north of the WRSP area, and in the Eastern Segment of the study area. Placer Parkway would be located west of this proposed plan area. Like the SVSP, the CSP is in the preliminary stages of planning, so detailed land use plans are not available. However, it is expected that the CSP will propose development of residential land uses across most of the site, with limited commercial and professional office land uses near major roadways.

Regional University Specific Plan. The proposed Regional University Specific Plan (RUSP) area is comprised of 1,100 acres of undeveloped agricultural land in Placer County situated between the western boundary of the WRSP area and Brewer Road in the Central Segment of the Placer Parkway study area. Alternative 1 crosses the eastern edge of this plan area and Alternative 2 bisects it diagonally from northeast to southwest. The RUSP project includes the completion of a private university and a new residential community. The university campus would encompass 600 acres of the project site and would serve a maximum of 6,000 students. Forty acres of the university campus would be used for development of a high school to serve 1,200 students. Residential land uses would occupy 365 acres of the site and would include a mixture of low-, medium-, and high-density residential land uses. The remaining 135 acres of land within the RUSP would be designated with a mixture of commercial, parks, school, and open space land use designations. Table 3-7 summarizes the proposed land uses for the site.

Table 3-7
Proposed Land Uses for
Regional University Specific Plan Area

Land Use Designation	Area (±Acres)
University	600.0
Low Density Residential	245.0
Medium Density Residential	80.0
High Density Residential	40.0
Community Commercial	70.0
Neighborhood Commercial	3.0
Parks	31.0
School	11.0
Open Space/Parkway	20.0
Total	**1,100.0**
Source: Placer County Planning Department, 2004	

Development of this project would require an amendment to the Placer County General Plan and Zoning Ordinance, and approval of the RUSP, among other entitlements. The current General Plan designation on the site is Agriculture/Timber (80-acre minimum), and the zoning is Farm (80-acre minimum).

Placer Vineyards Specific Plan. The proposed Placer Vineyards Specific Plan (PVSP) area is located in southwestern Placer County and is bounded to the north by Baseline Road, to the south by the Sacramento-Placer County line, to the west by the Sutter-Placer County line, and to the east by Dry Creek and Walerga Roads. Alternative 1 lies 1 mile north of this plan area. The majority of the 5,230-acre site is currently zoned for agriculture (80-acre minimum lot sizes), and a small portion of the site is zoned Residential Agriculture (10-acre minimum lot sizes). The August 1994 Placer County General Plan identified this area as appropriate for urbanization following adoption and implementation of a comprehensive Specific Plan.

The proposed PVSP includes residential, commercial, public/quasi-public land uses and a Special Planning Area. Table 3-8 shows the land use summary for the PVSP. Approximately 2,377 acres of residential land uses are planned within the urbanized area of the plan. The Special Planning Area comprises 979 acres of existing rural residential development where no land use changes are proposed. The PVSP may also incorporate 161 acres of commercial properties, including a 60-acre site for a regional retail "Power Center." The plan includes more than 1,076 acres of open space, public facilities, and parkland. Lastly, the PVSP proposes 34.5 acres for office space, 140 acres for new schools, and 330 acres for new roadways or improvements to existing roadways.

Table 3-8
Proposed Land Uses for Placer Vineyards Specific Plan

Land Use Designation	Area (±Acres)
Low Density Residential	991.0
Medium Density Residential	1,196.0
High Density Residential	190.0
Commercial Mixed Use-RES	47.0
Commercial	34.0
Commercial Mixed Use-COM	20.0
Office	34.5
Business Park	98.5
Power Center	60.0
Town Center	33.5
Parks	217.0
School	140.0
Open Space/Public/Quasi-Public Facilities	859.5
Major Roads	330.0
Special Planning Area	979.0
Total	**5,230.0**
Source: Placer County Planning Department, 2004	

Measure M. Measure M, a voter-approved advisory measure, directed the Sutter County Board of Supervisors to consider mixed land use development for an approximately 7,500-acre area within south Sutter County. This area is currently dominated by agricultural land uses, but is designated as Industrial/Commercial Reserve according to the Sutter County General Plan Map and contains a large developed industrial park and a 50-acre Sysco distribution and warehouse facility. Measure M language identified the need for a General Plan Amendment and Specific Plan, among other necessary entitlements, to allow for mixed land uses, including commercial/industrial and residential/community facilities. The proposed plan called for a maximum of 2,900 acres of residential land use, a minimum of 3,600 acres of business/industrial, and minimum of 1,000 acres for educational, retail, parks, and community facilities (Table 3-9). A General Plan Amendment covering 7,360 acres is currently being processed by Sutter County and a Specific Plan (Sutter Pointe Specific Plan) application further refining land uses was submitted to the County in summer 2006.

Table 3-9
Proposed Land Uses for Measure M

Land Use Designation	Area (±Acres)
Business/Industrial	3,600.0
Residential	2,900.0
Educational/Commercial/Parks/Community Facilities	1,000.0
Total	**7,500.0**
Source: Sutter County Planning Services, 2006	

It should be noted that recent FEMA decisions have cast some uncertainty over future development in the Natomas Basin, because of the inadequate flood protection in the basin, which lies in both northern Sacramento County and southern Sutter County, including Measure M/the Sutter Pointe Specific Plan.

Curry Creek Community Plan. The Curry Creek Community Plan is in the preliminary stages of conceptual planning at this time, but may include a mix of residential and commercial land uses on a 5,200-acre area of unincorporated Placer County located north of the proposed PVSP area and south of the proposed RUSP area. The final boundaries, size, and number of residential units are currently undetermined.

Reason Farms Environmental Preserve. In 2003, the Roseville City Council approved the acquisition of two parcels of land that total approximately 1,700 acres along Pleasant Grove Creek. These properties were acquired for the purpose of constructing a stormwater retention basin, in addition to providing potential open space and recreational opportunities for the City of Roseville. The Parks and Recreation Department is in the preliminary stages of updating the Master Plan, including refining it for the recreational aspects of the project. The recreational components will be balanced with the considerations for the recreational needs of the city, and the need to properly manage the natural resources within and surrounding the project site.

3.2.4.3 Other Potential Development Areas

In addition to the above formally proposed developments, there are indications of land assembly in the remaining City of Roseville undeveloped Sphere of Influence lands and nearby areas of unincorporated Placer County. Activities of two major land development companies are described below.

Brookfield. Brookfield Communities controls property north of the proposed CSP area, south of Sunset Boulevard West, and northeast of the WRSP area. The property is currently undeveloped and no development is proposed at the present time. Existing land use designations on the property allow for agricultural land uses on 80-acre minimum parcels.

AKT Development. In addition to the RUSP area, AKT Development owns thousands of acres of undeveloped agricultural land within the Central and Eastern segments of the proposed Placer Parkway project (adjacent to and west of the WRSL, including land within the CCCP area). This land is currently in agricultural production, including rice farming. The current Placer County General Plan land use designations for these properties allow for agricultural land uses on 80-acre minimum lot sizes.

3.2.5 Jobs/Housing Balance

The analysis of the "jobs/housing" balance is based on the planning premise of having people live close to where they work so that commute times and traffic congestion decrease, improvements in air quality are realized, and the number of vehicle trips is reduced. Those goals potentially can be realized when sufficient jobs are available locally to balance the employment demands of the community, and when commercial services are convenient to residential areas.

In order to achieve a jobs/housing balance, the local planning jurisdiction must determine the location, intensity, and types of employment and housing that would encourage residents to reduce their vehicle trips and miles traveled and potentially increase the use of alternative transportation methods (i.e., bicycling, car or vanpools, and walking). Planning for a jobs/housing balance requires an evaluation of employment potential, housing demand, new housing production, and the relationship between employment opportunities and housing availability. Other factors such as housing cost and transportation systems must also be evaluated.

Implementation strategies to create a jobs/housing balance include locating higher density housing near employment centers, promoting infill development, and actively recruiting businesses that can benefit from hiring the local workforce. All of the aforementioned strategies have been included in SACOG's Blueprint strategy for "smart growth" in the six-county region. The Roseville City Council officially adopted *Smart Choices for Roseville's Future--Implementation Strategies to Achieve Blueprint Project Objectives* in May 2005. The City of Rocklin does not have any formal standards, procedures or strategies that implement the SACOG Blueprint; however, their Downtown plan focuses on design and densities consistent with the Blueprint Preferred Scenario. Similarly, Placer County has not formally adopted the SACOG Blueprint, but County staff have been directing applicants to use Blueprint growth principles and propose development projects that meet the Blueprint goals.

There are currently relatively few existing employment opportunities in the study area. Areas planned for industrial growth currently exist in the Eastern and Western segments. The majority of the study area is rural and sparsely populated. Agriculture is the predominant land use in the study area, as shown on Figure 3-1, where large parcels typically include a farmstead. Chapters 5 and 6 of this CIA contain further descriptions of housing and jobs in the study area and surrounding region.

3.3 IMPACT ANALYSIS

This section evaluates the potential impacts of the project on the current and projected land use within the study area. The significance criteria listed below will be used to evaluate the potential project impacts. These significance criteria are used to assess potentially significant impacts which may be evaluated in CEQA environmental documents. (The FHWA has not adopted thresholds of significance for purposes of determining impacts under NEPA.)

3.3.1 Significance Criteria

Appendix G of the State CEQA Guidelines, the Community Impact Assessment checklist criteria, and professional judgment were used to determine whether the project would have a significant environmental impact to land use. Potentially significant impacts associated with the proposed action were evaluated using the following significance criteria:

- Physical disruption and conversion of existing land uses;
- Compatibility with adjacent or planned land uses; and
- Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to a general plan/specific plan goal or policy, general plan designations, or zoning designation).

3.3.2 Approach to Analysis

This evaluation was completed to identify potential conflicts that the project may have on land use within the study area. Three categories of possible impacts were identified: (1) direct land use impacts related to conversion of study area acreage for right-of-way purposes; (2) compatibility of the proposed transportation corridor with existing and planned land uses within the study area; and (3) the potential for the Parkway to conflict with local jurisdictions' adopted plans, policies, and regulations.

The following assumptions were used in the evaluation of potential impacts of the project:

- Direct physical impacts to land in the cities of Roseville and Rocklin, and the County of Sacramento are not anticipated and were not evaluated. None of the corridor alignment alternatives extend into Roseville or Sacramento County. The eastern interchange extends into Rocklin under all alternatives, in an area where an interchange is planned, so

new physical impacts in Rocklin were not evaluated. (Project consistency with policies of the Cities of Rocklin and Roseville, and Sacramento County are, however, evaluated in the following sections).

- Land use and zoning designations are subject to minimum parcel sizes. If an alignment under consideration would divide an existing parcel into two or more portions, one of which would no longer meet the minimum parcel size, then a potentially significant impact would occur.

Commercial, Industrial, and Public Facilities. Minimum parcel sizes for these types of land uses vary widely. The project's effects on commercial, industrial, and public facilities were not considered to adversely affect land use within the study area (Chapters 5 and 6 evaluate direct impacts to existing businesses and municipal facilities within the study area).

Residential. Although residential land uses (e.g., farmsteads) exist within the corridor alignment alternatives, there is no residentially designated or zoned land within the corridor alignment alternatives; therefore, no impacts to residential land uses are discussed in this section (refer to Chapter 5 for analysis of impacts to housing.

Agricultural. Numerous parcels are agriculturally designated/zoned in the study area, as shown on Figures 3-3 and 3-5, where the project could create parcels that no longer meet minimum size requirements. For example, much of the study area is currently designated for agricultural uses with an 80-acre minimum parcel size. If 40 acres of an existing 110-acre parcel were taken for right-of-way, the remainder would no longer be consistent with the zoning ordinance.

Parcels bisected by any particular corridor alignment alternative would be significantly impacted. A bisected parcel is presumed to be significantly impacted because:

- Placer Parkway would have very limited access, particularly in the Central Segment. Depending on the build alternative, there would be five or six interchanges along the entire length of the Parkway. The Parkway would be at grade except for spanning railroad alignments or large water features or floodplains (see Section 2.4). Establishing at grade crossings of the highway to provide access to parcel fragments would be infeasible. Under- or over-crossings would likely add significant cost that may make it infeasible to provide access to both parcel fragments; and

- The no-development buffer associated with the Parkway (either 500 feet or 1,000 feet depending on the segment) could substantially reduce the amount of useable land on the bisected parcels. Consistent with worst-case analysis, the analysis of impacts to land usability considers the impact of the full corridor (including buffer), not just the potential width of paving.

3.3.3 Potential Direct Impacts

The discussion of potential project-related impacts is presented by alternative below and is organized as follows (to reflect significance criteria):

- Physical Disruption or Conversion of Land Use
  - Land Use Conversion
  - Potentially Bisected Parcels

- Compatibility with Adjacent or Planned Land Uses
  - Compatibility with Adjacent Land Use
  - Compatibility with Proposed Land Use

- Consistency with Applicable Land Use Plans, Policies, and Regulations
  - Consistency with Zoning Acreage Requirements
  - Consistency with Applicable General Plan Policies and Other Local Plans

3.3.3.1 No-Build Alternative

Under the No-Build Alternative, land would not be acquired for Placer Parkway and the Parkway would not be constructed. There would not be any impacts on land use.

3.3.3.2 Alternative 1 – the Red Alternative

PHYSICAL DISRUPTION OR CONVERSION OF LAND USE

Land Use Conversion

Construction of the Parkway within the study area would introduce a regional transportation corridor into a predominantly agricultural area. This would result in the conversion of existing land uses to infrastructure-related uses. The land converted from its existing uses, or the potentially affected acreage within Alternative 1 is approximately 1,917.64 acres. As stated in the developable land discussion in Section 3.2.3, there are approximately 35,454 acres of land within the entire study area. Alternative 1 would convert approximately 5.41 percent of land within the study area from its current uses to road and buffer uses. Table 3-10 shows the amount of land that would be converted by segment for Alternative 1.

Table 3-10
Amount of Land Potentially Affected by Alternative 1

Alternative	Western Segment (acres)	Central Segment (acres)	Eastern Segment (acres)	Total Acreage Affected	Percentage of all Land in Study Area (%)
Alternative 1	385.29	902.09	630.26	1,917.64	5.41

Sources: State of California Housing and Community Development Department data (State of California HCD, 2006) and NFA GIS data analysis
Note: Alternative 1 uses the north of Riego Road SR 70/99 interchange

As shown on Figures 3-1 and 3-2, the proposed highway alignment would primarily convert land that is either zoned for agricultural production, is capable of being used for agricultural production, or that is in agricultural production. The conversion of agricultural land and the impacts associated with the loss of agricultural production (as well as recommended mitigation strategies) are discussed in detail in the analysis of farmland impacts in Chapter 4.

Western Segment

Alternative 1 would convert 385.29 acres of land in the Western Segment to transportation corridor use. Conversion of land in the Western Segment would affect large agricultural parcels that are primarily used for rice production at present. Most of this area has been planned for industrial development; however, the industrial development that has occurred to date has been limited. The Sutter Pointe Specific Plan that is currently in development will designate this area for mixed use residential and commercial-industrial development.

Central Segment

Alternative 1 would convert 902.09 acres of land in the Central Segment to transportation corridor use. Land conversion in the Central Segment would affect the largest amount of land due to the 1,000-foot-wide corridor sought for right-of-way acquisition in this area. The conversion of land in Central Segment would affect numerous agriculturally designated parcels, which are used for rice farming, grazing or open space.

Eastern Segment

Alternative 1 would convert 630.28 acres in the Eastern Segment to transportation corridor use. The conversion of land in the Eastern Segment of the study area would directly affect an existing industrial property. Several other undeveloped parcels would be affected by the direct conversion of property in the Eastern Segment. The greatest portion of the proposed alignment in the Eastern Segment is located within the proposed Placer Ranch Specific Plan area and is shown as a future road corridor within the plan area. The undeveloped parcels currently do not have any active agricultural operations (Bryant, 2006).

Potentially Bisected Parcels

Figure 3-6 shows the alternative alignments under study in comparison to the parcel boundaries in Placer and Sutter Counties. Table 3-11 lists the specific parcels that could be potentially bisected as a result of the Alternative by segment and by Assessor's Parcel Number (APN). In addition, the table shows the total acreage of each affected parcel, the amount of acreage affected, and the percentage that could be removed as a result of the project. There would be eleven properties in the Western Segment, eight properties in the Central Segment, and seven properties in the Eastern Segment that would be bisected by Alternative 1. "Bisected" parcels are those that would be split by the alignment, leaving two remnant parcels—one on either side of the corridor—as opposed to parcels that would be affected by a loss of acreage to the corridor but that would retain the unaffected land as a single remnant parcel located on only one side of the new corridor.

COMPATIBILITY WITH ADJACENT OR PLANNED LAND USES

Compatibility with Adjacent Land Uses

The proposed corridor alignment of Alternative 1 would be approximately 500 feet wide in the Western and Eastern segments and approximately 1,000 feet wide in the Central Segment. The corridor width is proposed to be wider than the right-of-way required for the actual transportation facility in order to control access to the facility, create a buffer along the Parkway, and reduce the potential for growth inducement. Construction of the Parkway would not conflict with the existing urban uses in the Eastern and Western segments of the study area. The transportation corridor would be compatible with the industrial and commercial uses in these areas and is expected to advance economic development goals adopted for these areas by improving goods movement between the Sunset Industrial Area near SR 65 and I-80 in the Roseville/Rocklin area to the Sutter County Industrial reserve area near SR 70/99.

Table 3-11
Parcels Bisected by Alternative 1

Segment	Assessors Parcel Number	Parcel Size (acres)	Affected Acreage	Percentage of Parcel Affected (%)
Western	35-250-003	120.10	26.59	22.14

Source: Sutter and Placer County Assessor's parcel data, accessed February 2006, in tandem with NFA GIS spatial analysis of Parkway corridor alignment alternatives.

The no-development buffer zone would help preserve the rural character of at least a strip of the agriculturally designated areas within all three segments by preventing development from extending to the roadway's edge. However, except in small portions of the Western Segment and somewhat larger portions of the Central Segment, much of the area through which the Parkway would be constructed would be converted from agricultural uses to more urban or suburban uses under the 2040 development scenario, even without Placer Parkway. PCTPA is working with local land use planning agencies to avoid or minimize impacts on proposed development within the study area. The Parkway could bring greater certainty to future land use planning efforts through the selection of a preferred corridor, so that right-of-way can be acquired to preserve a transportation corridor in which a roadway could be built in the future in conjunction with the construction of other planned projects in the area.

Compatibility with Proposed Land Uses

PCTPA is actively working with local lead agencies to avoid having an adverse effect on planned development within the study area. PCTPA is seeking to avoid impacts by evaluating potential corridor alignments and ultimately selecting a preferred alignment so that right-of-way can be acquired to secure a

highway corridor in conjunction with the construction of planned projects in the area (i.e., the potential developments described in Section 3.2.4). In addition, the project would preserve right-of-way for a regional highway that, upon completion, would reduce existing and anticipated congestion on the local and regional transportation system in southwestern Placer County and south Sutter County. Through its coordinated planning efforts, PCTPA has diminished the potential for conflicts with future development, by initiating communication with all interested parties and stakeholders in the area, so that other parties are aware of the project and can consider the Parkway proposal in relation to other planned development. PCTPA's coordinated effort involved working with its regional planning partners to develop a concept plan for the Placer Parkway, as described in Chapter 1. PCTPA staff continue to be involved in meetings with local jurisdictions pertaining to regional transportation planning and funding, as well as coordination of traffic needs associated with major new development proposals affecting the region.

Nevertheless, there could be substantial impacts on future planned development. For example, the Sutter Pointe Specific Plan area in south Sutter County would be affected by Alternative 1, crossing through areas proposed for commercial and residential development on the conceptual land use plan. In addition, Alternative 1 would impact the Curry Creek Community Plan (CCCP) area where land use planning for this area is in the early stages. Similarly, Alternative 1 would impact the eastern periphery of the RUSP area and the northwestern corner of the Sierra Vista Specific Plan area (currently proposed for low- and medium-density residential development, with community parks and open space). All alternatives would affect the future Brookfield project, as well as the Master Plan for Reason Farms and the Placer Ranch Specific Plan, both of which are in progress. Further analysis will be performed during Tier 2 to determine whether or not there would be any land use compatibility impacts from the Parkway on these proposed uses as plans for them become further developed.

CONSISTENCY WITH APPLICABLE LAND USE PLANS, POLICIES AND REGULATIONS

Consistency with Zoning Minimum Acreage Requirements

Each jurisdiction has adopted zoning regulations to implement its land use policies. Properties potentially affected by Alternative 1 have been evaluated in relation to minimum parcel sizes required in the Placer County and Sutter County Zoning Ordinances and potential project impacts. Table 3-12 identifies the parcels of at least 80 acres in size that could be reduced to less than 80 acres by Alternative 1. Only agriculturally designated land in the study area was analyzed, because this zoning has the only minimum acreage requirements expected to be impacted by the Parkway. There would be no similar impacts in the Eastern or Western segments associated with Alternative 1; however, there are parcels that are already less than 80 acres that are zoned for 80-acre minimum in this area that would be affected (see discussion below). There are two properties in the Central Segment that currently conform to minimum parcel requirements that would no longer be consistent with the Placer County Zoning Ordinance as a result of the Parkway under Alternative 1, as shown in Table 3-13.

Table 3-12
Parcels Larger Than 80 Acres
That Would Be Reduced to Less Than 80 Acres by Alternative 1

Segment	Assessors Parcel Number	Parcel Size (acres)	Acreage Removed	Remaining Acreage	Percentage of Parcel Removed (%)
Central	017-130-016-000	81.34	60.52	20.82	74.40
Central	017-130-064-000	85.46	21.73	63.73	25.43
Source: Placer County Assessor's parcel data, accessed February 2006, in tandem with NFA GIS spatial analysis of Parkway alignments.					

Table 3-13 lists existing parcels that are non-conforming to the minimum parcel size zoning requirement. Since these parcels are smaller than the current minimum acreage requirement, they are already inconsistent with the existing zoning requirements. If agricultural activity is currently being pursued on these sites, a further reduction in size would make them potentially even less viable for continuing agricultural production. There would be one such parcel in the Western Segment, nine parcels in the Central Segment, and four parcels in the Eastern Segment would be affected by Alternative 1. (Agricultural impacts are addressed in Chapter 4.)

There are other agriculturally designated/zoned parcels in the study area that could potentially be physically affected by the Parkway, but they are not listed in Table 3-13, since they would not be in conflict with minimum acreage requirements as a result of the project.

Table 3-13
Parcels Less Than 80 Acres That Would Be Affected by Alternative 1

Segment	Assessors Parcel Number	Land Use Designation	Parcel Size (acres)	Affected Acreage	Remaining Acreage	Percentage of Parcel Affected (%)

Source: Sutter and Placer County's Assessor's Parcel Data; GIS databases accessed February 2006

Consistency with Applicable General Plan Policies and Other Local Plans

Refer to Section 3.3.3.8 for a discussion of project consistency with applicable plans and policies, which is the same for all project build alternatives.

3.3.3.3 Alternative 2 – the Orange Alternative

Land Use Conversion

The land that would be converted from existing uses, or the potentially affected acreage within Alternative 2 corridor alignment, is approximately 1,835.31 acres. Therefore, Alternative 2 would convert approximately 5.18 percent of land within the study area from its current uses to a transportation corridor use. Table 3-14 shows the amount of land that would be converted by segment for Alternative 2.

Table 3-14
Amount of Land Potentially Affected by Alternative 2

Alternative	Western Segment (acres)	Central Segment (acres)	Eastern Segment (acres)	Total Acreage Affected	Percentage of all Land in Study Area (%)
Alternative 2	385.29	819.76	630.26	1,835.31	5.18

Sources: State of California Housing and Community Development Department data (State of California HCD, 2006) and NFA GIS data analysis
Note: Alternative 2 uses Riego Road interchange

As under Alternative 1, the proposed alignment for Alternative 2 would primarily convert land that is capable of agricultural production. Land use conversion impacts for the Western, Central, and Eastern Segments under Alternative 2 would be similar to those described for Alternative 1.

Potentially Bisected Parcels

Table 3-15 lists the specific parcels that could be potentially bisected as a result of Alternative 2 by segment and by APN; eleven properties in the Western Segment, ten properties in the Central Segment, and seven properties in the Eastern Segment.

Land Use Compatibility

Compatibility with Adjacent Land Uses. The compatibility of Alternative 2 with adjacent land uses would be similar to that discussed for Alternative 1.

Compatibility with Proposed Land Uses. Compatibility with proposed land uses for Alternative 2 would be similar to that discussed for Alternative 1, except that Alternative 2 would avoid the Sierra Vista Specific Plan area. Alternative 2 has the potential to affect future planning for the CCCP, but instead of bisecting it, as Alternative 1 would do, it would affect only a small portion of the northwestern area. In addition, Alternative 2 would bisect the RUSP area, passing through an area to the east of the proposed university campus that has been proposed for mixed use development. The draft *Regional University Specific Plan Land Use Plan* dated March 15, 2006 indicates that this area is proposed for high-density residential, commercial, park and open space uses.

Consistency with Zoning Minimum Acreage Requirements. Table 3-16 identifies the parcels of at least 80 acres in size that could be reduced to less than 80 acres by Alternative 2. There would be no impacts in the Western or Eastern segments for Alternative 2, and only two properties in the Central Segment that currently conform to minimum acreage requirements would no longer be consistent with the Placer County Zoning Ordinance as a result of this alternative.

Table 3-15
Parcels Bisected by Alternative 2

Segment	Assessors Parcel Number	Parcel Size (acres)	Affected Acreage	Percentage of Parcel Affected (%)

Table 3-17 lists existing parcels that are non-conforming to minimum parcel size zoning requirement. Since these parcels are smaller than the current minimum acreage requirement, they are already inconsistent with the existing zoning requirements (see the discussion of non-conforming parcels in the analysis of Alternative 1). Two such parcels in the Western Segment, seventeen parcels in the Central Segment, and three parcels in the Eastern Segment would be affected by Alternative 2.

Table 3-17

Source: Sutter and Placer County's Assessor's Parcel Data; GIS databases accessed February 2006

There are other agriculturally designated/zoned parcels in the study area that could potentially be physically affected by the Parkway, but they are not listed in Table 3-13, since they would not be in conflict with minimum acreage requirements as a result of the project.

3.3.3.4 Alternative 3 – the Blue Alternative

Land Use Conversion

The area of land that would be converted from existing uses by the Alternative 3 alignment is approximately 1,863.56 acres. Therefore, Alternative 3 would convert approximately 5.26 percent of land within the study area from its current uses to transportation corridor uses. Table 3-18 shows the amount of land that would be converted by segment for Alternative 3.

Like Alternative 1, the proposed highway alignment for Alternative 3 would primarily convert land that is capable of agricultural production. The Alternative 1 discussion of land use conversion impacts for the Western, Central, and Eastern segments is applicable to Alternative 3.

Table 3-18
Amount of Land Potentially Affected by Alternative 3

Alternative	Western Segment (acres)	Central Segment (acres)	Eastern Segment (acres)	Total Acreage Affected	Percentage of all Land in Study Area (%)
Alternative 3	385.29	848.01	630.26	1,863.56	5.26

Sources: State of California Housing and Community Development Department data (State of California HCD, 2006) and NFA GIS data analysis
Note: Alternative 3 uses Riego Road interchange

Potentially Bisected Parcels

Table 3-19 lists the specific parcels that would be bisected as a result of Alternative 3, by segment and by APN; eleven properties in the Western Segment, eight properties in the Central Segment, and seven properties in the Eastern Segment.

Land Use Compatibility

Compatibility with Adjacent Land Uses. The compatibility of Alternative 3 with adjacent land uses would be similar to that discussed for Alternative 1.

Compatibility with Proposed Land Uses. Alternative 3 would affect the Sutter Pointe Specific Plan area of south Sutter County, as well as Reason Farms, PRSP, and the Brookfield Property. It would avoid impacts to RUSP, CCCP and the Sierra Vista Specific Plan area.

Consistency with Zoning Minimum Acreage Requirements. Table 3-20 identifies the parcels of at least 80 acres in size that could be reduced to less than 80 acres by Alternative 3, depending on the final location of the roadway within the corridor. There would be no impacts in the Western or Eastern segments for Alternative 3, and only one property in the Central Segment conforming to minimum acreage requirements would no longer be consistent with the Placer County Zoning Ordinance as a result of this alternative.

Table 3-21 lists affected parcels that are non-conforming to minimum parcel size zoning requirement. Since these parcels are smaller than the current minimum acreage requirement, they are already inconsistent with the existing zoning requirements (see Figure 3-3). There would be two such parcels in the Western Segment, twelve parcels in the Central Segment, and two parcels in the Eastern Segment that would be affected by Alternative 3.

Table 3-19
Parcels Bisected by Alternative 3

Segment	Assessors Parcel Number	Total Acreage of Affected Parcel	Affected Acreage	Percentage of Parcel (%)
Western	35-250-003	120.10	26.59	22.14

There are other agriculturally designated/zoned parcels in the study area that could potentially be physically affected by the Parkway, but they are not listed in Table 3-13, since they would not be in conflict with minimum acreage requirements as a result of the project.

3.3.3.5 Alternative 4 – the Yellow Alternative

Land Use Conversion

The amount of land that would be converted from existing uses (the potentially affected acreage within the Alternative 4 alignment), is approximately 1,627.64 acres. Therefore, Alternative 4 would convert approximately 4.59 percent of land within the study area from its current uses to transportation corridor uses. Table 3-22 below shows the amount of land that would be converted by segment for Alternative 4.

Table 3-22
Amount of Land Potentially Affected by Alternative 4

Alternative	Western Segment (acres)	Central Segment (acres)	Eastern Segment (acres)	Total Acreage Affected	Percentage of all Land in Study Area (%)
Alternative 4	320.73	676.65	630.26	1,627.64	4.59
Sources: State of California Housing and Community Development Department data (State of California HCD, 2006) and NFA GIS data analysis Note: Alternative 4 uses Sankey Road interchange					

Like Alternative 1, the proposed highway alignment for Alternative 4 would primarily convert land that is capable of agricultural production. Land use conversion impacts described for the Western, Central, and Eastern segments for Alternative 4 would be similar to those under Alternative 1.

Potentially Bisected Parcels

Table 3-23 lists the specific parcels that would be bisected as a result of Alternative 4, by segment and by Assessor's Parcel Number. There would be nineteen properties in the Western Segment, four properties in the Central Segment, and seven properties in the Eastern Segment that would be bisected by Alternative 4.

Land Use Compatibility

Compatibility with Adjacent Land Uses. The compatibility of Alternative 4 with adjacent land uses would be similar to that described for Alternative 1.

Compatibility with Proposed Land Uses. Alternative 4 would affect the proposed Sutter Pointe Specific Plan area of south Sutter County. The County is using this northern alignment in the western segment in its current land use planning process for the Sutter Pointe Specific Plan, and the current conceptual land use plan shows a new interchange on Sankey Road, through an area proposed for commercial and industrial land uses, with some medium-density residential uses proposed for the eastern portion of the area. Compatibility with proposed land uses in the central and eastern segments under Alternative 4 would be the same as that described for Alternative 3.

Consistency with Zoning Minimum Acreage Requirements. Table 3-24 identifies the parcels of at least 80 acres in size that would be reduced to less than 80 acres by Alternative 4. These comprise one parcel in the Western Segment and two properties in the Central Segment, which conform to the existing zoning and which would no longer be consistent with the Placer and Sutter County zoning ordinances as a result of this alternative. There would be no impacts of this type in the Eastern Segment.

Table 3-23
Parcels Bisected by Alternative 4

Segment	Assessors Parcel Number	Total Acreage of Affected Parcel	Affected Acreage	Percentage of Parcel Bisected (%)
Western	35-140-033	17.25	7.26	42.09
Western	35-160-006	54.82	14.96	27.29

Source: Sutter and Placer County's Assessor's Parcel Data; GIS databases accessed February 2006

There are other agriculturally designated/zoned parcels in the study area that could potentially be physically affected by the Parkway, but they are not listed in Table 3-13, since they would not be in conflict with minimum acreage requirements as a result of the project.

3.3.3.6 Alternative 5 – the Green Alternative

Land Use Conversion

The land that would be converted from its existing uses, or the potentially affected acreage within Alternative 5 alignment, is approximately 1,623.47 acres. Therefore, Alternative 5 would convert approximately 4.58 percent of land, which is the smallest footprint of all the five alternatives. Table 3-26 shows the amount of land that would be converted by segment for Alternative 5.

Table 3-26
Amount of Land Potentially Affected by Alternative 5

Alternative	Western Segment (acres)	Central Segment (acres)	Eastern Segment (acres)	Total Acreage Affected	Percentage of all Land in Study Area (%)
Alternative 5	320.73	672.48	630.26	1,623.47	4.58

Sources: State of California Housing and Community Development Department data (State of California HCD, 2006) and NFA GIS data analysis
Note: Alternative 5 uses Sankey Road interchange

Like Alternative 1, the proposed highway alignment for Alternative 5 would primarily convert land that is capable of agricultural production. Land use conversion impacts for the Western, Central, and Eastern segments described for Alternative 5 would be similar to those described for Alternative 1.

Potentially Bisected Parcels

Table 3-27 lists the parcels that would be bisected as a result of Alternative 5, by segment and by APN. Nineteen properties in the Western Segment, nine properties in the Central Segment, and seven properties in the Eastern Segment would be bisected by Alternative 5.

Land Use Compatibility

Compatibility with Adjacent Land Uses. The compatibility of Alternative 5 with adjacent land uses would be similar to that described by segment for Alternative 1.

Compatibility with Proposed Land Uses. The compatibility of Alternative 5 with proposed land uses would be the same as that described for Alternative 4.

Consistency with Zoning Minimum Acreage Requirements. Table 3-28 identifies the parcels of at least 80 acres in size that could be reduced to less than 80 acres by Alternative 5. There would not be any impacts in the Western or Eastern segments. The only parcel impacted is in the Central Segment, and it would no longer be consistent with the Sutter County zoning ordinance as a result of this alternative.

Table 3-29 lists existing parcels that are non-conforming to the minimum parcel size zoning requirement. Since these parcels are smaller than the current minimum acreage requirement, they are already inconsistent with the existing zoning requirements (refer to the discussion of non-conforming parcels in the analysis of Alternative 1). Nine such parcels in the Western Segment, ten parcels in the Central Segment, and three parcels in the Eastern Segment would be affected by Alternative 5.

Table 3-27
Parcels Bisected by Alternative 5

Source: Sutter and Placer County's Assessor's Parcel Data; GIS databases accessed February 2006

There are other agriculturally designated/zoned parcels in the study area that could potentially be physically affected by the Parkway, but they are not listed in Table 3-13, since they would not be in conflict with minimum acreage requirements as a result of the project.

3.3.3.7 Comparison of Alternatives

Table 3-30 shows the potential impacts on land conversion, total acreage affected, number of parcels bisected, number of remnant parcels that would conflict with existing zoning, and number of pre-existing inconsistent parcels affected by project alternative.

Physical Disruption or Conversion of Land

As Table 3-30 indicates, Alternative 1 would affect the greatest amount of total land acreage, while Alternative 4 would affect the least. Alternative 5 would potentially bisect the most parcels in the study area, while Alternative 1 would bisect the fewest parcels.

Conflict with Applicable Land Use Plans, Policies and Regulations

Alternatives 3 and 5 would create one inconsistent parcel, while Alternatives 1 and 2 would each create two parcels that would be inconsistent with the minimum parcel size requirements under existing zoning. Alternative 3 would affect the fewest parcels that are already inconsistent with the existing zoning, while Alternative 5 would affect the most.

Table 3-30
Comparison of Alternatives' Impacts on Land Use

Potential Effect on Land Use	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5
Total acreage affected	1,918.43	1,836.78	1,863.56	1,627.64	1,623.47
Number of parcels bisected	22	27	26	30	36
Number of parcels created that conflict with existing zoning	3	1	1	3	1
Number of pre-existing inconsistent parcels affected	17	21	16	17	22

Land use compatibility is not addressed on Table 3-30, because all alternatives would have similar compatibility issues with adjacent land uses. In addition, all of the build alternatives would affect the planning process both for Brookfield, PRSP and the Reason Farms Master Plan update, while Alternative 1 would affect the Sierra Vista Specific Plan area, Alternatives 1 and 2 would also affect the proposed Regional University Specific Plan and the conceptual Curry Creek Community Plan, both of which are in draft form at present. Alternatives 4 and 5 represent the general alignment being considered by Sutter County in its Sutter Pointe Specific Plan planning process. Because there are no adopted plans for these areas at present, the actual effects are not known. Adoption of a Parkway alignment through these developments would, of necessity, affect the development plans, because subsequently the developments would need to accommodate the corridor alignment selected.

Consistency with applicable adopted plans and policies is discussed in the paragraphs below. This discussion is not presented by alternative and by segment, since the applicable General Plan policies are common to all alternatives and consistency determinations would be the same for all alternatives within each segment of the study area.

The General Plan policies listed in Table 3-31 were evaluated to assess the project's potential to conflict with adopted policies of the jurisdictions within the study area. No inconsistencies with the relevant

Table 3-31
Consistency of the Parkway with Existing General Plan Policies

Jurisdiction Plan	Policy Number	Policy	Potential Policy Inconsistencies	Avoidance, Minimization, And Design Standards	Consistency Determinations
Sutter County General Plan	C-6b	No parcel meeting the minimum parcel size as identified on the General Plan land use diagram shall be diminished to a size less than the minimum parcel size as identified on the land use diagram.	Project could create remnant parcels that do not meet minimum size requirements under current zoning.	(To be determined in Tier 2).	Potentially Inconsistent
	E-1	New development that may be incompatible with adjacent uses shall be required to provide buffer zones consistent with county standards to reduce anticipated conflicts with existing and future land uses.	No conflict as proposed	Plans for the project include the purchasing of right-of-way in excess of that required to create an adequate buffer between adjacent land uses and minimize land use conflicts.	Consistent
Placer County General Plan	1.A.3	The County shall distinguish among urban, suburban, and rural areas to identify where development will be accommodated and where public infrastructure and services will be provided. This pattern shall promote the maintenance of separate and distinct communities.	No conflict as proposed	Project proponent has and will continue to coordinate with regional planning agencies to resolve conflicts between the project and future development.	Consistent
	1.A.4	The County shall promote patterns of development that facilitate the efficient and timely provision of urban infrastructure and services.	No conflict as proposed	See response to policy number 1.A.3	Consistent
	1.B.1	The County shall promote the concentration of new residential development in higher-density residential areas located along major transportation corridors and transit routes.	The alternative corridor alignments propose to incorporate a land use buffer between the highway and adjacent land uses.	Decisions regarding future residential land uses are subject approval of the local agencies involved. Plans for the project include the purchasing of right-of-way in excess of that required to create a buffer between adjacent land uses and minimize the project's impacts to adjacent land use.	Consistent
	1.H.2	The County shall seek to ensure that new development and public works projects do not encourage expansion of urban uses into designated agricultural areas.	The alternative corridor alignments may compliment new development proposed for agricultural land in the study area.	See Section 7 for a complete growth inducement analysis including conclusions and potential avoidance, minimization, mitigation, and design measures to diminish the project's potential to expand urban growth within the study area.	N/A-see Section 7.0

Table 3-31 (Continued)
Consistency of the Parkway with Existing General Plan Policies

Jurisdiction Plan	Policy Number	Policy	Potential Policy Inconsistencies	Avoidance, Minimization, And Design Standards	Consistency Determinations
Placer County General Plan (Continued)	1.K.3	The county shall require that new development in rural areas incorporates landscaping that provides a transition between the vegetation in developed areas and adjacent open space or undeveloped areas.	No conflict as proposed	Specific landscape plans will be prepared after the Tier 1 document has been circulated and approved and an alternative selected. The Tier 2 document will evaluate landscaping needs including the incorporation of vegetation to provide a transition between rural and developed areas.	Consistent
	3.A.5	Through-traffic shall be accommodated in a manner that discourages the use of neighborhood roadways, particularly local streets. This through-traffic, including through truck traffic, shall be directed to appropriate routes in order to maintain public safety and local quality of life.	No conflict as proposed	Limited access on Placer Parkway would encourage through-traffic and discourage the use of local streets. The project would construct four or five local roadway interchanges along the approximately 17- to 18-mile-long route (depending on alternative).	Consistent
Sunset Industrial Plan Area	1.A.7	*The Sunset Industrial Area Plan Land Use Diagram* shall insure that proposed land uses are compatible with existing or planned adjacent uses, including established industrial firms in both the Sunset Industrial Area and in the surrounding cities.	No conflict as proposed	The project proponent has and will continue to coordinate with regional planning agencies to resolve conflicts between the project and existing and proposed industrial development. In addition, one of the purposes of the project is to "advance economic development goals in southwestern Placer County and Sutter County." Therefore, the project is envisioned to be compatible with industrial uses.	Consistent
	1.A.8	The county shall permit the development of only agricultural, industrial, or similar compatible uses around the Western Placer Waste Management Authority properties. Residential uses around these properties are not considered a compatible use.	No conflict as proposed	As an infrastructure project, the project is considered compatible use with the Western Regional Sanitary Landfill (WRSL).	Consistent

Table 3-31 (Continued)
Consistency of the Parkway with Existing General Plan Policies

Jurisdiction Plan	Policy Number	Policy	Potential Policy Inconsistencies	Avoidance, Minimization, And Design Standards	Consistency Determinations
Sunset Industrial Plan Area (continued)	1.A.9	The county shall seek to protect the industrial, commercial, professional, and agricultural uses in the Sunset Industrial Area from encroachment by incompatible uses from the surrounding cities and from unincorporated area development.	The Parkway is potentially incompatible with agricultural uses within the SIAP	As stated above, a project objective is to foster economic development. As a result, the Parkway would be compatible with the industrial, commercial, and professional uses in the SIAP. However, the Parkway may not be compatible with agricultural land uses. The only agriculturally designated land within the SIAP affected by this project (Eastern Segment alternative) is undergoing review by Placer County for urban development and amendment to the SIAP. The decisions regarding this agricultural land are anticipated prior to a Record of Decision and certification of the Placer Parkway Tier 1 EIS/EIR. As with other land uses, the PCTPA is proposing to purchase more right-of-way than is required to create a buffer between adjacent land uses and minimize the project's impacts to farmland and other agricultural uses.	Consistent
	1.F-1	The county will seek to provide a broad range of public facilities and services to businesses in the Sunset Industrial Area. Improvements to onsite services include the provision of improved fire protection, circulation improvements, and expanded utility services.	No conflict as proposed	The Parkway would improve circulation within the SIAP.	Consistent
	1.F-2	When considering land use changes in the vicinity of the Western Regional Sanitary Landfill and the Western Placer Waste Management Authority Material Recovery Facility operation, the county shall consider these solid waste facilities and operations as the dominant land use in the area. In order to protect these facilities and operations from incompatible encroachment, the county has established buffer zone standards described in Table I-6. The intent of this policy is to prohibit the creation of new parcels for residential use within 1 mile of the solid waste facilities and operations; not to prohibit construction of a residence on an existing legal building site within this area.	No conflict as proposed	The Parkway is not an applicable use subject to the county's buffer zone standards.	Consistent

Table 3-31 (Continued)
Consistency of the Parkway with Existing General Plan Policies

Jurisdiction Plan	Policy Number	Policy	Potential Policy Inconsistencies	Avoidance, Minimization, And Design Standards	Consistency Determinations
Sacramento County General Plan	LU-42	Future Agricultural-Residential development shall be limited to existing developed and infill Agricultural-Residential lands designated on the Land Use Diagram and such additional areas adjacent to existing developed lands to act as a buffer to new urban areas or as a buffer at the Urban Service Boundary as are consistent with LU-43.	No conflict as proposed	The Parkway would not encroach upon any land in Sacramento County.	Consistent
	LU-69	County departments shall coordinate implementation of electric service delivery, air quality, water supply, transportation, drainage/flood control, solid waste disposal/recycling, and hazardous waste management plans in conjunction with vested public and quasi-public agencies.	No conflict as proposed	PCTPA has and will continue to coordinate with regional planning agencies, including the county, to implement the Placer Parkway.	Consistent
	LU-72	The county shall coordinate with regional planning agencies setting land use and environmental policies and programs and cooperate in the implementation of programs consistent with General Plan policy.	No conflict as proposed	See response to policy number LU-69.	Consistent
	LU-73	The county shall consult with state and federal regulatory and resource agencies during initial review of development projects to identify potential environmental conflicts and establish, if appropriate, concurrent application processing schedules.	No conflict as proposed	PCTPA has and will continue to coordinate with regional planning agencies to resolve any potential environmental conflicts the project may have on the county.	Consistent
	CI-16	Policy: Sacramento County shall implement a program to buffer land uses from each other and transportation system facilities which is effective, aesthetically pleasing, and minimizes the amount of land lost to buffers.	No conflict as proposed	The project includes acquisition of more right-of-way than is necessary to build and maintain the project and to create a buffer between adjacent land uses. Furthermore, project alternatives would not physically affect any land in Sacramento County including land use buffers.	Consistent

Table 3-31 (Continued)
Consistency of the Parkway with Existing General Plan Policies

Jurisdiction Plan	Policy Number	Policy	Potential Policy Inconsistencies	Avoidance, Minimization, And Design Standards	Consistency Determinations
City of Rocklin General Plan	LU-16	To coordinate planning with neighboring jurisdictions in order to ensure compatible land uses.	No conflict as proposed	PCTPA has and will continue to coordinate with regional planning agencies, including the City of Rocklin, to resolve conflicts between the Parkway and land uses within the city.	Consistent
	LU-61	To continue to participate in the activities of regional entities as deemed appropriate, such as the Highway 65 Joint Powers Authority, the South Placer Regional Transportation Authority (SPRTA), Placer County Transportation Planning Agency (PCTPA), the Sacramento Area Council of Governments (SACOG), the Placer County Flood Control and Water Conservation District, and the landfill authority.	No conflict as proposed	PCTPA has and will continue to coordinate with the city of Rocklin.	Consistent
	LU-62	To consider the effects of land use proposals and decisions on the South Placer subregion jobs/housing balance.	No conflict as proposed	The jobs housing balance in the South Placer subregion was analyzed in this CIA. See Sections 3, 5, and 7 of this CIA for more information.	Consistent
	LU-63	To encourage communication between the county and the cities of Roseville, Loomis, Lincoln, and Rocklin to ensure the opportunity to comment on actions having cross-border implications. To address other community interface issues, including land use compatibility, circulation and access, and development standards.	No conflict as proposed	The Parkway has cross-border circulation implications. Therefore, the project sponsor has and will continue to coordinate with regional planning agencies to allow them the opportunity to provide input.	Consistent
	C-11	To encourage improvements to the existing Federal Interstate and State highway system, and the addition of new routes that would benefit the City of Rocklin.	No conflict as proposed	The Parkway would benefit the City of Rocklin by advancing economic development in southwestern Placer County, including the city.	Consistent

Table 3-31 (Continued)
Consistency of the Parkway with Existing General Plan Policies

Jurisdiction Plan	Policy Number	Policy	Potential Policy Inconsistencies	Avoidance, Minimization, And Design Standards	Consistency Determinations
City of Rocklin General Plan (continued)	C-23	To require landscaping and tree planting along major new streets, properties abutting highways/freeways and along existing streets as appropriate.	No conflict as proposed	Specific landscape plans will be prepared after the Tier 1 document has been circulated and approved and an alternative selected. The Tier 2 document will evaluate land-scaping needs, including the incorporation of vegetation to provide a transition between rural and developed areas.	Consistent
	C-24	To minimize the impact of road construction on the natural terrain and the character of existing neighborhoods.	No conflict as proposed	This CIA and other technical studies will be incorporated into the Tier 1 EIS/EIR which will evaluate the Parkway's potential impacts on the physical and human environment. The planned interchange within the City of Rocklin is consistent with current city-approved development plans; impacts to existing neighborhoods are not anticipated.	Consistent
	C–26	To design and phase construction of road improvements to minimize disruption to local residents and traffic, to the extent feasible.	No conflict as proposed	As stated above, the planned interchange within the City of Rocklin is anticipated and consistent with current city-approved development plans.	Consistent
City of Roseville General Plan	Circulation Policy 1	Coordinate with surrounding jurisdictions to achieve compatible functional classifications for roadways that cross the city's boundaries.	No conflict as proposed	PCTPA has and will continue to coordinate with regional planning agencies to have compatible roadway classification systems.	Consistent
	Circulation Policy 3	Work with appropriate agencies to develop measures to reduce vehicular travel demand and vehicle miles traveled and meet air quality goals.	No conflict as proposed	PCTPA has been working with regional planning agencies to assess regional air quality attainment goals.	Consistent
	Community Form Policy 3	Coordinate and take a lead role, where feasible, with local state, federal and other jurisdictional agencies on regional issues of importance including but not limited to air quality, transportation, water supply, sewage treatment, solid waste disposal and recycling, flood control, hazardous waste management, resource protection and transit.	No conflict as proposed	PCTPA has and will continue to coordinate with regional planning agencies to resolve any issues the City may have regarding this regionally significant highway.	Consistent

Table 3-31 (Continued)
Consistency of the Parkway with Existing General Plan Policies

Jurisdiction Plan	Policy Number	Policy	Potential Policy Inconsistencies	Avoidance, Minimization, And Design Standards	Consistency Determinations
City of Roseville General Plan (Continued)	Community Form Policy 4	To the extent feasible, coordinate land use policies and public improvements with neighboring jurisdictions.	No conflict as proposed	PCTPA has and will continue to coordinate with regional planning agencies to resolve conflicts between the existing and proposed land uses in relation to the project.	Consistent
	Growth Management Policy 8	New development proposals to the west of Fiddyment Road within the County/City Memorandum of Understanding Transition Area shall meet the objectives and terms of the Memorandum of Understanding between the City of Roseville and the County of Placer.	No conflicts as proposed	The PCTPA has and will continue to coordinate the review of project-related information with both Placer County and the City of Roseville in a manner conforming to the terms of the MOU.	Consistent
	Growth Management – Growth Areas Policy 5	Apply the City's adopted Guiding Principles to any new development proposed in and out of City's corporate boundaries, which is not already part of an adopted Specific Plan or within the infill area (see Section 3.1.3.4 for complete text of policy).	No conflicts as proposed	The PCTPA has and will continue to coordinate the review of project-related information with both Placer County and the City of Roseville in a manner conforming to the terms of the MOU.	Consistent

adopted plans and policies were identified as a result of this analysis, as potential conflicts can be addressed through the avoidance, minimization, and/or design measures described in the table. (These consistency determinations are preliminary and may change as additional studies are undertaken for Placer Parkway in Tier 2 studies.)

Consistency with Other Local Plans and Policies

Sunset Industrial Area Plan. The project would be consistent with the SIAP.

West Roseville Specific Plan. The WRSP contains policies related to its specific plan area and does not contain any broad regional policies. In addition, all of the proposed alternative alignments are adjacent to but not located in the WRSP area. Since none of the alternative alignments directly affect the WRSP area, the project is considered consistent with the policies contained in the WRSP.

Placer County/City of Roseville MOU. No conflict between the project and this MOU were identified.

MTP/RTP/Blueprint. The Parkway is listed as a high-priority transportation facility in the current MTP to receive state and federal money; therefore, the project is considered consistent with the SACOG MTP, as well as the 2027 Placer County RTP upon which the MTP is based. The proposed MTP (2030) (not yet adopted) reflects SACOG's *Blueprint* preferred land use scenario, so the project would be consistent with the SACOG *Blueprint*.

Placer County Conservation Program: Habitat Conservation Plan and Natural Communities Conservation Plan. An HCP/NCCP is currently being prepared by Placer Legacy called the Placer County Conservation Program (as described in Section 3.1); however, this document is currently in draft form and has not been circulated. It is unknown exactly when and if the plan will be adopted/implemented, how it will affect the project (if at all), and to which specific areas of Placer County the plan will be applicable. At this time, however, it appears that Placer Parkway would further the goals of the PCCP by attempting to limit growth in the region by creating large buffers in the Central Segment of the study area that may aid in preserving some of the existing agricultural land and open space. PCTPA (SPRTA) is considering becoming a participating agency in the PCCP with the Parkway as a covered activity and is working to ensure that Placer Parkway and the PCCP can be implemented without conflict. USCOE/USEPA guidance with relation to the draft PCCP was to ensure no corridor alternatives are located north of Pleasant Grove Creek. This would allow for more conservation/open space opportunities (and less growth inducement) north of the creek while acknowledging more urban development character for the area south of the creek.

Natomas Basin Habitat Conservation Plan. There are currently properties within and around the study area that are protected by the NBHCP (described in Section 3.1). None of these habitat/conservation preserve properties be affected by any of the corridor alignment alternatives or proposed interchanges. There was an HCP property located on the north side of Sankey Road in the Western Segment that would have been affected by Alternatives 4 and 5, but this property, the 242-acre Brennan parcel, was traded for land west of SR 70/99 in the fall of 2006. The proposed no-development buffer zone could help preserve some of the agricultural land along the highway alignments, which would aid in the Conservancy's goal of maintaining agricultural land and sensitive species habitat within the Natomas Basin. Thus, the project would be consistent with the NBHCP, although cumulative impacts associated with planned and proposed development in the area will place additional pressure on the resources protected under the NBHCB.

3.3.4 Secondary and Indirect Impacts

3.3.4.1 No-Build Alternative

Under the No-Build Alternative, land would not be acquired for Placer Parkway and the Parkway would not be constructed. There would not be any secondary or indirect impacts.

3.3.4.2 Alternatives 1 to 5

Secondary and indirect effects of the project on existing land use would be similar for all corridor alignment alternatives. Project implementation could indirectly affect the viability of continued agricultural production on lands affected by or adjacent to the selected corridor alignment. The analysis of farmland impacts is included in Chapter 4 of this CIA. The indirect land use impacts of this project could include potential growth inducement by increasing access into currently undeveloped rural areas of Sutter and Placer counties, as discussed in Chapter 7.

The study area for the analysis of secondary and indirect impacts is shown in Figure 3-7. A detailed discussion of secondary and indirect impacts associated with growth that could occur as a result of the Parkway is included in Chapter 7 of this CIA.

3.3.5 Cumulative Impacts

Analysis of cumulative impacts is required under the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). Cumulative impacts result when the effects of an action are added to or interact with other effects in a particular place and within a particular time. It is the combination of these effects, and any resulting environmental degradation, that are the focus of cumulative impact analysis. The CEQ's regulations (CEQ, 1987) explicitly state that cumulative impacts must be evaluated along with the direct and indirect effects of each alternative.

CEQA defines cumulative impacts as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts" (CEQA Guidelines, §15355). Stated another way, "a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the environmental document together with other projects causing related impacts" (CEQA Guidelines, §15130). Although a project may cause an individually limited or individually minor incremental impact that, by itself, is not significant, the increment may be "cumulatively considerable" and thus significant.

FHWA has requested that cumulative conditions for the analysis of project alternatives in the Tier 1 EIS/EIR for Placer Parkway be based on development levels that are 20 years beyond the projected opening of the Parkway. For planning purposes, PCTPA has identified 2020 as the opening year of the Parkway. Cumulative impacts are therefore being evaluated for the year 2040. This 2040 scenario includes the following projects (see Figure 3-4):

- Full build-out of all residential land in Placer County west of Sierra College Boulevard, including current general plan areas and the following major development proposals in West Placer County:
  - The Creekview and Sierra Vista Specific Plan areas in Roseville's Memorandum of Understanding (MOU) Remainder Area
  - The Sphere of Influence (SOI) expansion areas of Lincoln

  - The Placer Vineyards, Regional University and Community, and Placer Ranch Specific Plans in unincorporated Placer County
  - The Curry Creek Community Plan Area.

- Growth in retail employment in Placer County that balances the growth in residential development by matching SACOG's countywide estimate of about 0.32 employee per dwelling unit from their 2025 forecasts.

- Growth in total employment levels in Placer County that balances the growth in residential development by matching SACOG's 1.3 employees per dwelling unit from their 2025 forecasts.

- Full build-out of the residential development in the proposed South Sutter County Sutter Pointe Specific Plan, along with a non-residential development level that balances the residential development in that area.

- Estimated 2040 developments in all other portions of SACOG's six-county region based on assuming a constant rate for the development growth between 2005 levels and the 2050 Preferred Blueprint scenario for each of SACOG's traffic analysis zones (TAZs).

3.3.5.1 No-Build Alternative

Under the No-Build Alternative, land would not be acquired for Placer Parkway and the Parkway would not be constructed. There would not be any cumulative impacts on land use under the No-Build Alternative.

3.3.5.2 Alternatives 1 Through 5

There would be significant cumulative land use impacts associated with the planned (approved) and proposed (but not yet approved) development projects described above, with or without the Parkway. The potential for the Parkway to contribute to these cumulative land use impacts is addressed in Chapter 7 of this CIA. The creation of buffers along the proposed corridor alignment is expected to help maintain the rural character of at least a strip of the agriculturally designated areas within all three segments by preventing development from extending to the roadway's edge. However, except in small portions of the Western Segment and somewhat larger portions of the Central Segment, much of the area through which the Parkway would be constructed would be converted from agricultural uses to more urban or suburban uses under the 2040 development scenario, even without Placer Parkway. PCTPA is working with local land use planning agencies to avoid or minimize impacts on this future planned development within the study area. The Parkway could bring greater certainty to future land use planning efforts through the selection of a preferred alignment, so that right-of-way can be acquired to preserve a transportation corridor in which a roadway could be built in the future in conjunction with the construction of other planned projects in the area. The Parkway would support the existing and planned general pattern of development in this region. As stated in the project description, the new transportation corridor would serve the cities and unincorporated areas of south Sutter County and southwestern Placer County in an effort to stem anticipated congestion and advance economic goals in the region (as discussed in Chapter 6). The project would contribute to the cumulative effect of improving accessibility between the employment, manufacturing, and distribution centers in the region.

The Parkway is proposed to address transportation requirements associated with the rapid growth that has already occurred and is currently taking place in the study area, as described in Sections 3.2.4 and 5.2.1. Placer Parkway would provide a local and regional transportation facility that would work in conjunction

with the other proposed roadway improvements in the region to improve local and regional transportation systems. A list of these proposed improvements is included in Section 4.5 of the Transportation Technical Report for Placer Parkway (DKS Associates, 2007a).

The Placer Parkway and other roadway improvement projects within the study area would aid in relieving traffic congestion and improve the overall transportation network in south Sutter and southwestern Placer counties. It would thus not be a cumulatively considerable contributor to the significant cumulative land use impacts in 2040 that will occur independently of Placer Parkway. Cumulative impacts to land use would be less than significant (refer to Chapter 7 for growth inducement discussion).

3.3.6 Potential Watt Avenue Interchange

An interchange on Placer Parkway to a potential Watt Avenue roadway extension is included in this land use analysis, since this connection could affect existing and proposed land uses within the study area. All of the potential future Watt Avenue interchanges identified for the purposes of this analysis are located in Placer County and lie within the Central Segment of the study area, located north to south between Phillip Road and Baseline Road and (east to west) between the existing Watt Avenue alignment and Brewer Road. A precise location or alignment has not been identified for this potential interchange, just as a corridor has not been selected for the Placer Parkway. As a result, only preliminary concepts, as shown in Figure 2-3, are available for review and analysis at this time. Any future proposed Watt Avenue interchange with Placer Parkway would be subject to independent environmental review, separate from the analysis completed for the project.

The analysis below focuses on the potential incremental direct impacts that a Watt Avenue interchange could have on land use in the study area. Table 3-32 shows the additional land acreage and parcels that would be potentially affected by the conceptual Watt Avenue interchange.

Table 3-32
Parcels Potentially Affected by Potential Watt Avenue Interchange

Alternative Connection	Assessors Parcel Number	Acreage
Alternative 1 (Option 1)	017-100-021-000	5.5

Note: calculated acreage accounts for area outside potential Parkway corridor alignment only

3.3.6.1 Alternative 1 (Option 1)

Alternative 1 (Option 1) is the southernmost potential future Watt Avenue interchange. As shown in Figure 3-1, the land in and around the area of this potential future interchange is comprised of rice fields, pasture, or idle farmland. According to the Placer County General Plan and Zoning Ordinance, the

designated land use within and adjacent to the interchange is Agricultural 80-acre minimum, and the corresponding zoning is Farm-Building Site 80-acre minimum (see Table 3-2 for zoning definitions and Figures 3-2 and 3-3 for land use and zoning information).

This interchange would potentially convert an additional 17.5 acres of land on two separate parcels (see Table 3-32) from existing uses to a highway interchange. As stated above, the area within and adjacent to the interchange is currently in or would be suitable for agricultural production. Impacts to farmland from the potential future interchange are analyzed in Section 4.3.3.

No newly bisected parcels would be created as a result of the Watt Avenue interchange. This interchange would take additional acreage from parcels already potentially affected by the Alternative 1 corridor alignment; however, the additional acreage would not create parcels that would be inconsistent with the existing zoning.

The potential future interchange may impact future proposed developments in the study area, including the Curry Creek Community Plan and the Sierra Vista Specific Plan. These two areas are in the preliminary stages of planning at this time and there are not any detailed plans to assess potential conflicts. Therefore, when and if a new Watt Avenue interchange is formally proposed, the project proponents will need to consider effects on these proposed land uses.

3.3.6.2 Alternative 1 (Option 2)/Alternative 2

Another option for a potential future Watt Avenue interchange under Alternative 1 (Option 2) would be similar to the potential future Watt Avenue interchange under Alternative 2. The location would be farther north in the Central Segment of the study area. The land proposed for the new interchange and adjacent to the interchange is comprised of cultivated agriculture and idle farmland. According to the Placer County General Plan and Zoning Ordinance, the designated land use within and adjacent to the interchange is Agricultural 80-acre minimum and the corresponding zoning is Farm-Building Site 80-acre minimum (see Table 3-2 for zoning definitions and Figures 3-2 and 3-3 for land use and zoning information). The area of the interchange that is located within the City of Roseville is designated and zoned for Open Space.

This interchange would potentially convert an additional 16.5 acres of land on two separate parcels from existing uses to a highway interchange. As stated above, the area within and adjacent to the interchange in Placer County is currently in agricultural production or capable of being in agricultural production. Impacts to farmland from the potential future interchange are analyzed in Section 4.3.3.

No newly bisected parcels would be created as a result of the Watt Avenue interchange. This Watt Avenue interchange would take additional acreage from parcels already potentially affected by the Alternative 1 corridor alignment; however, the additional acreage would not create parcels that would be inconsistent with the existing zoning.

The potential future interchange may impact proposed developments in the study area, including the Curry Creek Community Plan and the Regional University Specific Plan. These two areas are in the preliminary stages of planning at this time and there are not any approved plans to assess potential conflicts. Therefore, when and if a new Watt Avenue interchange is formally proposed for study, the project proponents will need to consider any effects on these proposed land uses.

Approximately 5.5 acres of the land that would potentially be affected lie within an existing 267-acre designated Open Space area on the western fringe of the West Roseville Specific Plan area (City of Roseville, 2006f). This area is considered an open space preserve and was created to protect wetland resources, including vernal pools, and grasslands near Curry Creek. Land use within the open space area

is limited to activities allowed under the Section 404 permit per the Clean Water Act, issued by the U.S. Army Corps of Engineers. The potential effects of an urban interchange on the resources present in the preserve are outside the scope of this study. However, in addition to protecting wetlands and grasslands, this area was also envisioned to be a transition between the urban uses of the City of Roseville and the rural agricultural uses in Placer County. Since the planning of the Parkway incorporates design measures to complement rural land uses (e.g., wide buffers), it is expected that the potential future Watt Avenue interchange, if planned in conjunction with the Parkway design, would not affect the use of this land as a buffer between rural and urban uses.

3.3.6.3 Alternative 2

Alternative 2 has the same potential future Watt Avenue interchange as Alternative 1. Potential impacts would therefore be similar to those discussed above under Alternative 1.

3.3.6.4 Alternatives 3 and 4

Alternative 3 and Alternative 4 could have the same potential future Watt Avenue interchange location since their corridor alignments do not vary until a few miles west of the potential interchange. Land in the vicinity of this new interchange is comprised of cultivated or idle farmland. According to the Placer County General Plan and Zoning Ordinance, the designated land use within and adjacent to the interchange is Agricultural 80-acre minimum and the corresponding zoning is Farm-Building Site 80-acre minimum.

This interchange would potentially convert an additional 15 acres of land on two separate parcels (see Table 3-32) from its existing uses to an urban highway interchange. As stated above, the area within and adjacent to the interchange is currently suitable for agricultural production. Impacts to farmland from the potential future interchange are analyzed in Section 4.3.3.

There would not be any newly created bisected parcels as a result of this Watt Avenue interchange. This Watt Avenue interchange would take additional acreage from parcels already potentially affected by the corridor alignments for Alternatives 3 and 4; the additional acreage would not create parcels that would be inconsistent with the existing zoning.

The Alternative 3 or 4 interchanges would not directly affect any proposed developments in the study area.

3.3.6.5 Alternative 5

Alternative 5 includes the northernmost proposed Watt Avenue interchange within the Central Segment. The land in the vicinity of the interchange is comprised of rice fields and idle farmland. The Placer County General Plan and Zoning Ordinance show that the designated land use within and adjacent to the interchange is Agricultural 80-acre minimum and the corresponding zoning is Farm-Building Site 80-acre minimum.

This interchange would potentially convert an additional 17.5 acres of land on three separate parcels (see Table 3-32) from existing uses to a highway interchange. As stated above, the area within and adjacent to the interchange is capable of being in agricultural production. Potential Watt Avenue interchange impacts on farmland are analyzed in Section 4.3.3.

There would not be any newly created bisected parcels as a result of this potential future interchange to the Parkway. Alternative 5 would take additional acreage from parcels already as potentially affected by the Alternative 5 corridor alignment. In this instance, the additional acreage would have the potential to

create a parcel, specifically parcel number 017-100-024-000, which would be inconsistent with the current minimum zoning requirements. The right-of-way required for the Alternative 5 corridor and the potential future Watt Avenue interchange would reduce this parcel, which is currently 155 acres in size, to approximately 78 acres in size, thereby making it inconsistent with the existing zoning. Also, the potential future interchange would remove 31 acres of right-of-way from an existing non-conforming 79-acre parcel (parcel number 017-100-023-000).

Approximately 2 of the acres that would be affected lie within City of Roseville's Reason Farms facility. The Alternative 5 interchange may affect the proposed recreational opportunities, stormwater functions, or habitat preservation areas at Reason Farms, for which a master plan is currently being refined. Therefore, when and if a new Watt Avenue interchange is formally proposed for study, the project proponents will need to consider any affects on these proposed land uses.

3.3.7 Avoidance, Minimization, and/or Mitigation Strategies

3.3.7.1 Land Use Conversion

The alignment selected for Placer Parkway would convert between 1,623 and 1,918 acres to a transportation corridor, but the ultimate roadway would occupy less land, with buffer zones along both sides. Strategies to reduce impacts on individual affected parcels could include providing access between the remnant portions of bisected parcels via frontage roads and overcrossings, crafting agreements with agricultural property owners that would include residual rights provisions to encourage continuation of farming activities in the buffer zone that would not be used for the roadway, or rezoning or purchasing remnant parcels that would no longer be viable for continued use under existing zoning. Any property purchases would comply with the requirements of the Uniform Relocation and Assistance Real Properties Acquisition Act.

Between 26 and 36 parcels would be bisected, depending on which alternative is chosen, and could result in additional land use conversion. Parcels that are bisected are expected to be impacted substantially, and the effects may not be avoidable. During roadway design, impacts to specific parcels may be reduced through appropriate adjustments to the location of the actual roadway within the Parkway corridor alignment or through provision of alternative access to remnant parcels.

3.3.7.2 Land Use Compatibility

Suggested mechanisms to reduce land use compatibility impacts are land purchase/leases that would allow for continued use of the buffer for agricultural purposes, and partnering with local jurisdictions to institute land use controls (if local jurisdictions deem these necessary or desirable), such as general plan amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, and urban growth boundaries. Continued coordination with jurisdictions in the study area to plan for the Parkway and proposed development would reduce the likelihood of land use incompatibility.

3.3.7.3 Consistency with Adopted Plans, Policies, and Regulations

No conflicts with General Plan policies have been identified; therefore, no mitigation is recommended. The creation of remnant parcels that do not conform to zoning ordinance minimum size requirements could be reduced through mechanisms described above, including potential rezoning or purchase of remnant parcels that are too small to remain economically viable for any use.

3.3.8 Analysis To Be Undertaken in Tier 2 Analysis

3.3.8.1 Land Use Conversion/Bisected Parcels

This Tier 1 level of analysis focuses on broad environmental issues. Specific impacts to individual parcels, including those bisected, and the subsequent effect on land use will not be undertaken until a roadway alignment is identified within the selected corridor and the geographic area of impact is narrowed. The information necessary to perform the parcel-specific analysis is expected to be generated during the preparation of the Tier 2 environmental document.

3.3.8.2 Compatibility with Proposed Development

Planning for the Sutter Pointe Specific Plan, Curry Creek, Brookfield, Reason Farms Environmental Preserve, PRSP, and the RUSP planning areas is still in progress. Once a preferred alternative alignment is chosen and these Specific Plans are further developed, more definitive land use compatibility impacts resulting from Placer Parkway can be determined.

4.0 FARMLAND

4.1 REGULATORY SETTING

4.1.1 Pertinent Laws and Legislation

4.1.1.1 Federal Regulations

National Environmental Policy Act

NEPA requires that before taking or approving any federal action that would result in conversion of farmland, the federal agency must examine the effects of the action. This is implemented by using criteria developed pursuant to the Farmland Protection Policy Act (FPPA). If adverse effects are found, the federal agency must consider alternatives to lessen them. This CIA evaluates the effects of the project and documents the differences in impacts to farmlands through the evaluation of five separate alternatives. NEPA and the FPPA do not require a project to be modified solely to avoid or minimize the effects of conversion of farmland to nonagricultural uses.

Farmland Protection Policy Act

According to the NRCS, the FPPA is intended to minimize the extent to which federal programs contribute to the unnecessary and irreversible conversion of farmland to nonagricultural uses. It ensures that, to the extent practicable, federal programs are compatible with state and local units of government, as well as private programs and policies to protect farmland. Projects are subject to FPPA requirements if they may irreversibly convert farmland (directly or indirectly) to nonagricultural use and are completed by a federal agency or with assistance from a federal agency. In this case, the FHWA will be the lead federal agency and would provide planning oversight, design oversight, right-of-way acquisition assistance, and funding for construction. For the purpose of the FPPA, farmland includes prime farmland, unique farmland, and land of statewide or local importance. Farmland subject to FPPA requirements does not have to be currently used for crop production. In fact, the land can be forest land, pastureland, cropland, or other land, but does not include water bodies or land developed for urban land uses (i.e., residential, commercial, or industrial uses).

In 1981, the NRCS released a new system that was designed to provide objective ratings of the agricultural suitability of land compared to demands for nonagricultural uses of lands; Land Evaluation and Site Assessment (LESA). Soon after it was designed, LESA was adopted as a procedural tool at the federal level for identifying and addressing the potential adverse effects of federal programs (e.g., funding of highway construction) on farmland protection. Typically, staff of the NRCS are involved in performing LESA scoring analyses of individual projects that involve other agencies of the federal government. This score is used as an indicator for the project sponsor to consider alternative sites if the potential adverse impacts on the farmland exceed the recommended allowable level. This process of preparing a LESA requires a system of numerical weights assigned to different characteristics of affected parcels, a description and classification of affected farmlands, as well as early consultation with the NRCS for all proposed alternatives that may affect farmland. Processing of form CPA-106, the Farmland Conversion Impact Rating for Corridor Type Projects, is also necessary. An important consideration is that the FPPA does not require a project be modified solely to avoid or minimize the effects of conversion of farmland to nonagricultural uses, but does require evaluation of other alternatives that could lessen these impacts.

The FPPA 7 CFR, part 658.4(a)(4)(iii)(f) states the following:

> *Numerous states and units of local government are developing and adopting LESA systems to evaluate the productivity of agricultural land and its suitability for conversion to non agricultural use. Therefore state and local units of government may have already performed a evaluation using*

similar criteria to these contained in this rule applicable to federal agencies. USDA recommends that where sites are to be evaluated within a jurisdiction and has been placed on the SCS state conservationist's list as one which meets the purpose of the FPPA in balance with other public policy objectives, federal agencies use that system to make the evaluation.

For the purposes of this project, a consistent LESA rating score for each alternative is not achievable, because the Parkway has direct impacts on farmland across two county lines. Consultation with the NRCS was initiated to begin the LESA process with the NRCS providing the necessary Land Evaluation (LE) scores for each alternative. However, when the NRCS sent the completed forms back they included separate scores by county (Sutter and Placer) using the California LESA system. The NRCS advised the lead agency not to add the scores together from the separate jurisdictions because the LE score is derived from separate soil surveys performed on a county-specific basis. The two soil surveys are not directly compatible nor is there a conversion factor between the two counties. Therefore, while it would be possible to create a LESA score for each portion of each alternative within each county, this tabulation would be misleading because the two scores could not be added together to determine significance for a given alternative. The LESA system was designed to show which alternative(s) may have the least effect on farmland. At this time there are no federally or state approved LESA models that calculate farmland impacts across multiple jurisdictions or when multiple soil surveys are encountered. Therefore, no LESA was completed for the purposes of this analysis.

4.1.1.2 State Regulations

California Environmental Quality Act

CEQA requires that projects be evaluated for their possible effects on the environment. As they relate to agricultural lands, state CEQA Guidelines state that a project that would result in the cancellation of Williamson Act contracts for parcels 100 acres or more is a project considered to be "of statewide, regional, or areawide significance" (CEQA Guidelines Section 15206). Also, Appendix G of the CEQA Guidelines states that a project that would "convert prime agricultural land to non-agricultural use or impair the agricultural productivity, would "normally have a significant effect on the environment." Note that in the second case, there is no acreage threshold for prime farmland conversion that would constitute a significant impact defined by case law or regulation.

The formulation of a California LESA model is the result of Senate Bill 850, which charges the California Resources Agency, in consultation with the Governor's Office of Planning and Research, to develop an amendment to Appendix G of the CEQA Guidelines. Such an amendment is intended "to provide lead agencies with an *optional* methodology to ensure that significant effects on the environment of agricultural land conversions are quantitatively and consistently considered in the environmental review process" (Public Resources Code Section 21095). This legislation authorized the Department of Conservation (DOC) to develop a California LESA Model, which could in turn be adopted as the required amendment to Appendix G of the CEQA Guidelines. The DOC developed the California LESA model in 1997 so that lead agencies may refer to it when assessing impacts to agricultural resources. (No LESA model was used in this analysis, as explained in Section 4.1.1.1 above.)

The California Land Conservation Act–Williamson Act

The Williamson Act provides incentives, through reduced property taxes, to deter the early conversion of agricultural and open space lands. All private land defined by the state as "prime farmland," "other than prime farmland," and "open space land" are eligible for coverage by a Williamson Act contract. Such contracts are administered by the Office of Land Conservation within the DOC. Land other than prime farmland and open space land can be placed under contract if the lands are located in an area designated by a county or city as an agricultural preserve. The DOC estimates that more than half of California's irrigated farmland is protected by the act.

Williamson Act contracts specify that the owners will not convert their land to nonagricultural uses for a period of at least 10 years. At the end of each year within the 10-year contract period, the contract is automatically renewed for an additional year, unless the landowner or the local government moves to terminate the contract. Termination can occur in one of four ways: (1) non-renewal; (2) cancellation; (3) eminent domain; or (4) city annexation under certain circumstances.

Contracted land is assessed for county property tax purposes at its agricultural value rather than its full market value. That is, the value of the land is much lower than normal because it is based upon farming and open space uses as opposed to full market (or speculative) value. Forty-eight of the state's counties, including Placer, Sutter, and Sacramento counties, participate in Williamson Act programs for unincorporated areas. The state of California makes partial payments annually ("subvention entitlements") to local governments for lost local property tax revenues that landowners would otherwise pay if the property was taxed at its market value. Fees are charged to landowners who prematurely cancel Williamson Act contracts, but not if the lands are taken in eminent domain or annexation by a city.

The act prohibits a public agency from acquiring prime farmland covered under the act for the location of a public improvement if there is other land within or outside the preserve on which it is reasonably feasible to locate the public improvement. The law generally exempts existing state highways from this provision, but can apply to new highways or highway corridors.

Government Code Section 51295 states that when a project would condemn or acquire only a portion of a parcel of land subject to a Williamson Act contract, the contract is deemed null and void with respect to that portion only. The remaining land continues to be subject to the contract unless it is adversely affected by the condemnation. In such cases, the contract for the remaining portion may be canceled.

Government Code Section 51291(b) requires an agency to notify the DOC and the local governing body responsible for the administration of the Williamson Act (usually the county planning department) proposed for acquisition for a public improvement project (regardless of whether it is a state or federally funded project, or the amount of total acreage involved). This notification will occur via the process of submitting the Draft EIS/EIR to the DOC for review.

Contract Status Terms and Definitions

Active Contract. The minimum term for a Williamson Act contract is 10 years. Since the term automatically renews on each anniversary date of the contract, the actual term can be indefinite. Active contracts in this report are those that have not been subject to filing for notice of non-renewal, cancellation, public acquisition, or annexation.

Notice of Non-Renewal. Contracts may be terminated at the option of the landowner or local government by initiating the process of term non-renewal. Under this process, the remaining contract term (9 years in the case of an original term of 10 years) is allowed to lapse, with the contract null and void at the end of the term. Property tax rates gradually increase during the non-renewal period, until they reach normal (i.e., non-restricted) levels upon termination of the contract.

Cancellation. Under a set of specifically defined circumstances, a contract may be cancelled without completing the process of term non-renewal. Contract cancellation, however, involves a comprehensive review and approval process, and the payment of fees by the landowner equal to 12 percent of the full market value of the subject property.

Expired. Expired parcels are those parcels that have previously been subject to Williamson Act contract, and have since been removed from the contract through non-renewal, cancellation, or annexation.

Super Williamson Act

Senate Bill 1182, commonly known as the "Super Williamson Act," was signed into law in 1992. This law provides a method for landowners to convert existing Williamson Act contracts to 20-year "Farmland Security Zone'" (FSZ) contracts that provide additional property tax savings of approximately 35 percent. However, this additional tax reduction can only be realized if farmers and ranchers keep their property in the conservation program for at least 20 years. FSZ contracts are comparable to the Williamson Act contracts in that each year another year is added to the agreement unless the landowner or county does not renew the contract. Additionally, SB 1182 prohibits the annexation of land enrolled in a 20-year contract to a city, or a special district that provides non-agricultural services, or for use as a public school site. According to the DOC, more than 806,000 acres statewide are enrolled in this program. Also, the California Farm Bureau Federation states that currently only 19 counties in the state have adopted this FSZ program. There is no Super Williamson Land Act contracted land within the study area, thus it is not discussed in the impacts section of this CIA.

4.1.2 Adopted Goals and Policies

As mentioned in Chapter 3, California state law requires each city and county to adopt a General Plan. The purpose of each jurisdiction's General Plan is to guide the physical development of the land within its boundaries. The study area includes agriculturally designated lands under the jurisdiction of both Sutter and Placer counties. The General Plan policies identified in Table 4-1 were found to be relevant to the evaluation of agricultural resources with respect to the Parkway and are cited as written from their respective General Plan Elements.

Table 4-1
Placer and Sutter County Agricultural Policies

Jurisdiction	Policy Number	Policy
Sutter County General Plan	1.F-1	The County shall require that new development adjacent to agricultural areas be designed to minimize conflicts with adjacent agricultural uses.
	1.F-2	The County shall require that all lands set aside or utilized for mitigation of development in Sutter County or the Natomas Basin demonstrates that its creation and existence will not adversely impact existing and/or future planned agriculture or urban development.
	1.F-3	The County shall continue to implement its Right to Farm Ordinance. (Agricultural Operations Disclosure, Ordinance Code 1013, Chapter 1330 or its successor.)
	1.F-4	The County shall protect agricultural operations from conflicts with non-agricultural uses by requiring buffers between proposed non-agricultural uses and adjacent agricultural operations.
	6.A-1	The County shall preserve agriculturally designated areas for agricultural uses and direct nonagricultural development to areas designated for urban/suburban growth, or rural communities and/or cities.
	6.A-2	The County shall balance the needs of proposed urban and suburban development with the need to preserve agricultural lands.
	6.A-6	Minimum parcel sizes in agriculturally designated areas shall be 20 acres in those areas containing orchard compatible soil and 80 acres in those areas with soils used primarily for row crops, field crops, and range land as shown on the Land Use Diagram. Historical uses and physical boundaries may be considered on a case by base basis. All parcels resulting from subdivisions or parcel maps shall contain the minimum required acreage for land use designation. Homesite parcels, as permitted in Policy 6.A-4, shall not exceed 2 acres unless the Environmental Health program grants a waiver for sewage disposal, in which case the parcel may be allowed for up to 5 acres. Remainder parcels shall meet the minimum parcel size of the agricultural land use designation.

Table 4-1
Placer and Sutter County Agricultural Policies (Continued)

Jurisdiction	Policy Number	Policy
Sutter County General Plan (Continued)	6.A-7	Agriculturally designated parcels (not located in a rural community) which do not meet the minimum acreage requirement, as specified by the land use policies of the General Plan, may be adjusted by lot line adjustment pursuant to §65412(d) of the Government Code under the following conditions as specified in the Zoning Code: Are in conformance with the General Plan policies for home sites; or Are for agricultural support facilities that have been approved by use permit; or Are necessary in order to comply with the requirements of the Sutter County Ordinance Code provision pertaining to Environmental Health, Zoning, or Building regulations for the maintenance or expansion of existing improvements, or d. Are an adjustment between two adjoining lots, one or both of which are less than 20 or 80 acres in area as identified on the General Plan land use diagram.
Placer County General Plan	7.A.1	The County shall protect agriculturally designated areas from conversion to non-agricultural uses.
	7.A.2	The County shall ensure that unincorporated areas within city spheres of influence that are designated for agricultural uses are maintained in large parcel sizes of 10-acre minimums or larger.
	7.A.3	The County shall encourage continued and, where possible, increased agricultural activities on lands suited to agricultural uses.
	7.A.7	The County shall maintain agricultural lands in large parcel sizes to retain viable farming units.
	7.A.12	The County shall actively encourage enrollments of agricultural lands in its Williamson Act program.
	1.H.3	The County will maintain large-parcel agricultural zoning and prohibit the subdivision of agricultural lands into smaller parcels unless such development meets the following conditions: The subdivision is part of a cluster project and such a project is permitted by the applicable zoning; The project will not conflict with adjacent agricultural operations; and The project will not hamper or discourage long-term agricultural operations either on site or on adjacent agricultural lands.
	1.H.4	The County shall allow the conversion of existing agricultural land to urban uses only within community plan areas and within city spheres of influence where designated for urban development on the General Plan Land Use Diagram.
Sunset Industrial Area Plan	1.E.1	The County shall protect agriculturally designated areas from conversion to non-agricultural uses.
	1.E.2	The County shall ensure that unincorporated areas within the city spheres of influence that are designated for agricultural uses are maintained in large parcel sizes of 10-acre minimums or larger.
	1.E.3	The County shall encourage continued and, where possible, increased agricultural activities on lands suited to agricultural uses.
	1.E.4	The County shall maintain agricultural lands in large parcel sizes to retain viable expanded farming units.
Sources: Sutter and Placer County General Plans and Agricultural Elements; Sunset Industrial Area Plan		

4.2 AFFECTED ENVIRONMENT

The majority of the study area is within rural, unincorporated portions of Sutter and Placer counties. Sections of the corridor alignment alternatives are adjacent to the City of Roseville (or within its Sphere of Influence) and Sacramento County. A small portion of the Eastern Segment is within the City of Rocklin.

The farmland impact analysis focuses on impacts to farmland in Sutter and Placer counties only. There are no agriculturally designated lands or agricultural land uses in the cities of Roseville and Rocklin, so there would be no impacts to farmland in either jurisdiction. In addition, no impacts on Sacramento County's agricultural resources are anticipated, as none of the alignment alternatives would physically (directly or indirectly) affect any agricultural or farming operations. The following discussion assesses existing farming operations in southwestern Placer County and southeastern Sutter County, through consideration of the types of cultivated agriculture, crop values, and trends in agriculture.

The information contained in this section draws from several sources, of which the primary source is the *Western Placer Agricultural Study* (NFA, 2003). The study provides an overview of existing agricultural land characteristics, farm ownership and operations, and farm economics in western Placer County. Other sources of information include the Department of Conservation Farmland Mapping and Monitoring Program, crop reports prepared by the Sutter County and Placer County Agricultural Commissions, and consultation with the U.S. Department of Agriculture–NRCS.

4.2.1 Existing Agricultural Activities

4.2.1.1 Sutter County Agricultural Production Values

Agricultural production in southwestern Sutter County consists mainly of large rice growing operations. The county's 2004 Annual Crop Report states that farmers and ranchers produced $299,219,300 in gross agricultural products, down slightly from 2003, when the total gross value of agricultural products reached $307,322,200. Rice, walnuts, peaches, almonds, and tomatoes were the most valuable commodities, accounting for approximately 70 percent of the total gross value in crops for all of Sutter County.

Table 4-2 shows the gross value of the top five crops in 2004 for Sutter County. Table 4-3 displays the gross value of agricultural production for the five-year period between 2000 and 2004.

Table 4-2
Top Five Crops for Sutter County in 2004

Crop/Agricultural Product	Total Value ($)
Rice	111,189,200
Walnuts	38,925,500
Peaches	31,594,800
Almonds	15,082,300
Tomatoes	12,535,600
Total	**209,327,400**
Source: Sutter County Agricultural Commissioner, 2004	

Table 4-3
Five-Year Comparison of Sutter County Agricultural Production

Year	2000	2001	2002	2003	2004
Agricultural Value	$340,176,000	$264,673,000	$291,061,100	$307,322,300	$299,219,300
Source: 2003 Sutter County Annual Crop Report					

Sutter County's economy is strongly tied to and dependent on the agricultural industry. Although the costs to produce agricultural products increased (i.e., labor costs, fuel and electricity costs to run equipment and to process crops), and the prices of the agricultural products have not kept up with inflation, the relative size of the agricultural operations in Sutter County have kept agriculture production as a valuable asset to the county's economic base. According to the 2004 Crop Report, the agricultural industry returned more than $1.05 billion to the county's economy.

4.2.1.2 Placer County Agricultural Production Values

Agricultural production in southwestern Placer County is typified by large rice and field crop operations as well as pasture/grazing land, with a small amount of acreage left fallow. According to the 2003 Annual Crop Report for Placer County, farmers and ranchers produced $73,182,400 in gross agricultural products, down slightly from 2002, when the total gross value of agricultural products reached $76,278,600. Rice, nursery products, cattle/calf operations, timber, and irrigated pasture produced the most valuable commodities and accounted for approximately 69 percent of the total gross value in crops for all of Placer County.

Table 4-4 shows the gross value of the top five crops in 2003 for Placer County. Table 4-5 displays the gross value of agricultural production for the five-year period between 1999 and 2003.

Table 4-4
Top Five Agricultural Operations for Placer County in 2003

Crop/Agricultural Product	Total Value ($)
Rice	15,732,500
Nursery Products	14,046,000
Cattle and Calf Operations	11,407,500
Timber Production[1]	6,763,700
Irrigated Pasture	2,400,000
Total	**50,349,700**
Source: Placer County Agricultural Commissioner, 2003 Note: 1. There is no timber production within the project area.	

Table 4-5
Five-Year Comparison of Placer County Agricultural Production

Year	1999	2000	2001	2002	2003
Agricultural Value	$70,195,421	$68,933,500	$75,036,970	$76,278,600	$73,182,400
Source: Placer County Agricultural Commissioner, 2003					

As Tables 4-2 and 4-3 show, the gross value of agricultural production has fluctuated only slightly (due to factors such as climatic conditions in a given growing season) in recent years. However, the values in these tables do not reflect the net income or costs for all agricultural production. As documented in the *Western Placer Agricultural Study*, the net income to producers has actually declined recently (into negative territory for some commodities). Prices received for agricultural products at the farm level have not kept pace with inflation. As a result, higher prices for inputs have reduced net income substantially. That is, the prices paid for inputs such as fuel, electricity, labor, and water reflect increased prices in local markets, yet the prices received for agricultural products reflect global market conditions that have held down the price received for the agricultural products (NFA, 2003).

4.2.2 Trends in Agricultural Production and Farmland Conversion

4.2.2.1 Sutter County Trends in Agriculture

The agricultural outlook in Sutter County is almost the opposite of that in Placer County. According to the University of California Agricultural Extension March 2005 report, *The Changing Face of Agriculture in the Lower Sacramento Valley*, the agricultural income in Sutter County grew by 100 percent between 1983 and 2003. The latest agricultural Census, in 2003, showed an increase in the size of the average farm from 234 acres in 1992 to an average size of 267 acres in 2003. In addition, there were 505 farms with annual sales at $100,000 or more. This is 36 percent of the 1,391 farms in the county, and is relatively unchanged from the 1997 level of 37 percent.

Market conditions have led to changes in the types of crops being produced in Sutter County. Agricultural production has begun to shift from vegetable crop production to tree crops, due to the lack of profitability over the past several years for the former (UC Agricultural Extension, 2005). Acreage devoted to growing tomatoes is about half that of the previous five-year average and about 25 percent of what it was 10 years ago. Driving forces for this decline include the distance from processing facilities, as well as disease (soil-borne pathogens), and problems associated with Sutter County growing conditions. Similar problems are also affecting the local melon industry.

Tree crops such as peaches, prunes, walnuts, and almonds have shown a modest increase in both acreage and value. That industry has always been important to the local agricultural economy and continues to provide the county with approximately one-third of its total agricultural income. It is likely that the number of acres planted in prunes and peaches will be reduced in response to market conditions, while the number of acres devoted to almonds and walnuts will likely increase.

The value of rice to lower Sacramento Valley economies has continued to rise. The crop value of rice has increased by 100 percent over the past 10 years and there has been a 50 percent increase in acreage devoted to rice in the county. Rice also accounts for nearly one-third of all crop value in the county.

The Sutter–Yuba University of California Agricultural Extension (UC Agricultural Extension, 2005) has forecast that vegetables and agronomic (scientific agriculture) crops will continue to decrease in importance while tree crops occupy more of the landscape. This transition has changed aspects of the local agricultural economy, and the area continues to see positive growth in the agricultural sector. Furthermore, if government policies and other conditions are favorable, rice will continue to be a dominant crop and a strong contributor to local agricultural economies.

4.2.2.2 Placer County Trends in Agricultural Production

According to the Placer County Agricultural Study prepared by the University of California Davis Extension program in 2000, 90 percent of the county's farms are family owned. In addition, the operations that are corporately owned are generally owned by family corporations. According to the

U.S. Department of Agriculture National Agricultural Statistics Service (NASS), the average farm size in Placer County has decreased dramatically in size from approximately 140 acres in 1997 to 91 acres in 2003. Also, the NASS has estimated that only 62 of the 1,438 farms in the county, or 4 percent, earned $100,000 or more in agricultural sales. Additionally, agricultural-related employment has fallen from 5.1 percent in 1970 to 2.6 percent of total employment in Placer County in 2005.

The Placer County Industry Structure Study, prepared by the Sacramento Regional Research Institute (SRRI) (in March 2006), discusses conflicting economic indicators. This report states that in 2004 agriculture comprised only 0.5 percent of the industry composition in Placer County. Yet between 1994 and 2004, agricultural employment grew by 133.3 percent. In addition, this report forecasts agricultural employment to continue to grow by approximately 2.9 percent from 2004 to 2009. Dr. Lyndell Grey, President of the Placer County Economic Development Board, made the following statement at the Placer County Economic Development Board meeting in May 2006 when summarizing the Placer County Industry Structure Study:

> "Agricultural is a small part of the total economic industry in Placer County compared to other industries but it is on the upswing and this comes at a time when two factors would indicate just the opposite:
>
> 1. Agricultural growth is decreasing in the state and in the region, and
>
> 2. In Placer County there is currently a major shift in land from agricultural use to urban housing and manufacturing.
>
> The logical expectation based on these two factors would be for agriculture in Placer County to show a decrease or at the very least remain the same. In fact, the opposite is true."

Even with the decreasing scale of farming (i.e., size of farms) in Placer County, some large-scale producers are beginning to seek opportunities for developing small-scale, intensively farmed enterprises, such as strawberry production, as reflected in agricultural industry specialization, which grew over 100 percent between 1999 and 2004 (SRRI, 2006). Such small-scale operations can market directly to consumers through on-farm sales, community supported agriculture (CSA) subscriptions, and farmers markets. Although Placer County farmers and ranchers produce a variety of agricultural products, the size of the farms in the area and the unlikely ability to expand (due to urban growth pressures) will challenge the ability of these farms to remain viable. Long-time agricultural operators who were consulted during the course of this study (as described in Section 7.2.5) reported increasing conflicts between essential farm operations and urban uses (such as movement of farm equipment on local roadways where commuter traffic is increasing, increased incidences of vandalism, and increased costs for utilities such as water as local demand increases). The declining presence of local agricultural processing centers also adversely affects farm economics.

The future of agriculture in the county will likely depend on efforts by local farmers/ranchers to increase their ability to market commodities locally and diversify their products. Diversification of products could include marketing tourism and recreation opportunities on their properties. Examples include allowing hunting in field crops, farm stays, farm tours, fishing, and operating Christmas tree farms.

4.2.2.3 Sutter County Farmland Conversion

As in Placer County, the pace of urbanization in Sutter County from 1998 to 2000 increased in comparison to the rate of development between 1996 and 1998. In Sutter County, approximately 692 acres were urbanized in the three-year period beginning in 1998, in contrast to the 51 acres during the reporting period from 1996 to 1998. The majority of this development occurred on the fringe of existing

urban development areas near Yuba City and the unincorporated community of Sutter. According to the DOC Division of Land Resource Protection (DLRP), since 1990, 9,333 acres of farmland have gone out of production in Sutter County and 2,354 acres of new urban land have been created (DOC, 2000).

Sutter County will continue to face development pressure in the foreseeable future. Sutter County's 2005 population was 87,342 (SACOG, 2004). Growth projections from the state HCD show a population of 100,437 in 2010 and 116,408 in 2020, while the California Department of Finance projects that the county's population will grow to 161,600 in 2020. This growth will likely lead to a decline in the size of farming operations and increase the subdivision of farm units for urban/suburban development.

The following are examples of farmland and grazing land being urbanized or planned for urbanization in Sutter County:

- New developments were constructed around the unincorporated community of Sutter, including Sweco Products, Inc., and other businesses (15 acres).
- Helena Chemical Company was expanded (15 acres).
- New buildings were constructed on former grazing land at the Sutter Industrial Park (45 acres).
- The Yuba City Calpine Power Plant began operation in 2002 (25 acres).
- The Rio La Paz Golf Club near Nicolaus along the Feather River was developed (140 acres).
- Land was developed in Pleasant Grove for a Teichert facility and Consolidated Dealer Systems Inc. (about 20 acres).
- The Sutter County Board of Supervisors set aside more than 10,500 acres of land near the southeastern border with Placer/Sacramento County for the South Sutter County Industrial/ Commercial Reserve. The County is currently in the process of preparing a specific plan for approximately 7,500 acres, the Sutter Pointe Specific Plan, of the Measure M 10,500-acre reserve.

4.2.2.4 Placer County Farmland Conversion

As indicated by the DOC DLRP, the pace of urbanization from 1998 to 2000 increased significantly in Placer County compared to the period between 1996 and 1998 (DOC, 2002a). The Farmland Mapping and Monitoring Program (FMMP), created and published by the DLRP, maps millions of acres of California's public and private land to produce a major study that includes the evaluation of Farmland Conversion in California Counties, including Placer County.

In Placer County, 3,840 acres of undeveloped land was urbanized during the 2000 mapping cycle compared to 2,607 acres during the 1998 cycle; a 47 percent increase. Between 1998 and 2000, a total of 1,162 acres of farmland, 2,106 acres of grazing land and 572 acres of land classified as "other" (a category that includes wetlands, low-density residential areas, and brush or timberlands unsuitable for grazing) were rezoned to urban uses.

Since the FMMP began tracking changes in 1984, more than 18,000 acres of farmland and grazing land have been converted to urban uses. This growth rate earned the county a top 10 ranking among counties statewide in terms of acreage developed since 1994.

Placer County's agricultural land will continue to face development pressure in the future. Placer County's 2005 population was 301,560 (SACOG, 2004). HCD projects that the county's population will grow to 325,648 by 2010 and to 391,245 by 2020.

Following are examples of agricultural land that have been urbanized in Placer County, although this is not intended to be an all-inclusive list (see Chapter 3 of this report for a more complete list of projected land use/development in Placer County):

- Approximately 900 acres were developed with residential housing at the Del Webb Sun City development in Lincoln Hills.
- Approximately 170 acres were converted into the Turkey Creek golf course in Lincoln.
- Three large areas (127, 135 and 160 acres) were developed for homes and apartments near the intersection of SR 65 and Blue Oaks Boulevard.
- Shopping complexes that include the Galleria Mall and Home Depot were built along the SR 65 corridor in Roseville.
- The West Roseville Specific Plan area, approved and annexed into the City of Roseville, will convert 3,162 acres of agricultural land and open space to urban uses.

4.2.3 Farmland Classifications and Soil Patterns

4.2.3.1 Farmland Classifications

The DOC administers the FMMP, which produces maps and statistical data for California's agricultural resources. Agricultural land is rated according to soil quality and irrigation status. The best quality land is called Prime Farmland, while rural land less suited for crop production is usually categorized as grazing land. The following DOC-defined categories of farmland exist within Placer and Sutter counties and are shown in DOC's most recently published Important Farmlands Map (Figure 4-1).

Prime Farmland is land that has the best combination of physical and chemical characteristics for the production of crops. It has the soil quality, growing season and moisture supply needed to produce sustained high yields of crops when treated and managed, including water management, according to current farming methods. Prime Farmland must have been used for the production of irrigated crops at some time during the two update cycles prior to the mapping date. It does not include publicly owned lands for which there is an adopted policy preventing agricultural use. Prime Farmland also includes Prime Agricultural Farmland and must meet any of the following qualifications:

- All land which qualifies for rating as Class I or Class II in the Natural Resource Conservation Service land use capability classifications.
- Land which qualifies for rating 80 through 100 in the Storie Index Rating. The Storie Index expresses numerically the relative degree of suitability of a soil for general intensive agriculture as it exists at the time of evaluation. The rating is based on soil characteristics only and is obtained by evaluating such factors as soil depth, surface layer texture, subsoil characteristics, drainage, salts and alkali, and relief.
- Land which supports livestock used for the production of food and fiber and which has an annual carrying capacity equivalent to at least one animal unit per acre as defined by the U.S. Department of Agriculture.

- Land planted with fruit- or nut-bearing trees, vines, bushes or crops which have a nonbearing period of less than 5 years and which will normally return during the commercial bearing period on an annual basis from the production of unprocessed agricultural plant production not less than two hundred dollars ($200) per acre.

- Land which has returned from the production of unprocessed agricultural plant products an annual gross value of the previous 5 years. That is land that is planted with fruit- or nut-bearing trees, vines, bushes or crops that is currently being cultivated.

Farmland of Statewide Importance is land with a good combination of physical and chemical characteristics for the production of crops. It must have been used for the production of irrigated crops within the last three years. It does not include publicly owned lands for which there is an adopted policy preventing agricultural use.

Unique Farmland is land which does not meet the criteria for Prime Farmland or Farmland of Statewide Importance, but that is currently used for the production of specific crops having high economic value (as listed in the last three years of *California Agriculture* produced by the California Department of Food and Agriculture). It has the special combination of soil quality, location, growing season and moisture supply needed to produce sustained high quality or high yields of a specific crop when treated and managed according to current farming methods. Examples of such crops may include oranges, olives, avocados, rice, grapes, and cut flowers. It does not include publicly owned lands for which there is an adopted policy preventing agriculture use.

Farmland of Local Importance is either currently producing crops, or has the capability of production. Farmland of Local Importance is land other than Prime Farmland, Farmland of Statewide Importance, or Unique Farmland. This land may be important to the local economy due to its productivity. It does not include publicly owned lands for which there is an adopted policy preventing agricultural use.

Grazing Land is land on which the existing vegetation, whether grown naturally or through management, is suitable for grazing or browsing of livestock. The minimum mapping unit for Grazing Land is 40 acres. (Due to variations in soil quality, smaller units of Grazing Land may appear within larger irrigated pastures.

4.2.3.2 Soils in Southern Sutter County

The NRCS has established a GIS database which identifies soil units for several counties in California, including Sutter County. This GIS database, like the 1980 Placer County Soil Survey, is used as guidance to determine the agricultural potential of the soils within the project area, and aids the NRCS in their evaluation of the potential types of farmland in Sutter County.

Soils classifications for the study area, including southeastern Sutter County, southwestern Placer County and northwestern Sacramento County are shown on Figure 4-2. Soil types serve as partial indicators for growing agricultural products. However, crop production also depends on access to water, slope and aspect, and other local influences, in addition to its soil characteristics. Therefore, the soils shown on Figure 4-2 are for information only and will not be relied upon to assess the Parkway's farmland impacts.

4.2.3.3 Soils in Southwestern Placer County

The NRCS and the University of California Davis, Agricultural Extension Program completed a soil survey of the western portion of Placer County in 1980. This report serves as the framework for determining the agricultural potential of the soils within the project area, and aids the NRCS in their evaluation of the potential for farmland in Placer County.

Soils classifications for the project area, including southwestern Placer County and southeastern Sutter County, are shown on Figure 4-2. The Soil Survey also provides some indication of the varieties of crops that can be grown on each soil type.

4.2.4 Williamson Act Lands

Williamson Act lands comprise a significant portion of both Placer and Sutter counties. This section identifies current and historical trends in Williamson Land Act contract enrollment. Data regarding Williamson Act Land contract status in Placer and Sutter counties was acquired from the NRCS GIS database, the Placer County Planning Department GIS database, and the Sutter County Planning Commission files regarding Williamson Land Act contract status. Further information on the regulatory criteria and legislative framework of the act is discussed in Section 4.1.1.2 of this report.

4.2.4.1 Williamson Act Contracted Land in Sutter County

Unlike Placer County, Sutter County only recently (in January 2001) began participating in the Williamson Act. In 2001, the amount of new enrollments increased by 374,390 acres statewide compared to 2000. This was due to Imperial, Merced, Mono, and Sutter counties beginning to enroll land into Williamson Act contracts for the first time. Collectively, the four counties placed 384,175 acres of land under contract. Table 4-6 below shows the amount of newly enrolled acreage in Sutter County over the past three years and the county's statewide ranking in newly enrolled acreage.

Table 4-6
Sutter County Williamson Act Newly Enrolled Land

Year Enrolled	Acreage	Statewide Ranking
2001	6,802	6
2002	31,844	3
2003	12,620	2
Source: DOC, 2004b		

In 2002, Sutter County quintupled the amount of land enrolled in the act as shown in Table 4-6, followed by a sharp decline of newly enrolled acreage. Statewide, the Williamson Act program grew by 215,699 acres during 2002 and 2003. In comparison, the Williamson Act program grew by 367,317 acres during 2000 and 2001. The amount of newly enrolled counties, including Sutter County, and the sharp spikes in enrollment suggests that new enrollment levels are headed back down to pre-2001 averages. This represents a return to "normal" rates of increase after an enrollment increase spike from the four new counties. To date there has only been one cancellation for 1 acre of land in Sutter County.

4.2.4.2 Williamson Act Contracted Land in Placer County

During the spring of 2000, Placer County compiled a GIS database of Williamson Act contract information that identified each parcel under contract, the parcel size, its existing zoning, the date of enrollment, and the contract status. Conversion of the data into digital maps portraying contract status trends for the period from 1967 to 2000, including the information in the *Western Placer County Agricultural Land Assessment and Agricultural Land Conservation Evaluation Criteria*, confirmed a precipitous increase in the amount of land that was being taken out of Williamson Land Act contract (NFA, 2003).

Enrollment and Non-Renewal Trends

Placer County data indicates that the vast majority of acreage was placed under contract during the first 13 years of the program (1967-1980); acreage figures peaked around 1980 with a significant decline by

the end of the following decade (-17 percent) and a second, less significant decline (-4 percent), during the 1990s (see Table 4-7).

Table 4-7
Placer County Williamson Act Contract Status Trends (Acres)

Status	1967-1970	1971-1980	1981-1990	1991-2000
Active	18,695	53,230	44,058	42,244
New	18,695	39,808	11,342	3,777
Existing	0	13,422	32,718	38,467
Non-Renewal	0	5,273	19,251	3,308
Expired (out)	0	0	6,536	32,262

Source: NFA, 2003.

Table 4-7 appears to substantiate a trend in declining enrollment since non-renewal acreage increased 265 percent during the period between 1980 and 1990 with only a slight increase in non-renewals between 1991 and 2000. (Note: a nine-year non-renewal process accounts for the lag time between notice of non-renewal filing and expired status.)

County records show that no land was removed from Williamson Act until after 1980. Over the next 10 years, 6,536 acres, or 12 percent of the previous decade's acreage, was removed through expired contracts. In addition to non-renewal, more land was removed through cancellation, annexation, or public acquisition. The period between 1991 and 2000 saw the most significant increase in expired contracts. The result was removal of 32,262 acres of land, or 73 percent of the previous decade's land, from the program. This significant drop was largely offset by the amount of new enrollments into the program during the 10-year period, as evidenced by a mere 4 percent decrease in enrolled acres overall.

According to the *Williamson Land Act 2002 Progress Report*, prepared by the California Department of Conservation, over the past decade non-renewal of contracts has been the largest reason for the termination of Williamson Act contracted land. Furthermore, since 1991, more contracted acreage has been terminated through non-renewal than all of the other types of termination combined. Termination methods are discussed in Section 4.2.1.2.

Statewide, an average of 67,813 acres of land has expired annually from 1991 to 2001. In 1999, the greatest amount of land contracts expired, 118,391 acres, while 1993 was the year with the least amount of expired acreage with only 19,242 acres. Placer County ranked among the top ten counties with the greatest amount of non-renewals. In 1999, Placer County ranked 15th in the state for contract non-renewal, while in 2000 and 2001 it ranked 5th in the state with 2,658 acres and 1,306 acres of Williamson Land Act contract non-renewed land, respectively.

As indicated by the *Western Placer County Agricultural Land Assessment and Agricultural Land Conservation Evaluation Criteria* (NFA, 2003), the removal of farmland from Williamson Act protection in Placer County cannot be attributed to any single factor. It appears that it is the cumulative effect of several contributing factors. The aforementioned report provides more detailed information on the following causes of diminished Williamson Act contracted farmland:

- Suburbanization and fringe growth pattern in Placer County and throughout California;
- Federal policy and funding has facilitated the development of highway infrastructure and municipal wastewater treatment plants (WWTPs) to outlying areas—Placer Parkway, SR 65 Bypass, Roseville and Lincoln WWTPs;

- Water availability;
- Age of farmers;
- Regulatory uncertainty;
- Economics of production; and
- Land speculation. "Prime farmland" can be purchased and left unfarmed for two seasons, after which such farmland is no longer considered prime and may be potentially more likely to be developed. The causes mentioned above can also lead to land speculation.

4.3 IMPACT ANALYSIS

4.3.1 Significance Criteria

The significance criteria described below are used to assess potentially significant impacts which may be evaluated in CEQA environmental documents. (The FHWA has not adopted thresholds of significance for purposes of determining impacts under NEPA.)

Based on Appendix G of the CEQA Guidelines and professional judgment, the project could have a significant impact on agriculture if it would:

- Convert substantial amounts of farmland to non-agricultural use; or
- Convert more than 100 acres of Williamson Act contracted land to non-agricultural uses; or
- Conflict with adopted plans or policies pertaining to agriculture.

4.3.2 Approach to Analysis

Impacts on agriculture and farmland within the study area were assessed by tabulating and comparing project alternatives. The DOC maps and statistical data prepared for the FMMP and recent aerial photograph interpretation were used to determine the categories of farmland that exist within the study area as well as to quantify the potential impacts each alternative would have on all types of farmlands.

The amount of Williamson Land Act land that may be affected by the Parkway was quantified, as the intent of the legislation is to deter early conversion of agricultural and open space land, and conversion of contracted land to highway uses would require the premature termination of these contracts resulting in early conversion of land to non-agricultural uses.

The potential disruption of agricultural activities for each of the Build alternatives was considered at a general level of detail. The types and extent of potential impacts to agricultural operations were evaluated in the context of existing and future development within the study area. This analysis does not include evaluation of parcel-specific impacts due to disruption of agricultural activities; however, the conclusions reached in the *West Placer Agricultural Study* (summarized below) provide insight into the potential effects that this project and planned future development within the study area may have on existing agricultural activities.

> *In addition to reducing the inventory of agricultural land, conversion reduces opportunities for remaining operations. Land fragmentation increases conflicts with neighbors, reduces economies of scale, increases traffic on rural roads, and reduces the support services available to farmers and ranchers. While population growth may enhance marketing opportunities for some*

growers, the conversion of surrounding lands generally discourages farmers and ranchers from remaining in or entering the agricultural industry (NFA, 2003, p. 5-4).

4.3.3 Potential Direct Impacts

4.3.3.1 No-Build Alternative

Under the No-Build Alternative, land would not be acquired for Placer Parkway and the Parkway would not be constructed. There would not be any impacts on farmland.

4.3.3.2 Alternative 1 – the Red Alternative

Farmland Conversion

The Parkway would require the acquisition of a substantial amount of right-of-way. The alternatives under evaluation involve land that is designated as Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, and Grazing Land, as shown in Figure 3-5.

Table 4-8 shows the amount of important farmland that potentially would be converted by each corridor alignment alternative and segment. As this table shows, Alternative 1 would impact approximately 806.83 acres of farmland within the study area, including 355.60 acres of Farmland of Statewide Importance, Prime Farmland, and Grazing land in the Western Segment; 422.61 acres of Prime Farmland, Unique Farmland, Farmland of Statewide Importance, and Grazing land in the Central Segment; and 28.62 acres of Unique Farmland in the Eastern Segment.

Table 4-8
Important Farmland Potentially Affected by Alternative Alignments

Placer Parkway Segment	Type of Farmland					
	Farmland of Local Importance	Farmland of Statewide Importance	Prime Farmland	Unique Farmland	Grazing Land	Total Farmland
Western Segment – Alternatives 1, 2, and 3	0	280.81	62.88	0	11.91	**355.60**
Western Segment – Alternatives 4 and 5	0	239.10	32.64	0	32.94	**304.68**
Central Segment – Alternative 1	0	141.19	132.19	139.25	9.98	**422.61**
Central Segment – Alternative 2	1.58	183.32	246.72	162.49	11.73	**605.84**
Central Segment – Alternative 3	0	191.96	202.32	174.64	11.96	**580.88**
Central Segment – Alternative 4	0	66.8	128.71	260.6	3.05	**459.16**
Central Segment – Alternative 5	0	79.91	135.45	360.07	.31	**575.74**
Eastern Segment – All Alternatives	0	0	0	28.62	0	**28.62**

Source: Department of Conservation Farmland Mapping and Monitoring Program-2002 data for Placer County and 2004 data for Sutter County; and California Spatial Information Library GIS database.

Williamson Act Conflicts

Sutter County began enrolling in Williamson Act contracts in January 2001, so no long-term trend analysis is available for Williamson Act land in Sutter County. With the exception of pasture/non-native grasslands, most of the producing cropland in western Placer County has been, or is currently, under Williamson Act contracts. Recent enrollment data for Placer County identified in Section 4.2.4.2 shows that new enrollments have not been able to offset expired contracts. This demonstrates that Williamson Act contracts cannot be relied upon as a means of preserving agricultural land; rather other types of binding agreements such as agricultural easements need to be implemented to protect farmland. However, in areas that are moving steadily toward urbanization, Williamson Act contracts serve as a planning tool by slowing the conversion of agricultural land and forcing discussion of land use compatibility issues with developments proposed in proximity to farm operations, such as the project (NFA, 2003). Comparisons of time series aerial photographs and General Plan land use maps indicate the clear loss of farmland in the study area due to urbanization and annexations over the recent decades.

Alternative 1 has the potential to affect two properties that are currently under Williamson Act protection (see Figure 4-3), although cancellation of these two contracts has been proposed as part of the Placer Ranch Specific Plan development process. As shown in Table 4-9, 119.85 acres of land would be affected. Both of the affected properties lie within the Eastern Segment of Alternative 1. The Western and Central Segments of Alternative 1 do not pass through land that is protected by the act.

Table 4-9
Potentially Affected Williamson Act Land (in Acres)

Segments	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5
Western Segment-Riego Road	0.00	0.00	0.00	0.00	0.00
Western Segment – Sankey Road	0.00	0.00	0.00	0.06	0.06
Central Segment	0.00	123.85	120.71	120.71	120.35
Eastern Segment	119.85	119.85	119.85	119.85	119.85
Total	**119.85**	**243.70**	**240.56**	**240.62**	**240.26**

Source: Department of Conservation Farmland Monitoring and Mapping Program GIS data; Placer County 2002, Sutter County 2004

4.3.3.3 Alternative 2 – the Orange Alternative

Farmland Conversion

As shown in Table 4-8, Alternative 2 would potentially impact 990.06 acres of farmland and have the greatest total amount of farmland impacts within the study area. The Western Segment of Alternative 2 is the same as for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1. A total of 605.84 acres of all the farmland categories would be impacted within the Central Segment. The Eastern Segment of Alternative 2 is the same as for Alternative 1. Therefore, the potential impacts of this segment are the same as discussed for Alternative 1.

Williamson Act Conflicts

Alternative 2 would affect a total of eight parcels and 243.70 total acres of land currently under contract, all within Placer County. The Western Segment of Alternative 2 is the same as for Alternative 1.

Therefore, the potential impacts for this segment are the same as discussed for Alternative 1. In comparison to Alternative 1, Alternative 2 would pass through an additional six parcels in the Central Segment that total 123.85 acres of contracted land (see Figure 4-3 and Table 4-9). The Eastern Segment of Alternative 2 is the same as for Alternative 1. Therefore, the potential impacts of this segment are the same as discussed for Alternative 1.

4.3.3.4 Alternative 3 – the Blue Alternative

Farmland Conversion

Table 4-8 shows that Alternative 3 would impact 965.10 acres of important farmland within the study area. The Western Segment of Alternative 3 is the same as for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1. A total of 580.88 acres of all the farmland categories within the Central Segment would be impacted, except for Farmland of Local Importance. The Eastern Segment of Alternative 3 is the same as for Alternative 1. Therefore, the potential impacts of this segment are the same as discussed for Alternative 1.

Williamson Act Conflicts

Alternative 3 would affect a total of three parcels and 240.56 total acres of land currently under contract, all within Placer County. In comparison to Alternative 1, the Alternative 3 alignment would pass through one parcel in the Central Segment, affecting 120.71 acres of contracted land (see Figure 4-3 and Table 4-9). The Eastern Segment of Alternative 3 is the same as for Alternative 1. Therefore, the potential impacts of this segment are the same as discussed for Alternative 1.

4.3.3.5 Alternative 4 – the Yellow Alternative

Farmland Conversion

As shown in Table 4-8, Alternative 4 would potentially impact the least amount of total farmland at 792.46 acres of farmland within the study area. This includes 304.68 acres of impacts to Farmland of Statewide Importance, Prime Farmland, and Grazing land in the Western Segment, and a total of 459.16 acres of all the farmland categories within the Central Segment except for Farmland of Local Importance. The Eastern Segment of Alternative 4 is the same as for Alternative 1. Therefore, the potential impacts of this segment are the same as discussed for Alternative 1.

Williamson Act Conflicts

Alternative 4 would affect a total of four parcels and 240.62 acres of land currently under contract. The Sankey Road interchange in the Western Segment would potentially impact 0.06 acre of contracted land in Sutter County (see Figure 4-3 and Table 4-9). The Central Segment of Alternative 4 is the same as for Alternative 3. Therefore, the potential impacts for this segment are the same as discussed for Alternative 3.

4.3.3.6 Alternative 5 – the Green Alternative

Farmland Conversion

Table 4-8 shows that Alternative 5 would potentially impact 909.04 acres of farmland within the study area. This includes the same 304.68 acres of impacts to Farmland of Statewide Importance, Prime Farmland, and Grazing land as in Alternative 4 in the Western Segment; a total of 575.74 acres inclusive of all the farmland categories within the Central Segment except for Farmland of Local Importance; and

the same 28.62 acres of Unique Farmland impacts in the Eastern Segment as in all the corridor alignment alternatives.

Williamson Act Conflicts

Alternative 5 would affect a total of four parcels and 240.26 total acres of land currently under contract. The Western Segment of Alternative 5 is the same as for Alternative 4. Therefore, the potential impacts for this segment are the same as discussed for Alternative 4. The Western Segment of Alternative 5 is the same as for Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1. Alternative 5 passes through two parcels in the Central Segment, affecting 120.35 acres of contracted land.

4.3.3.7 Comparison of Alternatives

To compare impacts to farmland as a result of the implementation of one of the proposed Alternatives, it is helpful to establish thresholds or significance criteria on which to base the impact analysis. There are currently no specific significance thresholds within the CEQA Guidelines or CEQA Initial Study Checklist (Appendix G sample questions) regarding significance criteria or the establishment of a threshold for a project's potential impacts to Williamson Act contracted land. The CEQA Guidelines address Williamson Act contracted land in the context of determining whether a project is of statewide, regional, or areawide significance. Specifically, the CEQA Guidelines Section 15206(b)(3) states that "*The lead agency shall determine that a proposed project is of statewide, regional, or areawide significance if the project …would result in the cancellation of an open space contract made pursuant to the California Land Conservation Act of 1965 (Williamson Act) for any parcel of 100 acres or more.*

Applicable plans and policies created to provide guidance for development on and adjacent to Williamson Act lands in the project study area were reviewed for significance criteria. Neither the *Placer County General Plan* nor *Sunset Industrial Area Plan* were found to contain any policies that address specific impacts to Williamson Act contracted land, or put forth any criteria to determine the impacts. In addition, the Placer County Agricultural Commissioner was contacted to confirm that Placer County has no other criteria or thresholds with which to analyze impacts to Williamson Act land (Turner, 2006). At this time, there is no Williamson Act contracted land within the Sutter County portion of the project study area, and therefore there are no applicable Sutter County policies that apply. (Similarly, there are no specific acreage thresholds for the loss of prime farmland, unique farmland, farmland of statewide importance, or farmland of local importance.)

In the absence of any existing guidelines or policies with which to establish significance thresholds for determination of potential impacts to Williamson Act contracted land, the CEQA 100-acre threshold for assessing a project's potential to be of statewide, regional, or areawide significance was used in evaluating farmland impacts. All of the build alternatives would affect more than 100 acres of Williamson Act contracted land, and therefore all are considered to have significant impact on Williamson Act contracted land. The potential conversion of farmland associated with the alternatives (792.46 to 990.06 acres) is considered "substantial" and therefore significant.

Direct impacts of the build alternatives are summarized in Tables 4-8 and 4-9. The No-Build Alternative is not shown in these tables because no impacts to farmland would be associated with this alternative.

Alternative 1 would potentially affect 806.83 acres of farmland and the least amount of Williamson Act protected property at 119.85 acres.

Alternative 2 would potentially affect the greatest amount of farmland at 990.06. This alternative would also impact the greatest amount of Williamson Act contracted land, 243.70 acres.

Alternative 3 would potentially affect 965.10 acres of farmland and 240.56 acres of Williamson Act land.

Alternative 4 would potentially affect the least amount of farmland at 792.46 acres, and would affect 240.62 acres of Williamson Act land.

Alternative 5 would potentially affect 909.04 acres of farmland and 240.26 acres of Williamson act land.

4.3.3.8 Consistency with Plans and Policies

The policies listed in Table 4-10 were evaluated to assess the project's potential to conflict with adopted policies pertaining to agriculture or farmland within the study area. The consistency analysis of the policies demonstrates that the project may conflict with applicable policies. The potential policy inconsistencies are shown in Table 4-10. Some of the effects can be minimized through the avoidance, minimization, and/or design measures displayed in the table. A discussion of policy consistency is not presented for each alternative and/or segment, since the General Plan policies are common to all alternatives and equivalent effects are expected within each segment.

The Parkway would potentially be inconsistent with several of the analyzed agricultural policies evaluated in Table 4-10. Specifically, the project would be inconsistent with Sutter County agricultural policy number 6.A-1. In addition, the project would be inconsistent with Placer County policies 7.A.1, 7.A.3, 7.A.7, 1.H.3, and 1.H.4. The Parkway would also have inconsistencies with the Sunset Industrial Area Plan policies 1.E.1, 1.E.2, 1.E.3, and 1.E.4. These policies are aimed generally at preserving farmland and agricultural uses in the study area. It should be noted, however, that all farmland in the study area would not be preserved even if the project is not built (Section 4.3.5, Cumulative Impacts, presents more information on this issue.

4.3.4 Secondary and Indirect Impacts

No-Build Alternative

Under the No-Build Alternative, land would not be acquired for Placer Parkway and the Parkway would be constructed. There would not be any secondary or indirect effects on existing farmland.

Alternatives 1 Through 5

The study area for the analysis of secondary and indirect impacts is shown in Figure 3-7. A detailed discussion of secondary and indirect impacts associated with growth is included in Chapter 7 of this CIA. Secondary and indirect effects of the Parkway on the existing farmland would be similar for all build alternatives. The indirect impacts of the Parkway include the disruption of existing agricultural activities, fragmentation of farmland, adverse transportation effects, and the potential loss of agricultural support services. At this time, there is only program level information and no site-specific roadway features are designed. Therefore, the Tier 2 analysis will need to generate the information necessary to perform the farm-unit specific analysis. For example, Section 3.3.3 presents tables that list agriculturally zoned parcels that may be bisected or reduced in size as a result of each corridor alternative (varying from 500 feet to 1,000 feet wide). However, even though a parcel may be zoned for agricultural use, that does not mean that agricultural activities are currently taking place. A farm-unit specific analysis is infeasible at this time due to the size and range of corridor alternatives. As a result, a determination cannot be made at this time as to whether or not impacts to specific farm units or the potential disruption of agricultural activities can be avoided, minimized, or mitigated.

Agricultural Production and Farmland Fragmentation. The fragmentation of agricultural land within the study area could affect remaining farms through parcel size reduction, which consequently reduces the

Table 4-10
Sutter and Placer County Agricultural Policies

Jurisdiction	Policy Number	Policy	Potential Policy Inconsistencies	Avoidance, Minimization, or Standard Design Strategies	Consistency Determinations
Sutter County General Plan	1.F-1	The County shall require that new development adjacent to agricultural areas be designed to minimize conflicts with adjacent agricultural uses.	No conflict as proposed	Plans for the Parkway include the purchasing of right-of-way in excess of the amount required for the roadway to create a buffer between adjacent land uses and minimize land use conflicts. Furthermore, a roadway is not a sensitive land use that may conflict with agricultural operations.	Consistent
	1.F-2	The County shall require that all lands set aside or utilized for mitigation of development in Sutter County or the Natomas Basin demonstrates that its creation and existence will not adversely impact existing and/or future planned agriculture or urban development.	No conflict as proposed	Plans for the Parkway include the purchasing of right-of-way in excess of the amount required for the roadway to create a buffer between adjacent land uses and minimize land use conflicts specifically on agricultural lands. Once a specific roadway alignment is defined in Tier 2, PCTPA will work with the county agricultural commission to develop mitigation that minimizes impacts to the viability of individual farm units (and to identify mitigation lands, if appropriate, that will not harm existing or future agricultural activities in the county). In addition, PCTPA will continue to coordinate with regional planning agencies to resolve conflicts between the Parkway and future development, including urban uses, within the proposed corridor alignments.	Consistent
	1.F-3	The County shall continue to implement its Right to Farm Ordinance. (Agricultural Operations Disclosure, Ordinance Code 1013, Section 1330 or its successor.)	No conflict as proposed	PCTPA has and will continue to coordinate with regional planning agencies to resolve conflicts between the Parkway and future development within the corridor alignment alternatives. In addition, the Parkway is not a sensitive land use, nor is there any associated sensitive land uses proposed with the project that could affect agricultural operations.	Consistent
	1.F-4	The County shall protect agricultural operations from conflicts with non-agricultural uses by requiring buffers between proposed non-agricultural uses and adjacent agricultural operations.	No conflict as proposed	See response to Sutter County General Plan policy number 1.F-1.	Consistent

Table 4-10 (Continued)
Sutter and Placer County Agricultural Policies

Jurisdiction	Policy Number	Policy	Potential Policy Inconsistencies	Avoidance, Minimization, or Standard Design Strategies	Consistency Determinations
Sutter County General Plan (continued)	6.A-1	The County shall preserve agriculturally designated areas for agricultural uses and direct nonagricultural development to areas designated for urban/suburban growth, or rural communities and/or cities.	Placer Parkway corridor alignment alternatives would develop a high-speed highway in a predominantly agriculturally designated area. The current designation of the land within the Sutter Pointe Specific Plan area is primarily agricultural. There are no approved plans for the proposed Sutter Pointe Specific Plan area at this time and it is unclear where the urbanization is planned to occur.	While design options could be selected to minimize impacts to agricultural land stemming from construction of the Parkway, there are no feasible measures to preserve all existing agricultural land in Sutter County within the proposed alignments if Placer Parkway is constructed. Measures to avoid agricultural land and direct the Parkway to urbanizing areas within Sutter County will be reviewed in future analysis.	Potentially Inconsistent
	6.A-2	The County shall balance the needs of proposed urban and suburban development with the need to preserve agricultural lands.	No conflict as proposed	PCTPA has been and will continue to coordinate with regional planning partner agencies to resolve conflicts between the project, agricultural land, and future development within the corridor alignment alternatives.	Consistent

Table 4-10 (Continued)
Sutter and Placer County Agricultural Policies

Jurisdiction	Policy Number	Policy	Potential Policy Inconsistencies	Avoidance, Minimization, or Standard Design Strategies	Consistency Determinations
	6.A-6	Minimum parcel sizes in agriculturally designated areas shall be 20 acres in those areas containing orchard compatible soil and 80 acres in those areas with soils used primarily for row crops, field crops, and range land as shown on the Land Use Diagram. Historical uses and physical boundaries may be considered on a case by base basis. All parcels resulting from subdivisions or parcel maps shall contain the minimum required acreage for land use designation. Homesite parcels, as permitted in Policy 6.A-4, shall not exceed 2 acres unless the Environmental Health program grants a waiver for sewage disposal, in which case the parcel may be allowed for up to 5 acres. Remainder parcels shall meet the minimum parcel size of the agricultural land use designation.	Placer Parkway corridor alignment alternatives could create parcels that are smaller than the General Plan minimum size requiring a lot line adjustment or General Plan Amendment.	Avoid creating parcels smaller than the General Plan designated minimum size to the extent feasible. If unavoidable, the property may require a General Plan Amendment/Rezoning of the property to conform to acreage requirements, or the remainder parcels may be acquired.	Potentially Inconsistent
Sutter County General Plan	6.A-7	Agriculturally designated parcels (not located in a rural community) which do not	Placer Parkway corridor alignment alternatives could	Avoid creating agriculturally designated parcels smaller than the General Plan designated	Potentially Inconsistent

Table 4-10 (Continued)
Sutter and Placer County Agricultural Policies

Jurisdiction	Policy Number	Policy	Potential Policy Inconsistencies	Avoidance, Minimization, or Standard Design Strategies	Consistency Determinations
(continued)		meet the minimum acreage requirement, as specified by the land use policies of the General Plan, may be adjusted by lot line adjustment pursuant to §65412(d) of the Government Code under the following conditions as specified in the Zoning Code: Are in conformance with the General Plan policies for home sites; or Are for agricultural support facilities that have been approved by use permit; or Are necessary in order to comply with the requirements of the Sutter County Ordinance Code provision pertaining to Environmental Health, Zoning, or Building regulations for the maintenance or expansion of existing improvements, or Are an adjustment between two adjoining lots, one, or both of which are less than 20 or 80 acres in area as identified on the General Plan land use diagram.	create parcels that are smaller than the General Plan minimum size requiring a lot line adjustment or General Plan Amendment.	minimum size to the extent feasible. If unavoidable, the property may require a general plan amendment/rezoning of the property to conform to acreage requirements, or the remainder parcels may be acquired.	
Placer County General Plan	7.A.1	The County shall protect agriculturally-designated areas from conversion to non-agricultural uses.	The project would convert agriculturally designated land to a high-speed highway.	Plans for the project include the purchasing of right-of-way in excess of the amount required for the roadway to create a buffer between adjacent land uses and minimize land use conflicts. While design options could be selected to minimize impacts to agricultural land stemming from construction of the Parkway, there are no feasible measures to preserve all existing agricultural land in Sutter County within the proposed alignments if Placer Parkway is constructed. Lack of access, interchange interchanges to the Parkway will assist in reducing conversion of agricultural lands, particularly in the Central Segment. See response to Sutter County General Plan policy number 6.A-1.	Potentially Inconsistent

Table 4-10 (Continued)
Sutter and Placer County Agricultural Policies

Jurisdiction	Policy Number	Policy	Potential Policy Inconsistencies	Avoidance, Minimization, or Standard Design Strategies	Consistency Determinations
Placer County General Plan (continued)	7.A.2	The County shall ensure that unincorporated areas within city spheres of influence that are designated for agricultural uses are maintained in large parcel sizes of 10-acre minimums or larger.	Placer Parkway corridor alignment alternatives could create parcels that are smaller than the agricultural 10-acre minimum within the City of Roseville's Sphere of Influence.	Avoid creating agriculturally designated parcels smaller than the General Plan designated minimum size to the extent feasible. If unavoidable, the property may require a general plan amendment/rezoning of the property to conform to acreage requirements, or the remainder parcels may be acquired.	Potentially Inconsistent
	7.A.3	The County shall encourage continued and, where possible, increased agricultural activities on lands suited to agricultural uses.	The project would convert land in agricultural production and decrease the total amount of available agricultural land in the county.	See response to Placer County General Plan policy number 7.A-1.	Potentially Inconsistent
	7.A.7	The County shall maintain agricultural lands in large parcel sizes to retain viable farming units.	The Parkway would reduce the size of some agricultural operations by bisecting or acquiring a portion of the farm unit for right-of-way purposes. In addition, the project would create smaller parcels which may reduce the viability of the farm unit.	Evaluate the alternatives to determine which would result in the least amount of agricultural land for highway right-of-way. Also, while design options could be selected to minimize impacts to individual farm units and preserve the viability of some farm operations, there are no feasible measures to preserve all existing farm units and retain the viability of all farm units in the study area.	Inconsistent
	1.H.3	The County will maintain large-parcel agricultural zoning and prohibit the subdivision of agricultural lands into smaller parcels unless such development meets the following conditions: The subdivision is part of a cluster project and such a project is permitted by the applicable zoning; The project will not conflict with adjacent agricultural operations; and The project will not hamper or discourage long-term agricultural operations either on site or on adjacent agricultural lands.	The Parkway would reduce the size of some agricultural designated parcels by bisecting or acquiring a portion of the parcel for right-of-way purposes.	See response to Placer County General Plan policy number 7.A.7.	Inconsistent

Table 4-10 (Continued)
Sutter and Placer County Agricultural Policies

Jurisdiction	Policy Number	Policy	Potential Policy Inconsistencies	Avoidance, Minimization, or Standard Design Strategies	Consistency Determinations
Placer County General Plan (continued)	1.H.4	The County shall allow the conversion of existing agricultural land to urban uses only within community plan areas and within city spheres of influence where designated for urban development on the General Plan Land Use Diagram.	The Parkway would convert agricultural land to a high-speed highway outside of existing community plan areas and cities' SOIs.	Evaluate the alternatives to determine which would result in the least amount of agricultural land being converted to urban uses. There are no design measures that could avoid placing any of the alternatives entirely within areas designated for urban development.	Inconsistent
Sunset Industrial Area Plan	1.E.1	The County shall protect agriculturally-designated areas from conversion to non-agricultural uses.	The Parkway would convert agriculturally designated land to a high-speed freeway.	See response to Sutter County General Plan policy number 6.A-1.	Inconsistent
	1.E.2	The County shall ensure that unincorporated areas within the city spheres of influence that are designated for agricultural uses are maintained in large parcel sizes of 10-acre minimums or larger.	Placer Parkway corridor alignment alternatives could create parcels that are smaller than the policies 10-acre minimum within the City of Roseville's Sphere of Influence.	See response to Placer County General Plan policy number 7.A-2.	Potentially Inconsistent
	1.E.3	The County shall encourage continued and, where possible, increased agricultural activities on lands suited to agricultural uses.	The Parkway would convert land in agricultural production and decrease the total amount of available agricultural land in the county.	See response to Sutter County General Plan policy number 6.A-1.	Inconsistent
	1.E.4	The County shall maintain agricultural lands in large parcel sizes to retain viable expanded farming units.	The Parkway would reduce the size of some agricultural operations by bisecting or acquiring a portion of the farm unit for right-of-way purposes. In addition, the project would create smaller parcels which may reduce the viability of the farm unit.	See response to Placer County General Plan policy number 7.A.7.	Inconsistent

Sources: Sutter and Placer County General Plans, Agricultural Elements

amount of land available for agricultural production. This could decrease the ability of a farm to compete in the local market against larger agricultural producers. Also, current land uses that require large contiguous amounts of land, such as rice cultivation and cattle ranching, would be more susceptible to fragmentation than other types of agricultural activities, because large tracts of land are needed to sustain a high enough yield to hold down per-unit production costs.

Transportation Challenges. The project would provide access to large amounts of developable land. As more people inhabit this traditionally agricultural area, agricultural machinery and trucks may have to compete with residential traffic on local roadways. The differences in vehicle speeds and size can create potentially dangerous and frustrating situations for both suburban residents and for agricultural equipment operators. Also, in remote areas within the study area, livestock can be driven from pasture to pasture using public and private roads. However, as traffic increases, livestock producers may need to use trucks and trailers to transport livestock as an added safety measure. As documented by interviews with farmers in the project area (see growth inducement discussion in Chapter 7 of this CIA), some farmers interviewed considered that the Placer Parkway could have a positive effect on agriculture in the short term by taking commuters off local roadways, reducing conflicts with farm equipment and contributing to long-term sustainability of farming in the area.

Agricultural Support Services. For agricultural activities to remain viable, farming supply companies, heavy farm equipment sales and repair facilities, agricultural processing plants, and marketing companies need to be in close proximity to farming/ranching operations. However, for these support services to remain viable they need a customer base, i.e., agricultural producers. As agricultural land is converted to a transportation use within the study area, the Parkway could contribute to a gradual decline in support services as fewer agricultural producers remain in the study area and the economic base and market for agricultural services shrinks, causing agricultural support services to move out of the region. If support services were to close or relocate farther from their existing locales, there would be an additional adverse effect on agricultural producers associated with transportation.

4.3.5 Cumulative Impacts

No-Build Alternative

Under the No-Build Alternative, land for the Parkway would not be acquired and the Parkway would not be constructed. There would not be any cumulative impacts on farmlands under the No-Build Alternative.

Alternatives 1 Through 5

Section 3.3.5 describes the future cumulative development scenario assumed for the purposes of this analysis. Potential adverse impacts on farmlands associated with the Parkway could contribute to cumulative impacts associated with planned and proposed development in the study area (refer to Figure 3-4). The combined effects of farmland conversion and Williamson Act contract cancellation or non-renewal could increase adverse impacts associated with individual projects, through the loss of agricultural resources or support services and increasing conflicts with urban development. All five alternatives would cross the Central Segment in a general east-west direction, potentially intensifying the farmland fragmentation impacts and agricultural viability of farms affected by existing and planned high capacity power lines in the western portion of the Central Segment, since these facilities are generally aligned in a north/south direction and can impede agricultural activities such as rice seeding or crop dusting.

The potential amount of farmland converted and Williamson Act contracted land impacted by the project alternatives are contained in Tables 4-8 and 4-9. Depending on the alternative, the project could impact between 792.46 and 990.06 acres of farmland and between 119.85 and 243.70 acres of Williamson Act contracted land.

The anticipated urban development and roadway projects would convert an additional 5,203 acres of Farmland of Statewide Importance, no new disturbance to Farmland of Local Importance, 1,429 acres of Prime Farmland, 6,687 acres of Unique Farmland, and 250 acres of Grazing land, as shown on Table 4-11. The converted farmland would also include nearly 717 acres of Williamson Act contracted land within Sutter and Placer counties, as shown in Tables 4-11 and 4-12.

Table 4-11
Cumulative Impacts to Farmland (Acres)

Type of Farmland	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5	Cumulative Projects (excluding Placer Parkway)
Farmland of Local Importance	0	1.58	0	0	0	0
Farmland of Statewide Importance	425.35	464.24	472.77	305.90	319.01	5,203.00
Prime Farmland	195.90	309.46	265.20	161.35	168.09	1,429.00
Unique Farmland	168.69	190.70	174.64	289.22	388.69	6,687.00
Grazing Land	22.28	23.83	23.87	35.99	32.25	250.00
Total of all types of Farmland	**806.83**	**990.06**	**936.48**	**792.46**	**908.04**	**13,569.00**
Total for Cumulative Projects, including Placer Parkway	**14,375.83**	**14,559.06**	**14,505.48**	**14,245.46**	**14,477.04**	**N/A**
Source: URS and NFA GIS database, with NFA data analysis						

Table 4-12
Cumulative Impacts to Williamson Act Land (Acres)

Land	Alternative 1	Alternative 2	Alternative 3	Alternative 4	Alternative 5	Cumulative Projects
Williamson Act Land	119.85	243.70	240.56	240.62	240.26	717
Total Including Cumulative Scenario	836.85	960.70	957.56	957.62	957.26	N/A
Source: URS and NFA GIS database, with NFA data analysis						

The cumulative effects of the region's growth is likely to cause continued fragmentation of existing farmland, exacerbate transportation challenges and other conflicts, and decrease the likelihood that agricultural support services could continue to operate in the study area. The project's contribution to these effects would be cumulatively considerable.

Statewide Farmland and Williamson Act Conversion

The California Department of Conservation—Division of Land Resource Protection (DLRP) continually compiles data, monitors, and maps the inventory of farmland and Williamson Act enrolled lands on a

statewide level. The discussion below summarizes the conclusions reached in the DLRP's most recent farmland and Williamson Act reports (Farmland Conversion Reports from 1992 to 2002 and the California Land Conservation Act Status Reports From 1991 through 2006, respectively), and provides a brief analysis of the project's effect on farmlands and Williamson Act land from a statewide perspective.

Farmland Conversion. As shown in Table 4-13, an average of 84,324 acres of agricultural land was taken out of production during each two-year reporting cycle for the ten-year period beginning in 1992 and ending in 2002. There was also a corresponding increase in urbanization of agricultural land, which averaged 70,608 acres over the same ten-year reporting period. Other factors that reduced the amount of farmland included leaving land fallow, ecological restoration projects, rural residential development, and mining operations, which are not reflected in the table but explain the difference between the two values. Additional historical data are available from the DLRP via their website (DLRP, 2007), which contains all of the two-year farmland conversion reports and summary tables from 1992 up to 2002.

Table 4-13
Statewide Farmland Conversion Statistics 1992 through 2002

Land	1992-1994	1994-1996	1996-1998	1998-2000	2000-2002	Total Conversion 1992-2002	Average Change per reporting cycle (acres)
Net Agricultural Land Lost (acres)[1]	51,487	(2,487)[2]	94,292	104,767	173,560	421,619	84,324
Agricultural Land Converted to Urban Uses (acres)	49,555	53,034	67,536	90,165	92,750	353,040	70,608

Sources: Department of Conservation-Division of Land Resource Protection California Farmland Conversion Reports 1992 through 2002 (published biannually beginning in 1994 to 2004).

Notes:
1. Table includes all agricultural land which consists of Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, Irrigated Farmland, Nonirrigated Farmland, and Grazing Land.

2. Siskiyou County Farmland of Local Importance was reevaluated and revised by the County during the 1996 update. This resulted in large-scale decreases in Grazing Land and Other Land, and a corresponding increase in Farmland of Local Importance which led to a net increase in agricultural land.

As Table 4-8 illustrates, depending on the alternative selected, the project could impact between 792.46 and 990.06 acres of farmland. For the purposes of this analysis, the Placer Parkway facility is considered an urban use even though a portion of the right-of-way would be preserved as open space. If the biannual average amount of agricultural land lost to urbanization in California is approximately 84,324 acres, the project's contribution to the decrease in agricultural land would be between 0.8 percent and 1.2 percent of the biannual loss of agricultural land of one reporting cycle. It is also important to note that the project, as proposed, would be built out over more than two years, which would decrease the project's contribution to the biannual loss of agricultural land.

Williamson Act Conversion. The California Land Conservation Act 2006 Status Report (DOC, 2006) states that, as of January 2005, almost 16.6 million acres of land were enrolled in the Williamson Act statewide. This is an increase over the amount of land enrolled in the program in 1990, which was just below 16 million acres of land. Even though the Williamson Act was signed into law over 30 years ago,

new counties have recently been adopting the program so that now 54 of the state's 58 counties have adopted the Williamson Act and have procedures in place to enroll farmland into the program. According to the Department of Conservation (DOC, 2006), in the last five years alone, Imperial, Merced, Modoc, and Sutter counties have begun enrolling lands into the act. Conversely, agricultural producing areas that have traditionally enrolled lands in the program have allowed the non-renewal of contracts and even cancellations for urban expansion. Riverside, San Joaquin, Sacramento, and Placer counties have seen the sharpest declines in enrollment. Nevertheless, newly enrolled lands have exceeded nonrenewals in eight of the last fifteen years for a net increase in land that is currently under contract, as displayed in Table 14-14.

Table 4-14
Statewide Williamson Act Enrollment Statistics 1990 through 2005

Calendar Year	Total Reported Acreage[1]
1990	15,969,159
1991	15,946,783
1992	15,942,758
1993	15,952,365
1994	15,952,144
1995	15,908,538
1996	15,812,511
1997	15,889,804
1998	15,925,301
1999	15,977,116
2000	15,936,437
2001	16,344,433
2002	16,504,721
2003	16,560,132
2004	16,640,193
2005	16,581,920

Sources: Williamson Act Statewide Enrollment 1990-2003 and California Land Conservation Act 2006 Status Report

Note: 1. Totals include both continuing term and nonrenewal Williamson Act contracted land, as well as a small amount of other enforceably restricted non-Williamson Act acreage.

The amount of Williamson Act contracted land potentially impacted by each of the project Alternatives is listed in Table 4-9, and ranges between 119.85 and 243.70 acres, depending on the project alternative. Based on the amount of enrolled land in 2005, and assuming that there is no further increase or decrease in the amount of land enrolled in the act (i.e., assuming that enrollment becomes static, contrary to the increases seen over the past fifteen years), the project would result in a slight decrease in the amount of land enrolled in the program, between 0.0007 percent and 0.0015 percent of the current statewide total. As shown in Table 4-14, over the fifteen years reported, there has been a statewide trend of increased enrollment in the Williamson Act which is offsetting the non-renewal and/or cancellation of Williamson Act contracts. Nevertheless, since the contract terms are ten years in length, it is difficult to predict what

the future statewide trend will be. The Department of Conservation has not published any predictions of future enrollment with which to base future planning assumptions. This CIA does not attempt to forecast Williamson Act enrollment trends.

4.3.6 Potential Watt Avenue Interchange Impacts

The interchange with Placer Parkway and a potential Watt Avenue roadway extension is included in this farmland analysis since such a future interchange could affect farmland in the study area. There are no precise locations or alignments identified for this potential interchange to the Parkway, with the exception of the conceptual locations shown on Figure 2-3. Any future Watt Avenue extension would be subject to independent and future environmental analysis separate from the Tier 2 analysis to be completed for the Placer Parkway. The direct, indirect, and cumulative impacts on farmland increase with a Watt Avenue interchange to the Parkway. The discussion and table below focuses on the incremental direct impacts that a Watt Avenue interchange could have on important farmland by type.

Farmland Conversion

The potential amount and type of farmland converted by the potential future Watt Avenue interchange are contained in Table 4-15. Depending on the alternative or option selected, the interchange could affect an additional 1.88 acres to 10.95 acres of farmland.

Table 4-15
Watt Avenue Interchange Impacts on Farmland (Acres)

Watt Avenue Interchange	Farmland of Statewide Importance	Farmland of Local Importance	Prime Farmland	Unique Farmland	Grazing Land
Alternative 1 (Option 1)	0	0	0.55	0	1.33
Alternative 1 (Option 2)	0	0	0	10.35	0
Alternative 2 (Option 2)	0	0	0	8.78	0
Alternatives 3 and 4	0	0	0	5.14	0
Alternative 5	0.01	0	0	10.94	0
Source: URS and NFA GIS database, with NFA data analysis					

Williamson Act Conflicts

No Williamson Act protected parcels are in the vicinity of the potential Watt Avenue interchange to the Placer Parkway. Therefore, the Watt Avenue interchange would have no impact on Williamson Act land in the study area and the new interchange would not add to the severity of project impacts to Williamson Act protected parcels.

4.3.7 Avoidance, Minimization, and/or Mitigation Strategies

The project would result in significant adverse impacts to agricultural resources. The following mitigation strategies could be considered to decrease the potential for this project to adversely affect agricultural resources.

Farmland Conversion

Strategy #1. Conversion of farmland to non-farmland uses could be mitigated by preserving an equal amount of agricultural land within the respective counties in those areas that have not been approved or proposed for urban uses (i.e., primarily in the central segment). This would be consistent with Placer County's current policy of requiring 1:1 replacement for agricultural land impacted by proposed projects where feasible. The no-development buffer zone as proposed would meet much of this mitigation goal, since it would preserve agricultural and open space uses outside of the actual roadway alignment, which would vary in width but could be as much as 350 feet wide. The corridor would be approximately 500 feet wide in the portions of the study area that are proposed for urban uses and where continued viability of agricultural uses is unlikely. The corridor would be 1,000 feet wide, however, through the central segment, where continued agricultural use appears most viable. In this portion of the study area, the 350-foot roadway would leave 650 feet of buffer area where agricultural uses potentially could be preserved through mechanisms discussed below. This would exceed the 1:1 replacement goal, reaching almost a 2:1 replacement/preservation ratio if all of the buffer could be preserved for agricultural use, but it is possible that some of the area may not be viable as farmland as a result of parcel splitting or other impacts on particular farm units. This mitigation strategy should be coordinated with the Placer and Sutter County Agricultural Commissioners, particularly in areas where agricultural lands will have been converted to other uses prior to Placer Parkway Tier 2 environmental review, to ensure that a fair share mitigation strategy is promoted. This mitigation strategy would reduce impacts to farmlands.

Strategy #2. Agricultural easements administered by land trusts (examples include Placer Land Trust, Ducks Unlimited, The Nature Conservancy, American Farmland Trust) or other non-profit entities on agricultural parcels should be considered as a means to mitigate for the permanent loss of agricultural land within the Sutter and Placer County region. Another option would be the Agricultural Land Stewardship Program established by the California Farmland Conservancy, administered by the Division of Land Resource Protection under the DOC, which is a grant program that aids in purchasing and/or partially funding agricultural easements. Under this program, any property proposed for easement must meet certain criteria (e.g., location, soil quality, water availability) that make it a priority for the potential easement holder organization to pursue an easement. If the potential easement holder wishes to pursue an easement on the proposed property, the organization would negotiate terms with the landowner, including price (unless the easement is to be donated) and restrictions. If the easement is to be purchased, the potential easement holder may seek grant funding under this program.

If a landowner wishes to establish an agricultural easement and wants the easement to be administered by Placer County, then specific county criteria for evaluating agricultural easements must be followed. Each potential acquisition will be evaluated through a two-tiered approach: a "coarse filter" analysis of GIS data will be followed by an onsite analysis of property characteristics and resources. The Placer County Agricultural Commission undertakes this review and advises the Placer County Board of Supervisors regarding specific easement transactions. The Placer County Agricultural Commission uses the criteria set forth in the *Western Placer County Land Assessment*. The criteria are available on the Placer County Agricultural Commission website (Placer County Agricultural Commissioner, 2006).

Also, as mentioned in Section 3.1.4.4, the PCCP may be finalized and approved prior to right-of-way purchase for the Placer Parkway project. The PCCP is being developed to help protect the diversity of plant and animal communities, including endangered and other special status species. If and when approved, the PCCP would set aside large tracts of contiguous land for conservation purposes. These properties would help to maintain the diversity of flora and fauna in the county, and in most (but not all) cases could help preserve farmland, as well, where proposed preserve areas would serve agricultural purposes as well as maintain a diversified plant and animal community. For instance, the Placer Land Trust purchased a 500-acre property in western Placer County in March 2006, as a conservation easement

to be permanently protected as both grazing land and vernal pool grassland habitat (Placer Land Trust, 2006).

At this time, Sutter County does not have similar established criteria, or a program to review, execute, and administer agricultural easements. The Natomas Basin Habitat Conservation Plan may provide a structure that would be suitable for such mitigation.

Disruption to Agricultural Activities

The following mitigation strategies should be considered during future project planning to diminish the project's potential indirect effects on agricultural activities within the study area.

Strategy #1. The ultimate Placer Parkway design would include a six-lane facility. However, all six lanes may not be necessary when the Parkway is initially constructed and for some years into the future. An interim design of fewer than six lanes is probable, and the project may be built in phases. Therefore, leasing agreements to farm portions of the future right-of-way should be pursued in order to aid in offsetting the early conversion of agricultural land for transportation purposes and to encourage the continuation of agricultural production as long as feasible.

Strategy #2. Where parcels are bisected by a segment of the proposed highway, but enough usable land remains on either side of the highway to be cultivated, access for livestock, machinery, and/or drainage should be constructed where feasible in order to provide access to both portions of the property so that the land is still viable for farming operations. As discussed previously this strategy may add significant costs to the project which could affect mitigation feasibility.

Williamson Act Conflicts

Even though in some instances impacted Williamson Act properties may stay enrolled in the Williamson Act program, there are no feasible avoidance, minimization, mitigation, or design measures that could be implemented to diminish potential impacts on Williamson Act enrolled lands.

Consistency with Plans and Policies

Design options could be selected to minimize potential impacts to agricultural land; however, there are no feasible measures to ensure that the Parkway would be consistent with all of the Sutter and Placer County agricultural policies inherent in the Sutter County General Plan, the Placer County General Plan, and the SIAP.

The project may be inconsistent with Sutter County policies 6.A-1, 6.A-6 and 6.A-7, Placer County policies 7.A.1, 7.A.2, 7.A.3, 7.A.7, 1.H.3, and 1.H.4, as well as Sunset Industrial Plan Area policies 1.E.1, 1.E.2, 1.E.3, and 1.E.4. If the creation of parcels larger than the respective General Plan designated/ Zoning Ordinance minimum size is not feasible, then General Plan Amendments or Zoning Ordinance Amendments for the affected properties should be enacted to make them consistent with ordinance requirements. Alternatively, Sutter and Placer counties could enact a potential zoning overlay district for parcels reduced in size by Placer Parkway that would recognize the special non-conforming nature of these properties. Alternatively, the project proponents could purchase remainder parcels in their entirety so that there would not be a zoning consistency issue altogether.

4.3.8 Analysis to be Undertaken in Tier 2

This Tier 1 level of analysis focuses on broad environmental issues. Analysis of potential impacts to individual farm units and the associated disruption of agricultural activities or viability will not be

undertaken until a specific roadway alignment is identified within the selected corridor and the geographic area of impact is narrowed. The information necessary to perform the farm unit-specific analysis is expected to be generated during the preparation of the Tier 2 environmental document. At that time, individual farms affected by the roadway will be examined to determine how impacts can be reduced; such as, by provision of frontage roads and/or overcrossings to maintain access, merging or trading of remnant parcels to facilitate continued viability of individual farm units, or purchasing non-viable remnant parcels and rezoning them for alternative uses.

5.0 SOCIAL CONDITIONS

5.1 REGULATORY SETTING

5.1.1 Pertinent Laws and Legislation

Both NEPA and CEQA require consideration of social and economic impacts. In addition, other types of legislation influence community impact assessment, including requirements for analysis of environmental justice impacts and impacts to public recreation resources. Local jurisdictions may also adopt goals and policies that address population growth and distribution or quality of life issues related to transportation systems. Relevant laws and guidelines are described below.

5.1.1.1 National Environmental Policy Act

NEPA calls for the integrated use of social sciences to assess the potential impacts of federal projects on the "human environment." Regulations issued by the Council on Environmental Quality for implementing NEPA suggest that the "human environment" should be interpreted comprehensively to include "the natural and physical environment and the relationship of people with that environment" (40 Code of Federal Regulations [CFR] 1508.14). Agencies are directed to assess economic and social effects of projects, whether direct, indirect, or cumulative (40 CFR 1508.8).

5.1.1.2 California Environmental Quality Act

CEQA defines "environment" as physical conditions (including land, air, water, minerals, flora, fauna, noise, and objects of historic or aesthetic significance) that do not include social or economic resources (CEQA Section 21060.5). CEQA does not treat social and economic changes that might result from a project as significant environmental effects, although they may be used to determine that a physical change in the environment might be significant (CEQA Guidelines Sections 15064(e), 15131 and 15360). CEQA requires that environmental documents "Discuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Included in this are projects which would remove obstacles to population growth. . . .Increases in the population may further tax existing community service facilities so consideration must be given to this impact. Also discuss the characteristic of some projects which may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively. It must not be assumed that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment" (CEQA Guidelines, Section 15126.2(d)).

5.1.1.3 Executive Order 12898 (Environmental Justice)

Executive Order 12898, "Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations" requires each federal agency (or its designee) to take the appropriate and necessary steps to identify and address "disproportionately high and adverse" effects of federal projects on the health or environment of minority and low-income populations to the greatest extent practicable and permitted by law.

5.1.1.4 Section 4(f)

Section 4(f) of the U.S. Department of Transportation (DOT) Act of 1966 established a new requirement for consideration of park and recreational lands, wildlife and waterfowl refuges, and historic sites in transportation project development. The law, now codified in two places (49 U.S. Code [USC] 303c and 23 USC 138), is implemented by the Federal Highway Administration and Federal Transit Administration through regulations found at 23 CFR 771.135. Section 4(f) applies to all projects that receive funding from

or require approval by an agency of the DOT, including FHWA. Recreation resources protected under Section 4(f) include any formally designated, publicly owned park or recreation area.

Before approving a project that affects a Section 4(f) resource, FHWA must find that there is no prudent and feasible alternative and that the selected alternative minimizes harm to the resource. If there is a prudent and feasible alternative that completely avoids 4(f) resources, it must be selected. If there is no prudent and feasible alternative that avoids 4(f) resources, or if the impacts to the resources are minimal, FHWA has some discretion in selecting the alternative that causes the least harm to 4(f) resources.

FHWA determines whether Section 4(f) applies to a resource, reviews assessments of each alternative's impacts to 4(f) properties, and determines whether the law allows the selection of a particular alternative after consulting with the Department of Interior. For the purpose of this analysis, resources protected by Section 4(f) that could be affected by project alternatives are identified, and potential use of the resource is determined to establish whether the Section 4(f) requirements for detailed evaluation, consultation, and coordination would be triggered.

5.1.1.5 The Uniform Relocation Assistance and Real Property Acquisition Act of 1970

The Uniform Act addresses the need for consistent and equitable treatment of persons displaced from their homes or farms by federally assisted programs. It specifies the due process to be followed in real property acquisitions and relocation of displaced individuals, families, businesses, farms, and nonprofit organizations. It provides for payment of moving expenses, housing rental or purchase supplements, down payment assistance, etc.

5.1.2 Adopted Goals and Policies

5.1.2.1 SACOG Metropolitan Transportation Plan

SACOG's Metropolitan Transportation Plan 2027 contains the following goals:

1. *Overarching Goal: Quality of Life*. Develop a fully-integrated, multi-modal transportation system to serve as a catalyst to enhance the quality of life enjoyed by the current and future residents of the Sacramento region.

2. *Access and Mobility*. Improve access to goods, jobs, services, housing and other destinations; provide mobility for people and goods throughout the region, in a safe, affordable, efficient and convenient manner.

6. *Equity*. Pursue a transportation system that addresses the needs of all people in all parts of the region and assure that impacts of transportation projects don't adversely affect particular communities disproportionately.

5.1.2.2 Sutter County

Sutter County, as part of its most recent General Plan update process, identified a 10,500-acre "Industrial-Commercial Reserve" (I-C Reserve) in the agricultural southern area of the county and decided to allow up to 3,500 acres of industrial and commercial development within that area, as discussed in Chapters 3 and 4. The voter-approved Sutter Pointe Specific Plan, however, will allow mixed use development in this area in the future (if the EIR, General Plan amendment and Specific Plan are approved). Lennar Communities is now planning a master-planned community for this area, which lies mainly east of SR 70/99 in the project study area.

5.1.2.3 Placer County

The Placer County General Plan contains goals and policies aimed at improving the balance between jobs and housing, including the following (Placer County, 1994):

Goal 1.M: To work toward a jobs-housing balance.

Policy 1.M.1. The County shall concentrate most new growth within existing communities, emphasizing infill development, intensified use of existing development, and expanded services, so individual communities become more complete, diverse, and balanced.

Policy 1.M.2. The County shall encourage large residential projects to be phased or timed to occur simultaneously with development that will provide primary wage-earner jobs.

Policy 1.M.3. The County shall encourage the creation of primary wage-earner jobs, or housing which meets projected income levels, in those areas of Placer County where an imbalance between jobs and housing exists.

5.1.2.4 City of Roseville

The City of Roseville's General Plan 2020 (City of Roseville, 2004a) contains numerous goals and policies that address growth management issues, including the following:

Goal 1: The City shall proactively manage and plan for growth.

Goal 2: The City shall encourage a pattern of development that promotes the efficient and timely provision of urban infrastructure and services, and preserves valuable natural and environmental resources.

Goal 3: Growth shall mitigate its impacts through consistency with the General Plan goals and policies and shall provide a positive benefit to the community.

Goal 6: The City shall manage and evaluate growth in a regional context, not in isolation.

Goal 7: Potential population growth in Roseville must be based on the long-term carrying capacities and limits of the roadway system, sewer and water treatment facilities, and electrical utility service, as defined in the Circulation Element and the Public Facilities Element.

Goal 9: Growth should be managed to minimize negative impacts to existing businesses and residents within the City.

Goal 10: Growth should be planned in a way that addresses the appropriate interface between City and County lands.

Goal 12: The City shall use growth management as a tool to maintain the City's identity, community form, and reputation in the region, to maintain high levels of service for residents and to influence projects outside the City's boundaries that have the potential to affect the quality of life and/or services that are provided to residents.

Goal 13: New development to the west of Fiddyment Road shall be consistent with the City's desire to establish an edge along the western boundary of the City that fosters: a physical separation from County lands through a system of connected open space; a well-defined sense of entry to City from west; opportunities for habitat preservation and recreation; and view preservation corridors that provide an aesthetic and recreational resource for residents.

5.1.2.5 Sacramento County

Sacramento County's General Plan articulates an urban growth strategy that attempts to enhance the urban environment through a number of development policies, including orienting new development towards transit use. The Plan encourages infill development and directs limited growth to rural areas, to minimize direct and indirect impacts on the County's fiscal, environmental, and land resources (County of Sacramento, 1993). The North Natomas Community Plan, which will shape growth and development in northern Sacramento County, is currently being developed (County of Sacramento, 2006).

5.2 AFFECTED ENVIRONMENT

This section provides a brief overview of population growth trends and demographic characteristics in the greater Sacramento region and in the three counties that encompass the study area (additional discussion of growth trends and projections is also included in Chapter 7). This section also describes social conditions within the study area, including population distribution, community services and facilities, circulation and access, and recreation resources.

5.2.1 Population Growth and Demographic Characteristics

5.2.1.1 SACOG Region

The study area includes sparsely populated, rural, unincorporated portions of southern Sutter and southwestern Placer counties, as well as a small segment of northern Sacramento County. These three counties are part of the six-county Sacramento Metropolitan Area, one of the fastest growing regions in California. Between 1950 and 2000, California's population more than tripled, but population in the Sacramento region grew by more than 800 percent (SACOG, 2006).

Table 5-1 presents projections of population growth for the SACOG region from 2000 to 2050. The regional population is expected to continue to grow faster than the population of the state or nation during this period, approximately doubling by 2050, to about 4 million residents, with the Roseville-Rocklin-Lincoln area remaining one of the fastest growing areas of the SACOG region.

It is estimated that the SACOG region contained 712,866 households in 2000, and that by 2030 the region will have more than 1.2 million households, increasing to more than 1.4 million households by the year 2050. The average household size is expected to remain relatively stable, as the trend toward smaller households in the aging population is counterbalanced by higher fertility rates in younger households. Median household income is expected to increase almost 85 percent over the 50-year period, from $45,267 in 2000 to $83,481 in 2050, in constant 1999 dollars (Levy and Doche-Boulos, 2005).

Over the 50-year projection period, the percentage of White households is expected to decline steadily, from 65 percent of the population in 2000 to 54 percent in 2030 and 48 percent in 2050. The percentage of Black and Asian households will increase slightly, and the percentage of Hispanic households will increase substantially. (Additional discussion of population growth trends and projections in and around the study area is provided in Chapter 7, the Growth Inducement Analysis).

Table 5-1
Summary of Population, Household, Race and Income Projections for the SACOG Region, 2000, 2030, and 2050

Parameter	2000		2030		2050	
Population	1,948,700		3,232,589		3,952,098	
Households	712,866		1,209,216		1,445,678	
Household Population	1,940,800		3,168,100		3,873,255	
White	1,261,821	65%	1,716,348	54%	1,867,808	48%
Black	147,219	8%	295,928	9%	394,147	10%
Asian	224,525	12%	419,283	13%	544,073	14%
Hispanic	307,234	16%	736,540	23%	1,067,228	28%
Average Household Size	2.66		2.62		2.68	
Median Household Income (1999 $)	$45,267		$65,700		$83,381	

Source: Levy and Doche-Boulos, 2005.

Note: Percentages may not add to 100 percent due to rounding.

5.2.1.2 Study Area

Table 5-2 presents census information on population growth trends in the three study area counties from 1970 to 2000. During this time, the population almost doubled in Sutter and Sacramento counties and it more than tripled in Placer County.

Table 5-2
Population in Study Area Counties, 1970 to 2000

Location	1970	1980	1990	2000
Sutter County	41,935	52,246	64,415	78,930
Placer County	77,306	117,247	172,796	248,399
Sacramento County	631,498	783,381	1,041,219	1,223,499

Source: SACOG, 2004.

Table 5-3 shows projected population growth in the three study area counties for 2020 (approximately when Placer Parkway would be completed) and 2040 (the end of the study period, or after about two decades of Placer Parkway operation). Sacramento County had the largest population in 2000, and Sutter County the lowest. Over the study period, all three counties will see substantial population increases—of approximately 134 percent in Sutter County, 143 percent in Placer County, and 57 percent in Sacramento County. The paragraphs below describe population growth and racial composition in each of the three counties, as well as in the study area specifically.

Table 5-3
Population in Study Area Counties, 2000, 2020, and 2040

Location	Population 2000	Population 2020	Percentage Change 2000-2020 (%)	Population 2040	Percentage Change 2020-2040 (%)	Percentage Change 2000-2040 (%)
Sutter County	79,930	84,400	6.9	84,846	119	134.2
Placer County	248,399	433,540	74.5	603,819	39.3	143.1
Sacramento County	1,223,499	1,484,951	21,4	1,914,444	8.9	56.5

Data Sources: SACOG, 2004; State of California Department of Finance, 2004.

2000 data are from the U.S. Census Bureau; 2020 and 2040 data are based on projected growth data from DKS Associates presented in the Placer Parkway Transportation Technical Report (DKS Associates, 2007a)

Sutter County. Sutter County's 2005 population was estimated to be 87,342 (SACOG, 2004). The five most populated areas of the County include Yuba City—where almost half of all county residents currently live—South Yuba City, Live Oak, Tierra Buena CDP, and Sutter CDP (Census of Population and Housing, 2000). In the portion of Sutter County that lies within the study area, most of the population resides in and around the community of Pleasant Grove.

In 2000, Sutter County's population was 60 percent White, 22 percent Hispanic, and 12 percent Asian. The remainder of the population consisted of 2 percent Pacific Islander and American Indian, 2 percent Black, and 2 percent multiracial. The racial composition is projected to change, so that by 2020 the county will be approximately 43 percent White, 31 percent Hispanic, and 18 percent Asian, with the proportions of other racial groups either increasing slightly or remaining the same. By 2040, the county's population is projected to be 36 percent Hispanic, 33 percent White, 21 percent Asian, 4 percent American Indian and Pacific Islander, 3 percent Black, and 2 percent of two or more races (State of California DOF, 2004).

Placer County. Placer County's 2005 population was estimated to be approximately 301,560 people (SACOG, 2004). The most populated cities include Roseville, Rocklin, Granite Bay, Auburn, North Auburn Census Designated Place (CDP), and the City of Lincoln (Census of Population and Housing, 2000). Roseville, Rocklin, and Lincoln are located adjacent to the study area, to the east and northeast. These three cities have experienced rapid rates of growth over the past few years, due to the relocation of high technology and health care businesses to the area and associated demand for workforce housing.

In 2000, about 84 percent of the residents in Placer County identified as White, and 10 percent as being of Hispanic origin. The remainder of the population consisted of 3 percent Asian, 1 percent Pacific Islander and American Indian, 1 percent Black, and 1 percent multiple races. By 2020, it is expected that the racial composition of the county will be 77 percent White, 12 percent Hispanic, 5 percent Asian, 2 percent Pacific Islander and American Indian, 3 percent Black, and 2 percent identifying with multiple races. In 2040, the racial composition is projected to be 72 percent White, 14 percent Hispanic, 7 percent Asian, 2 percent Pacific Islander and American Indian, 3 percent Black, and 2 percent identifying with more than one race (State of California DOF, 2004). These projections are consistent with those expected in other counties in the SACOG region over the coming decades.

Sacramento County. Sacramento County's 2005 population was estimated at approximately 1.32 million (SACOG, 2004). The major population centers in Sacramento County include the City of Sacramento, the Arden-Arcade CDP, Citrus Heights, Elk Grove CDP, and Rancho Cordova CDP. The racial composition of the County is expected to follow trends similar to other counties in the region,

experiencing a decrease in the proportion of White, and increases in other traditionally minority groups, especially Hispanic. It is estimated that by 2020, 34 percent of the population will be White, 26 percent of the population will be Hispanic, 17 percent will be Asian, and 14 percent of the population will be Black, with remaining ethnicities at lower percentages. By 2040, the racial composition of the county is expected to be 32 percent Hispanic, 25 percent White, 18 percent Asian, 16 percent Black, 6 percent American Indian and Pacific Islander, and 3 percent multiracial (State of California DOF, 2004).

Study Area. The Placer Parkway study area encompasses predominately rural agricultural land and open space. The small portion of the study area that lies within Sacramento County is undeveloped farmland and open space that does not contain any residential population at present. Population distribution in the Placer and Sutter county portions of the study area is described below.

Farmsteads[1] are scattered throughout the study area in Placer and Sutter counties. Five locations in and bordering the study area also have relatively dense concentrations of homes. These areas, which have been identified as "potential communities"[2] for the purpose of this impact analysis, are referred to in this report as Pleasant Grove, Sankey/Pleasant Grove, Riego, Country Acres, and Amoruso Acres. The location of each of these residential areas is shown on Figure 5-1 and described briefly below.

- **Pleasant Grove.** Pleasant Grove is a small community with a range of services including a school, library, general store, post office, and fire station. The boundaries of the Pleasant Grove community are not precise, as it is unincorporated and boundaries depicted on several local maps (e.g., mail delivery area, school district boundaries, county service district boundaries) do not coincide. At the Pleasant Grove scoping meeting held in October 2003, residents living on Sankey Road and along Pleasant Grove Road almost as far south as Riego Road identified themselves as Pleasant Grove residents. For the purpose of this analysis, the concentration of homes in the vicinity of Howsley Road and Pleasant Grove Road (see Figure 5-1) is referred to as the Pleasant Grove community.

- **Sankey/Pleasant Grove.** Sankey/Pleasant Grove is a large, irregularly shaped concentration of rural residential homes in the vicinity of Sankey Road and Pleasant Grove Road. Some of these are homes on 5-acre parcels; others are on smaller lots that appear to have been subdivided in the past and "grandfathered in," as they would not be permitted under existing zoning regulations, which call for a minimum parcel size of 80 acres in agricultural areas. The only community services in this area appear to be a fire station and a plant nursery business that recently closed.

- **Riego.** Riego is a residential community located mainly southeast of the intersection of Pleasant Grove Road and Riego Road. A general store and gas station are located in the southeastern quadrant of the intersection of these two roads. Several other homes clustered around this intersection have also been included in the Riego community, under the assumption that these residents would be more likely to orient themselves to the nearby Riego community and general store than with the Pleasant Grove community facilities farther away.

[1] A "farmstead" is defined as a collection of buildings related to an active agricultural enterprise, of which one or more buildings is used as a residence.

[2] It is important to try to define potential "communities" because CEQA and Caltrans guidance indicate that project impacts could be significant if they "divide or disrupt an established community."

- **Country Acres.** Country Acres is a collection of approximately 28 homes that lie on subdivided parcels on the north side of Baseline Road, in the Central Segment. This rural residential area has no services and is surrounded by agricultural land and open space.

- **Amoruso Acres.** Amoruso Acres is a rural residential community that abuts Sunset Boulevard West, near the northern boundary of the study area, in the Central Segment. It is outside the study area, but lies directly adjacent to it and potentially could be indirectly affected by the northern corridor alignment alternative.

Outside of the areas of relatively dense residential development (the "potential communities") described above, approximately one hundred isolated homes, farmsteads, and businesses scattered throughout the study area. The locations of these were identified from aerial photographs of the study area in 2003, and information obtained from area residents at the Parkway scoping meetings (October 2003) with limited subsequent field verification.

Environmental Justice Considerations. The study area population lives predominately in three census block groups: Placer County Census Tract 213.01, Block Group 2; Placer County Census Tract 213.03, Block Group 1; and Sutter County Census Tract 511, Block Group 4. (There is currently no resident population in the portion of Sacramento County that lies within the study area.) Table 5-4 presents information on race and poverty status for the population in these block groups from the 2000 census. As these data indicate, the population residing in these block groups is neither predominately minority nor predominately low income.

Table 5-4
Race, Ethnicity and Poverty in Study Area Census Block Groups

Location	Percentage White	Percentage Non-White or Other	Percentage Hispanic	Percentage Below Poverty
Sutter County				
CT 511 Block Group 4	82.8%	17.2%	11.5%	18.9%
Placer County				
CT 213.01 Block Group 2	90.5%	9.5%	9.4%	8.6%
CT 213.03 Block Group 1	89.7%	10.3%	7.0%	0.4%
Source: Census of Population and Housing, 2000				

5.2.2 Housing

As Table 5-5 indicates, there were approximately 1.9 million housing units in the SACOG region in 2000, with about one-fourth of all units located in Sacramento County. The number of units is expected to increase by about 50 percent, to 2.8 million, by 2025. Substantial increases in housing stock are anticipated in all three counties; but most notably in Placer County and Sutter County. With proposed developments that include the approved West Roseville Specific Plan and the planned Placer Vineyards Specific Plan, as well as the Sutter Pointe Specific Plan proposed mixed use development in south Sutter County and several major new developments proposals (such as Placer Ranch and Regional University), much of this construction is expected to occur in and around the study area (as shown on Figure 3-4).

Table 5-5
Total Housing Units, SACOG Region and Study Area Counties
2000 and 2025 (Projected)

Location	2000	2025
SACOG Region	1,886,175	2,814,223
Sutter County	29,077	50,096
Placer County	98,730	175,039
Sacramento County	473,211	662,004
Source: SACOG, 2002.		

Much of the demand for housing in Sacramento and surrounding areas in recent years has been driven by employment growth and the relative affordability of housing in the region in comparison to housing prices in the San Francisco Bay Area. In the late 1990s, the Sacramento region added only one dwelling unit for every three new jobs in the region, resulting in higher demand for homes and contributing to rapid increases in home prices.

Building permit data for the Cities of Roseville, Rocklin, and Lincoln indicate that new construction surged in Roseville and Rocklin between 1997 and 2002, then began to taper off, while the number of building permits issued in Lincoln has increased steadily since 1999, as shown on Table 5-6. Single-family homes dominate new construction.

Table 5-6
Residential Building Permits Issued in Roseville, Rocklin and Lincoln, 1995 through 2005

	Roseville			Rocklin			Lincoln		
Year	Single-Family	Multi-Family	Total Units	Single-Family	Multi-Family	Total Units	Single-Family	Multi-Family	Total Units
1995	1,416	0	**1,416**	269	40	**309**	107	88	**195**
1996	1,607	0	**1,607**	422	103	**525**	22	0	**22**
1997	1,688	330	**2,018**	570	372	**942**	80	120	**200**
1998	2,034	440	**2,474**	843	862	**1705**	173	0	**173**
1999	1,204	609	**1,813**	983	229	**1212**	888	120	**1,008**
2000	1,393	1,116	**2,509**	1,036	291	**1327**	1,490	0	**1,490**
2001	1,456	762	**2,218**	1,071	211	**1282**	1,443	2	**1,445**
2002	2,300	914	**3,214**	906	815	**1721**	1,441	0	**1,441**

2004	1,015	93	**1,108**	461	52	**513**	2,100	0	**2,100**
2005	826	165	**991**	274	154	**428**	2,689	111	**2,800**
Data Source: Construction Industry Research Board, 2006.									

Of the approximately 128,000 housing units currently planned in the Sacramento region, 65 percent of the units are proposed for the three study area counties, with 30 percent of all units in the region proposed for construction in Placer County (Paquin, 2006).

Prior to 1999, median home prices and housing affordability in the Sacramento region were close to the national average, and considerably better than home prices and affordability in the San Francisco Bay Area. In 1999, the median price of existing homes in the region was $131,500, compared to $132,900 in the nation and $217,300 in California. Between 1999 and 2004, however, home resale prices in the Sacramento region increased by 165 percent, to an average of $347,790 (Levy and Doche-Boulos, 2005).

As shown on Table 5-7, the average price of new homes in the study area also rose sharply during this period, increasing by 61 percent in Sacramento County and by 71 percent in Placer County between 2001 and 2005. Price increases in Roseville, Rocklin and Lincoln were even higher, with the average cost of a new home more than doubling in Lincoln during this period.

Table 5-7
New Home Average Sale Price Trends, 2001 through 2005

Location	Fourth Quarter 2001	Fourth Quarter 2002	Fourth Quarter 2003	Fourth Quarter 2004	Fourth Quarter 2005	Percentage Change 2001-2005 (%)
Sutter County	N/A	N/A	257,604	306,552	346,154	N/A
Placer County	$324,352	$372,746	$445,185	$547,943	$554,967	+71
Roseville	334,167	372,708	451,962	555,655	590,395	+77
Rocklin	304,184	367,923	449,476	518,729	551,231	+81
Lincoln	243,721	289,702	402,369	547,369	547,372	+115
Sacramento County	289,454	323,172	357,165	458,233	464,641	+61

Data Source: The Gregory Group, 2006.
NA = Not available.

Recent data indicate that the residential real estate market in the Sacramento region has been softening slightly since mid-2005, with the inventory of homes for sale increasing and the number of sales declining (Lyon Realty, 2006). While housing prices and the rate of new home sales are expected to stabilize in the near future, demand for new homes in the region is expected to remain strong (SPHERE Institute and Stanford Institute for Economic Policy Research, 2005). This is particularly true of southwestern Placer County and southern Sutter County, because of the strong projected job growth in these areas.

Planned and Proposed Housing Construction

SACOG expects that 80 to 90 percent of all new housing construction in the next two decades will occur at or beyond the urban edge, including in northern Sacramento County and in southwestern Placer County—especially in the communities of Roseville, Rocklin, and Lincoln (SACOG, 2005).

The adopted General Plans for the communities of Roseville, Rocklin, and Lincoln allow for the construction of more homes than are currently built in these communities. Table 5-8 compares the number of dwelling units in these communities in 2004 with the number of dwelling units approved under existing General Plans.

Table 5-8
Comparison of Existing Homes with Buildout Potential in Roseville, Rocklin, and Lincoln

Location	Existing Units (2004)	Total Units Allowed under General Plans
Roseville	40,889	60,039
Rocklin	19,641	28,606
Lincoln	10,478	22,218
Total units	71,008	110,863
Data Source: DKS Associates, 2006.		

In addition, many new housing units have been proposed as part of major new master-planned development projects that have been proposed but not yet approved in and around the study area, including:

- Curry Creek 16,209 units
- Regional University 4,387 units
- Placer Ranch 6,759 units
- Placer Vineyards 14,321 units
- Creekview 2,600 units
- Sierra Vista 10,000 units
- Lincoln SOI expansion 33,720 units
- Sutter Pointe Specific Plan 17,500 units

Land assembly activities in southwestern Placer County indicate a likelihood that there will continue to be proposals for master planned, mixed use development projects in this area in the future.

5.2.3 Community Services

Figure 5-2 shows the location of existing community services within the study area. Most of the community services currently provided in the study area are associated with the Pleasant Grove community, located in the Western Segment. These include a school, library, cemetery, fire station, and post office. The paragraphs below describe other community services provided in and around the study area.

5.2.3.1 Protective and Emergency Services

Regional Providers. The California Department of Forestry (CDF) operates 21 units, 228 CDF fire stations, and contracts with 575 local government fire stations around California. The CDF has 3,800 permanent employees, 1,400 seasonal employees, and 5,600 volunteer firefighters (State of California Department of Forestry and Fire, 2005).

The Valley Division of the California Highway Patrol (CHP) provides highway patrol services to the study region. The Valley Division has 16 area offices, five residential posts, one commercial inspection facility and one transportation management center. It employs 826 uniformed officers and 277 non-uniformed personnel. The area offices closest to the study area are the Auburn Office in Newcastle, the North Sacramento Office in Sacramento, and the Yuba-Sutter Office in Yuba City (California Highway Patrol, 2006).

The Emergency Medical Services Authority (EMSA) operates three trauma centers that serve residents of the study area. They are located at Mercy Hospital in Carmichael, the Sutter Roseville Medical Center in Roseville, and the University of California at Davis Hospital in Sacramento (State of California Emergency Medical Services Authority, 2006).

Sutter County. Sutter County has six fire districts, of which three are Board-governed districts known as County Service Areas (CSAs). The CSA that services the portion of the study area that lies in south Sutter County is known as County Service Area D, which includes the Pleasant Grove Fire Department, headquartered at 3100 Howsley Road in the community of Pleasant Grove (Sutter County, 2006). The Fire Department has an additional fire station located near Pleasant Grove and Sankey roads.

The Sutter County Sheriff's Department provides law enforcement services to the unincorporated areas of Sutter County. The Sheriff's Department office is located at 1077 Civic Center Boulevard in Yuba City (Sutter County Sheriff's Department, 2006).

Placer County. The Placer County Office of Emergency Services (OES), headquartered in Auburn, coordinates countywide disaster response services and manages the County's Emergency Operation Centers. The Placer County Fire Department is administered by the OES. It provides fire protection services and manages the Hazardous Materials Response Program, which has a Roseville team and two interagency teams based in Auburn and Truckee (Placer County, 2006c). There is a County/CDF station on Athens, close to the northeastern portion of the study area.

The cities of Roseville, Rocklin, and Lincoln have independent police and fire departments that provide services within their city limits and can also coordinate with other emergency service providers in the region on a mutual aid basis. The Roseville Fire Department has seven fire stations located throughout the city, and a new fire station is proposed at a location near Pleasant Grove Boulevard and SR 65. All fire stations have paramedic staff and equipment (City of Roseville, 2006a).

Sacramento County. Fire protection services for the portion of the study area that lies in Sacramento County are provided by the Sacramento Metropolitan Fire District (Metro Fire). Metro Fire services 417 square miles and approximately 600,000 people in Sacramento County. The district operates 42 stations and employs 750 uniformed and support personnel. The six stations closest to the study area are Stations #116 and #117 in Elverta, Station #111 in Rio Linda, Stations #41 and #112 in North Highlands, and Station #26 in Antelope. Metro Fire also has ten 24-hour advanced life support (ALS) ambulances and several reserve ambulances (Sacramento Metropolitan Fire District, 2006).

The Sacramento County Sheriff's Department provides law enforcement services in the portion of the study area that lies in Sacramento County. The two closest stations are in the Northwest Division—the McClellan Station in McClellan and the Northwest Service Center in North Highlands. The McClellan Station houses the Northwest Division Administrative Offices, where staff include Detectives, Patrol Deputies, Crime Analysts, and Arson Investigators. The Northwest Service Center includes a Community Resources Supervisor and Specialist, four Problem Oriented Policing (POP) Officers, a School Resource Officer, four Code Enforcement Officers, and a CHP Officer (Sacramento County Sheriff's Department, 2006).

5.2.3.2 Schools

The Pleasant Grove Elementary School, located at 3075 Howsley Road in Pleasant Grove, is the only school facility within the study area. The school is operated by the Pleasant Grove Joint Union Elementary School District, which currently provides K-8 educational services for 176 students (Public Schools, 2005). Most of the students reside locally, but some are bussed or driven to the Pleasant Grove School through an interdistrict program.

Other elementary schools in the surrounding area include Marcum-Illinois Union Elementary School in East Nicolaus, Elverta Elementary School in Elverta, Browns Elementary School in Rio Oso, Coyote Ridge Elementary School in Roseville, Quail Glen Elementary School in Roseville, Oak Hill Elementary School in Antelope, Dudley Elementary School in Antelope, and Blue Oaks Elementary in Roseville (GreatSchools, Inc., 2006). Other middle schools in the vicinity are Alpha Technology in Elverta, Riles Middle School in Roseville, Center Junior High School in Antelope, and Silverado Middle School in Roseville (GreatSchools, Inc., 2006).

Public high schools serving the study area vicinity include East Nicolaus High School in Nicolaus (where graduates of Pleasant Grove Elementary School typically go to high school), Three Rivers High School in Nicolaus, McClellan High School in Antelope, Center High School in Antelope, and Woodcreek High School in Roseville (McMurry, 2006; GreatSchools, Inc., 2006).

Several charter schools also located in the area include South Sutter Charter School in East Nicolaus, Antelope View Charter School in Antelope, Westside Charter School in Rio Linda, Heritage Peak Charter School in Rio Linda, Horizon Instructional Systems in Lincoln, Futures High School in North Highlands, and Creative Interchanges Arts Academy in North Highlands. All the charter schools except Creative Interchanges Arts Academy, Futures High School, and Westside Charter School serve grades K-12. Westside Charter School is for grades 7-8, the Creative Interchanges Arts Academy is for grades K-8, and Futures High School is for grades 7-12 (GreatSchools, Inc., 2006).

Private schools in the area include Antelope Christian Academy (pre K-8) in Antelope, Gates of Learning Center (7-12) in Roseville, St. Lawrence Elementary School (K-8) in North Highlands, Roseville Community School, Inc. (K-5) in Roseville, and Heritage Community Christian School (pre K-5) in Lincoln (GreatSchools, Inc., 2006).

Planned School Facilities

If future planned and proposed housing construction occurs, there will be a need to accommodate many more students in and around the study area in the future. Planned and proposed new school facilities associated with the development areas shown on Figure 3-4 include those described below.

The West Roseville Specific Plan identifies four elementary school sites, one middle school site, and one high school site. Population growth as a result of the WRSP's implementation is expected to generate an estimated 2,288 elementary (K-5) students, 984 middle school (6-8) students, and 1,463 high school (9-12) students (City of Roseville, 2004b).

The Regional University Specific Plan proposes a private university offering both undergraduate and graduate programs that will accommodate approximately 6,000 students and 800 professors and staff. Part of the campus is planned as a potential private high school that would accommodate up to 1,200 students, staff and faculty (Placer County, 2006e).

The Placer Ranch Specific Plan allocates more than 10 percent of its 2,200 acres for a 245-acre satellite campus of the California State University Sacramento. The land use plan also includes sites for two elementary schools and a middle school (Thomson, 2004; Placer County, 2006b).

The Placer Vineyard Specific Plan DEIR indicates that one high school, two middle schools and seven elementary schools are planned for the area, with the sites in each neighborhood serving as co-locations for recreation and schools (Quad Knopf, Inc., 2004).

Additional new school facilities are also being planned for the Sierra Vista and Creekview Specific Plan areas west of Roseville.

5.2.3.3 Libraries

There are no libraries within the study area. The closest one is Sutter County's Pleasant Grove Branch at 3093 Howsley Road, immediately to the west of the study area.

5.2.4 Municipal Facilities and Utilities

Municipal facilities within or near the study area include:

- the Western Placer Waste Management Authority Landfill, located east of Fiddyment Road, between Athens and Sunset Boulevard;
- the City of Roseville's Regional Pleasant Grove Wastewater Treatment Plant, located on Phillip Road;
- the Roseville Energy Park, located immediately north of the Wastewater Treatment Plant; and
- the planned City of Roseville's Reason Farms Stormwater Retention Basin.

These municipal facilities are described in more detail below and their locations are shown on Figure 5-2.

The Western Placer Waste Management Authority Landfill is a 280-acre facility that includes a convention landfill, materials recovery facility, household hazardous waste center and buy-back center (WPWMA, 2006). The facility was planned with a 1-mile buffer zone that would prohibit residential development near the landfill; however, the proposed Placer Ranch development includes plans for mixed use development within the buffer zone. The facility owns an expansion area directly west of Fiddyment Road from the existing landfill, which is planned for use when then existing landfill capacity is reached. This 265-acre property would undergo permitting nearer to its likely use (current estimates range from 2036 to 2045 (Schwall, 2006).

The City of Roseville's Regional Pleasant Grove Wastewater Treatment Plant is operated under a Joint Powers Agreement and provides wastewater treatment services, as well as recycled water for non-potable use such as irrigation, to the north and northwest areas of Roseville. It has a 12 million gallon per day treatment capacity and serves areas of Rocklin and the Sunset Industrial Plan Area, as well as Roseville residents (City of Roseville, 2004c).

The Roseville Energy Park, owned by the City of Roseville, is under construction adjacent to the Wastewater Treatment Plant, north of the West Roseville Specific Plan area but within the City of Roseville's Sphere of Influence. Construction is expected to be completed by 2007. The 12-acre park will house a natural gas-fired electrical energy generating facility that is expected to supply 60 percent of the city's electricity requirements (Roseville Electric, 2003).

In 2003, the City of Roseville purchased approximately 1,700 acres of land along Pleasant Grove Creek for the purpose of constructing a stormwater retention basin. In addition to providing flood protection, this preserve will provide critical habitat protection, preserve agricultural practices in the area, and offer open space and recreation amenities, as described in Section 5.2.5.

Electricity to homes, farms and businesses in the study area is provided by Pacific Gas & Electric Company. Dispersed homes in the study area, including those in the community of Pleasant Grove, have private well and septic systems. Sewer and wastewater treatment services in Roseville and Rocklin are provided by the South Placer Municipal Utility District. Placer County Flood Control and Water Conservation District, Placer County Water Agency, the City of Roseville, and the City of Rocklin provide additional utilities and services to the portions of the Eastern Segment of the study area. The Natomas Central Mutual Water Company has a system of canals providing irrigation water to farms in the

western portion of the study area, and Reclamation District No. 1000 maintains the primary drainage and flood control facilities in this vicinity.

5.2.5 Recreation Resources

No existing public parks or recreation facilities were identified within the study area, although plans for the City of Roseville's Reason Farms Retention Basin include provisions for future recreational uses such as picnicking, hiking, horseback riding and model airplane flying, as shown on Figure 5-3. (The City of Roseville has not yet finalized its master plan for this multi-use facility, but reflects the Placer Parkway concept in its conceptual master plan diagram). Similarly, preliminary land use concepts for RUSP, Sierra Vista Specific Plan, and the Sutter Pointe Specific Plan all include areas that are generally designated for recreational uses, some of which would be affected by proposed corridor alignments if they are adopted, as discussed in Appendix A.

Bikeways had been proposed in the Western Segment of the study area as part of the South Sutter Specific Plan, which was subsequently rescinded. Future bikeways were identified along SR 99, Pleasant Grove Boulevard, Pacific and existing railroad right-of-ways. While the South Sutter Specific Plan is no longer in effect, it is anticipated that Sutter County will continue to push for development of bikeways as part of any proposed development in the area, especially if it includes residential uses (Wilson, 2006).

There are other recreation facilities in the surrounding area, particularly in the western part of Roseville, including a system of bike trails and several new golf courses that have been developed as part of master planned communities. The City of Roseville operates fifty parks and recreation facilities encompassing 1,186 acres of parkland, 3,236 acres of open space, and more than 30 miles of creek frontage (City of Roseville, 2006b). Public parks located closest to the study area include:

- Mahany Regional Park is a 225-acre park located at Woodcreek Oaks and Pleasant Grove Boulevard that includes the Roseville Sports Center, Roseville Aquatics Complex, an all-weather field, batting cages and bike paths (City of Roseville, 2006c).

- Misty Wood Park is a 2-acre neighborhood park with a picnic area, a children's play area, a half court basketball court and open space (City of Roseville, 2006d).

- The School House Park is an 8.7-acre park located within the Del Webb Community, with an outdoor amphitheater, a vernal pool preserve, and historic landmarks (City of Roseville, 2006e).

Other Planned and Proposed Parks

Several of the new master planned communities approved or proposed in and around the study area include provisions for the creation of new park and recreation facilities, as described below.

- The approved West Roseville Specific Plan indicates that approximately 950 acres will be designated for park and open space uses. Of this acreage, 250 acres will be dedicated to neighborhood and citywide parks, while 685 acres will remain open space (City of Roseville, 2004b).

- The Placer Vineyards proposal includes 931 acres of parks and open space. Of these, 260 acres are planned for parks and 711 acres are planned to remain as open space (Placer County, 2006d).

- The proposed land use plan for Placer Ranch currently includes 275 acres of parks, landscape corridors and open space (Placer County, 2006b).

- The proposed Regional University Specific Plan indicates 198 acres of open space and public land, as well as more than 180 acres of open space on the university campus. Approximately 40 acres are planned specifically to be developed as parkland (Placer County, 2006e).

Additional new park and recreation facilities are also being planned for the Sierra Vista and Creekview Specific Plan areas west of Roseville.

5.2.6 Circulation and Access

The study area is served by a relatively simple grid system of rural roadways (described in Section 3.2.3). Two main east-west arterial roads (separated by approximately 4 miles) serve the Eastern and Central segments—Sunset Boulevard West in the north and Baseline Road in the south. These two roads extend into the Western Segment as Howsley Road and Riego Road, respectively, with an additional east-west arterial road, Sankey Road, located between them. The main north-south roadways serving the study area are Fiddyment Road, located near the boundary between the Eastern and Central segments, and Pleasant Grove Road, located approximately 1 mile west of the Placer County/Sutter County border. Other rural collector roadways providing access to farms and homes in the study area include Brewer Road, Phillip Road, and Locust Road.

Two major freeways carry traffic north-south at the outer edges of the study area—SR 65 in the east and SR 70/99 in the west. The Sunset Industrial Area Plan, at the eastern edge of the study area, is accessed by Sunset Boulevard, Whitney Ranch Parkway, and Industrial Boulevard. Most of the existing industrial development in the Western Segment (south Sutter County) is located along Pacific Avenue, which runs between Sankey Road and Riego Road, approximately 1 mile east of SR 70/99.

Impacts of the Parkway build alternatives to specific transportation features are not addressed in Section 5.3 below, because at the Tier 1 phase the precise location and extent of such impacts is not known. Any of the alternatives under consideration would require crossing over railroad tracks and local roads (as well as creeks, irrigation canals and drainage ditches), necessitating construction of overpasses or underpasses to maintain circulation. The locations of such overpasses and underpasses would be determined during Tier 2 roadway design work (see the Transportation Technical Report (DKS Associates, 2007a) for additional discussion of traffic impacts associated with the Parkway).

5.3 IMPACT ANALYSIS

5.3.1 Significance Criteria

Based on pertinent existing laws and regulations, Caltrans impact assessment guidance, and professional judgment, the project would be considered to have significant social impacts if it would:

- disrupt or divide the physical arrangement of an established community;
- displace a large number of people;
- conflict with established recreational, educational, religious or scientific uses of the area;
- disproportionately affect a minority or low income population relative to impacts on the general population of the study area;
- be inconsistent with local adopted goals and policies that pertain to social or economic conditions;
- result in substantial deterioration of park and recreation facilities through increased use;

- substantially affect provision of community services or municipal facilities in the area, by displacing such services or facilities, or disrupting access to them.

5.3.2 Approach to Analysis

Direct impacts to population, community services, municipal facilities and recreation resources in the study area were identified by comparing the footprint of corridor alternatives to aerial photographs and GIS data that included mapping of the locations of homes, farmsteads, community services, and municipal facilities within the study area. For the purposes of this analysis (consistent with "worst-case analysis" principles), it was assumed that if a community resource fell within a corridor alignment it would be affected, even though it may be possible to avoid the resource in the future, when a specific Parkway right-of-way (via Tier 2 review) is identified within the selected corridor. Where disruption or division of an established community would occur, effects on community cohesion or other adverse impacts on the affected neighborhood are considered. Impacts to recreation resources and other resources protected under Section 4(f) of the Department of Transportation Act are addressed in a separate Section 4(f) evaluation included in Appendix A.

5.3.3 Direct Community Impacts

Table 5-9 presents a summary of potential direct impacts to communities, homes or farmsteads, and municipal facilities associated with each of the five alignment alternatives. None of the Build alternatives would directly impact any existing community services, such as schools or fire stations, in the study area. Direct impacts associated with each Build alternative are discussed by segment below. (This section focuses on social impacts and impacts to community facilities and services only; Chapter 6 includes a discussion of business and economic impacts). Recreation impacts are discussed in Section 5.3.3.9.

Table 5-9
Summary of Direct Impacts to Community Resources
Associated with the Five Placer Parkway Alternatives, by Segment

Alignment Alternative	Residential Communities (number)			Residential Communities (acres)			Homes and Farmsteads (number)			Municipal Facilities (acres)		
Segment	**W**	**C**	**E**	**W**	**C**	**E**	**W**	**C**	**E**	**W**	**C**	**E**
1	0	0	0	0	120.6	0	0	3	1	0	95.2	13.3
2	0	0	0	0	0	0	0	3	1	0	95.6	13.3
3	0	0	0	0	0	0	0	2	1	0	87.2	13.3
4	1	0	0	14.7	0	0	4	2	1	0	87.1	13.3
5	1	0	0	14.7	0	0	4	5	1	0	82.7	13.3

Data Source: URS Corporation GIS file data, February 2006.
W = Western Segment
C = Central Segment
E = Eastern Segment

5.3.3.1 No-Build Alternative

Under the No-Build Alternative, land for Placer Parkway would not be acquired and the Parkway would not be constructed. There would not be any impacts on community resources under the No-Build Alternative.

5.3.3.2 Alternative 1 – the Red Alternative

Alternative 1 would affect 120.6 acres of an existing rural residential community, displace four additional isolated homes or farmsteads and encroach upon 108.5 acres of existing municipal facilities. These impacts are described by segment below.

Western Segment. In the Western Segment, Alternative 1 would not directly affect any existing residential communities, would not displace any isolated homes or farmsteads, and would not affect any existing municipal facilities.

Central Segment. In the Central Segment, Alternative 1 would take up to 120.6 acres of County Acres; a rural residential community located on the north side of Baseline Road, in the central portion of this segment. The alignment would not split or divide this community, but it would remove a strip of land along a 1-mile section at the northern edge of this community, removing several rural residential homes. In addition, it would displace three other scattered homes, farmsteads or businesses located north of the Riego community. The alignment would also impact the City of Roseville's Reason Farms retention basin property, encroaching on 95.6 acres of this facility.

Eastern Segment. Alternative 1 in the Eastern Segment would not affect any concentrated residential communities, but it would displace a single farmstead located on the south side of Sunset Boulevard West, southeast of Amoruso Acres. The alignment would also encroach upon approximately 13 acres of the City of Roseville's Reason Farms facility, which straddles the border between the Central and Eastern segments. A future interchange at Fiddyment Road could potentially encroach upon the area immediately west of the existing sanitary landfill that is owned by the Western Placer Waste Management Authority and identified as a future landfill expansion area. Encroachment, if any, would affect approximately 5 to 6 acres of the southeastern corner of this property.

This portion of the property is already constrained by power lines crossing the site diagonally. The encroachment required for realignment of Sunset Boulevard West would reduce the useful life of the landfill expansion area; to what extent is not known and would depend on a variety of technical and operating parameters that would be identified closer to the time the landfill expansion facility would be planned and permitted. The existing landfill is expected to meet waste disposal needs to 2036 or 2045 (Golder Associates, 2005; Schwall, 2006), so it is likely that the expansion area would not be placed into use until after the Parkway interchange is completed, if it is approved.

5.3.3.3 Alternative 2 – the Orange Alternative

Alternative 2 would not disrupt any existing rural residential communities, but it would displace four isolated homes or farmsteads and it would encroach upon approximately 109 acres of a municipal facility, as described by segment below.

Western Segment. The Western Segment of Alternative 2 is the same as Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

Central Segment. Alternative 2 would displace three isolated homes or farmsteads in the Central Segment, in the vicinity of Locust and Brewer Roads. It also would encroach on 95.6 acres of the City of Roseville's Reason Farms facility.

Eastern Segment. The Eastern Segment of Alternative 2 is the same as Alternative 1. Therefore, the potential impacts of this segment are the same as discussed for Alternative 1.

5.3.3.4 Alternative 3 – the Blue Alternative

Alternative 3 would not disrupt any existing rural residential communities, but it would displace three isolated homes or farmsteads and it would encroach upon approximately 100 acres of a municipal facility, as described by segment below.

Western Segment. The Western Segment of Alternative 3 is the same as Alternative 1. Therefore, the potential impacts for this segment are the same as discussed for Alternative 1.

Central Segment. Alternative 3 would displace two isolated homes or farmsteads in the Central Segment. It also would encroach on 87.2 acres of the City of Roseville's Reason Farms facility.

Eastern Segment. The Eastern Segment of Alternative 3 is the same as Alternative 1. Therefore, the potential impacts of this segment are the same as discussed for Alternative 1.

5.3.3.5 Alternative 4 – the Yellow Alternative

Alternative 4 would directly impact one rural residential community, removing approximately 15 acres from it, reducing the size of several adjacent rural residential properties. In addition, it would remove seven other isolated homes or farmsteads scattered along the alignment, and it would encroach on approximately 100 acres of an existing municipal facility. These impacts are described by segment below.

Western Segment. In the Western Segment, Alternative 4 would directly affect about 15 acres at the northwestern corner of the Sankey-Pleasant Grove community. The re-alignment of Sankey Road would also impact several residences located east of the UPRR tracks in this vicinity. The alignment would not split or divide this community, but it would impact several rural residential properties along its northern edge, near the railroad right-of-way north of Sankey Road. In addition, this alignment would displace four homes or farmsteads that are located along Sankey Road between the railroad right-of-way and Pacific Avenue.

Central Segment. Alternative 4 would displace two isolated homes or farmsteads in the Central Segment. It also would encroach on 87.1 acres of the City of Roseville's Reason Farms facility.

Eastern Segment. The Eastern Segment of Alternative 4 is the same as Alternative 1. Therefore, the potential impacts of this segment are the same as discussed for Alternative 1.

5.3.3.6 Alternative 5 – the Green Alternative

Like Alternative 4, Alternative 5 would impact one rural residential community, removing approximately 15 acres and reducing the size of several adjacent rural residential properties, as well as impacting several homes east of the railroad tracks (through Sankey Road realignment). Alternative 5 would also displace ten other isolated homes or farmsteads scattered along the alignment, and encroach upon approximately 96 acres of an existing municipal facility. These impacts are described by segment below.

Western Segment. The Western Segment of Alternative 5 is the same as Alternative 4. Therefore, the potential impacts of this segment are the same as discussed for Alternative 4.

Central Segment. The Alternative 5 alignment would displace five isolated homes or farmsteads in the Central Segment, in the area south of Pleasant Grove Creek. It also would encroach upon 82.7 acres of the City of Roseville's Reason Farms facility.

Eastern Segment. The Eastern Segment of Alternative 5 is the same as Alternative 1. Therefore, the potential impacts of this segment are the same as discussed for Alternative 1.

5.3.3.7 Comparison of Alternatives

None of the alternative alignments would divide the physical arrangement of an established community or disrupt access to community facilities and services, although Alignments 1, 4, and 5 could potentially disrupt an existing cluster of rural residential homes by removing several of the homes and converting this existing residential use to a transportation corridor use (roadway and buffer). None of the alternatives would disrupt or divide an established community, displace a large number of people; conflict with established recreational, educational, religious or scientific uses of the area; cause substantial deterioration of local park or recreation facilities through increased use; substantially affect provision of community services or municipal facilities; or conflict with local adopted goals and policies.

Alternatives 1, 4, and 5 each would affect a rural residential community in the study area; Country Acres. Alternative 1 would have the greatest impact, on 120.6 acres of the community on the north side of Baseline Road, compared with 14.7 acres in the Sankey-Pleasant Grove area that would be impacted by Alternatives 4 and 5. Each of the alternative alignments would displace several isolated homes or farmsteads, ranging from three (Alternative 3) to ten (Alternative 5). All build alternatives would affect the Reason Farms municipal facility, with impacts ranging from 96.0 acres (Alternative 5) to 108.9 acres (Alternative 2). The City of Roseville is planning for and accommodating the Parkway alignments in their planning process (as discussed in Section 3.3.9), so no disruption is anticipated. No other community facilities or services, such as schools or fire stations, would be directly impacted by any of the alignment alternatives.

Western Segment. In the Western Segment, all alignment alternatives would terminate either at Sankey Road or north of Riego Road. The three alignment alternatives terminating north of Riego Road (Alternatives 1, 2, and 3) would not directly impact any existing residential communities, would not displace any isolated homes or farmsteads, and would not affect any municipal facilities. Alternatives 4 and 5, which terminate at Sankey Road, would directly affect 14.7 acres of the Sankey-Pleasant Grove community. This would not split or divide the community, but would impact several adjacent rural residential properties along the north side of Sankey Road. In addition, Alternatives 4 and 5 would remove another four more isolated homes and farmsteads that are scattered along Sankey Road to the west of the more densely populated area.

Central Segment. The five alternatives follow different routes through the Central Segment, resulting in different community impacts associated with each alternative in this portion of the study area. Alternative 1 would have the greatest impact on existing residential communities, taking 120.6 acres of the rural residential area located north of Baseline Road in the central portion of this segment. The alignment would not split or divide this community, but it would remove a strip of land along a 1-mile section at the northern edge of the rural residential area, removing several homes. All of the alignment alternatives would displace a number of the more isolated homes or farmsteads in the Central Segment, ranging from two (Alternatives 3 and 4) to five (Alternative 5). In addition, all five alternatives would impact the City of Roseville's Reason Farms Retention Basin. The acreage of this facility within the Central Segment that would be affected by each alternative is similar, ranging from 82.7 acres (Alternative 5) to 95.6 acres (Alternative 1).

Eastern Segment. In the Eastern Segment, all build alternatives follow the same route, connecting with SR 65 at Whitney Ranch Parkway, so potential community impacts would not vary by alternative alignment in this segment.

5.3.3.8 Environmental Justice Considerations

Because the population potentially affected by the alternative alignments is neither predominately minority nor predominately low income, none of the project alternatives would cause disproportionate or adverse impacts to a minority or low income population. Therefore, the project would not cause Environmental Justice impacts.

5.3.4 Secondary and Indirect Impacts

No-Build Alternative

Under the No-Build Alternative, land would not be acquired for Placer Parkway and the Parkway would not be constructed. There would not be any secondary and indirect impacts under the No-Build Alternatives.

Alternatives 1 Through 5

The Parkway would cause both beneficial and adverse impacts to the quality of life enjoyed by residents of the study area. A new roadway would bring potentially adverse visual, noise, and air quality impacts to the area, but it could also improve access, reduce travel times and reduce traffic congestion on local roadways used by current and future residents. (As described in Section 5.2.1.2, population is sparse in the study area at present, but it could increase substantially in the future, depending upon anticipated future development and the corridor alignment selected.)

In the Western Segment, the construction of two new potential interchanges along the corridor connecting at SR 70/99 north of Riego Road or one new potential interchange along Sankey Road would improve access to these areas and would accelerate southern Sutter County's change from a rural, agricultural area to a mixed-use new community, as contemplated under the Sutter Pointe Specific Plan. The rural agricultural character of this area will be transformed by the new land uses proposed under Sutter Pointe Specific Plan, with or without Placer Parkway, but the Parkway would contribute to this substantial change in the character of the community. Future residents of the Sutter Pointe Specific Plan area, as well as long-time residents of Riego and the Sankey-Pleasant Grove communities (which straddle the boundary between the Western and Central segments) would have improved access to amenities in Placer County via the interchanges built in the Western Segment. The Parkway would bring noise, visual and air quality impacts that could adversely affect the quality of life of residents whose homes lie close to the new roadway right-of-way.

Because the Parkway is not proposed to have any interchanges in the Central Segment, it would not provide the same level of mobility and access benefits to residents of this area as to residents of the Western and Eastern segments would receive. Quality of life could improve for area residents from the reduction in traffic congestion along local roadways, but visual, noise and air quality impacts would be introduced in the vicinity of the new roadway. Conflicts between farmers and urban commuters in this segment could be reduced by the project, at least in the short term, as through traffic is removed from local roadways onto the Parkway .

Secondary and indirect social impacts in the Eastern Segment of the study area would be similar to those described for the Western Segment. The Parkway would introduce some adverse quality of life impacts (e.g., noise, visual, and air quality changes) to residents whose homes or farms lie in the vicinity of the new roadway; however, it would also improve quality of life by removing through traffic from local roadways and by providing improved access to Sutter County destinations and the northern area of Sacramento. It would also facilitate development of and access to new homes and community amenities being planned for the Placer Ranch Specific Plan area. (Business and economic impacts are addressed in Chapter 6).

5.3.5 Cumulative Impacts

No-Build Alternative

Under the No-Build Alternative, land would not be acquired for Placer Parkway and the Parkway would not be constructed. There would not be any cumulative impacts under the No-Build Alternative.

Alternatives 1 Through 5

Section 3.3.5 describes the future cumulative development scenario that is assumed for the purposes of this analysis. Because of its location with respect to the Sutter Pointe Specific Plan area, the Placer Ranch Specific Plan area in Placer County and other major proposed developments in the region, Placer Parkway would provide a cumulatively considerable contribution to the implementation of planned land use changes that will transform the rural, agricultural character of the Western and Eastern segments of the study area to higher density, mixed use, master-planned communities. Families who have historically farmed in these areas may be displaced through this cumulative urbanization process, but may also benefit from increased land values as population densities increase and land uses intensify. (The cumulative community changes associated with this planned future urbanization of the Western and Eastern segments of the study area may be perceived as positive by some and as adverse by others). Because Placer Parkway would provide no interchanges in the Central Segment, it would not contribute measurably to cumulative impacts to social resources or community facilities and services in this portion of the study area.

5.3.6 Potential Watt Avenue Interchange

A future Watt Avenue interchange would not divide or disrupt any existing communities or concentrations of rural residential homes, nor would it displace any isolated homes or farmsteads. None of the conceptual locations identified on Figure 2-3 would displace any businesses or community services or facilities, except that the Alternative 1, Option 2/Alternative 2 interchange could impinge upon the future Curry Creek Community Plan Area, and the Alternative 5 interchange could impinge upon the City of Roseville's Reason Farms property on the more northerly alignments. This potentially could affect recreation facilities depending upon the final location and design of recreational amenities associated with the Reason Farms master plan in relationship to the interchange.

A future interchange at Watt Avenue, under any of the alternatives, would contribute to indirect, secondary and cumulative community impacts by accelerating the rate of urban development and the loss of family farming and the rural character that currently exists in the Central Segment. New urban development would bring higher population densities, an expanded housing stock, and new community services and amenities, but it would also bring increased traffic congestion, noise, visual and air quality impacts, as well as increased demand on existing community facilities and services.

5.3.7 Avoidance, Minimization, and/or Mitigation Strategies

Alternatives 1, 4, and 5 could disrupt an existing rural residential community by displacing homes and converting a portion of the community to a transportation corridor. Since no vital community services or gathering places would be impacted in either of the two affected areas, it may be possible to mitigate this potentially significant impact and minimize potential adverse effects in these areas by relocating the displaced households within or close to the affected rural residential communities, if they so desire. Since no vital community services or gathering places would be impacted in either of these two areas, no mitigation is required beyond standard provisions of the Uniform Relocation and Real Property Acquisition Assistance Act.

Any households or businesses displaced by the project would receive relocation assistance payments and counseling in accordance with the Federal Uniform Relocation Assistance and Real Properties Acquisition

Policies Act, as amended, to ensure that any displaced residents are relocated to a decent, safe, and sanitary home. All eligible displacees would be entitled to moving expenses and other benefits as provided by the act. All benefits and services would be provided equitably to all relocatees without regard to race, color, religion, age, national origins, or disability as specified under Title VI of the Civil Rights Act of 1964.

During Tier 2, PCTPA should evaluate shifts in the roadway alignment that would reduce residential displacements and consider these, along with other factors (such as engineering feasibility, cost, natural resources impacts, etc.) in selecting the roadway location.

Strategies related to potential reduction in the useful life of the landfill expansion area could include providing compensatory land, providing or participating in programs to reduce generation or increase diversion through new programs or new technologies, or contributing to infrastructure improvements that will eventually be needed to send materials off site. Given the magnitude of the impact and the long lead time available for planning minimization strategies, impacts to the facility are likely to be minor.

PCTPA has been coordinating project planning with local emergency service providers to ensure the Parkway design will accommodate their needs and minimize potential adverse impacts on response times. Similarly, PCTPA has been coordinating planning efforts with the City of Roseville to ensure that the project design is compatible with recreation and other facilities being planned for the Reason Farms Retention Basin. The purpose of the corridor preservation is to establish a general location for the Parkway so that other developments and plans in the general vicinity will be apprised of that location and can avoid locating recreational or wildlife refuge resources where they might conflict with the Parkway.

PCTPA should continue to cooperate and coordinate with local jurisdictions to avoid impacts to future recreation resources and other community facilities and services, by adjusting the locations of these planned facilities so that they would lie outside of the parkway corridor, or possibly within the roadway buffer areas on either side of the future roadway, where impacts to such facilities may be minimized.

5.3.8 Analyses to be Undertaken in Tier 2

Tier 2 analyses will include preparation of a Relocation Impact Report that will identify any homes that would be displaced by the project and identify any special needs that potentially displaced households may have (such as low income status, language barriers, or presence of senior citizen citizens or persons with disabilities or other needs) and recommend any special measures to be taken to address those needs.

The location of utilities such as power lines, water lines, sewer pipes and canals or drainage ditches that could be impacted by the project (e.g., require temporary disruption or permanent relocation) will be identified. (If such work is required during project construction, it would be coordinated with the agencies responsible for managing the affected utilities or services.)

During Tier 2, PCTPA will continue to coordinate project planning with local emergency service providers to address their concerns and minimize any potential to adversely affect response times. Consistent with the Context Sensitive Solutions process, which provides detailed guidance on the development of safe transportation projects that minimize community disruption and environmental impacts, and maximize efficient use of resources (Transportation Research Board, 2002), PCTPA will continue to work with providers during future roadway design phases, taking such measures as incorporating median crossings for use by emergency vehicles only, if necessary, to protect or enhance service response times. PCTPA will continue to coordinate planning efforts with the City of Roseville to ensure that the project design is compatible with recreation and other facilities being planned for the Reason Farms Retention Basin. Similar coordination will occur to confirm that the concurrent planning effort has been successful and there are no Section 4(f) resources used by the Project, or that Section 4(f) evaluations, consultation, and coordination will be completed as required.

6.0 ECONOMIC CONDITIONS

6.1 REGULATORY SETTING

6.1.1 Pertinent Laws and Legislation

NEPA and CEQA requirements for social and economic impact analysis are described in Section 5.2.1. In addition, the provisions of the Uniform Relocation Assistance Act described in Section 5.2.1 apply not only to residential displacements, but also to business displacements that may be caused by federally funded projects.

6.1.2 Adopted Goals and Policies

Adopted local goals and policies that address economic growth and development in the study region are summarized below.

6.1.2.1 Regional Plans

SACOG's Metropolitan Transportation Plan 2027 contains the following plan goals:

Goal No. 5. Economic Vitality. Enhance the economic vitality of our region by efficiently and effectively connecting people to jobs, goods, and services, and by moving goods within our region and beyond with an integrated multi-modal freight system.

Goal No. 8. Funding and Revenue. In order to adequately fund the MTP 2025, develop appropriate, innovative, equitable, and stable funding sources (both short- and long-term) and identify cost-reduction measures.[3]

6.1.2.2 Sutter County

The Sutter County General Plan states that the county exhibits a high unemployment rate characteristic of rural agricultural jurisdictions and that it is increasingly becoming a bedroom community for commuters who are employed outside the county in a variety of professional and related occupations. Goals and policies aimed at economic growth and development include the following:

Goal 1.I: To preserve and promote a healthy and diverse economy to serve the needs of Sutter County residents.

Policy 1.I-1. The County shall work to preserve and expand business and employment opportunities within Sutter County.

Policy 1.I-4. Economic development efforts should attempt to diversify the County's economic base while encouraging retention and expansion of existing businesses and industries.

Goal 6.B. To facilitate preservation, growth and expansion of agricultural industries within Sutter County.

Policy 6.B-1. The County shall support the development of agricultural production, processing and distribution industries within Sutter County.

Policy 6.B-2. The County shall encourage local processing of agricultural products grown in Sutter County and other locations.

Policy 6.B-3. The County shall encourage the continued operation and expansion of existing agricultural industries.

[3] This goal is from the MTP 2027, although it refers to funding the MTP 2025. While portions of the MTP 2027 were updated, not all sections were revised, and many of the goals and policies remained unchanged from the MTP 2025.

There are additional policies contained in the General Plan that are specific to the southern portion of the county and set out considerations for development in the Industrial/Commercial Reserve area:

Policy 9.C-1 The County shall establish an I-C Reserve designation in the South county and will allow up to 3,500 acres of non-residential development consistent with the goals and policies of the General Plan and mitigation measures of the General Plan EIR. Any project proposed within the I-C Reserve which does not cumulatively or individually exceed the 3,500-acre threshold, and which demonstrates consistency with all other elements of the General Plan, may be processed as consistent with the General Plan and will not require a General Plan Amendment (GPA). Projects that individually or cumulatively exceed the 3,500-acre threshold shall require a GPA and conduct an appropriate environmental analysis.

Policy 9.C-3 The County shall require that infrastructure planning be done in a coordinated fashion and project proponents must demonstrate how the development provides sufficient facilities to meet County standards and that the development of the project will not adversely impact future developers in the area.

Policy 9.C-4 The County's existing agricultural 20/80 policies shall apply and be utilized to determine allowable uses and parcel sizes until such time that an application has been approved for industrial and/or commercial uses in the I-C Reserve area.

Policy 9.C-5: The County shall consider development applications in the I-C Reserve area and base its decisions on, but not limited to, information contained in the following: 1 – A Completed Rezone Application identifying all proposed uses on the site; 2 – A Design Review application complying with established design and development standards; 3 – Findings that the project is consistent with applicable General Plan policies and the General Plan EIR mitigation measures; 4 – Findings that the infrastructure is adequately provided for within the project boundaries and is properly coordinated with adjacent lands.

Policy 9.C-5 The County should encourage contiguous development patterns within the I-C Reserve as a priority.

6.1.2.3 Placer County

The Placer County General Plan contains the following goals and policies pertaining to economic development:

Goal 1.N: To maintain a healthy and diverse local economy that meets the present and future employment, shopping, recreational, public safety, and service needs of Placer County residents and to expand the economic base to better serve the needs of residents.

Countywide Policies

1.N.2. The County shall encourage the retention, expansion and development of new businesses, especially those that provide primary wage-earner jobs, by designating adequate land and providing infrastructure in areas where resources and public facilities and services can accommodate employment generators.

1.N.7. The County shall strive to coordinate its economic development efforts with the efforts of cities and other economic development organizations, including local chambers of commerce.

South Placer Policies

1.N.10. The County shall support the development of primary wage earner job opportunities in the South Placer area to provide residents an alternative to commuting to Sacramento.

1.N.12. The County shall seek the establishment of a joint powers authority (JPA) between the county and the cities of Roseville, Rocklin and Lincoln in order to improve the provision of infrastructure in the incorporated and unincorporated areas in and around the Sunset Industrial Area. The JPA is to also develop an economic development strategy with the goal of improving the economic development potential of the region (Placer County, 1994).

6.2 AFFECTED ENVIRONMENT

6.2.1 Regional Overview

The number of jobs in the Sacramento region increased by more than 800 percent between 1950 and 2000, from approximately 100,000 in 1950 to 921,000 in 2000. The total number of jobs in the region is expected grow slightly faster than population over the next 50 years, increasing another 105 percent, to almost 1.9 million jobs by 2050.

The Sacramento region's share of all jobs in California increased from 4.5 percent in 1979 to 5.2 percent in 1990, to 5.5 percent in 1995, and to 5.7 percent in 2000. The region's share of statewide jobs has risen steadily because the region has continued to attract an above average share of the state's new job growth, capturing approximately 8 percent of California's job growth between 1979 and 2000 (Levy and Doche-Boulos, 2005).

After 2000, the region's share of jobs continued to rise, as employment shifted from other areas of California during the economic recession. Between 2000 and 2005, the largest job growth was experienced in the construction sector, followed by the government and health care sectors. The only sectors to lose jobs during this period were Manufacturing and Professional and Business Services (Paquin, 2006).

Government has historically been the strongest employment sector in the Sacramento region, but that has changed in recent years. As land available for development in the San Francisco Bay Area became more scarce and prices escalated, businesses moved to the Sacramento region, diversifying the region's economic base. Jobs in electronics, manufacturing, information services, health care, agriculture, food processing, and tourism have increased rapidly in recent years (SACOG, 2005).

The six-county SACOG region is expected to add 2 to 2.5 percent more jobs annually in the short term (through mid-2007, with the rate of job growth decelerating slightly after that time), with the highest gains expected in the Government sector. Other sectors expected to see substantial job growth include the Manufacturing and Construction sectors, while the Information sector is expected to continue to experience job decreases (SPHERE Institute and Stanford Institute for Economic Policy Research, 2005).

Employment

Table 6-1 displays recent data on the breakdown of employment by sector in the three study area counties. As this table indicates, Sacramento County provides the most employment, with a high concentration of jobs in the Government sector. The region's recent rapid growth is reflected in the concentration of jobs in the Construction sector, as well as in Retail Trade (especially in Placer and Sacramento counties). Many of the new jobs in high technology and health care are concentrated along the I-80 and SR 65

corridors, spurring growth in the Cities of Roseville, Rocklin, and Lincoln. Farm employment represents about 10 percent of all employment in Sutter County, but less than 1 percent in the other two counties.

Table 6-1
Full-Time and Part-Time Employment by Industry, 2003

Area	Sutter County	Placer County	Sacramento County
Total employment	42,471	170,278	759,033
Farm employment	4,346	1,478	3,430
Forestry, fishing, related activities	1,908	547	1,4981
Mining	107	211	488
Utilities	96	494	869
Construction	2,557	21,470	50,469
Manufacturing	2,196	10,400	31,851
Wholesale trade	1,202	3,349	21,312
Retail Trade	6,180	24,019	80,478
Transportation and warehousing	1,317	3,245	14,667
Information	271	3,106	18,942
Finance and insurance	1,246	9,488	46,214
Real estate and rental and leasing	2,017	9,606	26,680
Professional and technical services	1,739	10,661	49,881
Management of companies and enterprises	(D)	1,905	7,160
Administrative and waste services	2,099	9,942	46,071
Educational services	668	2,850	11,976
Health care and social assistance	4,137	13,420	64,324
Arts, entertainment, and recreation	(D)	4,693	12,932
Accommodation and food services	2,356	14,122	45,167
Other services, except public administration	2,633	16,998	42,698
Federal, civilian	171	670	7,476
Military	155	544	3,310
State and local government	3,989	15,784	171,140

Source: Regional Economic Information System, Bureau of Economic Analysis, 2005a, Table CA25 (NAICS), April 2005.
(D) – Not shown to avoid disclosure of confidential information, but the estimates for this item are included in the totals.

Placer County has experienced stronger annual employment growth rates than the state of California, the San Francisco Bay Area or the SACOG region since 1992. In 2004, it was ranked as the fourth county in the nation in year-over-year job growth, at 6.3 percent. Since 1998, the strongest employment gains have been in the Construction sector, which accounted for 13 percent of all employment in 2003 and almost 98 percent of Placer County's employment growth between 1998 and 2003, reflecting population and business growth in the County and increased demand for homes and commercial space. Other employment increases were experienced in Financial Activities and in Educational and Health Services, while manufacturing jobs declined (SRRI, 2004).

Employment Centers in the Study Area

Historically, the study area's economy has been based on agriculture, but in recent years a number of manufacturing businesses have moved into the area, and there are proposals and plans that would bring considerable new job growth to the area. At present, there are several small businesses, such as convenience stores, cafes, and farm supply stores, scattered throughout the study area, but two areas have more intensive industrial/commercial development, with associated concentrations of jobs. These are the

Sunset Industrial Area located near SR 65 in the Eastern Segment and the South Sutter industrial/commercial reserve area located south of Sankey Road in the Western Segment.

Placer County's Sunset Industrial Plan Area includes a variety of industrial and warehousing uses located along Industrial Boulevard, as well as business park developments along SR 65. The polygons representing these clusters of industrial and commercial development, as shown on Figure 6-1, occupy more than 600 acres within the study area.

Businesses in the industrial/commercial reserve area of south Sutter County include the Sysco Foods plant, Holt of California, and JB Construction. A concrete batch plant and several manufacturing businesses are located along Pacific Road. In addition, a cluster of businesses (including warehousing and miscellaneous small retail and service businesses) is located on the south side of Sankey Road, immediately west of the Natomas East Main Drainage Canal.

Other major employment centers that are close to the study area include those in the cities of Roseville, Rocklin and Lincoln. In Roseville, major private employers include Hewlett-Packard, NEC Electronics, Kaiser Medical Center, Union Pacific Railroad, SureWest Communications, Sutter Roseville Medical Center, and Agilent Technologies. Those in the City of Rocklin include Oracle Corporation, Hewlett-Packard, TASQ Technology and the Sierra Community College District. Thunder Valley Casino is the major employer near the City of Lincoln. Other major employers in Lincoln are Solectron Global Services and Sierra Pacific Industries (SRRI, 2004).

The Roseville-Rocklin area is gaining a reputation as a leader in information technology. Hewlett-Packard has approximately 5,500 employees between the main 500-acre Roseville site and the satellite campuses in Rocklin and Lincoln. The Roseville site was established in 1979, making Hewlett-Packard Roseville's largest employer. Operations include research and development and customer support (Placer County, 2006a; Hewlett-Packard Development Company, L.P., 2006).

Employment growth in southwestern Placer County is expected to remain strong. Among the recent proposals for mixed use developments within the study area are two proposals for university campuses—the Regional University and a satellite campus for the California State University at Sacramento to be included in the Placer Ranch Specific Plan area. These two university facilities are expected to provide approximately 9,400 jobs and generate more than 1 billion dollars in economic output annually (Thomson, 2004).

In addition, job growth is expected in the south Sutter County Sutter Pointe Specific Plan area, which lies within the study area. Projected total employment estimates associated with major new development proposals in and around the study area are as follows (DKS Associates, 2006):

- Curry Creek 12,303
- Regional University 1,309
- Placer Ranch 29,372
- Placer Vineyards 11,869
- Creekview 650

6.2.2 Labor Force and Unemployment

Table 6-2 presents data on the labor force and unemployment rates in the three study area counties in 2000 and 2005. Sacramento County has the largest labor force, followed by Placer County. Sutter

County has a considerably smaller resident labor force. Unemployment rates have been relatively stable in the three counties. Placer County and Sacramento County have unemployment rates around 4 percent, somewhat better than the statewide unemployment rate of around 5 percent, while Sutter County's unemployment rate is considerably higher, exceeding 9 percent, reflecting its dependence on agriculture.

Table 6-2
Annual Average Labor Force Size and Unemployment Rates, California and Study Area Counties, 2000 and 2005

Area	Labor Force		Unemployment		Rate	
	2000	2005	2000	2005	2000 (%)	2005 (%)
California	16,857,500	17,695,600	833,200	948,700	4.9	5.4
Sutter County	38,000	40,800	3,600	3,800	9.4	9.4
Placer County	131,500	162,300	4,700	6,400	3.6	4.0
Sacramento County	606,000	673,800	26,400	32,400	4.4	4.8

Source: Employment Development Department, Labor Market Information Division, 2006, Report 400c, Monthly Labor Force Data for Counties, 2005.

6.2.3 Income

Median and mean household income in the SACOG region grew faster than the rate of inflation from 1979 to 1999. Median household income in the region grew by 24.7 percent over the two decades, for an average annual growth rate of 1.1 percent, compared with 0.8 percent for the state and the nation during the same time period. Both median and mean household incomes in the SACOG region are expected to continue to rise in the coming decades. Median household income, adjusted for inflation, is projected to increase from $45,267 in 1999 to $58,516 in 2020 and to $83,481 in 2050. Average household income is projected to increase from $58,376 in 1999 to $73,565 in 2020 and $101,135 in 2050 (Levy and Doche-Boulos, 2005).

Table 6-3 presents recent data on the number of employed persons and per capita personal income for the study area counties in 2000 and 2003. Reflecting the size of their respective labor forces, Sacramento County had the highest number of employed persons, followed by Placer County. Per capita income was highest in Placer County—approximately 22 percent higher than per capita income in Sacramento County and 43 percent above per capita income in Sutter County. Table 6-4 presents information on total wage earnings by industry in study area counties for 2004.

Table 6-3
Total Employment and Per Capita Income, California and Study Area Counties, 2000 and 2003

Area	Employment (number of jobs)		Per capita personal Income	
	2000	2003	2000	2003
California	19,626,033	19,746,205	$32,464	$33,415
Sutter County	38,810	42,471	$24,487	$25,606
Placer County	147,756	170,278	$36,419	$36,613
Sacramento County	728,803	759,033	$28,463	$30,129

		Avg. Weekly Pay	$727	$616	$1,145
	Local Government	Total Payroll ($1,000)	$145,312	$628,154	$2,840,833
		Avg. Weekly Pay	$705	$843	$843

Data Source: Quarterly Census of Employment and Wages (EDD, 2006).

6.2.4 Transportation Facility Funding

Funding for transportation projects is available from federal, state, regional and/or local sources, although in recent years, funding has not kept pace with needs. Budget deficits have restricted the funding available for needed transportation improvements and have delayed implementation of approved projects. Placer County's few "promised" transportation projects (i.e., projects identified as priorities in the RTP and for which future funding is anticipated to be committed when it becomes available) like the Lincoln By-pass and the I-80/Sierra College Boulevard Interchange have been delayed due to lack of funding. Available federal and state funds have been allocated toward breaking the I-80 bottleneck and transit expansions, but local matches are required (PCTPA, 2006; HDR/HLB Decision Economics Inc., 2006).

At the federal level, on August 10, 2005, the President signed into law the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU). With guaranteed funding for highways, highway safety, and public transportation totaling $244.1 billion, SAFETEA-LU represents the largest surface transportation investment in history. Some of the SAFETEA-LU funds, approximately $61 million, have been allocated to PCTPA. It builds on the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) and the Transportation Equity Act for the 21st Century (TEA-21). The State of California provides funding through three separate programs: the State Transportation Improvement Program (STIP), the State Highway Operation and Protection Program (SHOPP) and the Traffic Congestion Relief Program (TCRP).

Many local jurisdictions in California now levy development impact fees, so that new development pays for the additional infrastructure that is required to accommodate it. Most of these development fees pay for local road improvements, but financing regional roadway improvements can be more challenging.

In 2002, four local jurisdictions in Placer County—Placer County and the cities of Roseville, Rocklin, and Lincoln—formed the South Placer Regional Transportation Authority (SPRTA), a joint powers authority (JPA). The JPA's purpose is to coordinate planning, design, financing, determining construction timing, and construction for several regional transportation improvements – including the Placer Parkway. One of SPRTA's powers is to collect and implement a regional transportation and air quality mitigation fee on new development. This fee program is expected to generate $55 million for the Placer Parkway.

Funding for planning and environmental work conducted on the project to date has come from a variety of sources, including STIP and SPRTA. Funding for future phases of the project is uncertain. At present, there are many more proposed transportation projects than there are funds available to implement them, and the condition of the federal and state budgets continues to make future funding commitments for transportation infrastructure improvements uncertain. The project sponsors are considering a variety of alternative potential funding mechanisms, including new developer fees, county-wide transportation sales tax, and toll facilities (PCTPA, 2005; PCTPA, 2006). It is assumed that Sutter County would contribute to Parkway costs through development exactions in the Sutter Pointe Specific Plan, and that Placer County would demand similar exactions for projects in and adjacent to the Parkway corridor. It is anticipated that Placer Parkway would be constructed in phases, as individual developers contribute certain interchanges or roadway segments as part of their master-planned developments and/or as funds become available.

One of the first funding challenges to develop the Placer Parkway will be to acquire land that can be used as mitigation. Waiting until the roadway and its Tier 2-level environmental review to be completed will make securing mitigation lands more difficult and expensive. PCTPA has requested that Placer County staff help to secure land to mitigate Parkway impacts through development agreements for Specific Plans in and adjacent to the study area.

6.3 IMPACT ANALYSIS

6.3.1 Significance Criteria

Based on pertinent existing laws and regulations, Caltrans impact assessment guidance and professional judgment, Placer Parkway would be considered to have significant economic impacts if it would:

- disrupt or divide the physical arrangement of a major established business park or employment center;
- displace a large number of businesses and jobs;
- cause substantial loss of local government revenues; or
- be inconsistent with local adopted goals and policies pertaining to economic growth and development.

6.3.2 Approach to Analysis

Direct impacts to businesses and employment in the study area were identified by comparing the footprint of the corridor alignment alternatives to aerial photographs and the GIS database that contained coordinates for the locations of employment centers and individual businesses within the study area. For the purposes of this analysis, it was assumed that if a business fell within a corridor alignment it would be affected, even though it may be possible to avoid the business in the future, when a specific roadway right-of-way is selected within the corridor. Project-related employment and income benefits were estimated using national multipliers developed through FHWA-funded research. Pertinent adopted goals and policies were reviewed to determine consistency or inconsistency with project alternatives.

6.3.3 Direct Economic Impacts

Table 6-5 presents a summary of potential direct impacts to existing employment centers in the study area that would be associated with each of the build alternatives, indicating the potential to disrupt or divide the physical arrangement of a major established business park or employment center, or to displace a large number of jobs—the first and second significance criteria above (the third and fourth criteria are addressed in Sections 6.3.4.2 and 6.3.3.7 below, respectively).

Table 6-5
Summary of Direct Impacts to Employment Centers
Associated with the Project Alternatives

Alignment Alternative	Affected Employment Centers (number)			Affected Employment Centers (acres)		
Segment	**W**	**C**	**E**	**W**	**C**	**E**
1	0	0	1	0	0	19
2	0	0	1	0	0	19
3	0	0	1	0	0	19
4	1	0	1	2	0	19
5	1	0	1	2	0	19
Data Source: Aerial photo and URS Corporation GIS data summary file, February 2006.						

Table 6-6 presents a summary of the acres of farmland that would be lost under each of the build alternatives. Removing farmland from agricultural production would result in loss of revenues from crop sales, which is very roughly estimated based on an average commodity price of $1,000 per acre[4] and assuming all of the lost acres are used for crop production. Potential direct impacts on employment centers and crop values in the study area are described by alternative alignment and by segment below. (Loss of jobs associated with the employment centers cannot be calculated at this time. Losses of agricultural jobs associated with farmland conversion are expected to be minimal, because of the predominance of rice cultivation and cattle ranching in the project study area. These are typically family farming operations that are not dependent upon seasonal or migrant labor, the way vineyard or orchard operations are.)

Table 6-6
Acres of Farmland Potentially Affected by Project Alternatives

Alternative	Western Segment (acres)	Central Segment (acres)	Eastern Segment (acres)	Total Acreage Affected
Alternative 1	356	423	29	808
Alternative 2	356	606	29	991
Alternative 3	356	581	29	966
Alternative 4	305	343	29	677
Alternative 5	305	576	29	910

Source: Department of Conservation Farmland Mapping and Monitoring Program – 2002 data for Placer County and 2004 data for Sutter County; and California Spatial Information Library GIS database.

6.3.3.1 No-Build Alternative

Under the No-Build Alternative, land would not be acquired for Placer Parkway and the Parkway would not be constructed. There would not be any economic impacts under the No-Build Alternative.

6.3.3.2 Alternative 1 – the Red Alternative

Western Segment. Alternative 1 is located outside of the major employment centers in the Western Segment and would not directly impact these resources. The potential value of crops lost as a result of farmland conversion in this segment is estimated at $356,000.

Central Segment. There are no major employment centers currently located in the Central Segment. Alternative 1 would therefore not affect any major employment centers in this segment of the study area. The potential value of crops lost as a result of farmland conversion in this segment is estimated at $423,000.

Eastern Segment. Alternative 1 would impact approximately 19 acres of the existing Rio Bravo biomass power plant property in the Sunset Industrial Area in the vicinity of Industrial Boulevard, potentially displacing jobs and affecting the viability of the businesses on the remnant parcels. The potential value of crops lost as a result of farmland conversion in this segment is estimated at $29,000.

[4] This figure is based on Sutter and Placer County average crop values per harvested acre of rice in 2003 and 2004. In Sutter County, this was $1,085 per acre in 2003 and $740 per acre in 2004 (Sutter County Agricultural Commissioner, 2005). In Placer County, this was $1,360 per acre in 2003 and $843 per acre in 2004 (Placer County Agricultural Commissioner, 2006). (Substantial increases in rice production in 2004 resulted in significantly lower prices per ton, which is why an approximate average price per acre is used conservatively for the purpose of this analysis).

6.3.3.3 Alternative 2 – the Orange Alternative

Western Segment. Alternative 2 is located outside of the major employment centers in the Western Segment and would not directly impact these resources. The value of crops lost as a result of farmland conversion would be the same as Alternative 1.

Central Segment. No major employment centers are identified in the Central Segment. Alternative 2 would therefore not affect any major employment centers in this portion of the study area. The potential value of crops lost as a result of farmland conversion in this segment under Alternative 2 is estimated at $606,000.

Eastern Segment. Direct impacts to employment centers associated with Alternative 2 would be identical to those identified for Alternative 1 in the Eastern Segment. The potential value of crops lost as a result of farmland conversion in this segment is estimated at $356,000, the same as Alternative 1.

6.3.3.4 Alternative 3 – the Blue Alternative

Western Segment. Alternative 3 is located outside of the major employment centers in the Western Segment and would not directly impact these resources. The value of crops lost as a result of farmland conversion would be the same as Alternative 1.

Central Segment. No major employment centers are identified in the Central Segment. Alternative 3 would therefore not affect any major employment centers in this portion of the study area. The potential value of crops lost as a result of farmland conversion in this segment under Alternative 3 is estimated at $581,000.

Eastern Segment. Direct impacts on employment centers associated with Alternative 3 would be identical to those identified for Alternative 1, as would the estimated value of crops lost due to farmland conversion.

6.3.3.5 Alternative 4 – the Yellow Alternative

Western Segment. Alternative 4, which would terminate near Sankey Road, would affect 2 acres of the Sysco property but would not directly affect the building or existing parking facilities. The Sankey Road realignment that would occur under this alternative would affect the complex of small industrial and commercial enterprises located on the south side of Sankey Road just west of the UPRR tracks.

The potential value of crops lost as a result of farmland conversion in this segment from Alternative 4 is estimated at $305,000 annually.

Central Segment. No major employment centers are identified in the Central Segment. Alternative 4 would therefore not affect any major employment centers in this portion of the study area. The potential value of crops lost as a result of farmland conversion in this segment under Alternative 4 is estimated at $343,000.

Eastern Segment. Direct impacts on employment centers associated with Alternative 4 in the Eastern Segment would be identical to those identified for Alternative 1, as would the estimated value of lost crop production.

6.3.3.6 Alternative 5 – the Green Alternative

Western Segment. Alternative 5 would follow the same alignment as Alternative 4 in the Western Segment. It would impact 2 acres of industrial uses on the south side of Sankey Road, but would

probably not displace any businesses because of the small amount of land affected. The value of crops lost as a result of farmland conversion in this segment would be the same as for Alternative 4.

Central Segment. No major employment centers are identified in the Central Segment. Alternative 5 would therefore not affect any major employment centers in this portion of the study area. The potential value of crops lost as a result of farmland conversion in this segment under Alternative 5 is estimated at $576,000.

Eastern Segment. Direct impacts on employment centers associated with Alternative 5 in the Eastern Segment would be identical to those identified for Alternative 1, as would the estimated value of crops lost as a result of farmland conversion.

6.3.3.7 Comparison of Alternatives

All of the build alternatives would directly impact the same employment center in the Eastern Segment, in the Sunset Industrial Area, and would not affect any employment centers in the Central Segment. Alternatives 1, 2, and 3 would not directly impact any employment centers in the Western Segment, while Alternatives 4 and 5 would impact several businesses located on the south side of Sankey Road. The estimated value of crops lost as a result of farmland conversion under the various alternatives would be similar, with estimates ranging from $808,000 (Alternative 1) to $991,000 (Alternative 2). Placer Parkway is included in the RTP and MTP, and its Purpose and Need statement includes a goal of fostering economic growth. The conflict between economic development and farmland preservation is evident in all of the proposed development planned for the region (see Section 4.3.5 for discussion of the cumulative impacts of regional growth on agricultural resources).

Western Segment. In the Western Segment, Alternatives 1, 2, and 3, which would terminate north of Riego Road, would not directly affect any existing businesses or employment centers in the study area. Alternatives 4 and 5, which would terminate near Sankey Road, would impact 2 acres of industrial uses on the south side of Sankey Road, but would probably not displace any businesses because of the small amount of land affected. The estimated value of crops lost as a result of converting farmland to a roadway use is estimated at $356,000 under Alternatives 1, 2, and 3, and at $305,000 under Alternatives 4 and 5.

Central Segment. As no major employment centers are located in the Central Segment, none of the alternative alignments would cause any impacts on these resources. The estimated value of crops lost as a result of farmland conversion would be highest in this segment, ranging from $343,000 (Alternative 4) to $606,000 (Alternative 2).

Eastern Segment. Employment and crop loss impacts associated with all build alternatives would be identical in the Eastern Segment, because they all follow the same alignment in this segment.

Consistency with Adopted Goals and Policies

The No-Build Alternative would be inconsistent with Placer County economic development policy 1.N.2, which states that the county shall encourage the retention, expansion and development of new businesses by providing infrastructure in areas where resources and public facilities and services can accommodate employment generators. The Sunset Industrial Area has been designated as such an area, but development of businesses in this area has been hindered by infrastructural constraints, including local traffic congestion and lack of efficient access to air freight services at the Sacramento International Airport.

All build alternatives would be inconsistent with Sutter County and Placer County policies aimed at preserving and enhancing agricultural activities in the county, such as Sutter County economic development Goal 6.B and related policies aimed at facilitating preservation, growth and expansion of agricultural industries within Sutter County; as well as Placer County General Plan Policy 7.A.3, which states that the county shall encourage continued and increased agricultural activities on lands suited to agricultural uses.

6.3.4 Secondary and Indirect Impacts

No-Build Alternative

Under the No-Build Alternative, land would not be acquired for Placer Parkway and the Parkway would not be constructed. There would not be any secondary and indirect impacts under the No-Build Alternative.

Alternatives 1 Through 5

Because employment and income associated with future roadway construction would not occur in the same time and place as the corridor preservation action, these are addressed as secondary and indirect impacts below. These impacts would not occur within specific segments of the study area as defined for the purposes of this analysis, but would be more regional in nature. Similarly, since fiscal impacts would occur at the time of land acquisition for right-of-way preservation and continue into the future, these are also described as secondary and indirect impacts below.

6.3.4.1 Construction Employment and Income Benefits

Project-related employment and income impacts associated with all of the build alternatives would be similar, but it is not possible to predict where these would occur, because it is not known where the major suppliers or construction contractors would be located or where construction labor would be hired. Direct, indirect, and secondary employment and income benefits would be experienced within Sutter, Placer and Sacramento counties, but many of these benefits could be dispersed throughout the greater Sacramento region, northern California or beyond.

The total estimated cost of construction for Placer Parkway would be more than $600 million, as shown on Table 6-7, which presents the current preliminary estimated costs for right-of-way acquisition, environmental mitigation, engineering, and construction by segment. The current preliminary estimated cost for the Parkway is approximately $611 million for a four-lane facility and $654 million for a six-lane facility. This includes approximately $158 million for right-of-way and environmental costs and approximately $453 million for construction for the four-lane facility, and $160 million for right-of-way and environmental costs and $495 million for construction for the six-lane facility (HDR/HLB Decision Economics, 2006; URS Corporation, 2005).

FHWA estimates transportation infrastructure accounts for 11 percent of the nation's economic activity, and that every dollar invested in the highway system yields $5.60 in economic benefits (FHWA, 1999b). Using the FHWA average multiplier, the $453 construction expenditure would result in approximately $2.5 billion in regional economic benefits. FHWA research has shown that expenditures of capital for highway improvements reduces costs, increases efficiency and expands output of businesses in the region, resulting in increased demand for labor, capital, and materials, generally strengthening the regional economy (FHWA, 1999a).

Table 6-7
Estimated Placer Parkway Total Project Cost
(Preliminary)

Placer Parkway – Four-Lane Facility				
Items	Segment			Complete Corridor
	Western	Central	Eastern	
Right-of-Way/Utilities	$18,700,000	$48,100,000	$48,600,000	$115,400,000
Environmental Mitigation	$5,800,000	$14,200,000	$11,200,000	$31,200,000
Environmental Analysis	$4,250,000	$4,510,000	$2,990,000	$11,800,000
Engineering Design	$10,640,000	$11,270,000	$7,490,000	$29,400,000
Project Segment Construction	$141,800,000	$150,200,000	$99,800,000	$391,800,000
Construction Administration (8%)	$11,340,000	$12,020,000	$7,980,000	$31,400,000
Total	$192,530,000	$240,300,000	$178,060,000	$610,900,000
Placer Parkway – Six-Lane Facility				
Right-of-Way/Utilities	$18,700,000	$48,100,000	$48,600,000	$115,400,000
Environmental Analysis	$4,510,000	$3,630,000	$4,720,000	$12,900,000
Environmental Mitigation	$5,800,000	$14,200,000	$11,200,000	$31,200,000
Engineering Design	$11,270,000	$9,080,000	$11,800,000	$32,200,000
Project Segment Construction	$150,200,000	$121,000,000	$157,300,000	$428,500,000
Construction Administration (8%)	$12,020,000	$9,680,000	$12,580,000	$34,300,000
Total	$202,500,000	$205,690,000	$246,200,000	$654,400,000

Notes: Construction costs are based on October 2005 unit costs. Estimate is based on Alternative 3 alignment with north of Riego Road interchange.
Data Source: HDR/HLB Decision Economics, 2006.

Based on FHWA's estimate that every billion dollars spent in highway construction generates 42,000 jobs, the $453 million spent on constructing a four-lane Placer Parkway would generate an estimated 19,026 jobs. Of these, approximately 8,942 workers would be employed supplying highway construction materials and equipment, 6,469 would work in businesses where construction dollars are spent and 3,615 would work at roadway construction sites (FHWA, 1999b). Regional economic and employment benefits would be about 7 percent higher for a six-lane facility.

It is anticipated that Placer Parkway would be constructed in phases, as individual developers contribute certain interchanges or roadway segments as part of their master-planned developments and as funding becomes available (e.g., four lanes could be constructed initially, with two additional lanes added at a later time).

6.3.4.2 Fiscal Impacts

As reported in Section 3.3 and summarized on Table 6-8, the Parkway would convert almost two thousand acres of land in the study area to a transportation corridor. This would result in the permanent

loss of some current property tax revenues received by local jurisdictions, as taxable land uses are converted to nontaxable highway right-of-way. In addition, farmland that is under Williamson Act contracts that would be converted to the roadway corridor (as shown on Table 4-10) would result in further reductions in local revenues, through the loss of the partial tax reimbursements made to Placer County by the state under that program.

Table 6-8
Amount of Land Potentially Affected by Project Alternatives (Acres)

Alternative	Western Segment	Central Segment	Eastern Segment	Total Acreage Affected
Alternative 1	385	903	630	1,918
Alternative 2	385	821	630	1,837
Alternative 3	385	848	630	1,864
Alternative 4	321	677	630	1,628
Alternative 5	321	672	630	1,623
Source: Department of Conservation Farmland Mapping and Monitoring Program – 2002 data for Placer County and 2004 data for Sutter County; and California Spatial Information Library GIS database.				

Because of the uncertainty about funding sources for construction of Placer Parkway, other local fiscal impacts of roadway construction on regional or local jurisdictions cannot be evaluated at this time. It is likely that the estimated $600 million facility construction cost would be financed using a variety of federal, state, regional, and local funding sources—such as government grants, development mitigation fees and special sales taxes—and possibly even private funding (the toll road option). A special study conducted in 2006 by HDR/HLB Decision Economics, Inc., for SPRTA indicated that constructing the Placer Parkway as a toll road could be a feasible option, especially if there were to be a combination of public and private financing available for the project. The conclusion was based on population projections for the area, projections of household income, anticipated congestion on the local roadway network without the Parkway and estimated travel time savings that would be achieved by using Placer Parkway. Annual operation and maintenance costs for Placer Parkway as a toll road were estimated at approximately $1 million per mile, or approximately $15 million annually in 2005 dollars (HDR/HLB Decision Economics, 2006).

6.3.5 Cumulative Impacts

No-Build Alternative

Under the No-Build Alternative, land would not be acquired for Placer Parkway and the Parkway would not be constructed. There would not be any cumulative impacts under the No-Build Alternative.

Alternatives 1 Through 5

The major development projects proposed for the project area (see Section 3.3.5 and Figure 3-4) and surrounding vicinity (including two new university campuses) will contribute to strengthening and diversifying the local and regional economy (this would be a cumulative economic benefit, not a significant adverse impact). While the proposed development would result in further losses of farm revenues, this would be replaced by other forms of revenue, including employment and sales taxes, as well as higher property tax revenues.

The project would contribute to the cumulative loss of farmland (as discussed in Section 4) and associated revenues from agricultural activities in the study region. The study area contains approximately 35,454 acres of land, most of which are undeveloped. The percentage of the study area as a whole that is estimated to be converted from its present use by the Parkway ranges between and 1,623 and 1,918 acres (4.58 and 5.41 percent of this area, respectively). As shown on Figures 3-1 and 3-2, most of this acreage is either zoned for agricultural production, capable of being used for agricultural production, or in agricultural production. As shown in Table 6-5, the total acres of farmland potentially affected by the Parkway is estimated to range from 677 to 991 acres, with potential loss of crop value estimated from $808,000 to $991,000 (see Section 6.3.3.7). The Parkway could also potentially affect industrial uses on the south side of Sankey Road, but would probably not displace any of these businesses because the effect would be minimal. The Parkway would also affect up to 19 acres of the Rio Bravo biomass power plant property in the Sunset Industrial Area, depending on where the roadway is finally sited. Any affects on the economic viability of these facilities would be fully mitigated.

As shown on Figure 3-4, the potential for development within the study area dwarfs the area that would be used by the selected Parkway alignment. The cumulative developments shown on this figure, and described in Section 3.2.4.1 through 3.2.4.3, would have a major effect on economic losses related to loss of farmland in the study area. Based on the relative proportion of Placer Parkway's farmland conversion as compared to the entire cumulative development scenario, and the Parkway's absolute dollar contribution, this contribution is not cumulatively considerable in the context of expected farmland losses as a whole.

Placer Parkway would contribute to a stronger and more diversified local and regional economy. The project would contribute to the structural change from an agricultural economy to an increasingly diversified economic base and increased property tax revenues, as higher-density urban uses replace farming, especially in the Western and Eastern segments. It would contribute to regional economic strength and to the development of commercial and industrial businesses planned for the Sutter Pointe Specific Plan area, the Sunset Industrial Area, and the proposed Placer Ranch Specific Plan area by improving access to these areas; providing an alternative to SR 65 and I-80 for connecting the Roseville-Rocklin-Lincoln area to the Sacramento airport; and improving LOS on roadway segments.[5]

The Parkway's contribution to the estimated value of crops lost as a result of farmland conversion is not cumulatively considerable and would be more than offset by other forms of revenue such as employment and sales taxes and a higher property tax base from planned and proposed development within the study area that could be accelerated by the Parkway. Because cumulative economic impacts are not significant, and because the Parkway's contribution to cumulative economic impacts are likewise not significant, cumulative economic impacts of the Parkway would be less than significant.

6.3.6 Potential Watt Avenue Interchange

A future interchange at Watt Avenue would improve regional connectivity, which could have a positive effect on some businesses (particularly those providing goods or services to or at locations near intersections along the new Parkway). It could shorten commute distances for some drivers within the region, if they live or work in the vicinity of the future interchange. Because a Watt Avenue intersection would increase traffic volumes substantially, however, it would decrease levels of service on many segments of the new roadway if only four lanes are constructed, potentially reducing the reliability or efficiency of the link between businesses located in the Sunset Industrial Area and the Roseville-Lincoln-

[5] LOS is a qualitative measure of the effect of a number of factors which include speed and travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience, and operation costs. Levels of Service are designated "A" through "F," from the best to worst, which cover the entire range of traffic operations that might occur. Level of Service "E" describes conditions approaching or at maximum capacity.

Rocklin area and the Sacramento airport and associated regional economic benefits. The levels of service on the Parkway with a six-lane facility and a Watt Avenue interchange are not projected to fall below LOS C, with the expected exception of Alternative 3, which is projected to operate at LOS D in the segment east of Watt Avenue.

6.3.7 Avoidance, Minimization and/or Mitigation Strategies

No significant adverse economic impacts were identified for this Tier 1 project. Individual businesses that would be displaced by the Proposed Action will be identified during the Tier 2 environmental analysis. Any such businesses would receive financial assistance and relocation assistance and other benefits provided under the Uniform Relocation Assistance Act.

Mitigation strategies (for further reducing or avoiding less-than-significant economic impacts) could include reducing the cost of Placer Parkway mitigation by securing mitigation lands early, possibly through developer agreements associated with the major new mixed-use developments proposed for the study area and surrounding vicinity. This strategy would result in purchasing mitigation lands using 2008 dollars, rather than 2020 dollars, and would provide greater certainty that mitigation lands would be available when and if needed, particularly in light of anticipated pressures on mitigation lands due to other planned and proposed major development in the region. During Tier 2, a roadway alternative could be designed that would minimize the taking of or encroachment into existing commercial/industrial facilities in the Western and Eastern Segments. Such considerations could include locating the roadway in a portion of the corridor that would avoid such facilities and/or phasing of median widening (e.g., from the SR 65 interchange to west of the Rio Bravo facility).

6.3.8 Analyses to be Undertaken in Tier 2

Further research to be conducted at the Tier 2 phase will include field research to identify specific businesses that could be displaced by the project, as well as the estimated number of jobs associated both with the displaced businesses and with any farm units that would no longer be economically viable as a result of reductions in size or parcel splitting. A Relocation Impact Report will be prepared to describe the potentially impacted businesses, as well as any special relocation needs they may have, and to evaluate the likely availability of comparable replacement resources in the vicinity. Fiscal impacts on local jurisdictions will be estimated based on revised information about parcels affected, current assessed values, Williamson Act contract status and proposed funding mechanisms for Placer Parkway corridor acquisition and construction.

7.0 GROWTH INDUCEMENT

7.1 REGULATORY FRAMEWORK

The California Environmental Quality Act requires that environmental documents: "Discuss the ways in which the project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Included in this are projects which would remove obstacles to population growth...Increases in the population may further tax existing community service facilities so consideration must be given to this impact. Also discuss the characteristic of some projects that may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively. It must not be assumed that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment" [CEQA Section 15126.2(d)]. In addition, NEPA requires consideration of the potential indirect project impacts, including those that may occur farther away or later in time, but are still reasonably foreseeable [NEPA Section 1508.8(b)].

Caltrans defines growth inducement as the relationship between a proposed project and growth within the transportation project area (Caltrans, 1997). The Caltrans Environmental Handbook, Volume 4, Community Impact Assessment (June 1997) is the primary guidance document that was used in the preparation of this CIA, including the growth inducement analysis. Just as this analysis was being completed, the Mare Island Accord interagency working group (representing FHWA, U.S. EPA, and Caltrans) released new guidance for assessment of growth-related impacts analyses (Mare Island Accord, 2006). The approach described in the new guidance is more elaborate than, but similar and complementary to, the earlier guidance. Specifically, it recommends a six-step approach for developing a growth-related impact analysis: (1) Review previous project information and decide on the approach/level of effort needed for the analysis; (2) Identify the potential for growth for each alternative; (3) Assess the growth-related effects of each alternative to resources of concern; (4) Consider additional opportunities to avoid and minimize growth-related impacts; (5) Compare the results of the analysis for all alternatives; and (6) Document the process and findings of the analysis. While this section is not structured to reflect these six steps in order, they were substantially completed during the course of this analysis. Step one has been an ongoing process throughout project design, with a commitment made to completing a thorough growth inducement analysis using multiple methodological approaches, as described in Section 7.2. This chapter of the CIA identifies growth inducement potential associated with the project alternatives (Step 2). A summary of the growth inducement findings was prepared and provided to the members of the environmental consulting team so that they could determine the implications of these findings for the resources of concern in the project area, and consider additional opportunities to avoid or minimize impacts (Steps 3 and 4). Results of the analyses have been compared and documented in the appropriate resource technical reports, as well as in the draft EIR/EIS (Steps 5 and 6).

Specific analytical approaches identified in the new guidance include contacting local planning agencies and business development councils for their input, and consulting with experts (such as planners, developers and agency staff). These approaches were used extensively in this CIA, particularly for the growth inducement analysis, as documented in Section 7.3.3.

7.2 METHODOLOGICAL APPROACH

Appendix B contains a summary of recent literature on the role of transportation infrastructure in land use changes or growth and development. As this literature demonstrates, growth and development patterns are shaped by a wide range of social, economic, political, and environmental influences. Many factors interact to encourage or discourage growth at any particular location. These factors are complex and interrelated, and there is no standard or widely accepted methodology for evaluating or quantifying how

any single factor, such as construction of a new transportation facility, contributes to local or regional growth.

Caltrans' guidance on growth inducement analysis acknowledges the difficulty of determining the relationship between transportation and land use accurately, or isolating the influence that transportation improvements have on growth and development, especially because in many instances transportation improvements are planned in cooperation with local and regional governments in response to anticipated, planned, and desired growth. The guidance describes a variety of quantitative and qualitative approaches that have been used on past transportation projects to address growth inducement. The guidance document includes a special appendix on growth inducement methodologies that describes four primary analytical techniques:

- the ***forecast methodology***, which describes the transportation planning and traffic engineering process that was used to determine the size and type of transportation facility proposed;
- ***factor analysis***, which identifies and evaluates the local factors that encourage or constrain growth and development in the study area;
- the ***No Action Alternative***, which focuses on a comparison of the projected growth that would occur with and without the project; and
- use of a ***growth inducement checklist***, which asks a series of questions about the project in relation to population and employment growth and trends in the study area.

The Caltrans guidance refers to the **forecast methodology** as the preferred methodology, because it is typically the most quantitative and least speculative of the analytical techniques reviewed.

With the recent rapid growth that has taken place northeast of the City of Sacramento, growth inducement has been identified by resource agencies and environmental groups as a concern with regard to any new proposed development in the study area and the surrounding vicinity. Because of the importance and relatively high sensitivity of the growth inducement issue for Placer Parkway, it was determined that the growth inducement analysis should be conducted using a number of different methods, employing both quantitative and qualitative analytical tools, to achieve a thorough growth inducement analysis. For this reason, all four of the methodological approaches identified above are employed for this analysis. In addition, input was solicited from planners, realtors, builders, and developers familiar with the study area, so that their expertise and knowledge of the area could be used to better understand growth and development trends in the region.

7.3 IMPACT ANALYSIS

This section evaluates potential growth inducement impacts related to Placer Parkway using three of the four methodologies described above—forecast method, factor analysis, the No-Build Alternative, and the Caltrans Growth Inducement Checklist. It also summarizes the results of informational interviews conducted with local planners, developers and real estate market specialists familiar with the study area. The Growth Inducement Checklist information is presented last, since many of the responses drafted to this list of standard questions are based on information developed or discussed in the sections that precede it.

7.3.1 Forecast Method

The forecast method summarizes the transportation planning process that was used to determine the size of the proposed facility, in order to illustrate the relationship between the project's capacity and the amount of growth expected to occur in the area by 2040, with the objective of distinguishing between growth inducement and the forecasting of traffic demand and transportation needs based on local and regional growth policies, and determined in conjunction with responsible local government agencies.

Placer Parkway planning has been a collaborative process involving representatives of federal, state, regional, and local governments, as well as substantial public involvement, over the past decade. Project planning has been coordinated with diligent and innovative regional and local planning efforts aimed at shaping actual and anticipated growth and development in south Sutter County, southwestern Placer County, and the greater Sacramento region over the next several decades. Project planning has occurred in coordination and communication with such efforts as SACOG's Blueprint transportation and land use visioning process, the Placer Legacy project, local habitat conservation planning efforts, and the preparation of numerous Specific Plans for proposed major new development projects in and around the study area.

As part of its effort to involve affected stakeholders, PCTPA established three specific committees for the Placer Parkway: a PAC, an SAC, and a TAC (as described in Section 1.1). In addition, federal agencies have been involved for endangered and threatened species issues, and through a modified NEPA/404 process for Clean Water Act provisions. These working groups have met regularly throughout the project planning process to help guide project development and identify alternative alignments that would minimize environmental impacts, enhance public safety, and be financially feasible.

Public comments were solicited on the goals and initial concepts for Placer Parkway through a newsletter with mail-in comment card and two public workshops conducted in September 1999. In October 1999, the PAC voted unanimously to recommend to the PCTPA and SACOG Boards that a Route Adoption Study be conducted to identify a feasible alignment for the Parkway. A recommended study area was delineated, and the PAC made several other recommendations regarding making the alignment independent of Baseline and Riego Roads, proposing to design it as a controlled-access highway that would meet Caltrans standards, with interchanges to SR 65 and SR 70/99.

Placer Parkway was first shown as a "plan line" concept in the Placer County General Plan adopted in 1994. The concept for this new regional roadway originated from a perceived need to connect planned development in the vicinities of SR 70/99 and SR 65. The rapidly expanding high technology and service businesses located along the SR 65 corridor and in the Sunset Industrial Area needed better access to the air freight services at the Sacramento airport.

The Conceptual Plan for Placer Parkway, completed in 2000, articulated a number of reasons why a new corridor connecting SR 65 to SR 70/99 should be preserved. These included:

- projections of very strong growth (by both SACOG and the State Department of Finance) for the western Placer County/southern Sutter County/northern Sacramento County sub-regions through 2040;

- associated substantial increase in travel demand on the inter-regional roadway system, resulting in deterioration of travel speeds and travel times on regional and local roadways;

- projections of strong job growth in western Placer County such that total employment in this area would exceed total employment in downtown Sacramento by 2022; and

- growth of high-technology industries in the SR 65 corridor, requiring efficient access to the Sacramento airport to move manufactured goods reliably and rapidly (DKS Associates, 2001).

The Conceptual Plan indicated that Baseline Road and Riego Road, with some improvements, could accommodate a portion of the expected growth in travel demand that would result from population and employment growth in the region, but would be overwhelmed without construction of an alternative east-west travel corridor capable of carrying more traffic at consistently high speeds.

The question of growth inducement has been considered throughout the planning process for Placer Parkway, and concerns related to this issue were addressed in both the 2000 Conceptual Plan and 2001 Project Study Report that were prepared for the project. Both documents contain an adopted goal to avoid growth inducement and protect the rural character of agriculturally designated areas. Policies that were adopted to support this goal include: (1) not allowing access to the roadway in areas designated for agricultural use; (2) creating a 500- to 1,000-foot no-development buffer zone along the Parkway; and (3) using control signage along the corridor.

The 2000 Conceptual Plan for Placer Parkway recommended initial construction of a four-lane limited-access highway, but preservation of sufficient right-of-way for future expansion to six lanes or potential inclusion of a rail line. Throughout the project planning period, however, projections of urban growth in southwestern Placer County and southern Sutter County have continued to increase, making it appear more likely that a six-lane facility would be needed to maintain LOS C conditions in portions of the corridor by 2040. The project's current recommended "sizing" is based on 2040 traffic forecasts developed by SACOG for the study area and the traffic analysis, which indicate that if the Parkway were constructed with four lanes, some segments of all alternative alignments (with or without the Watt Avenue interchange) would operate at LOS E or F in 2040. At six lanes, the Parkway would operate at LOS C or better for all segments of all alignments (refer to Transportation Technical Report). The traffic analysis concluded that all five corridor alignment alternatives (compared to the No-Build Alternative would increase total Vehicle Miles Traveled (VMT) on the affected regional roadway system, but would reduce the amount of VMT on congested roadways in the region. The projected increase in total VMT is attributed to "induced travel demand" (rather than higher density of population or more jobs), whereby people living and working in the region would make more or longer trips, or trips to different destinations than they would under more congested traffic conditions, because traffic congestion can discourage drivers from taking additional or longer trips. For each alternative, the potential Watt Avenue interchange would provide a greater reduction in VMT on the congested local roadways (DKS Associates, 2006).

As the preceding discussion indicates, Placer Parkway project planning to date has been primarily a cooperative and collaborative process aimed at meeting projected travel demand associated with actual and anticipated population and employment growth in the region, rather than an effort aimed at stimulating or facilitating unplanned growth.

7.3.2 Factor Analysis

Within the study area, as in any area, a wide variety of factors influence the direction and pace of development. This section reviews some of the major factors noted in the Caltrans guidance that can work to stimulate or constrain development in a particular area. These include the availability and relative cost of land, local government plans and policies, public attitudes toward growth and development, terrain and existing land use, cost and availability of labor, commute times, accessibility, infrastructure availability (water, sewer, roads), as well as any potential constraints associated with the proposed facility. Because the discussion of these factors is qualitative in nature, the discussion is summarized using a system of plus and minus signs to indicate whether these factors encourage or

discourage growth and development in each segment of the study area (Table 7-2). The paragraphs below provide a discussion that responds to the pertinent questions that are posed in the Caltrans guidance document for each of the factors.

Table 7-1
2040 LOS for Placer Parkway Segments, by Corridor Alignment Alternative

Projected LOS in 2040								
Alternative	**With or Without Future West Avenue Interchange**		**East of SR 70/99**	**East of Pacific St.**	**West of Watt Ave.**	**East of Watt Ave.**	**East of Fiddyment Road**	**West of SR 65**
1	With Option 1	4 lanes	D	E	F	D	D	E
		6 lanes	B	C	D	B	C	C
	With Option 2	4 lanes	C	C	D	D	D	E
		6 lanes	B	B	B	B	C	C
	Without	4 lanes	B	C	C	C	D	E
		6 lanes	B	B	B	B	B	C
2	With	4 lanes	C	D	F	D	D	E
		6 lanes	B	B	C	B	C	C
	Without	4 lanes	C	C	D	D	D	E
		6 lanes	B	B	B	B	C	C
3	With	4 lanes	C	D	F	D	E	F
		6 lanes	B	B	C	B	C	C
	Without	4 lanes	C	C	D	D	D	E
		6 lanes	B	B	B	B	C	C
4	With	4 lanes	D	F	F	D	E	F
		6 lanes	B	C	C	B	C	C
	Without	4 lanes	C	D	D	D	D	E
		6 lanes	B	B	B	B	C	C
5	With	4 lanes	D	E	E	D	D	E
		6 lanes	B	C	C	B	C	C
	Without	4 lanes	C	D	D	D	D	E
		6 lanes	B	B	B	B	C	C

Notes: Shaded cells represent segments that would operate at LOS E or F conditions. Two general locations for a potential interchange on Placer Parkway at the future extension of Watt Avenue were identified with Alternative 1 – a south location, called Option 1, and a north location, called Option 2. See Figure 2-3 for the location of these options.

Table 7-2
Summary Evaluation of Major Growth and Development Factors in the Study Area, by Segment

Development Factors:	Western Segment	Central Segment	Eastern Segment
Availability and Cost of Vacant Land	+	+	+
Local Government Plans and Policies	+	-	+
Public Attitudes toward Growth	+	+/-	+
Terrain and Land Use	+/-	-	+/-
Cost and Availability of Labor	0	0	+
Available Infrastructure	-	-	+
Potential New Roadway Effects:			
Commute Times	+	0	+
Access	+	0 (+ with Watt Avenue Interchange)	+
Proposed Facility Constraints	0	0	0

+ = existing conditions encourage growth and development (Development Factors); project would improve conditions (Potential New Roadway Effects)
- = existing conditions constrain growth and development (Development Factors)
+/- = existing conditions both encourage and constrain growth and development
0 = neutral or not applicable
? = data not available

Cost of Land: Is the cost of land in the affected area high, average, or low (as compared to the county or statewide figures?

An important factor in the rapid rate of growth and development experienced in the Roseville-Rocklin area during the 1990s was the large discrepancy between local land costs and those in the San Francisco Bay Area, as well as in the Sacramento region and the state. As discussed in Chapter 5, this gap in land and housing costs has narrowed considerably over the past decade, as home prices and commercial leasing rates have risen in the Roseville area, similar to the rest of California. Nonetheless, land costs in the study area remain lower than in the San Francisco Bay Area and competitive with those in the greater Sacramento region (SRRI, 2004; Marie Jones Consulting, 2006). In addition, a recent study conducted for the Placer County Conservation Plan found that land values in valley areas of Placer County were substantially lower than in foothills areas of the County. For example, parcels 20 to 40 acres in size were $7,000-10,000 per acre in the valley, compared with $14,000-20,000 per acre in the foothills (Bender Rosenthal Inc., 2004). On Table 7-2, the Western, Central, and Eastern segments are given a plus to indicate relatively good availability of land at competitive prices.

Local Plans and Policies: Do local government plans and policies support or restrict growth in the affected area?

Chapters 3 and 5 describe growth trends and growth management policies that have been adopted by local governments in the study area to support or accommodate future anticipated growth. Local government jurisdictions generally have adopted plans and policies that support orderly growth, as reflected in such mechanisms as the Placer County/City of Roseville Memorandum of Understanding, Lincoln's and Roseville's expansions of Spheres of Influence, and the processing of development applications and preparation of Specific Plans for major new development proposals.

The rate of growth in northern Sacramento County and southwestern Placer County has been so rapid that adopted plans governing land use in particular new-growth areas have been built out much sooner than expected, and "long range" planning efforts meant to address growth needs over a 20-year planning horizon have had to be updated or replaced much sooner than expected (Pease, 2006; Doyel, 2006). As a result, General Plans are being amended and Specific Plans developed in response to particular new development proposals, sometimes at the expense of long-range planning. While SACOG does not have jurisdiction over local land use decisions, it has exerted regional planning leadership through the Blueprint process, which encourages smart growth principles such as higher-density housing development, infill development, and transit-oriented development. The preferred Blueprint scenario, which would result in more growth in southwestern Placer County and southern Sutter County than is currently allowed under adopted plans and policies, is supported by Placer County and the City of Roseville (although other jurisdictions in the region, such as Elk Grove and Lincoln, have not embraced the Blueprint principles).

In the Western Segment, local plans and policies have supported orderly industrial development in south Sutter County in the past, and now the Sutter Pointe Specific Plan for mixed-use development has been prepared. City and county plans and policies in the Eastern Segment also attempt to accommodate anticipated growth in an orderly fashion, so these can also be seen as supportive of development. Local jurisdictions are now in the process of amending General Plans and adopting Specific Plans for major new proposed development projects, including Placer Vineyards, Placer Ranch, Creekview, Sierra Vista, Regional University, Curry Creek, and the Lincoln SOI expansion.

By contrast, local plans and policies are restrictive in the Central Segment, where land is designated and zoned predominately for agricultural use with an 80-acre minimum parcel size. These policies do not support or encourage development, although the collaborative political process described in the next paragraph (as well as general local jurisdiction support for SACOG's Blueprint process described previously in this report) does support and encourage development.

Public Attitudes: Does public opinion as articulated in public meetings, the political process or the media, support or oppose growth in the affected area?

Articulated attitudes toward growth and development in the study area vary. While some civic or environmental organizations and individuals have expressed concern about the rapid rate of population growth in the region (leading to local efforts to support farmland preservation and habitat conservation, as described in Chapters 3 and 4), there are also strong indications of general support for accommodating the growth that has occurred and is projected to continue. In Sutter County, public attitudes toward growth are reflected in the recent passage of Measure M, through which the voters directed county officials to permit mixed-use development in the area of south Sutter County that had been designated for industrial and commercial development. In Placer County, the County Board of Supervisors has directed staff to proceed with consideration of several major new proposals for conversion of agricultural areas to urban mixed-use development that would require General Plan amendments (including the Placer Ranch and Regional University Specific Plans), as well as to begin preparation of a Curry Creek Community Plan (Placer County Planning Department, 2004). In addition, there appears to be general public support for these proposed developments, despite concern for potential impacts on sensitive habitats and farmland. Placer County voters passed Measure H in November 2005, supporting the development of the universities in the region (Gold Country Media, 2006).

Similarly, the City of Roseville's City Council has directed staff to proceed with consideration of the Creekview and Sierra Vista Specific Plans, and the Council has actively encouraged citizen involvement in managing future growth through formation of committees such as the Growth Management Visioning Committee (City of Roseville, 2005). Furthermore, in response to the recent submission of multiple development proposals for projects in southwestern Placer County, Placer County and the Cities of Roseville, Rocklin, and Lincoln have collaborated to develop a "likely" future development scenario (the

Super-Cumulative scenario described in Section 3.3.5.1) for purposes of evaluating cumulative impacts associated with these proposals. This scenario assumes full buildout of all residential land in Placer County west of Sierra College Boulevard by 2025, including current general plan areas, as well as major proposed developments, including Placer Vineyards, the Regional University, and Placer Ranch in the unincorporated County area; Creekview and Sierra Vista Specific Plans in Roseville's MOU Remainder Area; the City of Lincoln's SOI expansion areas; and the Curry Creek Community Plan Area. Placer Parkway is also recognized as a component of this future cumulative development scenario.

Terrain and Land Use: Is the terrain of the affected area suitable for development? Are existing land uses in the affected area conducive to or would they conflict with new residential/retail/office/industrial growth?

The terrain throughout the study area is relatively flat (i.e., no steep slopes) and conducive to development, except in the vicinity of sensitive habitats such as vernal pool complexes and creeks, as well as in the Natomas basin zone, where FEMA flood insurance requirements or flood ratings may constrain development until flood protection is enhanced. In the Western Segment, new residential and commercial development would conflict with the existing agricultural land uses, but the terrain is suitable for development and planning is underway to transform this area into a mixed use, master planned community. In the Central Segment, new residential and commercial development would conflict with the existing agricultural uses. In the Eastern Segment, the terrain is suitable for development. Existing land uses are compatible with new growth in the Sunset Industrial Area, but not in the agricultural areas in the western portion of this segment.

Cost and Labor Pool: Are the cost, availability, and skills of the labor pool in the affected area conducive or restrictive to employment growth?

This question needs to be considered in the context of the greater Sacramento region, as well as with respect to the study area and corridor alignment alternatives, as there is extensive commuting throughout the region. In general, the labor force in this region is competitive in terms of educational attainment or training and cost. As discussed in Chapter 5, very strong employment growth has occurred in the Sacramento region and in the Roseville-Rocklin-Lincoln area in recent years, and this job growth is expected to continue. Roseville now accounts for approximately half of all jobs in Placer County and has become a net importer of workers, i.e., there are many more jobs than employed residents in the city. Many of these new jobs pay relatively well, attracting skilled workers. Furthermore, the proposals for two new university campuses in western Placer County, if approved, will help ensure a skilled labor force in the future. For these reasons, a plus is shown on Table 7-2 for the Eastern Segment. The labor force question is less applicable to the Central and Western segments, where population density is low, the resident population is predominately engaged in agricultural activities, and unemployment rates are higher. Nonetheless, abundant skilled labor is available in adjacent areas of the greater Sacramento region to support employment growth. In addition, much of the growth contemplated for the Sutter Pointe Specific Plan area is mixed-use development that would attract new residents to fill new jobs to be created in that area.

Infrastructure: Is the existing infrastructure (e.g., local roads, water and sewage facilities, schools and community facilities) adequate or inadequate to handle growth? Would the local economy support construction of new facilities?

The existing roadway network in the study area was not planned to accommodate the amount of growth that has occurred and is projected to occur in the region in the future. As a result, traffic congestion has become an increasing problem on some local roadways. Typically, local roadway construction is required as a condition of development approval in the study area, but the construction of roadways within and adjacent to a particular development does not necessarily alleviate deteriorating regional traffic conditions. While projects are being implemented to address problem areas along the regional SR 65 and

I-80 corridors, commuters are using alternative routes on roads such as Baseline Road and Riego Road to avoid bottlenecks on the state and interstate freeway system.

Local government entities typically condition new Specific Plans to require that new roadways be constructed to accommodate increased traffic volumes. Similarly, local government entities typically require new major developments to pay development impact fees or directly provide certain utilities and services as a condition of development approval. Long-range planning efforts to provide water, sewer and energy have been relatively successful. Schools in the Roseville-Rocklin-Lincoln area have received adequate investment and most receive high ratings in comparison with schools statewide (California Department of Education Policy and Evaluation Division, 2006). Much of the recent growth this area has occurred through Specific Plan processes (like the West Roseville Specific Plan) that encourage a master planning approach to meet infrastructure needs, as well as to construct parks, community centers, recreational facilities and other amenities in concert with new residential and commercial space. As a result, infrastructure in the Eastern Segment is more developed to accommodate growth, while infrastructure in the Western and Central segments of the study area is less developed at present. Population density in these areas is low, homes and businesses rely on water services from private wells and septic systems, and there are few schools or parks. As major development projects are planned and approved for these areas in the future, developers will undoubtedly be required to provide basic services and amenities, as is the case in developing areas of the surrounding region, but at the present time the existing infrastructure is not adequate to accommodate substantial growth. While local infrastructure needs may be met through planning and mitigation requirements for specific master planned developments, regional needs also need to be addressed. To some extent, local government entities may be basing development approvals on assumptions that regional infrastructure needs will be met—for example, through funding and implementation of projects identified in the MTP and RTP (including Placer Parkway). While the local economy is relatively strong, there are many competing demands for funding and infrastructure development, making the implementation of desired regional transportation and other infrastructure improvements uncertain.

Commute Time: How would commute times to the affected area be changed by the proposed project?

Recent rapid development northeast of Sacramento has resulted in increased traffic congestion and slower travel times throughout the area. Many drivers are now taking "shortcuts" on roadways that were not designed to carry regional through traffic, in order to avoid the bottlenecks experienced on highways and major arterials. Recent major improvements made or planned to roadways in the region include widening SR 65 between Roseville and Lincoln, construction of the Lincoln (SR 65) by-pass, construction of new SR 65 interchanges at Pleasant Grove Boulevard, Sunset Boulevard, and Twelve Bridges Drive), and improvements at Blue Oaks Boulevard. Nonetheless, many more improvements to the local and regional roadway network are needed to accommodate the projected increase in travel demand associated with anticipated population and employment growth. By providing an alternative regional connector linking the Roseville-Lincoln area to SR 70/99 and the Sacramento airport and relieving traffic congestion on local roadways, Placer Parkway would improve commute conditions and reduce the number of peak hours spent in traffic congestion.

A future Placer Parkway roadway could shorten commute times from SR 65 to downtown Sacramento or the Sacramento Airport vicinity by approximately 15 minutes in peak commute hours, or about 12 minutes during off-peak hours (HDR/HLB Decision Economics, 2006; DKS Associates, 2006). This would shorten trip duration by approximately one-third. Appendix C shows sample travel times from SR 65 to the Sacramento Airport and downtown that were calculated for the evaluation of the PSR alternatives.

Access: How would the proposed facility change access to adjacent land?

The Parkway would improve access to adjacent land in the Western and Eastern segments, where new high-speed interchanges are proposed to connect the new roadway with existing SR 65 at the eastern terminus and SR 70/99 at the western terminus. In addition, new interchanges would be constructed to provide access to adjacent areas in these two segments. By contrast, no interchanges are proposed for the Central Segment, so the new roadway would not affect access to adjacent lands in this segment, unless a interchange with Watt Avenue is constructed by others at some future time.

Constraints: Are there any features on the highway that could constrain the new capacity of the transportation improvement?

Since it is likely that construction of Placer Parkway would happen incrementally (as mentioned in Chapter 6), depending upon funding availability and willingness of adjacent property developers to provide land and/or finance roadway construction, it is possible that portions of the Parkway may not be constructed in the early years of operation, and that the capacity of six-lane portions built to accommodate traffic in rapidly-growing adjacent areas would be constrained by the capacity limitations of four-lane sections constructed in areas that are not experiencing such rapid development. Once the ultimate six-lane facility is completed, the lack of interchanges in the Central Segment would not limit roadway capacity, but could limit its potential use by people living or working in and around that segment, unless a future interchange with Watt Avenue were to be constructed by others, independently of this project.

Other Factors and Uncertainties

Numerous factors are at work encouraging growth and development in the study area, in addition to those reviewed according to Caltrans guidance above. These include continuing net in-migration to California, the proximity of the study area to Sacramento and the Roseville-Rocklin-Lincoln real estate market and job centers, the strength of the state and regional economy, the relatively flat topography of the study area, a temperate climate, ease of land assembly (due to the presence of large parcels of land, versus smaller parcels with many more individual owners involved), open space and vistas, and easy access to Sierra foothill and mountain recreational opportunities. These factors, working together, have created an atmosphere of relatively intense development pressure, especially northeast of Sacramento and throughout the study area.

There are some factors working to discourage growth and development in the study area, including the presence of Williamson Act contracts on agricultural parcels, movements to define habitat conservation areas and agricultural preserves, increasing difficulty in obtaining project entitlements, rising land costs, rising development mitigation fees, rising interest rates, challenges in supplying water and wastewater treatment services, increasing traffic congestion on the local roadway network, and growing FEMA concern about flood risks in the Natomas Basin, which potentially lead to a building moratorium in that area until flood hazard issues are addressed. Similarly, hearings are contemplated for the Placer County Conservation Program in the future, and could result in adoption of a Habitat Conservation Plan that would prohibit development in portions of the study area. Such factors are important considerations for any new proposed development, but to date these obstacles have been overcome for new development projects around the area and have not reduced the relatively intense development pressures that are being experienced in the project vicinity.

As the above discussion indicates, the factors stimulating (rather than constraining) development in the study area are predominately positive (i.e., they encourage rather than discourage development) at present, without the Parkway. The factors favoring or stimulating development in the Eastern Segment are overwhelmingly positive under existing conditions, and the Parkway (by improving access and reducing commute times) would add to these positive factors. Factors at work in the Western Segment

are somewhat more mixed, because of the lack of developed infrastructure and potential conflicts with existing uses, but still predominately positive. The Parkway would improve access and commute times in the Western and Eastern segments. In the Central Segment, there are more development constraints, including existing zoning, the prevalence of agricultural activity, concerns about farmland and habitat conservation and lack of developed infrastructure, resulting in less overwhelming growth pressure. Nonetheless, the availability and relative cost of undeveloped land in proximity to major developing areas makes this area subject to moderate development pressures.

7.3.3 The No-Build Alternative

The purpose of the No-Build Alternative is to attempt to compare the growth patterns that would occur in the study area with and without the project. The MEPLAN model described below was selected as a tool to be used for this analysis, as well as to compare the effects of a northerly vs. southerly alignment on regional growth and development patterns. The decision to supplement the growth inducement analysis with MEPLAN model runs was made in order to add a more quantitative layer to what would otherwise remain a relatively qualitative growth inducement analysis.

MEPLAN is an integrated land use transportation model that forecasts the influence of transportation conditions on local land use development and the impacts of local land use development on transportation conditions. The model was developed by the University of Calgary and UC Davis and has been used for several recent planning and visioning exercises in the Sacramento region, including SACOG's Blueprint project (SACOG, 2004) and the Mineta Foundation Report on transit-oriented transportation and land use scenarios (Johnston et al., 2004). Documentation of the MEPLAN model runs and results is provided in a separate technical report (DKS Associates, 2007b).

Use of the MEPLAN model was discussed with SACOG staff, members of the Project Development Team and federal resource agency representatives (U.S. EPA and U.S. Army Corps of Engineers, who encouraged the use of this model to support the Placer Parkway growth inducement analysis. The general consensus was that the MEPLAN model runs could help clarify differences in the potential distribution of growth in the study area with and without the project, as well as to differentiate the potential for growth inducement among various project alternatives, including options with and without a future Watt Avenue connection.) Details of the effect of the addition of a Watt Avenue interchange on the MEPLAN findings are provided in Section 7.4.

MEPLAN is a detailed and comprehensive model that forecasts the influence of transportation conditions on local land use development and the impacts of local land use development on transportation conditions. Inputs to the model include the local transportation network and information about the supply and location of land available for development. MEPLAN uses an input-output model to determine changes in the demand for land and to forecast which available parcels are most likely to be developed, considering traffic congestion as an important factor influencing builder and consumer location decisions (Abraham, 1998). The model was developed by the University of Calgary and UC Davis and has been used for several recent planning and visioning exercises in the Sacramento region, including SACOG's Blueprint project (SACOG, 2004) and the Mineta Foundation Report on transit-oriented transportation and land use scenarios (Johnston et al., 2004).

There were several reasons for choosing MEPLAN over other simulation models available:

- It has been "vetted" by SACOG and local government entities and is generally accepted by community interests in the project area as a reasonable forecasting tool.
- MEPLAN has been recently calibrated and validated for applications in the SACOG region.

- Land use assumption inputs for southern Sutter County and western Placer County to the MEPLAN model have been recently updated, in collaboration with local governments, as part of SACOG's effort to update the Metropolitan Transportation Plan growth projections.

One potential disadvantage of using the MEPLAN model is that it aggregates subareas of the six-county SACOG region into 73 Regional Analysis Divisions (RADs), compared to the 1,300 Traffic Analysis Zones used in the SACMET traffic analysis model. Thus the entire study area is encompassed in only a few of the MEPLAN RADs, with several additional RADs (representing Roseville, Lincoln and Rocklin) also influencing traffic patterns and growth and development in the study area. For a Tier 1 level analysis predicting land use changes in 2040 under hypothetical project alternatives, however, this gross scale is probably much more appropriate than the very detailed subarea analysis conducted to determine impacts on local roadway networks. Nonetheless, for the purposes of this analysis, several of the study area RADs were subdivided into smaller areas and SACOG land use data was disaggregated to those subareas, in order to provide a better definition of impacts on growth in the study area that might result from a northern alignment vs. a southern alignment for a major new transportation facility constructed within the RAD. This and other refinements that were made to MEPLAN prior to running the model for this impact analysis are described in the technical report cited above.

7.3.3.1 Results of the Analysis

The MEPLAN model predicted 2040 development levels in the project study area and the surrounding region based on five scenarios:

1) No-Build Alternative
2) Alternative 1
3) Alternative 1 with Watt Avenue interchange
4) Alternative 5
5) Alternative 5 with Watt Avenue interchange

For each scenario, the model predicted 2040 changes in households and employment in each of the 96 RADs comprising the project study area and the surrounding region, as shown on Figure 7-1. Figures 7-2 through 7-9 graphically depict the findings of the MEPLAN model runs. Key findings include the following:

- Compared to the No-Build Alternative, the MEPLAN model estimates that about 1,000 to 1,200 additional households would develop by 2040 in the project vicinity with the build alternatives. The amount of residential development in the remainder of the region would decrease by about the same amount.

- The 1,000 to 1,200 additional households represent an increase of about 0.4% in the total number of households in the local project vicinity by 2040, compared with No Build.

- Although Figures 7-2 through 7-9 show that in some rural portions of Yuba, Sutter and Yolo counties the build alternatives would have changes in households compared to the No-Build Alternative, the increase or decrease of 0.5 to 2 percent in these rural areas is a small number of households

- The MEPLAN model estimates that Alternative 1 would have about the same number of households in the local project vicinity as Alternative 5.

- Compared to the No-Build Alternative, the MEPLAN model estimates that about 1,800 to 2,100 additional jobs would exist by 2040 in the local project vicinity with the build

alternatives. The amount of jobs in the remainder of the region would decrease by about the same amount.

- The 1,800 to 2,100 additional jobs represent an increase of about 0.6% to 0.7% in the total number of jobs in the local project vicinity by 2040.

- The MEPLAN model estimates that Alternative 1 would have about 100 more jobs in the local project vicinity than Alternative 5.

- The location of the increase in households is somewhat influenced by the corridor alignment. A comparison between Figures 7-3 and 7-7 indicates that a small number of additional households would locate further north under Alternative 5 compared to Alternative 1. A similar comparison of the increase in jobs as shown on Figures 7-2 and 7-6 indicates less of a difference between Alternatives 1 and 5.

As the model results and figures show, there would be slight differences in the distribution of households and jobs within the project study area and the surrounding region under each scenario, but, overall, these differences are not substantial.

7.3.4 Expert Opinions

Telephone interviews were conducted in March and April 2006 with a number of persons who are actively involved in planning and development issues in and around the study area, or who have been engaged in long-term agricultural activities in the area, to solicit their insights and informed opinions about the factors influencing growth and development in the area. The interviews do not constitute a statistically valid survey or represent all opinions on these topics, but an attempt was made to contact representatives of all affected local jurisdictions and the major development interests active in southwestern Placer County and southern Sutter County, as well as other professionals and area residents familiar with growth trends and real estate development issues. The persons interviewed included the following:

Bob Amarel, Jr.	Former Owner of Reason Farms (now the planned City of Roseville Retention Basin)
Perry Beck	Loomis Town Manager
John Bianchi	Rice Farmer and Land Owner, Sutter County
Eric Bryant	Project Manager, Placer Ranch (proposed Specific Plan)
Rodney Campbell	Community Development Director, City of Lincoln
George M. Carpenter	Project Manager, Lennar Communities (Sutter Pointe Specific Plan)
Loren Clark	Assistant Planning Director, Placer County
Cameron Doyle	Project Manager, Brookfield Land Company (Northern Territories/Metro area of northern Sacramento County)
Ashley Feeney	Associate Planner, City of Sacramento Long Range Planning Section (Natomas Joint Vision annexation area)
Ken Gianotti	Senior Vice President, Stanford Land Company, Rocklin
Mrs. Gaynell Gleason	Cattle Rancher, Placer County
Ed Graves	Consultant (former Economic Development Director for Placer County, retired March 2006)
Julie Hanson	Senior Vice President, KT Communities
Ken Hough	Director of Community Planning and Operations, SACOG

Townley Lazerle	Real Estate Market Consultant, The Whitney Group
Darryl Lauppe	Rice Farmer and Land Owner, South Sutter County
John Norman	General Manager, Brookfield Land Co. (controls area immediately north of Creekview and immediately west of proposed Placer Ranch)
Kathy Pease	Senior Planner, City of Roseville Planning and Redevelopment Department
Steve Pease	Commercial Developer, KMS Development LLC, Roseville
Terry Richardson	City of Rocklin Community Development Director
Cindy Schaer	Senior Entitlement Manager, Richland Communities, Roseville
Surinder Singh	Senior Planner, Sacramento County Planning and Community Development Department
Bill Turpie	Project Leader, Blue Oaks Property Owners (developing plans for Creekview area in Roseville SOI)
Deborah Waterbury	Rice Farmer, Pleasant Grove
Lisa Wilson	Senior Planner, Sutter County Community Services Department, Planning Services Division

Local government representatives were asked to what extent the Placer Parkway proposal influences land use planning in their jurisdiction, and whether or how they thought it might influence development activity or timing in their jurisdiction. They were asked what factors are the most important influences on development in their jurisdiction, and then they were asked to rank the relative importance (on a 1 to 10 scale, with 1 being not important and 10 being very important) of each of a list of 18 factors (see Table 7-3) that potentially could influence (either constrain or stimulate) development, with regard to what was occurring in the jurisdiction they oversaw.

Developers were asked how the Placer Parkway proposal influenced their company's decisions to plan or propose real estate developments in the project vicinity, and whether or not they thought it would affect the timing of entitlements, construction, or buildout of their proposed or planned development projects. They were asked to discuss the major factors influencing their development decisions in the study area or the surrounding vicinity, and then they were asked to rank the same set of 18 factors (on the same 1 to 10 scale), according to their relative importance to their company's strategic planning decisions regarding their development projects in the area.

Interviews with past and present agricultural operators in the project area were conducted to obtain information on their perspectives on regional growth and their outlook on the future of farming in the study area. These interviews, therefore, were more open-ended and informal. They were not asked to rank the 18 factors. Instead, they were asked about the effects of area growth (if any) on their agricultural activities over the past two decades, and they were asked whether they had sold or optioned their land, or had been approached by developers to do so. Some of the information obtained from the agricultural operators is discussed in Chapter 4, and it is also incorporated into the growth inducement analysis.

The paragraphs below summarize the information obtained from the interviewees. First, there is a summary of responses to questions on growth and development that were made by developers, then of responses made by planners. This is followed by an analysis of the results of the development factor ranking exercise. Finally, there is a summary of pertinent remarks and observations about regional growth trends that were made by the farmers, as well as miscellaneous comments made by other interviewees.

Table 7-3
Summary of Average Scores for Development Factors

Development Factors	Developer Opinions	Planner Opinions	Average (all interviewees)
Raw Land Cost	6.1	5.4	6.1
Ease of Land Assembly	4.7	5.0	5.2
Existing Zoning	3.7	5.0	5.2
Williamson Act Contracts	4.4	3.8	4.1
Flat Terrain	5.0	4.8	5.2
Proximity to Existing Development	6.7	7.4	6.9
Local Attitudes toward Development	7.3	7.0	7.6
Local Roadway Traffic Congestion	6.1	7.5	7.1
Development Impact Fees	6.8	5.0	6.2
Environmental Mitigation Requirements	7.9	6.8	7.4
Water Availability	7.3	6.8	7.1
Sewer Availability	6.9	6.3	6.6
Proximity to Parks and Open Space	4.8	5.0	5.0
Proximity to Job Centers	6.6	6.5	6.7
Proximity to Major Highways	7.2	6.8	7.4
Available Financing	5.5	6.6	6.3
Regional Growth Patterns	7.0	6.8	7.1
SACOG Blueprint	6.0	7.1	6.2

Note: 1 on the scale indicated not important; 10 indicated very important.
Source: Interviews conducted by Mara Feeney in March and April 2006

Developer Responses

Nine developers (representing major players in the project study region, including Richland Communities, KT Communities, Placer Ranch, Brookfield Land Company, Blue Oaks Property Owners, Stanford Ranch, KMS Development, Northern Territories, and Lennar Communities) were asked the direct question: "Did the proposal for a Placer Parkway influence your company's decision to plan or propose real estate development in the vicinity?" Findings were as follows:

- All developers commented that Placer Parkway had not been a major consideration in their development proposals.
- Many developers had purchased the land for development many years prior to the inception of the Placer Parkway concept.
- Many projects would complete buildout before the Parkway was scheduled to begin construction.
- In most cases, proposed residential development would be completed before the Parkway came into existence, although buildout of non-residential uses would take longer.

- Some developers said they considered the Parkway a speculative proposal, because no alignment has been selected and funding has not been secured.

- Developers commented that the selection of a final Parkway alignment would be important in facilitating implementation of specific development plans.

- One developer opined that the selected location of Parkway intersections would be a key factor in attracting more commercial development than residential development around those locations

- Most developers felt that urbanization of the study area was inevitable because of its location, with development moving rapidly northward from Sacramento and strongly westward from the Roseville area.

- Most of the developers who commented about potential effects of the Parkway on the region considered that traffic would be affected rather than land use or development.

- Many developers believed the Parkway would be beneficial for the area, because it would improve the region's growing traffic problems and relieve congestion by providing an alternative route for truck traffic and commuters.

- Most developers considered the project would be crucial for economic development as it would accommodate reliance of major businesses on truck transport and serve the need for an alternative to I-80 for accessing Sacramento airport and associated air freight services.

- Many felt that the Parkway would boost non-residential construction but would not influence residential construction patterns or timing.

- Key factors in determining developers' decisions about when and where to develop included:

  – strategic location
  – proximity to the active development markets (Sacramento, Roseville, Rocklin, Lincoln),
  – clarification of urban limit boundaries,
  – Roseville's rules regarding the order of development approvals for its Sphere Of Influence;
  – absorption rates of new construction in nearby areas
  – property owner or client relationships
  – building where people want to live and work.

- Several developers distinguished between development "considerations" and development "constraints." There are many factors regarded as important considerations, such as availability of water, sewer and other infrastructure—but these are issues that can be resolved, not insurmountable problems. Even litigation was taken in stride and assumed in project timelines. Factors such as conflicting zoning and Williamson Act contracts were not seen as serious constraints.

- The only real constraint to development identified by developers was a lack of market demand (which none of the developers saw as an issue in the study region) or some type

of physical or environmental condition (e.g., extreme slope or presence of a water body) that would make construction impossible or infeasible (too expensive to pencil out).

- When asked to rank the importance of eighteen specific development factors (as reported below), Environmental Mitigation Requirements received the highest average score from the developers interviewed. Several noted that development has become more difficult or challenging over the past decade, with the entitlement process taking longer and rising costs such as development fees and provision of infrastructure.

Planner Responses

Eight senior-level planners representing eight jurisdictions or agencies (SACOG, Placer County, Sutter County, Sacramento County, City of Roseville, City of Rocklin, City of Lincoln, and the City of Sacramento) were asked the direct question: "To what extent does the Placer Parkway proposal influence land use planning in your jurisdiction?" Findings were as follow:

- Most planners considered that the Parkway had no influence or very little influence on local land use planning in their jurisdiction.

- One planner commented that while a Parkway could relieve traffic congestion in southwestern Placer County, traffic impact analyses that are being done for new development do not presume this roadway, since it has not been approved.

- Many planners suggested that while the Parkway would influence traffic in the region, they did not consider it would influence land use planning or development patterns, which they considered to be more market-driven.

- One planner noted that whether or not the Parkway is funded and constructed, there would be a similar east-west roadway constructed to serve planned development in the vicinity, and, rather than the Placer Parkway stimulating development activity in the area, the opposite was true—that implementation of the major proposed developments in the area would make it more likely that the Parkway would be funded and built.

- One planner considered that the Parkway would influence land use.

- One planner considered that the Parkway would not influence the types of land uses that would occur in the area, but that it could affect development timing.

The planners were also asked to name the factors they perceived to be most important in influencing development activity and timing in their jurisdictions. The most common response was "market demand," although many mentioned infrastructure availability, including water supply, wastewater treatment and/or transportation facilities. Several mentioned environmental constraints and habitat conservation planning as uncertainties. Others mentioned the designation of urban limits and Spheres of Influence as important factors influencing where development is likely to occur.

Factor Ranking Exercise Results

Table 7-3 summarizes the rankings of the importance of the eighteen development factors that were provided by the persons who were interviewed for this analysis. The first column lists the development factors, the second column presents the average score that was given for each factor by the eight representatives of developer-builder firms. The third column shows the average score given by the eight Planners or Community Development agency staff who were interviewed. The last column presents the

overall average score for each factor that was provided by all who participated in this exercise (including not only developers and planners, but also the real estate market consultant, economic development consultant and town manager[6]).

As this table shows, developers and planners had slightly differing opinions as to which of these factors were the most important. Developers ranked Environmental Mitigation Requirements the highest, followed by Local Attitudes Toward Development and Water Availability. Planners ranked Local Roadway Traffic Congestion the highest, followed by Proximity to Existing Development and SACOG Blueprint.

There was reasonable consistency among interviewees regarding which development factors were the least important: Ease of Land Assembly, Existing Zoning, Williamson Act Contracts, Flat Terrain, and Proximity to Parks and Open Space. While the planners had also ranked Development Impact Fees as not very important (5.0), the developers interviewed gave this factor a higher average score (6.8).

What the Farmers Had to Say

The persons interviewed included four rice farmers and one cattle rancher. Of the five, one had recently sold his land holdings in the area, two had sold development options on some or all of their land, and two had received expressions of interest in their property but had not sold property or development options yet. Three owned land in southwestern Placer County and two in southern Sutter County.

All five of the farmers interviewed expressed deep skepticism about the future of agriculture in the study area. All commented on the intense development pressures being felt in the area, the substantial increase in conflicts between agricultural and urban uses in recent years, and the increasing costs of agricultural production relative to other areas of the state. They viewed developers in the area as extremely influential, and themselves as having neither the money nor the time to stop development. All saw it as a matter of time before agricultural activity would cease in the area, and they were all looking for the right opportunity to transition out of the area and try to exchange their property for agricultural land further up in the foothills. (Several specifically mentioned the "1031 exchange" that reduces capital gains taxes through the simultaneous sale of one property and purchase of another.)

The one person who had already sold his land in the study area said he felt "lucky to get out in time." He noted that the cost of water in the rapidly growing area has become too high to make rice farming viable or competitive any longer. He also noted that the quality of the soil in the area is not good, making it more suitable for urban development than other prime agricultural areas of the state that are under development pressure. He viewed continued urbanization of the study area as inevitable, along with the other four interviewees.

One farmer said he had spent a considerable amount of time at meetings over the past decade, trying to prevent leapfrog development and encourage more orderly development of the area. He felt some success had been achieved in this regard, but in spite of this, farming in the area was becoming more and more difficult and economically marginal.

Examples of conflicts with urban uses were mentioned by all interviewees. Several mentioned the difficulty of moving large farm equipment from one field to another, on roadways that are increasingly filled with commuters in a hurry to get somewhere and frustrated by anything that might slow them down. (Examples of

[6] Some average scores in the last column appear to be skewed disproportionately higher. This is because one of the interview respondents felt that most of the development factors were extremely important, giving more than half of them a score of ten. The other two interviewees who were neither developers nor planners also tended to rank the factors relatively high in comparison to other interviewees.

road rage included gun-waving incidents and reports of automobiles passing a baler, then slamming on the brakes in front of it.) One reported that there was more vandalism as the population grew. Another noted that homeowners protest rice seeding at 6:00 a.m. and that as cities move their urban limit lines outward, farmers find they can no longer get insurance, because their crop dusters would fly too close to homes.

None of the farmers interviewed felt there was a future for long-term agricultural activity in the study area. Reasons listed for the predictable demise of agriculture in the area included the following:

- The quality of the soil is marginal;
- The cost of water keeps going up;
- The cost of gas and diesel keeps going up;
- Commodity prices are uncertain and unstable;
- Rice subsidies are decreasing;
- The conflicts as the population changes, farmers are regularly outvoted;
- Few young people are interested in farming as a way of life; and
- There is no political power to protect farmland.

These agricultural property owners also expressed substantial concerns over the movement to "preserve" farmland. They feared having the remaining agricultural lands designated as permanent open space, which would penalize the remaining farmers by reducing their property values considerably. They also observed that sometimes when property owners in the area sold development options, active farming of the land would cease, resulting in domination of fields by star thistle or other noxious weeds—not the idyllic type of farmland the preservationists imagine preserving.

The universal cynicism of the farmers interviewed was summed up by such comments as:

- "We're surrounded."
- "The whole area is owned or optioned by developers."
- "The writing is on the wall."
- "You just can't farm next to an urban area, period."

The farmers interviewed did not think the project would affect the pace of growth and development in the study area, but they thought it could have a short-term benefit to agriculture by taking commuters off the local roadways, reducing conflicts with farm equipment and perhaps allowing farming to continue a little longer than it would otherwise.

Other Comments

Economic specialists commented that the Parkway would be crucial to economic development in the area, because it would improve access to the Sacramento airport and provide an alternative route to I-80, which is congested and where one accident can cause severe traffic problems.

One long-time landowner in the project study who has been very active in attending meetings pertaining to growth issues in the area commented: "If Placer Parkway is built, it will have no effect on the pace of growth and development. The last thing people worry about is the roads. I can't see development slowing, just because Placer Parkway is not there. The biggest effect on development is open space and environmental requirements these days."

Another long-time landowner in the study area expressed cynicism over the concept of making the Placer Parkway a thoroughfare by not providing access in the central segment. "This is an opportunity, for once, to plan a road before the growth happens. In an election year people want to hear about No Growth—but

get real, the writing is on the wall! We're surrounded by development activities and options. Provide access to the Parkway, or traffic will just get worse."

Many of those interviewed echoed the belief that continued rapid growth and development in the study area was inevitable. They pointed out that most of the land from Roseville to Sutter County is owned or controlled by developers, who have lots of political savvy and apply lots of pressure. With strong population growth expected to continue in California, and with the Sacramento region continuing to capture much of that growth, it appears that the market conditions will remain favorable, even though there has been some softening in new home prices very recently. The farmers who were interviewed all felt that agriculture could not be sustained in the study area much longer. If they had not already sold or optioned their land, they were planning to do so and were looking for the right opportunity to move to another area, where agricultural activity might be more viable and less in conflict with ongoing and planned urban development.

7.3.5 Growth Inducement Checklist

This section lists the eight questions contained in the Growth Inducement Checklist developed for Caltrans and included in Appendix D of the Environmental Handbook Volume 4, Community Impact Assessment (Caltrans, 1997). The questions are answered in accordance with the Caltrans guidance, with a Yes response indicating some potential for a growth inducing impact, but without regard to the level of significance of that impact.

1. a) Will the project attract more residential development or new population into the community or planning area? b) If yes, would it be higher than is projected in the local general plan?

a – *No*. The project would not directly attract more population into the area, e.g., through the construction of new homes or businesses, and it is anticipated that all housing units currently allowed under adopted general plans will be built by 2020, when the Parkway is assumed to open. The cumulative development scenario for 2040 anticipates construction of many additional housing units as proposed by major projects in south Sutter and southwestern Placer County, but these units are being aggressively planned in the absence of any approvals or funding for Placer Parkway, so they cannot be attributed to the project. While the residential development that is anticipated under the 2040 cumulative development scenario is higher than what is currently anticipated under local adopted General Plans, local jurisdictions in Placer County are in the process of amending General Plans and adopting Specific Plans for proposed major projects, including Placer Vineyards, Placer Ranch, Creekview, Sierra Vista, Regional University, Curry Creek and the Lincoln SOI expansion. In Sutter County, the South Sutter Specific Plan, which proposed extensive industrial development in the project area, was later rescinded and has been superseded by voter-approved Sutter Pointe Specific Plan, which promotes a major mixed use commercial and residential development (now in the planning process) in the General Plan-designated Industrial-Commercial Reserve area at the County's southern border and straddling SR 70/99.

2. a) Will the project encourage the development of more acreage of employment generating land uses in the area (such as commercial, industrial or office)? b) If yes, would it be beyond that which is designated in the current local general plan?

a – *Yes*. Most of the planners, developers, real estate market consultants, and economic development specialists interviewed for this project expressed their professional opinion that, while the Parkway project would not influence the pace or direction of housing development, it was likely to have the effect of stimulating non-residential development, resulting in the buildout of planned industrial and commercial uses sooner than would occur otherwise. b – *No and Yes*. The non-residential development that would be encouraged by the Parkway would not exceed the levels contemplated in the Sutter County or Placer

County General Plans, or the Sunset Industrial Area Plan. However, the project could encourage intensification of employment-generating land uses in the vicinity of intersection locations in the Placer Ranch and the Sutter County Sutter Pointe Specific Plans), and land use plans for these areas have not been finalized or adopted yet.

3. a) Will the project lead to the increase of roadway, intersection, sewer, water supply, or drainage capacity? b) If yes, would it be beyond that projected or planned for in the local general plan?

a – *Yes*. The project would increase regional roadway supply and capacity, and it would provide several new interchanges where none exist at present (it would not affect sewer or water infrastructure availability). The new roadway would provide substantial new east-west traffic capacity and would relieve anticipated local roadway network congestion.

b – *Yes and No*. Placer County's General Plan has shown a concept line for Placer Parkway since 1994. The 1997 Sutter County General Plan does not refer to Placer Parkway, although the concept was included in the 2004 South Sutter Specific Plan, which was subsequently rescinded. Plans are being developed for a major east-west thoroughfare to serve the south Sutter Pointe Specific Plan, which will be incorporated into the Specific Plan for that area, whether or not Placer Parkway is approved and funded (Wilson, 2006). The increase in these capacities would occur as a result of the planned and proposed growth identified in the 2040 development scenario, as these projects would be required to provide roads, intersections, sewer and water infrastructure, and retention and detention facilities as part of their entitlement process. Placer Parkway could result in different land uses, or more intensive land uses, in the vicinity of interchanges where land use plans are still being developed and have not yet been approved. If approved, these projects will by definition be included in the General Plans. As described above, such development is not dependent on Placer Parkway.

4. a) Will the project encourage the rezoning or reclassification of lands in the community general plan from agriculture, open space or low density residential to a more intensive land use?

No. With its controlled access, an objective of the proposed transportation facility is to strike a balance among advancing planned job growth along the SR 65 and SR 70/99 corridors, avoiding urban growth inducement in areas not designated for development, and helping to preserve the existing rural character of southwestern Placer and southern Sutter Counties. The areas Placer County has designated as Agricultural Preserve (80-acre minimum lot size) are located for the most part in the Central Segment, where there would be no interchange access provided to Placer Parkway (unless a Watt Avenue interchange is constructed as a separate future project), and there would be a buffer zone associated with the future roadway. The trend toward rezoning and reclassification of agriculture and open space lands in and adjacent to the Western and Eastern Segments has been occurring without an adopted Placer Parkway corridor. The rezoning of low-density residential to more intensive land uses is occurring in the area largely as a result of the SACOG Blueprint process, which some local government entities (such as the City of Roseville) support to promote "smart growth" principles.

5. Is the project not in conformance with the growth related policies, goals or objectives of the local general plan or the area growth management plan? Or is it in conflict with the implementation measures contained in the area's growth management plan?

No. The project is in conformance with local policies, goals and objectives. It is in conformance with SACOG's Blueprint program, and it is shown in the adopted MTP – as a high-priority regional transportation facility serving the region. It is a part of Placer County's Regional Transportation Plan (2027). It is also shown as a future roadway concept in the Placer County General Plan and it is cited in

several Specific Plans that are being prepared for portions of the study area (e.g., Placer Vineyards Revised DEIR). As described in Chapters 3 and 5, most of the jurisdictions in the study area accept growth as inevitable and have been developing strategies to try to accommodate anticipated growth without adversely affecting quality of life.

6. Will the project lead to the intensification of development densities or accelerate the schedule for development or will it facilitate actions by private interests to redevelop properties within two miles of an existing or future major arterial roadway or within four miles of a limited access highway interchange?

Yes and No. The project would not lead to intensification of development densities in areas currently under development or being planned for development, but it could accelerate the rate of development, especially in areas near proposed new interchanges. It is not likely to stimulate redevelopment of properties within two miles of the roadway or four miles of interchanges within the project study period (to 2040), because these areas are predominately undeveloped agricultural land or open space, or have been developed relatively recently with urban uses, or are in the planning stages for mixed use development that should have a constructive life substantially longer than the Placer Parkway project study period (i.e., well beyond 2040).

7. Will the project measurably and significantly decrease home to work commuter travel times to and from or within the project area (more than 10 percent overall reduction or five minutes or more in commute time savings)?

Yes. The transportation impact analysis completed for the evaluation of PSR alternatives indicated that commute time savings for trips from SR 65 to the Sacramento Airport or downtown could range from 9 to 14 minutes, resulting in commute time savings in excess of 30 percent. The traffic analysis conducted for the five alternative alignments indicates that there would be reductions in traffic congestion on many local roadways within the study area. It also indicates that the project would "induce" additional travel demand somewhat, as measured by total Vehicle Miles Traveled, although it would reduce the total number of hours that commuters would experience congested traffic conditions.

8. Is the project directly related to the generation of cumulative effects as defined by CEQA guidelines?

Yes. According to CEQA, "cumulative impacts refer to two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts…The cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present and reasonably foreseeable probable future projects." Given the rapid recent urban development around the study area and the number of major new development proposals likely to be approved in the near future, the environmental impacts associated with the Placer Parkway project would increase the total universe of impacts to the environment that would result from implementation of all of the recent and foreseeable planned projects, each of which is likely to cause some significant environmental impacts.

The use of the Growth Inducement Checklist indicates that the project has growth inducing potential, because some of the questions were answered "Yes."

7.4 FINDINGS AND CONCLUSIONS

The results of the analytical approaches used above are mixed, and it is difficult to draw any simple conclusion regarding the precise relationship between the project and future growth in the project area.

The factors influencing regional growth are complex, and there is no reliable method known for quantifying the influence of a particular transportation facility such as the Placer Parkway on that growth.

Caltrans guidance encourages drawing one of the following four conclusions regarding the growth inducement potential of a project:

- *Not affect growth* – this conclusion can be made when no growth is expected, or when the project would yield no advantages that would have effects on developers' decisions.

- *Cannot determine effect on growth* – this conclusion can be appropriate when only wild guesses can be made about the likely course of growth: this is sometimes the case in rural areas, but in urban areas the analyst should be able to be more precise.

- *Hasten (or slow) growth, intensify growth, or shift growth from elsewhere in the region* – this kind of conclusion can be made when developers are expected to modify their course of development because of the project; the terms "support growth," "contribute to growth," "facilitate growth," or "respond to growth" are less precise ways of making this conclusion.

- *Induce growth* – this conclusion can be made when a larger amount of development would be expected to occur (area wide) during or after the project's construction than otherwise would have been expected in the foreseeable future.

The first conclusion above is not appropriate for Placer Parkway, since the new transportation facility would yield advantages that could affect developers' decisions. For example, the Placer Ranch and Sutter Pointe Specific Plans are currently being developed and would benefit from the certainty associated with adoption of a specific Placer Parkway corridor.

The second conclusion above is not appropriate for Placer Parkway, since there is clear evidence of likely future growth in the numerous formal proposals for major new master planned developments and SOI expansions, as well as in the pace of land assembly and development option activities in the area.

The third conclusion above could be appropriate, because the project would *hasten growth or contribute to growth* in the region, mainly by facilitating implementation of proposed commercial and industrial development in the western and eastern segments of the study area in the study period, but possibly encouraging additional conversion of farmland and open space to urban uses in the long term.

The fourth conclusion above could also be appropriate, because by hastening growth or contributing to growth, more growth would occur with the project than without it in the foreseeable future (e.g., the project study period to 2040).

The conclusion drawn from this review of growth factors and influences and application of various analytical approaches is that the Placer Parkway project ***would be growth inducing as a component of the rapidly evolving urban matrix in Western Placer County***, because it would help facilitate planned and proposed developments in the region and it is expected to influence the timing of development in the vicinity of its proposed interchange locations, particularly those proposed near vacant land adjacent to rapidly developing areas or areas now proposed for urban development.

Figure 3-7 shows the alternative alignments in relationship to existing city boundaries and Spheres of Influence, developed unincorporated areas, community plan and redevelopment areas, and major development projects that have been proposed and are undergoing environmental review but that have not yet been approved. The figure also indicates development constraints such as existing habitat

conservation areas, 100-year floodplains, and municipal facilities that represent substantial public investment in infrastructure. Based on a review of these features, a study area for secondary and indirect impacts is indicated on Figure 3-7, outlined in dark purple. This area encompasses the entire Transportation Analysis study area as defined for the project (Transportation Technical Report [DKS Associates, 2007a]) and expands it in several ways, including extending it westward to the Sacramento and Feather Rivers (natural features and significant barriers to development). The area was also expanded to the north to encompass all of the City of Lincoln's proposed Sphere of Influence expansion area, as well as to the east to encompass all of the land within the city limits of Roseville and the town limits of Loomis. The paragraphs below discuss the Placer Parkway's potential to induce growth within this area.

The project is not likely to induce growth in the areas of Figure 3-7 that are shown in dark gray, tan, green, or purple shading. The dark gray areas represent existing city limits and approved SOI boundaries. These areas have experienced rapid development in recent decades and are predominately built out or are expected to be predominately built out (except for minor infill opportunities) prior to project construction. Much of the existing development in these urbanized areas occurred prior to the Parkway proposal and planned development continues to occur without regard to plans for a new east-west transportation facility in the region. Similarly, the areas shaded in tan are unincorporated areas that are already developed with urban or rural residential uses and thus are unlikely to undergo substantial redevelopment in the next several decades. The areas shaded in green represent existing conservation areas, which present serious constraints to future development, and the areas shaded in light purple indicate areas where there has been substantial public investment in municipal facilities and utilities.

The project could influence proposed land uses or hasten the construction of some proposed uses (which include future conservation areas) in the areas shaded in light gray on Figure 3-7. This is especially probable in the areas surrounding proposed future interchange locations, such as the Sutter Industrial Reserve/Sutter Pointe Specific Plan in Sutter County and the Placer Ranch Specific Plan area in Placer County. Because the land use plans for these two specific plan areas are still being developed, adoption of a corridor alignment for Placer Parkway could result in proposals for more intensive future land uses in the vicinity of proposed interchanges. The remainder of the Sutter County Industrial Reserve land immediately north of the Sutter Pointe Specific Plan area (approximately 3,000 acres) is also shaded in light gray, because it is currently prohibited from development as part of the Natomas Basin HCP agreements between Sutter and Sacramento counties (Wilson, 2006). Placer Parkway is more likely to influence the timing of commercial and industrial development in the light gray areas that lie within the project study area boundary (the black line), as buildout of planned and proposed residential uses in these areas (as well as in the Placer Vineyards and Riolo Vineyard Specific Plan areas to the south) is anticipated by 2020, but absorption of commercial and industrial space is projected to occur more slowly. Development in the Lincoln SOI expansion area (especially the southern portions closest to the proposed Parkway interchanges) is more likely to be hastened by the project, although development pressure in this area is and will continue to be intense even without the project.

In northern Sacramento County, south of the western terminus of the proposed Parkway, the project is unlikely to influence land use patterns, but could play a minor role in influencing the timing of commercial and industrial development, perhaps especially in the vicinity of the Sacramento International airport. Buildout of residential uses in the North Natomas Unit in the City of Sacramento is expected to occur before 2020, but given the supply of office and industrial space in the greater Sacramento region, buildout of non-residential components is expected to take several decades longer, although this timing is much more likely to be determined by office absorption rates in Sacramento, rather than construction of a new roadway to the north (Mende, 2006). The Natomas Joint Vision Area is still in the early planning stages, but Sutter and Sacramento counties have agreed to retain a one-mile no development zone along the south side of the County boundary, and conceptual plans indicate that a one-mile conservation strip along the east side of the Sacramento River is also being contemplated. The Natomas Joint Vision Area

is unlikely to be influenced much by the project, because the pressure to develop this area (south of the one-mile buffer) is more likely to come from spillover housing demand once the North Natomas Unit residential uses are built out, and also from other urbanization pressures associated with Sacramento's status as a regional job center. In the longer term, improved access provided by a parkway to land in south Sutter and southwestern Placer counties could be a factor in stimulating additional growth and development in areas not currently proposed for development, as shown on Figure 3-7. Most of the white and blue areas shown on the figure are currently in agricultural and open space use. Infrastructure in this area is generally poorly developed, with farms and homes on individual wells and septic systems, and a considerable portion is subject to 100-year flooding from creeks that have generally sensitive riparian habitat areas. As seen in Section 7.3.3, planners and developers identify other constraints, such as political opposition to development and the lack of water and sewer service, as being as important as freeway access. At the same time, however, the existing constraints to development in southwestern Placer County have not necessarily slowed or limited growth in the area to date.

Much of the land that lies north of the Cross Canal and west of the East Side Canal is protected by 80-acre minimum agricultural zoning and Williamson Act contracts, or is potential giant garter snake habitat with active habitat conservation interests involved in developing conservation easements and conservation area expansions. A review of land ownership maps of this area indicates that it remains in agricultural ownership and has not been subject to land assembly by development interests, as is the case in southwestern Placer County, as discussed below.

The areas shown as white Figure 3-7 that lie within the central portion of the project study area could come under more intensive development pressure as a result of the project, although no new interchanges are proposed between Fiddyment Road and Pleasant Grove Road. The area surrounding Sunset Boulevard West already appears to be under considerable development pressure, as many of the parcels in this vicinity are being assembled by development interests either for future development or to preserve as conservation areas as mitigation for environmental impacts associated with other planned development activity in the region. A review of land ownership maps updated to November 2006 indicates that more than half of the land between Phillip Road and Dowd Road (from the county line to the city of Lincoln) is now owned by development interests, and according to a source knowledgeable about development activities in this area, much of the rest of it is optioned or in sale or option negotiations (McCoy, 2006). It is impossible to quantify what effect the proposed new roadway project may be contributing to this land assembly activity. No doubt it has contributed to cumulative development pressures in the area to some extent, but the fact that considerable land assembly activity has occurred prior to route adoption, combined with the fact that no new intersections are proposed in the central segment, would indicate that the influence of the project is limited.

Although growth is anticipated throughout the larger secondary and indirect study area over time (as reflected in SACOG's preferred Blueprint scenario), such development is not currently reflected in adopted general plans and has not been formally proposed by landowners. By providing improved access to adjacent areas, Placer Parkway could be one of many factors that would encourage growth in these areas sooner than this might otherwise occur. Thus, it would be growth inducing.

At the same time, there are indications that Placer Parkway's contribution to regional growth may be limited. These include the following:

- no interchanges are proposed within areas that are not already approved or proposed for development;
- all approved and proposed residential development that has not already been built is projected to be built out prior to 2020, when the Parkway is proposed to open; and,

- real estate market pressures in the area have been and continue to be intense without the Parkway, and local government jurisdictions have been supportive of processing development applications in spite of anticipated regional transportation challenges, making it seem likely that much of the approved and proposed development may occur with or without the Placer Parkway.

Comparison of Alternative Alignments

It is unlikely that the choice of one Placer Parkway alternative over another would substantially change expected patterns of growth and development in the study area and the surrounding region. In the Western Segment, all alignments would provide new access to an area that is currently undeveloped farmland, but that is proposed for mixed use urban development. The three more southerly alignments (Alternatives 1, 2, and 3) would provide two interchanges in the Sutter Pointe Specific Plan area, while the more northerly alignments (Alternatives 4 and 5) would provide only one interchange in this area, approximately one mile further north of the more southerly alignments in the Western Segment. It could be argued that the more southerly alignments would be more growth inducing, because they would provide more interchanges (and more access) than the more northerly alignments, in addition to which the northerly alignments would be further removed from existing urban development. The entire Sutter Pointe Specific Plan area, however, is slated for urban development and is under relatively intense development pressure, so that it is likely to build out relatively quickly, with or without the Placer Parkway project. (Prior to approving this and other proposed developments, local jurisdictions are required to analyze traffic impacts and evaluate feasible mitigation strategies, and either demonstrate that adequate traffic capacity exists, or require mitigation such as traffic system improvements or payment of "fair share" fees to improve regional facilities, or the lead agency must adopt a statement of overriding considerations in order to approve the project.) The roadway alignment would not serve as an urban limit line in either location, although the more northerly route would provide better access to farmland north of the Sutter Pointe Specific Plan area that is not currently planned or proposed for development (although it is earmarked for eventual future development, as part of Sutter County's remaining Industrial-Commercial Reserve area).

It could also perhaps be argued that the provision of a single interchange—as is proposed under Alternatives 4 and 5—would convert less land area to roadway surface, thereby leaving more land available for contemplated urban uses, which could be seen as facilitating more growth than would occur with two interchanges, which would convert more land to roadway uses. On the other hand, long term development and redevelopment efforts would likely result in more intensive land uses closer to the intersections. Given the uncertainties surrounding these predictions, there appears to be no basis for finding that one alignment would be more growth inducing than another in the western segment. Since none of the alternative alignments would include any interchanges in the Central Segment, there would be little difference in growth inducement effects among the alternatives in this segment. In the Eastern Segment, all alternatives would follow an identical alignment, so there would be no differences in growth inducement effects among the alternatives.

Watt Avenue Interchange

A future interchange at Watt Avenue could be growth inducing, because it would provide major new regional access to a portion of the study area that is currently rural and undeveloped. The MEPLAN analysis described in Section 7.3.3 evaluated the effect of a Watt Avenue interchange on potential future development. The model indicated that an interchange at Watt Avenue would increase the number of households in the study area, adding approximately 180 under Alternative 1 and 70 under the Alternative 5. Jobs would also increase, with approximately 200 more jobs under Alternative 1 and 260 under Alternative 5 with an interchange at Watt Avenue. The area around the interchange, however, is

also already subject to intense development pressure, as indicated on Figure 3-4. The area surrounding the southerly option is likely to be substantially built out by the time such an interchange is built. The northerly option could stimulate growth in the area between Phillip Road and the Curry Creek Community/Regional University plan areas—one of the few remaining areas in the eastern half of the central segment that has not been proposed for development yet. Whether a future Watt Avenue interchange would be growth inducing or would be built to meet the needs of existing or planned development would depend upon when it is constructed in relation to entitlements or buildout of specific developments approved for the surrounding area. This would be evaluated in more detail in the separate environmental review process for that project.

7.5 SECONDARY AND INDIRECT IMPACTS ASSOCIATED WITH GROWTH

7.5.1 Introduction and Definitions

Recent FHWA, EPA, and Caltrans guidance on growth inducement (Mare Island Accord, 2006) advises that analysis of potential impacts associated with growth should include an evaluation of the effects of growth on resources of concern. The following discussion presents a qualitative evaluation of potential secondary and indirect impacts of Anticipated Growth (see below for definition) on human and environmental resources in the study area.

The CEQ NEPA regulations define "indirect effects" as those "which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems" (40 CFR Section 1508.8(b)). In contrast to indirect effects, "direct effects" are those "which are caused by the action and occur at the same time and place" (40 CFR Section 1508.8(a)). As provided for in the CEQ NEPA regulations, effects and impacts are considered synonymous (40 CFR Section 1508.8(b)). The CEQA Guidelines definition of indirect effects is consistent with the CEQ definition.

A key term used in this section is "Anticipated Growth." This is defined as the growth that is anticipated in the study area as described in the relevant General Plans and adopted regional forecasts, such as the SACOG Blueprint scenario (as detailed in other sections of this Community Impact Assessment), including additional growth that may occur as a result of major new development proposals that have not yet been formally approved. It is possible that this additional growth may accelerate the rate of buildout in the study area, but it is not ultimately expected to result in any greater levels of development than is presented in adopted regional forecasts.

The definition of indirect effects includes a causation factor; that is, to be considered an indirect effect of the project, the effect must be "caused by" the project. There is not a clear answer as to whether the anticipated growth is caused by the Placer Parkway or not. As discussed in Section 7.3, the Parkway "would not directly attract more population into the area," and housing units currently allowed under adopted general plans are expected to be built by the time the Parkway opens. Other development proposals are proceeding in the absence of any approvals or funding for Placer Parkway, so that development cannot be attributed to the project. At the same time, Placer Parkway could accelerate the rate of development, especially in areas near proposed new interchanges. In the longer term, improved access provided by the Parkway could be a factor in stimulating additional growth and development in some of the few remaining areas in the project vicinity that are not currently urbanized, protected (e.g., conservation areas) or proposed for development.

Although the relationship between the Parkway and future growth in the study area is complex and there is no simple conclusion about such growth, this Community Impact Assessment concludes (Section 7.3), that the Placer Parkway project would be growth inducing, because it would help facilitate planned and proposed development in the region and is expected to influence the timing of development in the vicinity of proposed interchanges. Thus, for purposes of this secondary and indirect impacts assessment, Placer Parkway is considered to be a causal factor for growth. It is the effects of that growth that are considered here as secondary or indirect effects of the Parkway, to the extent such effects are reasonably foreseeable.

The discussion discloses a comprehensive range of impacts that could potentially occur; it is not intended to suggest that all such impacts are likely. Furthermore, as discussed above, a number of factors influence growth and no specific portion of the impacts of growth discussed in this section are attributed to the Parkway. The secondary and indirect impacts associated with growth are addressed in the relevant Placer Parkway Tier 1 EIS/EIR Technical Memoranda. Therefore, the impacts noted below are provided in a summary format to avoid extensive duplication. The reader is referred to the analysis of each environmental topic for further details.

7.5.2 No-Build Alternative

If the proposed Placer Parkway were not constructed secondary or indirect impacts as a result of anticipated growth are still expected to occur. Other planned and proposed development in the study area would be expected to be implemented and potential impacts on environmental and human resources associated with these projects would be subject to independent environmental review. Since it is anticipated that much of the projected growth would occur with or without Placer Parkway (see Sections 7.3.1, 7.3.4, and 7.4 of this Community Impact Assessment), however, it is likely that impacts from growth will be similar to those discussed below.

7.5.3 Build Alternatives

Secondary and indirect impacts associated with anticipated growth would be direct impacts of other projects (see Section 3.3.5 and Figures 3-4 and 3-7) not associated with Placer Parkway, and would be required to be analyzed as part of independent environmental review. Although it is not feasible to perform a detailed evaluation of these projects at this stage as specific design details are not known, potential impacts are taken into account in the Placer Parkway 2040 cumulative analysis. This analysis evaluates a 2040 cumulative scenario, presented in Section 3.3.5, which includes full-residential buildout in Placer County west of Sierra College Boulevard, including general plan areas and major developments, and employment and population growth in line with SACOG forecasts. It assumes levels of growth and development will occur at the higher end of a potential feasible range and therefore represents a reasonable maximum development scenario for which cumulative and secondary and indirect impacts have been analyzed.

A discussion of potential impacts on specific environmental resources is presented below.

7.5.3.1 Land Use

Anticipated growth could affect land use in the study area through the conversion of land from agricultural use to commercial, residential, and industrial uses. Such growth would also result in the conversion of existing undeveloped and vacant land to similar uses.

7.5.3.2 Farmland

Agricultural Production and Farmland Fragmentation

- Fragmentation and parcel size reduction could reduce the amount of land available for agricultural production and related effects on certain types of agricultural activities that require larger tracts of land to hold down per-unit production costs.
- Impacts on the ability of a farm to compete in the local market against larger producers could be affected.
- Increase in impervious surfaces in the study area could increase surface water run-off and could increase erosion, adversely affecting productivity of agricultural soils. These effects are expected to be offset by water quality requirements imposed on new development.

Transportation Challenges

- Increase in the number of users of roadways, and agricultural machinery and trucks that would have to compete with residential traffic on local roadways. The differences in vehicle speeds and size can create potentially dangerous and frustrating situations for both suburban residents and for agricultural equipment operators.
- In remote areas within the study area, livestock can be driven from pasture to pasture using public and private roads. However, as traffic increases, livestock producers may need to use trucks and trailers to transport livestock as an added safety measure.

Agricultural Support Services

- Possible effects on agricultural viability due to reductions and changes in support services (in turn impacted by changes in customer base).

7.5.3.3 Socioeconomic and Community Resources

Social Conditions

- Increased population in the study area, resulting in increased demand for and use of community facilities such as schools, hospitals, places of worship, and emergency support services.
- Additional such facilities would be required, and would be expected to be planned for and provided by Sutter and Placer counties or provided by private sources as part of conditions incorporated into approval of new development proposals.
- Change from a predominantly rural, agricultural area to an area comprising a greater density of mixed-use communities and associated infrastructure and facilities.

Economic Conditions

- Generation of employment and fiscal benefits within the study area, as a result of construction employment and income benefits, and also as a result of revenue and taxes

generated and spent by new businesses, employees and residents. These benefits could be applied to the greater Sacramento region, northern California or beyond.

7.5.3.4 Visual Resources

- Conversion of portions of a rural area into a more urban landscape, resulting in a perceived reduction in the visual quality of the existing natural environment.

- Changes in the type of viewer in the study area, and in changes to the viewer exposure to the area (e.g., number, location, and duration of existing viewers).

- Introduction of numerous commuters to the area, who would experience short-duration views of the surrounding landscape from the Parkway, and would also increase the number of residents and workers in the area who would have longer-duration views of the Parkway and the surrounding area.

- Increase in the urban influences in the study area, consequently adding more "grey" than "green" with future growth (i.e., more pavement and structures than natural elements), a secondary impact of bringing in more urbanization to an area now dominated by rural influences.

Additional information on potential visual resources in the study area is provided in the Visual Impact Assessment prepared for the Placer Parkway Tier 1 EIS/EIR.

7.5.3.5 Cultural Resources

- Potential disturbance of both known and as yet unidentified unknown historic properties archaeological sites that may occur in and around the study area. Such resources are generally protected via federal and state regulations, but development could result in adverse impacts to archaeological or historical resources.

Additional information on potential cultural resources in the study area is provided in the Archaeological Survey Report and Historical Resources Evaluation Report prepared for the Placer Parkway Tier 1 EIS/EIR.

7.5.3.6 Traffic/Transportation

- New roadways would be constructed as part of proposed future developments, which would also contribute to traffic pattern changes. Traffic patterns and volumes changes can affect air quality and noise, and these are discussed below in Sections 7.4.3.7 and 7.4.3.8.

- Increase in traffic generated. Changes in traffic patterns, including congestion on some roadway segments (see below).

- Placer Parkway planning to date has been primarily a cooperative and collaborative process aimed at meeting projected travel demand associated with actual and anticipated population and employment growth in the region, rather than an effort aimed at stimulating or facilitating unplanned growth. Thus, traffic generation and traffic congestion relief will be occurring at the same time, as Placer Parkway is intended to alleviate congestion in the study area and will reduce commute times.

Additional information on traffic and transportation in the study area is provided in the Transportation Technical Report prepared for the Placer Parkway Tier 1 EIS/EIR.

7.5.3.7 Air Quality

New traffic patterns and increased traffic volumes could adversely affect air quality, particularly if this results in additional congestion on roads in the study area. Although it is not possible to predict with any certainty where such growth-induced congestion might occur, it is reasonable to assume that pollutant emissions associated with such congestion could adversely affect air quality, although this could be wholly or partially offset by the improved Level of Service, decreased vehicle delay, and reduced congestion afforded by the Parkway.

This could occur in a number of ways:

- Increased risk of adverse health effects on humans residing in areas affected by poor air quality;
- Impacts on pollution-sensitive wildlife species, such as lichens; and
- Contribution to climate change associated with higher levels of atmospheric carbon dioxide generated from vehicle emissions. This could be wholly or partially offset by cleaner future vehicle technology and use of alternative fuels.

Additional information on air quality in the study area is provided in the Air Quality Technical Report prepared for the Placer Parkway Tier 1 EIS/EIR.

7.5.3.8 Noise

Modified traffic patterns could adversely affect noise, particularly if this results in traffic traveling at higher speeds within the study area. Although precise impacts on future receptors cannot be predicted, it is reasonable to assume that both new and existing developments that would be present in the study area in the future could be affected by noise. Impacts could include the following:

- Increase in overall ambient noise in the area;
- Increased risk of reduced quality of life, and associated adverse health effects on residences, business and facilities located in areas affected by increased noise levels;
- Adverse economic impacts on residences adversely affected by noise; and
- Impacts on noise sensitive wildlife, such as birds, mammals, and reptiles. Impacts are also possible on species that are sensitive to noise, and noise-related disturbance at particular stages of their life cycle, such as during nesting and other breeding activities.

Additional information on noise in the study area is provided in the Traffic Noise Analysis Technical Memorandum prepared for the Placer Parkway Tier 1 EIS/EIR.

7.5.3.9 Hydrology and Floodplains

Although it is not possible to predict with any certainty where new impervious surfaces may be created, it is reasonable to assume that impacts associated with reduction in pervious land cover and increased run-

off, either directly associated with the construction of the Parkway or as a result of growth induced by the Parkway, could adversely affect floodplains and hydrology. This could occur in a number of ways:

- Contamination of surface water and groundwater through increased erosion and run-off of pollutants;
- Increased peak flows and runoff volumes cause flooding downstream;
- Declining levels of developable land could place additional pressure for continued floodplain encroachment, with its associated adverse effect on wildlife and increased risk of flooding;
- Impacts on aquatic wildlife as a result of increased sedimentation from erosion and run-off; and
- Impacts on aquatic wildlife as a result of constriction or blockage of natural stream flow associated with stream crossings.

Additional information on hydrology and floodplains in the study area is provided in the Hydrology and Floodplains Technical Memorandum prepared for the Placer Parkway Tier 1 EIS/EIR.

7.5.3.10 Water Quality

Although it is not possible to predict with any certainty where increased run-off will occur, it is reasonable to assume that secondary and indirect impacts associated with reduction in pervious land cover and increased run-off, either from the construction of the parkway or as a result of anticipated growth, could adversely affect water quality. This could occur in a number of ways:

- Increased non-point source water pollution of surface water bodies through increased run-off from new developments;
- Impacts on aquatic flora and fauna as a result of degraded water quality and increased erosion and sedimentation; and
- Additional contamination of surface water bodies associated with new stream crossings required by new developments.

Additional information on hydrology and floodplains in the study area is provided in the Hydrology and Floodplains Technical Memorandum prepared for the Placer Parkway Tier 1 EIS/EIR.

7.5.3.11 Geology, Soils, Seismic and Topography

Anticipated growth would not be expected to have any secondary or indirect impacts on geological, seismic or topographical conditions in the study area. However, new development could affect soils by increasing the amounts of impervious area in the study area, which would increase surface water run-off and which could increase erosion. Increased erosion can impact agriculture by decreasing soil productivity and can also impact biological resources. Potential impacts on water quality associated with erosion are discussed in Section 7.4.3.10.

7.5.3.12 Biological Resources

Although it is not possible to predict with any certainty where secondary or indirect impacts could occur at this stage, it is reasonable to assume that secondary and indirect impacts as a result of anticipated growth could adversely affect biological resources. This could occur in a number of ways:

- Modification of land, including the fallowing of existing rice fields that are currently irrigated by flooding during the growing season or vernal pool complexes that are currently grazed.

- Loss or degradation of habitat for species that benefit from the current land management practices. Examples of affected habitats might include agricultural areas used by foraging Swainson's hawks, greater sandhill cranes, wintering waterfowl, giant garter snakes, and burrowing owls, as well as grazed vernal pool areas occupied by rare plants.

- A decrease in land management activities might also benefit nesting Swainson's hawks and white-tailed kites, the Valley elderberry longhorn beetle, and riparian habitats that are adversely affected by intensive land management activities.

- Adverse affects on the surrounding natural communities and special-status species. Increased noise and lights would likely decrease the value of such habitat for nesting and foraging, causing disturbance and potentially affecting natural breeding cycles and behavior. Increased impervious surfaces would increase stormwater run-off rates and could have adverse impacts on water quality and on water-dependent wildlife.

- Habitat fragmentation and division of larger tracts of habitat into smaller non-contiguous areas as a result of artificial structures such as roads, buildings, and other infrastructure. Fragmentation lowers habitat quality and can affect particular species that require large tracts of habitat or are vulnerable to disturbance from human activities.

- Where anticipated growth results in new crossings of waterbodies and streams, secondary impacts on water quality and aquatic wildlife could occur. Riparian areas associated with creeks are particularly valuable in providing foraging, nesting, and migratory habitat for wildlife species, and could also be adversely impacted, either through direct loss from new development or from the effects of habitat fragmentation.

- Vernal pool complexes would also be susceptible to the effects of fragmentation caused anticipated growth. Development can have effects on the hydrology of vernal pools that are not directly impacted. The coverage of land surfaces with concrete and/or deep ripping of the hardpan layer can affect the amount and quality of water available to the perched water tables characteristic of vernal pool areas. Changes to the perched water table can lead to alterations in the rate, extent, and duration of inundation (water regime) of remaining habitat (USFWS, 1996). Survival of vernal pool branchipods is directly linked to the water regime of their habitat. Roads in or near vernal pool habitat areas can lead to additional impacts through the introduction of chemically laden runoff (i.e., petroleum products).

- Anticipated growth may also produce conditions that are favorable for exotic predators such as bullfrogs and mosquito fish (USFWS, 1996). The U.S. Fish and Wildlife Service typically considers any ground-disturbing activities within 250 feet of a vernal pool to comprise an indirect impact.

Additional information on biological resources in the study area is provided in the Natural Environment Study prepared for the Placer Parkway Tier 1 EIS/EIR.

7.5.3.13 Hazardous Materials

Anticipated Growth could result in the potential disturbance of as yet unknown hazardous sites and potential recognized environmental concerns that may occur in and around the study area. Although it is not possible to predict with any certainty where such sites may be located, it is reasonable to assume that, if not properly investigated and remediated, such disturbance could result in accidental spillage or releases, which could adversely affect human health, soil, air quality, and groundwater or surface water. However, the development review process through state and federal law and regulation is expected to prevent such impacts.

Additional information on hazardous materials in the study area is provided in the Initial Site Assessment prepared for the Placer Parkway Tier 1 EIS/EIR.

7.5.3.14 Energy

Anticipated growth would utilize energy during construction and would consume energy in the form of heating and cooling, lighting, and business operations. Traffic trips associated with such development would also consume energy by increased Vehicle Miles Traveled (VMT) and trip generation, but such impacts could be wholly or partially offset by cleaner future vehicle technology and use of alternative fuels, and by the improved Level of Service, decreased vehicle delay and reduced congestion afforded by the Parkway. Although overall VMT would increase, the Parkway would result in a reduction of VMT on congested arterials and local streets, which would reduce the extra energy used by vehicles in congested conditions.

San Francisco, California

APPENDIX A
SECTION 4(F) EVALUATION

TABLE OF CONTENTS

1.0 Introduction

The purpose of this report is to evaluate potential impacts to resources protected under Section 4(f) of the Department of Transportation Act of 1966, now codified at 49 U.S. Code 303(c), that may be associated with the proposed transportation improvement project referred to as Placer Parkway, located in south Sutter and southwestern Placer counties, California. The project (including location, maps and planning history) is described in detail in Chapters 1 and 2 of the CIA.

2.0 Section 4(f) Applicability

Section 4(f) of the Department of Transportation Act of 1966 declared it "the policy of the United States Government that special effort should be made to preserve the natural beauty of the countryside and public park and recreation lands, wildlife and waterfowl refuges, and historic sites." To this end, Section 4(f) permits the Secretary of Transportation to approve a transportation program or project that would "use" land from a significant publicly owned public park, recreation area, or wildlife or waterfowl refuge, or land from a significant historic site (regardless of ownership), only if there is no "prudent and feasible alternative" to using that land and all possible planning has been done to minimize harm to the park, recreation area, wildlife or waterfowl refuge, or historic site resulting from the use.

In general, a project may "use" land from a 4(f) resource in one of three ways:

1. By permanently incorporating 4(f) land into a transportation facility,
2. By temporarily occupying 4(f) land in a way that is adverse in terms of the statute's preservationist purposes (23 C.F.R. 771.135(p)(7)), or
3. By constructively using 4(f) land; that is, causing proximity impacts to a 4(f) resource so severe that the protected activities, features, or attributes that qualify the resource for protection under Section 4(f) are substantially impaired (23 C.F.R. 771.135(p)(2)).

In practical terms, the protections afforded to 4(f) resources by the statute means that unlike NEPA, Section 4(f) requires a substantive result, with a strong bias towards protecting public parks and other 4(f) sites. If a project alternative would avoid 4(f) resources and be prudent and feasible to construct, then it must be selected. If no prudent and feasible avoidance alternative exists, then FHWA must select the alternative that would cause the least overall harm to 4(f) resources. In cases where all project alternatives would cause substantially the same harm to 4(f) resources, FHWA may select any alternative it chooses.

This Draft Section 4(f) Evaluation has been prepared in conjunction with the Tier 1 Draft Environmental Impact Statement for the Placer Parkway Corridor Preservation Project. The FHWA's regulations implementing Section 4(f) recognize that – YELLOW TEXT IS QUOTE

> (o) An analysis required by section 4(f) may involve different levels of detail where the section 4(f) involvement is addressed in a tiered EIS.
>
> (1) When the first-tier, broad-scale EIS is prepared, the detailed information necessary to complete the section 4(f) evaluation may not be available at that stage in the development of the action. In such cases, an evaluation should be made on the potential impacts that a proposed action will have on section 4(f) land and whether those impacts could have a bearing on the decision to be made. A preliminary determination may be made at this time as to whether there are feasible and prudent locations or alternatives for the action to avoid the use of section 4(f) land. This preliminary determination shall consider all possible planning to minimize harm to the extent that the level of detail available at the first-tier EIS stage allows. It is recognized that such planning at this stage will normally be limited to ensuring that opportunities to minimize harm at

subsequent stages in the development process have not been precluded by decisions made at the first-tier stage. This preliminary determination is then incorporated into the first-tier EIS.

(2) A section 4(f) approval made when additional design details are available will include a determination that:

(i) The preliminary section 4(f) determination made pursuant to paragraph (o)(1) of this section is still valid; and

(ii) The criteria of paragraph (a) of this section have been met.

23 CFR 771.135(o).

The following analysis has been undertaken in compliance with this regulatory provision.

3.0 Description of Section 4(f) Property

RD 1000 occupies more than 55,130 acres of land and consists of a historic system of drainage canals, pumps, levees, ditches, pumping plants, and a system of access roads. It is currently managed by the Bureau of Reclamation.

South Sutter County and the greater Sacramento area were historically vulnerable to seasonal flooding events. In the nineteenth century, various attempts were made to address this problem through the construction of levees and installation of river gauges to monitor water levels. In spite of these efforts, agricultural activities in the south Sutter County area in the late nineteenth century were limited to grazing, with some farming on higher ground areas. Early in the twentieth century, the state legislature began a series of new reclamation efforts. In 1911, the legislature created RD 1000, which later became part of the Sacramento Valley Flood Control Project.

The Natomas Consolidated Company used large-scale earth moving and gold-dredging equipment to transform the RD 1000 area into productive agricultural land. Its activities included construction of the Natomas East Main Drainage Canal, parallel to the Western Pacific (now Southern Pacific) railroad tracks, as well as construction of a 60-mile network of roads to provide access to drainage canals for construction and maintenance. The company then subdivided and leased large acreage blocks for wheat and grain crop production, thus establishing a pattern of large-acreage, predominately single crop agricultural land use in the area. The RD 1000 road system provided access to the farm parcels within the district's new subdivisions. The original two-lane dirt roads, which were paved with macadam or concrete during the 1920s and 1930s, generally followed the township and section survey lines and drainage canals to delineate the large, regularly spaced agricultural parcels (JRP Historical Consulting, 2006).

The Office of Historic Preservation (OHP) has concurred that the RD 1000 rural historic landscape historic district is significant within the context of reclamation and flood control activity in the Sacramento Valley during the early twentieth century, because RD 1000 was one of the first large, modern reclamation districts in the state and it was the largest reclamation project in the country at the time of its inception. It provided flood control security and facilitated the creation of large areas of land that could be farmed much more productively. The levees, canals, and road system built by Natomas Consolidated Company helped shape the spatial land use pattern of the district. RD 1000 also served the goals of the region-wide early twentieth century Sacramento Flood Control Project, the result of more than six decades of legislation and technical studies that provided the legal, institutional, and engineering framework to achieve flood control along the Sacramento River. The Sacramento Flood Control Project supported improved navigation along the river, as well as land reclamation for agricultural use and other

development. RD 1000 and its landscape features are considered representative of this important historical trend, including the emergence of modern corporations as land managers and developers in reclamation districts. The historic district's primary contributing features are its drainage system, road system, and large-scale land patterns (JRP Historical Consulting, 2006).

4.0 Potential Impacts on Section 4(f) Property

All of the project corridor alignment alternatives would impact RD 1000 (Figure D-1) in the Western Segment, from SR 70/99 to the drainage canal. The northerly corridor alignment alternatives (Alternatives 4 and 5) would impact 268.3 acres, while the southerly alignments (Alternatives 1, 2, and 3) would impact 363.2 acres of land that lie within the boundaries of this historic district. The roadway ultimately constructed within this corridor, however, would impact considerably less land, since the road surface would occupy a maximum width of 350 feet within the 500-foot corridor in this area. A new roadway would affect landscape features within RD 1000, although this area is part of the Sutter Pointe Specific Plan of Sutter County that has been proposed for urban development. Much of the Sutter Pointe mixed use development that has been proposed for this area is likely to be completed before Placer Parkway construction would begin, as discussed in Chapters 3 and 7 of the CIA. Impacts to specific features such as ditches, canals, and pumping facilities would be identified and mitigated once a specific roadway alignment is selected within the preserved future corridor.

5.0 Avoidance Alternatives

The No-Build Alternative would avoid impacts to RD 1000; however, this alternative would not meet project purpose and need. Minor corridor alignment adjustments would not avoid or minimize impacts to RD 1000, since it extends north to south throughout the western end of the study area (see Figure D-1), and the proposed roadway is an east-west facility. If the Western Segment of the Parkway were to be located to the north of the existing study area, avoiding RD 1000, this would result in a facility of considerably greater length than currently proposed. This would also result in out of direction travel and consequentially a substantial increase in VMT, as the facility would have to connect with SR 70/99 several miles to the north, and because part of the Parkway would be located several miles further away from the areas in south Sutter County it is intended to serve, compared to the existing build alternatives. Extending the corridor along the northern portion of the study area (thus reducing the length of out of direction travel) was examined (URS Corporation and DKS Associates, 2004). This alternative was rejected because it did not sufficiently meet the purpose and need (i.e., it did not attract enough vehicles to reduce local roadway congestion southwest Placer County), and because it would affect numerous vernal pool and wetland areas, which would not likely result in permit approval from the Wildlife Agencies. Also, it would substantially affect prime farmland in Sutter County, an important economic factor in Sutter County. Construction of a longer facility would be considerably more expensive than the Build Alternatives analyzed in this Tier 1 EIS/EIR and would have greater environmental impacts during both construction and operation due to its length and the out of direction travel, including impacts on traffic, visual resources, noise, air quality, and biological resources.

Major corridor alignment alternatives such as tunneling or bridging would be prohibitively expensive and/or technically infeasible, because of the distances involved (approximately 4 miles of the Parkway are currently proposed within RD 1000), and because of its location within a floodplain. An interchange to SR 70/99 would still be required within the district boundaries.. If the facility were to be constructed to the south of RD 1000, it would require a diversion of more than 10 miles in order to avoid the district, which is not feasible in terms of construction costs or in meeting travel demand. . This location would also not provide for any connections to the local roadway network in Sutter County, and so would not contribute to the advancement of economic development in the county, which is one of the major purposes of the Parkway.

During Tier 2 roadway alignment selection and design, coordination and planning can occur to identify and avoid or minimize impacts to specific RD 1000 facilities such as ditches, canals, or pumping equipment in coordination with the Bureau of Reclamation.

6.0 Measures to Minimize Harm

Planning and design efforts of the project to date have incorporated numerous measures to minimize harm to 4(f) resources, including:

- Elimination of alternatives with unacceptably high impacts from further consideration. Such impacts included potential effect on known historic resources, and anticipated impacts on special-status species habitats, wetlands, and conservation areas (see Section 2.5 of this EIS/EIR for additional details);
- Inclusion of buffer areas along the proposed Parkway to help preserve open space and agricultural activities;
- Inclusion of plans to maintain the integrity of existing canals, pumping facilities, ditches and local roadways within RD 1000; and
- Coordination and consultation with local planning agencies to reduce the potential for cumulative impacts to protected resources.

The project alignment alternatives have been designed through a concurrent planning process that has included extensive consultation with appropriate resource agencies and iterative consideration of environmental impacts, including impacts to the facilities and features (such as canals and roadways) that are contributing elements to the RD 1000 historic district. Additional measures to minimize harm to RD 1000 will be identified through coordination and consultation between FHWA/Caltrans and the Bureau of Reclamation, as described below.

7.0 Coordination

FHWA/Caltrans has been coordinating and consulting with the State Historic Preservation Office during preparation of the Historic Resources Evaluation Report and with other resource agencies and local jurisdictions through a consultative planning process aimed at selecting feasible corridor alignment alternatives that minimize environmental impacts and meet project purpose and need. Additional consultation with responsible agencies will occur during and after circulation of the Tier 1 Draft EIS/EIR, including coordination and consultation with the Bureau of Reclamation to obtain their concurrence on findings and to identify additional strategies for avoiding or minimizing potential project impacts on RD 1000 resources.

Letters of concurrence will be sought for inclusion in the final Section 4(f) Evaluation report. The public will have an opportunity to comment on the findings of the Section 4(f) analysis through circulation of the draft environmental document prepared for the project.

8.0 Potential Future 4(f) Resources in the Study Area

Several proposed (but not yet approved or adopted) development plans include provisions for proposed future parks and recreation facilities that could be affected by project corridor alignment alternatives, as described below. While these parks and recreational facilities are not Section 4(f) resources at this time, they would become 4(f) resources once the plans are formally adopted, and the newly designated parks are transferred to public ownership.

Future development in the project study area, including conceptual planning for future parks and recreation facilities, is being planned within a planning context that includes development of the Parkway.

Placer Parkway is noted as a conceptual alignment on numerous major adopted plans, including the Placer County General Plan, the Metropolitan Transportation Plan (MTP) and the Regional Transportation Plan (RTP), as well as SACOG's Preferred 2020 Blueprint Scenario. These planning documents provide notice to other agencies of the plans for a future Placer Parkway. Thus, conceptual planning for the Parkway has preceded conceptual planning for the other resources discussed below. Nonetheless, once they are formally designated, publicly owned recreation facilities or wildlife and waterfowl refuges would become resources that would be protected under the provisions of Section 4(f). Section 4(f) protection would apply to such facilities if they are adopted prior to formal adoption and preservation of a Placer Parkway corridor.

Each identified potential future 4(f) resource is briefly discussed below. The discussion, based on the limited information available, includes, where feasible, the location, status, concurrent planning efforts, and potential for avoidance of the resource.

Reason Farms Retention Basin

Future proposed uses of the City of Roseville's Reason Farms Retention Basin include certain recreational uses such as picnicking, hiking, horseback riding, and model airplane flying. The City of Roseville held public workshops in the spring of 2006 to obtain community input on the concept master plan for the Retention Basin and it is continuing to modify the conceptual plan for the Retention Basin based on input received from the public and from the Park and Recreation Commission. A Final Supplemental EIR on the master plan is expected before the end of 2006 (Morse, 2006).

It is evident that the City of Roseville is considering the Placer Parkway concept in its planning for the Retention Basin, as indicated by the Placer Parkway corridor concept line shown on the current Master Plan (Figure 5-3). PCTPA have been coordinating planning efforts with city staff to ensure that project design is compatible with facilities being planned for the Retention Basin. At this time, recreational uses are generally planned for the central area of the Retention Basin, away from the southeastern area where the Placer Parkway would cross the property. Until the plan is finalized, the location of specific recreation facilities will not be confirmed.

RUSP Area and Sierra Vista Specific Plan

The Alternative 1 alignment would impact the eastern periphery of the proposed RUSP area and the northwestern section of the proposed Sierra Vista Specific Plan area. Both areas propose low- and medium-density residential development, with conceptual community park and open space areas that would be affected by the Alternative 1 corridor alignment. The Alternative 2 corridor alignment would also impact an area of the RUSP that includes proposed conceptual parks and open spaces. Until the plan is finalized and adopted, the location of specific recreation facilities will not be confirmed.

Sutter Pointe

The Sutter Pointe development proposal submitted to Sutter County by the Sutter Pointe Specific Plan Group in August 2006 shows a number of conceptual linear parks and open space facilities. Alternatives 1, 2, and 3 would affect the southern edge of an area indicated as a "Recreational Village" on the conceptual land use plan. The Sankey Road realignment associated with Alternatives 4 and 5 would impact the northern edges of three linear parks in the northern portion of the plan area. Until the plan is finalized, the location of specific recreation facilities will not be confirmed.

Wildlife Refuges Created by PCCP

It is possible that new refuges could be designated through the ongoing efforts of the PCCP, as described in Section 3.1.4.4. However, PCCP is being developed in concert with adopted local and regional plans that include Placer Parkway, and this concurrent planning will reduce conflicts between uses, and reduce the possibility of use of a 4(f) resource. In addition, the process of defining Parkway alternatives has taken into consideration sensitive resources such as vernal pool complexes and riparian habitat, in order to avoid or minimize potential impacts on these resources early in the planning process and to be consistent with resource agency guidance relative to habitat plans. Avoidance of these resources (as well as continued concurrent planning efforts) is likely to minimize potential use of any future-designated wildlife refuge or park.

APPENDIX B
LITERATURE REVIEW

APPENDIX B

LITERATURE REVIEW

A literature review was conducted to evaluate the role of transportation infrastructure on land use changes and development or growth. This literature review is summarized below. A wide range of literature was reviewed. Much of the literature on the effect of highways on growth is from guidebooks published by State Departments of Transportation, the Environmental Protection Agency, and the FHWA. A substantial focus of these guidebooks is the methodology, including modeling, to assess growth effects, although some of these also included quantitative analysis and case studies of the effects of transportation improvements on growth and identified other factors that would influence growth. Some recent academic research papers were also reviewed. The literature reviewed includes the following:

Mare Island Accord, 2006. *Guidance for Preparers of Growth-Related, Indirect Impact Analyses*. Interagency Working Group: Federal Highway Administration, U.S. Environmental Protection Agency, and California Department of Transportation. May 2006.

FHWA (Federal Highway Administration) and Urban Land Institute, 2004. *Influence of Transportation Infrastructure on Land Use*, December 6-8, 2004.

General Results and Summary of Literature Review Findings

The sources uniformly commented that there is some relationship between land use and transportation, but because "the dynamics of land use change rely in large part on local and regional economic factors, it is difficult to construct a general framework of analysis that applies to a broad ranges of circumstances" (ODOT and FHWA, 2001, page B-1). Most sources concluded that "State Departments of Transportation influence land development through providing infrastructure and, to a lesser extent, through transportation regulations" and that the most significant impact of transportation on land development was the access provided to land, which "raises its potential for development" (FHWA, 1999, page 11). Another source stated there "is no doubt that new roadway capacity might cause more development to occur" (FHWA and Urban Land Institute, 2004, page 12). At the same time, the following nontransportation factors affect the relationship between transportation and land use: local conditions (great variation in historical development patterns, geography, population mix, political traditions, and economic vitality); the incremental, long-term process of land use change; random events; and flexibility of travel demand (NCHRP, 1998, page 17).

Key findings and conclusions of the studies are highlighted by the following quotes from the studies:

> There is an interdependent relationship between land development and the provision of transportation infrastructure. Transportation services must be available to provide access before land can be developed, but the demand for development also creates a demand for access, which in turn increases requests for improvements to the transportation infrastructure. This interdependence complicates efforts to determine the effect of road improvements on land development, because most road modernization improvements are at least partially in response to growing demand. (ODOT and FHWA, 2001, page B-2)

> The key finding of this literature is that total investments in road infrastructure are sufficiently large in most urban areas that marginal investments for road improvements appear to have little impact on the rate of local economic growth. In *The Effects of State and Local Public Services on Economic Development,* Fisher[7] notes, "Of all the public services examined for an influence on economic development, transportation services, and highway facilities especially, show the most substantial evidence of a relationship. Of the 15 studies reviewed, a positive effect of highway facilities or spending on economic development is reported in 10…[however]…the magnitudes of the estimated effects of highway spending on economic development appear to be quite small" (Fisher, 1997*).* Hence, the road system is generally acknowledged as being very important in terms of the local economy, but the amount of infrastructure affected over relatively short periods is sufficiently small that it shows little impact on the overall level of growth. These studies are necessarily rather crude in their attempts to identify the impact of investment, but the results are consistent with expectations (ODOT and FHWA, 2001).

With the general recognition that there is some influence on development, the sources also universally cited a myriad of other factors that would influence growth. The general circumstances or factors that influence a shift in development related to transportation include:

- Extent and maturity of existing transportation infrastructure.
- Land availability and price.
- State of the regional economy.
- Area vacancy rates.

[7] Fisher, R.C., 1997. The Effects of State and Local Public Services on Economic Development. *New England Economic Review*, March/April, 53-67.

- Location attractiveness.
- Local political/regulatory conditions.
- Land Use Controls.

(NCHRP Report 466, Course Module 7, Step 5, Page 62).

Another source stated that "affordability and other factors may be just as important as, or even more important, than accessibility" (NCHRP, 1998, page 9). And, from a developer's perspective, new roadway capacity "is not the driving factor for development decisions" (FHWA and Urban Land Institute, 2004, page 9). Important factors for a developer in making a development decision include the following: market demand, site suitability, economic feasibility, regulatory environment and capital availability (FHWA and Urban Land Institute, 2004, page 10).

Potential "land use impacts" of a new highway facility are: "redistribution of metropolitan growth to highway corridors, decentralization of population and employment, increased land values and concentration of development around interchanges." These impacts are offset or mitigated by the following factors: "local and regional economic conditions, degree of impact on regional accessibility, congestion levels, local land use policies, and NIMBYism" (NCHRP, 1998, page 19).

Because "transportation is only one of many factors that influence land use decisions" there is "no consistent or predictable relationship between improvements to the transportation system and land use changes." "In addition, transportation is not usually a dominating factor. Modern day transportation improvements can be characterized as a small player in the large, complicated process of land development." (Wisconsin DOT, 2005, Introduction, B.A. Primer on Project-Induced Land Development).

Results of Quantitative Studies

The results of quantitative studies provide more detail on the wide range of factors and influences that highlight the difficulty in making precise predictions about the effects of transportation on land use. Thus, these studies support the general conclusions provided in the section above.

One study found that the land use effects of modern highway projects likely operate over a "very fine geographic scale, rather close to the project …" (The Brookings Institution, 2000, page 7). A later study found that the Orange County California toll roads created an accessibility premium that was reflected in home sale prices (Institute for Transportation Studies, 2002, page 19). That study also found that, in addition to the effect on home values, the toll roads positively influenced employment growth in the vicinity of the facilities. Commercial office and retail, public buildings and industrial location decisions could be influenced by highway expansions (Institute of Transportation Studies, 2002, page 26). But, any residential or non-residential growth that occurs in the vicinity of new or expanded highway systems likely comes at the expense of growth elsewhere in the region. "… the evidence suggests that highways influence land prices, population and employment changes near the projects, and that the land use effects are likely at the expense of losses elsewhere" (The Brookings Institution, 2000, page 4).

The Oregon Department of Transportation funded a "trend analysis of urban development patterns with particular emphasis on the location of state highway corridors" (Oregon Department of Transportation, 2001, Page C-1). The study analyzed aerial photographs to determine changes in urban development in twenty cities that experienced significant rates of urban development from 1970 to 1990, and also used a geographic information system overlay to estimate urbanization rates. The study also found that, in the case of the cities analyzed, "highway capacity increasing projects, which are typically a response to current or anticipated increases in travel demand, did not lead to direct and immediate land development activities (Oregon Department of Transportation, 2001, page C-19). While the study found that "the location of existing highways and capacity increasing highway improvements were somewhat correlated

with urban development patterns" the study also found that "urban development has not clustered along state highway project corridors." (Pages C-18 and C-22). Furthermore, the "correlation between land use change and highway project locations was inconsistently related to city size and city population growth trends" (Oregon Department of Transportation, 2001, page C-22).

Conclusion

In summary, the results of the literature review are that that there is no single cause and effect relationship between a transportation improvement and growth and thus no feasible way to predict such growth inducing effects based on the results of other studies and other transportation improvements. The growth inducing effects of transportation improvements can best be understood in the context of local conditions and factors that influence growth.

Placer Parkway Corridor Preservation Tier 1 EIS/Program EIR

June 2007

SUMMARY OF FINDINGS

The South Placer Regional Transportation Authority (SPRTA) and the Federal Highway Administration (FHWA), in cooperation with the California Department of Transportation (Caltrans), propose to select and preserve a corridor for the future construction of Placer Parkway—a new east-west roadway linking State Route (SR) 65 and SR 70/99. Tier 1 of the proposed undertaking comprises the selection and acquisition of the corridor in which future construction of the Parkway would occur.

The FHWA is the federal lead agency for the National Environmental Policy Act (NEPA), and SPRTA is the lead agency for the California Environmental Quality Act (CEQA). The project will receive federal funding and is therefore subject to review under the January 2004 *Programmatic Agreement among the Federal Highway Administration, the Advisory Council on Historic Preservation, the California State Historic Preservation Office (SHPO), and the California Department of Transportation Regarding Compliance with Section 106 of the National Historic Preservation Act, as it Pertains to the Administration of the Federal-Aid Highway Program in California* (Section 106 PA).

This Historic Properties Survey Report (HPSR) was prepared in accordance with the *Programmatic Agreement Between the Federal Highway Administration and the California State Historic Preservation Officer Regarding Implementation of the Placer Parkway Project, Placer County, California* (Placer Parkway PA), which is expected to be executed in summer, 2007 (Attachment 1). The HPSR summarizes the findings of an Archaeological Survey Report (ASR) (Attachment 2) and Historical Resources Evaluation Report (HRER) (Attachment 3) conducted for the project, requests SHPO concurrence on the determinations of National Register of Historic Places (NRHP) eligibility contained therein, and notifies SHPO of a finding of effect for Tier 1 of the proposed undertaking.

The ASR and the HRER cultural resource identification efforts in the Area of Potential Effects (APE) in accordance with the terms of the Placer Parkway PA and the Section 106 PA. Both studies satisfy the requirements of NEPA and CEQA as they relate to cultural resources.

In accordance with Stipulations II.B.1.a. and 2.a. of the Placer Parkway PA, archaeological studies for the Tier 1 effort included archival research, a pedestrian survey of areas common to all proposed alternatives, and formation of a predictive model to assess archaeological sensitivity. As a result of this effort, no archaeological resources were identified in the common alignment portion of the Placer Parkway APE. The predictive model for the alignment alternatives of the APE ranked the corridors for their relative archaeological sensitivity using environmental factors known to influence past human activity in the project vicinity. This analysis determined that Alternative 1 is the most archaeologically sensitive alignment, followed in descending order by Alternative 3, Alternative 2, Alternative 4, and Alternative 5. Based on this analysis, Alternative 5 is the least sensitive alignment in terms of potential archaeological resources.

In accordance with Stipulations II.B.1.b and 2.b., the HRER for the Tier 1 effort includes an evaluation of historic buildings, structures, and objects within the APE that appear to be potentially eligible for listing in the NRHP under Criterion C.[1] Because the Parkway may not be under construction until 2020, the HRER considered any buildings, structures, or objects within the architectural APE that were constructed in or prior to 1975 as meeting the 50-year age requirement for eligibility. As a result of this effort, no buildings, groups of buildings, or structures within the architectural APE appear to be eligible for the NRHP under Criterion C. Therefore, no building, object, or structure was formally evaluated on a California Department of Parks and Recreation (DPR) 523 form for this effort. One resource within the

[1] To meet Criterion C or 3, a resource must meet one of the following requirements: embody distinctive characteristics of a type, period or method of construction; represent the work of a master; possess high artistic values; represent a significant and distinguishable entity whose components may lack individual distinction.

APE for all alternatives was previously determined eligible for inclusion in the NRHP and is a historical resource under CEQA. In 1994, Reclamation District (RD) 1000 was determined eligible for the NRHP as a rural historic landscape (as a historic district) by a consensus between SHPO and the U.S. Army Corps of Engineers under Criterion A at the state level of significance. The historic property's area of significance is reclamation and its historic context is the reclamation and flood control of the Sacramento River Basin within the Sacramento Flood Control Project during the period between 1911 and 1939. The historic district, including its contributing features, was found to retain historic integrity.[2] The architectural APE for all proposed alternatives encompasses a small portion of the easternmost section of RD 1000.

Tier 1 of the proposed undertaking comprises the acquisition of land only, which does not have the potential to affect identified cultural resources; therefore, a finding of No Historic Properties Affected is appropriate for this undertaking. It is possible, however, that buried archaeological materials remain undetected within the study area, and that built environment resources within the APE meet the other NRHP criteria. Additional research will be conducted during Tier 2 of the proposed undertaking to identify any additional cultural resources within the selected alternative and to determine potential effects of the Parkway.

1.0 PROJECT DESCRIPTION

1.1 PROJECT DESCRIPTION AND LOCATION

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

The project study area is an area of approximately 33,460 acres located in Placer and Sutter counties, with a small section located in Sacramento County (see Figures 1-1 and 1-2). The portion of the study area in Sacramento County is located in the extreme southwest corner of the study area and does not include any of the proposed corridor alignment alternatives. It extends from SR 70/99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego roads.

For the purposes of the analysis the study area is divided into three segments: western, central, and eastern (see Figure 1-2). The Area of Potential Effect (APE) is delineated on Figure 1-4.

1.2 PHYSICAL IMPACTS OF THE PROJECT

1.2.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane facility. A preliminary conceptual cross section (see Figure 1-3) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/ Program EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

1.2.2 Conceptual Roadway Elevation

As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on either side of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways, or trails.

Throughout the project study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These over-crossings would not connect to the Parkway.

1.2.3 Potential Watt Avenue Interchange

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 1-5). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/Program EIR. However, an interchange between Placer Parkway and a potential Watt Avenue extension could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/Program EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges with Placer Parkway.

2.0 CONSULTING PARTIES AND PUBLIC PARTICIPATION

2.1 ARCHAEOLOGICAL RESOURCES

A request for a review of the Sacred Lands File was sent to the California Native American Heritage Commission (NAHC) on May 27, 2003.

A search of the Sacred Lands File by the staff of the NAHC did not indicate the presence of Native American cultural resources in the immediate study area. A letter from the NAHC reporting these findings as well as providing a list of local Native American individuals and organizations was sent to URS on June 6, 2003, and is included, with responses, within Attachment A.

Other sources of information consulted for the Placer Parkway cultural resources investigations included the Placer County Historical Society, Lincoln Arts and Culture Foundation, Roseville Historical Society, Community Memorial Museum, Placer County Museum, Sutter County Historical Society, and Rocklin Historical Society.

On three occasions (June 16, 2003, October 13, 2003, and March 6, 2006) letters requesting information and comment were sent to the Native American individuals identified on the NAHC contact list for Placer, Sacramento, and Sutter counties. In addition to the letters, telephone calls were made in August of 2003 notifying, when possible, these same individuals about the project. The list provided by the NAHC comprised:

- Harvey Angle, Chairperson, Enterprise Rancheria of Maidu Indians
- Rose Enos
- David Keyser, United Auburn Indian Community of the Auburn Rancheria
- Joe Marine
- Jeff Murray, Cultural Resources Manager Shingle Springs Band of Miwok Indians
- Martha Noel, Maidu Elders Organization
- Sam Starkey, United Auburn Indian Community of the Auburn Rancheria
- Christopher Suehead, Cultural Representative Todd Valley Miwok-Maidu Cultural Foundation
- Jessica Tavares, Chairperson, United Auburn Indian Community of the Auburn Rancheria

On October 21, 2003, a response was received from Greg Baker, Tribal Administrator, United Auburn Indian Community of the Auburn Rancheria (Auburn Rancheria). Mr. Baker requested that a copy of the technical report be provided to the United Auburn Indian Community of the Auburn Rancheria. The letter also instructed URS Corporation to contact Dr. Shelley McGinnis of Analytical Environmental Services (AES). No other responses were received.

Contact with was made Dr. McGinnis and a decision was made to hold a formal meeting between representatives of the Auburn Rancheria, SPRTA, the FHWA, Caltrans, and URS Corporation. This meeting was held on January 9, 2004, and was used to provide the Auburn Rancheria with project specifics including levels of effort for the Tier 1 investigation as well as potential avenues of investigation during Tier 2.

No other comments or concerns were expressed by any other parties contacted.

2.2 HISTORICAL RESOURCES

As mentioned above, staff consulted with local historical societies to solicit information regarding known cultural resources within the project APE. Additionally, extensive public and stakeholder consultation was implemented as part of a comprehensive public participation program under the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA) (see Section 2.3, below). Further consultation with appropriate individuals and organizations will occur during Tier 2 of the proposed undertaking.

2.3 NEPA AND CEQA PUBLIC INVOLVEMENT EFFORTS

The Tier 1 EIS/Program EIR for Placer Parkway has included a comprehensive Public Participation Program, designed to ensure that community stakeholders, including community interest groups and the public, are aware of the Parkway, and are involved and engaged in the planning process.

The Public Participation Program for the Tier 1 EIS/Program EIR was designed to actively involve project stakeholders in the planning process. Its objectives included obtaining input into the formulation of the range of alternatives and selection of corridor alignment alternatives ensuring that the issues and concerns expressed by members of the public and community interest groups are addressed, continuing ongoing stakeholder consultation throughout the Tier 1 EIS/Program EIR and environmental decision-making process, and coordination with partner agencies and other project proponents in the study area.

The following subsections summarize public participation activities conducted for the Tier 1 EIS/Program EIR. Additional detail is provided in the Placer Parkway Public Participation Methodology Report, available on the PCTPA website.

2.3.1 Participant Groups

The following participant groups were targeted in the public participation program:

Property Owners: The project team ensured that the property owners in the study area were informed about and involved in the planning and environmental review process, including receiving details of public meetings and project-related information at key project milestones.

Key Stakeholders: Key project stakeholders included business and industry, environmental, agricultural, neighborhoods, community, and special interest groups, public agencies, and local jurisdictions. A variety of methods were developed to engage these groups through interviews, meetings, and other outreach activities as described in Section 2.3.2.

Local, State and Federal Agencies: Coordination for the Tier 1 EIS/Program EIR is being carried out with a number of public agencies and organizations, including:

- Federal Highway Administration
- California Department of Transportation
- U.S. Army Corps of Engineers – Sacramento District
- U.S. Environmental Protection Agency – Region IX
- U.S. Fish and Wildlife Service
- California Department of Fish and Game
- Sacramento Area Council of Governments
- Natomas Basin Conservancy

Local Jurisdictions

The following local jurisdictions were directly involved in the planning process:

- Placer County
- Sacramento County
- Sutter County
- City of Lincoln
- Town of Loomis
- City of Rocklin
- City of Roseville
- City of Sacramento

2.3.2 Public Participation Program Methods

Community Stakeholder Interviews

The project team conducted interviews with 30 community stakeholders between May and July 2003 to identify issues, concerns, and potential benefits regarding the proposed project. Interviewees included representatives from public agencies, businesses, the agricultural sector, environmental groups, and local government. Interviews were conducted in person or by telephone. A September 2003 summary report is posted on the Placer County Transportation Planning Agency (PCTPA) website.

The interviews were considered part of the public scoping process and their results helped to focus subsequent public presentations and meetings with local jurisdictions and agencies. In addition to the interviews, written and verbal scoping comments were received from the general public (at public meetings and through newsletters), from meetings with jurisdictions and agencies, from responses to the Notice of Intent/Notice of Preparation, and from the Technical Advisory, Study Advisory, and Policy Advisory Committees established for the project as discussed below.

Advisory Committees

Building on the public outreach programs for the Placer Parkway Interconnect Study Conceptual Plan and the 2001 Project Study Report for Placer Parkway (both prepared by DKS Associates), three advisory committees were re-established: a Study Advisory Committee: a Policy Advisory Committee, and a Technical Advisory Committee.

The Technical Advisory Committee (TAC) was established to advise and assist PCTPA and its consultants with the technical aspects of the project. Membership of the TAC consisted of staff representatives from local jurisdictions and regional, state, and federal agencies. TAC representatives provided knowledge of environmental resources, planning, and transportation. The TAC met eight times from May 2003 to August 2005. Meeting agendas and minutes are available via PCTPA.

The Study Advisory Committee (SAC) was established to assist in the identification of project issues and solutions. Representatives from a wide range of key community interest groups were invited to be members of the SAC, including staff representatives from all local jurisdictions in the study area, staff representatives from regional, state, and federal agencies, representatives from environmental and neighborhood groups, and representatives from business and industry. The SAC met six times from June 2003 to August 2005. Meeting agendas and minutes from SAC meetings are available from PCTPA.

The Policy Advisory Committee (PAC) was established to provide advice and assistance in identifying project issues and solutions. Membership of the PAC consisted of elected officials/ex officials from all

local jurisdictions. The PAC's primary role was to provide the technical staff with policy recommendations related to the needs of various jurisdictions in the project study area. The PAC met four times from September 2003 to August 2005. Meeting agendas and minutes from PAC meetings are available from PCTPA.

2.3.3 Public Meetings and Notices

On September 18, 2003, a Notice of Intent for the project was published in the Federal Register and a Notice of Preparation was submitted to the State Clearinghouse. These documents described the proposed project and solicited agency and public comment on the scope and content of the Tier 1 EIS/Program EIR. Copies of these documents were mailed to 58 federal, state, and local agencies. Twenty comment letters were received and are included in the Tier 1 EIS/Program EIR. The lead agencies considered these comments when determining the appropriate information to include in the Tier 1 EIS/Program EIR.

In October 2003, PCTPA held two scoping meetings (one in Sutter County and one in Placer County) as part of its comprehensive public participation program. The purpose of the meetings was to provide an opportunity for community members, community interest groups, and public agencies to provide input on the overall scope and content of the Tier 1 EIS/Program EIR. These meetings were the first in a series of three rounds of public meetings planned throughout the project. An October 2003 Scoping Meetings and Scoping Process Summary Report is available at PCTPA. A copy is posted on PCTPA's website.

Informational notices for both meetings were mailed to community members in the study area, including businesses, community leaders, agency staff, environmental groups, project advisory committee members, local elected officials, property owners, and the general public. More than 1,300 notices were mailed. Print advertisements were also placed in local newspapers to provide additional information and publicity for the meetings. A press release was distributed to local media outlets (radio, television, and newspapers) in Placer, Sutter, and Sacramento counties, providing an overview of the project and information on the scoping meetings

Approximately 25 people attended the Roseville meeting and approximately 100 people attended the Pleasant Grove meeting. The project team followed up on a number of issues that were raised at the public scoping meetings including comments on meeting format, maps and hand-out materials, study area expansion, and enlarging the notice area. In addition to comments received at these meetings, letters in response to the Notice of Intent and Notice of Preparation were received from agencies, jurisdictions, and members of the public. These letters were considered in the lead agency's determination of the appropriate scope and content of the Tier 1 EIS/Program EIR, and will be included in that document's appendices.

In August 2004, PCTPA held two public meetings (one in Sutter County and one in Placer County) as part of its comprehensive community outreach program. The purpose of the meetings was to obtain feedback from area residents and other community members on four potential corridor alignment alternatives being considered for evaluation in the Tier 1 EIS/Program EIR. These meetings were the second in a series of three rounds of public meetings planned throughout the project. An August 2004 Public Meetings Summary Report is available at PCTPA. A copy is posted on PCTPA's website.

PCTPA also produced newsletters that provided updates on the project. These were distributed to the project mailing list, including property owners, businesses, interested community organizations, public agencies and individuals to inform them about the public. The first two newsletters were developed to coincide with the 2003 scoping and the 2004 public meetings. A third newsletter, in August 2005, provided information on two additional corridor alignment alternatives being considered.

2.3.4 Project Website

A website (www.pctpa.org/placerparkway/index.htm) provided relevant information on the project background, the project description, corridor alternatives, the environmental review process, funding, key milestones of the planning process, a project library with posted project documents, and public meeting dates and materials. The website was linked to PCTPA's existing website. The project website will remain active through the duration of the planning process. Members of the public were able to access information on the website and learn how to stay involved.

The project website expanded outreach and provided an alternative means for dissemination of project-related information.

2.3.5 Public Hearings

PCTPA will hold public hearings in 2007 to obtain public comments on the Tier 1 EIS/Program EIR. The public meetings will be held at two locations, one each in Placer and Sutter counties. Updates on meeting dates and locations will be posted on the project website. Notices for these hearings will be distributed in a variety of ways, including newspapers, Federal Register, news release, newsletter, and website.

3.0 SUMMARY OF IDENTIFICATION EFFORTS

The phased approach for compliance with Section 106 of the National Historic Preservation Act for the proposed undertaking is mandated in the *Programmatic Agreement between the Federal Highway Administration and the California State Historic Preservation Office Regarding Implementation of the Placer Parkway Project, Placer County, California* (Placer Parkway PA).

3.1 ARCHAEOLOGICAL RESOURCES

In accordance with Stipulations II.B.1.a. and 2.a. of the Placer Parkway PA, identification efforts with respect to archaeological resources consisted of background and archival research, contact with the Native American Heritage Commission (NAHC) and local Native American groups and individuals identified by the NAHC, an intensive archaeological pedestrian reconnaissance of the previously unsurveyed portion of the common alignment (Figure 3-1; also see Section 3.1.2 for more details) where access had been secured, and the development and use of a predictive model based on environmental factors to assess the relative archaeological sensitivity of the project alternatives.

3.1.1 Records Search

The archaeological records search included the study area (Figure 1-2) as well as areas within a ¼-mile radius of the study area boundary. Because the archaeological records for Sutter County are housed separately from those in Placer and Sacramento counties, two separate record searches were conducted for the project. The record searches at the North Central Information Center (NCIC) and Northeast Information Center (NEIC) included searches of archaeological site and historic property files, the National and California Registers of Historic Places, the Historic Property Data File for their respective counties, California Historic Landmarks, California Points of Historic Interest, Caltrans Local Bridge Survey, and historic General Land Office Maps.

The records search results were used to develop corridor alignment alternatives routed to avoid and/or minimize potential impacts to various resources including historic and prehistoric archaeological sites. Known archaeological sites identified in the record search, including trinomial numbers, are listed in Attachment A. No previously identified archaeological sites occur within the corridors subject to the current investigation. The corridor alignment alternatives selection process was also used to locate, to the extent possible given other environmental constraints, the corridor alignment alternatives within areas previously subjected to archaeological inventory. A list of previous archaeological inventory studies that include lands bisected by the project is included in Attachment A.

Because the screening process was used to avoid historic and prehistoric archaeological sites, none of these efforts resulted in the identification of archaeological sites within the corridor alignment alternatives.

Since the record search and screening efforts were conducted, three additional studies have been conducted that include tracts of land traversed by the common alignment alternatives (see Figure 3-1). These studies were completed for the Amoruso Property (ECORP, 2006), the Placer Ranch Project (Hale, 2004), Reason Farms Retention Basin (Hale, 2002), and the SR 65 Widening Project (Norton, 1998). Given the recent dates of completion of these surveys, in agreement with Caltrans, the common corridor alignment alternative through these parcels was not re-inventoried for archaeological resources. None of these efforts identified archaeological resources within any of the corridor alignment alternatives.

3.1.2 Field Surveys

In accordance with Stipulation II.B.2.a. of the Placer Parkway PA, only the alignment common to all build alternatives (Figure 3-1) was subject to archaeological pedestrian reconnaissance. The common alignment occurs primarily in the Eastern Segment of the study area, although a small section of common alignment also is found in the eastern extent of the Central Segment. The majority of the common alignment has been previously investigated in the recent past. As depicted on Figure 3-1 the corridor bisects a number of areas currently under environmental review for other development project proposals. Environmental review of these projects has included archaeological investigations, and the results of these investigations have been used in this report to characterize the baseline conditions of the corridor analysis. Further details of these areas are provided in Attachment 2.

The survey corridor, comprised of parcels within the common alignment, was subjected to an archaeological pedestrian reconnaissance following the guidelines proposed by King (1978). Specifically, the previously unsurveyed portions of the common alignment where access had been secured were visually inspected using 20-meter (66-foot) parallel transects.

Because the current undertaking consists only of the preservation of a transportation ROW, the archaeological APE (Figure 1-4) for this Tier 1 investigation consists of the area within the boundaries of the corridor alignment alternatives. Furthermore, because the project has yet to be designed, the APE is currently limited to the ground surface only and there is no vertical APE. An APE encompassing areas that potentially would be disturbed by construction activity, as well as areas that potentially would be used for construction excavation, will be developed and assessed in Tier 2. The remaining portions of the APE outside of the common alignment are comprised of a series of interconnected corridor alternatives. Archaeological issues in these corridors, as agreed upon by the signatories and concurring parties of the Placer Parkway PA, were addressed through the use of environmental factors including length of stream corridor, area above floodplain, and area of farm land to rank the archaeological sensitivity of the project alternatives. The results of the ranking efforts will be used to assist with alternative selection in the Tier 1 EIS/Program EIR.

3.1.3 Predictive Model

As indicated previously, signatories to the Placer Parkway PA agreed that only the common alignment of the Placer Parkway needed to be inventoried for archaeological resources prior to the preparation of the Tier 1 EIS/Program EIR. The portion of the archaeological APE outside of the common alignment consists of the remaining five interconnected corridor alignment alternatives. The Placer Parkway PA outlines that a predictive model would be used to assess the various alternatives for their relative archaeological sensitivity. These data could then be used in the Tier 1 EIS/Program EIR to make conclusions about potential impacts to archaeological resources.

For the current investigation, the predictive model is a geographic information system (GIS)-based application that assesses the relative sensitivity of each alternative corridor based on various, common environmental factors known to influence past human activity in the project vicinity. Further details of the predictive model are provided in Attachment 2.

The environmental factors used in this investigation are those known to influence (either attract or deter) past human activity in the study area based on archaeological evidence, ethnographic data, and historic land-use information. These factors comprised the following:

- proximity to stream courses
- total length in mile of stream course

- acreage of land at or above 33 feet above sea level and in close proximity to an actual or historic floodplain,
- total acreage of farmland

3.1.4 General Land Office Plat Maps

To further assess the historic archaeological sensitivity of the various project corridors, General Land Office (GLO) surveyor's plat maps were also consulted. GLO plat maps provide details of previous land surveys and divisions and depict historic features that may be represented in the archaeological record. Data retrieved from these maps were used to complement the environmental parameters discussed in the previous section. Additional details of GLO plat maps are provided in Attachment 2.

3.1.5 Results of Research

In the area of the common corridor alignment, no prehistoric or historic archaeological materials, evidence of archaeological deposits, or indications of occupation were found on the surface within the APE. It is Caltrans' policy to avoid cultural resources whenever possible. At this time no further archaeological work is necessary within the common corridor alignment. The selected corridor alignment alternative will be subjected to pedestrian archaeological inventory during Tier 2 efforts.

Table 3-1 presents the assessment of archaeological sensitivity for the Parkway alternatives in the remaining portions of the APE outside of the common alignment (Figure 3-1), as generated by the predictive model.

Table 3-1
Predictive Model for Assessment of Archaeological Sensitivity of Project Alternatives (Excluding Common Alignment)

Alignment	Total Miles of Stream Corridor (Ranking)		Total Acreage Above Floodplain (Ranking)		Total Acreage of Farmland (Ranking)	
Alternative 1	3.0099	(1)	950.8	(1)	1,238.4	(1)
Alternative 2	1.2942	(2)	868.8	(3)	1,153.10	(3)
Alternative 3	0.9148	(3)	904.7	(2)	1,188.1	(2)
Alternative 4	0.7720	(4)	782.4	(4)	953.7	(4)
Alternative 5	0.6906	(5)	778.2	(5)	945.0	(5)
Note: 1 = most sensitive 5 = least sensitive						

Alternative 1 contains the greatest length of stream course, the most acreage above floodplain, and the most acreage of farmland. Using the criteria described above, Alternative 1 is the most archaeologically sensitive alignment alternative. Alternative 3 is the next most archaeologically sensitive alignment, ranking second in both total acreage above floodplain and total acreage of farmland and scoring third in total length of stream course. Alternative 2 follows, ranking second total length of stream course and third for both total land above floodplain and total acreage of farmland. Alternative 4 is next, ranking fourth for all identified criteria. Lastly, Alternative 5 ranks fifth for all categories, making it the least sensitive for archaeological resources.

The total length of stream corridor, as described previously, can also provide insight to the potential for a corridor to contain buried archaeological deposits. Based on total stream corridor length, it can be

predicted that Alternative 1 is the corridor most likely to contain buried archaeological resources while Alternative 5 is the least likely (Table 3-1).

The predictive model, as well as previous archaeological surveys and those conducted for this study, indicate that the general archaeological sensitivity of the current archaeological APE for both prehistoric and historic archaeological resources is low. This is based on the fact that while resources have been identified, relatively few archaeological sites have been identified given the total acreage of land subjected to archaeological survey.

The GLO plat maps indicated a number of potential archaeological resources in the vicinity of the Parkway alternatives. The paths of several historic roadways are bisected by the corridor alignment alternatives. Further details of these roadways are presented in Attachment 2. As all alternatives intersect all of these historic roads, or at least can be comfortably inferred to intersect them, as well as bisect a number of not fully plotted ancillary roads, no one corridor alignment alternative is more or less archaeologically sensitive than another, based solely upon the roads intersected along their length.

Besides the aforementioned roads, only one other potential historic archaeological resource was identified from the GLO maps within any of the potential corridor alignment alternatives of the Placer Parkway project. Labeled as a "house" on the GLO plat map for Township T11N/R4E, the potential resource is situated in the southeastern quadrant of Section 23 directly within the path of the corridor alignment alternative common to both Alternatives 4 and 5, where it intersects Sankey Road at its easternmost point. No other information is known about the structure other than it was present by 1868. Air photos of this location reveal that the vicinity is currently under cultivation.

Intact remnants of this structure would likely represent an important cultural resource. However, this section of the study area has not been previously subjected to an intensive archaeological pedestrian reconnaissance. As such, it is unknown whether remnants of this structure occur within the current APE. The potential presence of this structure elevates the archaeological sensitivity of both Alternatives 4 and 5.

Although a potential historic archaeological resource was identified in Alternatives 4 and 5, elevating the archaeological sensitivity of both of these corridor alignment alternatives, given the limitations in the original GLO mapping and the fact that the area has been plowed, this finding does not outweigh the sensitivity of the alternative corridors as described on the previous page.

3.2 HISTORICAL RESOURCES

A search of the records at the Northeast and North Central information centers was conducted in June 2003. The searches included cultural resources site and historic property files, the National Register of Historic Places, California Register of Historical Resources, the Historic Property Data File for their respective counties, California Historic Landmarks, California Points of Historic Interest, Caltrans Local Bridge Survey, and historic General Land Office and U.S. Geological Survey (USGS) maps.

While the Secretary of the Interior sets the standard guidelines for review of potential National Register-eligible buildings, structures, or features that are 50 years of age or older, as construction of the Placer Parkway may not begin until 2020, this age limit has been extended to include resources constructed in 1975 or before. Buildings, structures, and features built after 1975 were not included in the survey. A reconnaissance survey of the historical resources APE was conducted on March 22, 2005 to account in the field for all the buildings, structures, and objects found within the APE that appeared to be built in or before 1975. In accordance with Stipulations II.B.1.a. and 2.a. of the Placer Parkway PA, any properties that appeared to have potential for eligibility under Criterion C of the NRHP would be formally evaluated via the completion of a DPR 523 form. To be eligible for inclusion in the NRHP, a property must have

both significance and integrity. Loss of integrity, if sufficiently great, will overwhelm the historical significance of a resource and render it ineligible. Likewise, a resource can have complete integrity, but if it lacks significance, it must also be considered ineligible.

In order to identify potential historic resources that could be affected by the Parkway, previous historic resource inventory and evaluation surveys and reports were evaluated and research conducted at the California State Library; County Assessor's and Recorder's offices for Placer and Sutter counties; Shields Library at University of California, Davis; and the Bureau of Land Management State Office, Sacramento. In addition, background research was done through the First American Real Estate Solutions commercial database, review of historic and current USGS topographic maps, Caltrans Historic Bridge Inventory, and other documents to confirm dates of construction.

3.2.1 Results of Research

The vast majority of the properties identified in the APE are Ranch-, Minimal Traditional- or Contemporary-style residential structures predominantly built during the 1960s and 1970s. These buildings are of standard twentieth-century styles, types, and methods of construction and are ubiquitous in Northern California and in Sutter and Placer counties.

Of the handful of properties that were built in the first half of the twentieth century, most have been substantially altered by additions, replacement siding or windows, or have suffered severe damage from lack of maintenance and do not appear to retain sufficient integrity to warrant further investigation.

Four resources within the APE were previously determined ineligible for listing and one resource was previously determined eligible for listing in the NHRP and CRHR. Section 4.2 further describes the properties identified in this study.

4.0 PROPERTIES IDENTIFIED

4.1 ARCHAEOLOGICAL RESOURCES

No archaeological resources were identified during the course of this investigation. No archaeological resources were identified in the common alignment portion of the project's APE. The predictive model for the alignment alternatives of the APE ranked the corridors for their relative archaeological sensitivity using environmental factors known to influence past human activity in the project vicinity. This analysis determined that Alternative 1 is the most archaeologically sensitive alignment, followed in descending order by Alternative 3, Alternative 2, Alternative 4, and Alternative 5. Based on this analysis, Alternative 5 is the least sensitive alignment in terms of potential archaeological resources.

It is possible that buried archaeological materials remain undetected within the study area. If such resources are encountered during project implementation, it is Caltrans policy that ground-disturbing activities within the vicinity halt until a qualified archaeologist can evaluate the nature and significance of the find.

Mark R. Hale, URS Senior Project Archaeologist, prepared the Archaeological Survey Report (ASR) (Attachment 2) to document cultural resources identification efforts in the project's APE. Pedestrian archaeological reconnaissance was led by Mr. Hale. Mr. Hale holds a B.A. in Anthropology from the University of California, Berkeley, and has completed his course work, completed his research, and defended his thesis for an M.A. in cultural resources management from Sonoma State University. He has more than 20 years of professional experience in conducting and managing cultural resources investigations. Project oversight was provided by Mr. Brian Hatoff (URS Senior Archaeologist). Mr. Hatoff received both his B.A. and his M.A. in Anthropology from the University of California, Davis; is a Registered Professional Archaeologist, and has more than 30 years of professional experience in California and the Great Basin.

Mr. Mark Hale, who meets the Professionally Qualified Staff Standards in Section 106 PA Attachment 1, as a Lead Archaeological Surveyor or above, has reviewed the project APE and confirmed that the only other properties currently known to be present within the APE meet the criteria for Section 106 PA Attachment 4 (Properties Exempt from Evaluation). Additional investigations will be undertaken at Tier 2 to confirm the potential presence of as yet unknown potentially NRHP- or CRHR-eligible archaeological resources.

4.2 HISTORICAL RESOURCES

Table 4-1 lists the only National Register-eligible property identified in this study: Reclamation District 1000. This historic district was found to be eligible for inclusion in the NRHP under Criterion A (Table 4-1, below). The architectural APE also included two county-owned bridges along South Brewer and Lotus roads in Placer County and two railroads. Caltrans previously identified these bridges (19C0104 and 19C0124) as Category 5 structures (not eligible for listing in the National Register of Historic Places) in the California Historic Bridge Inventory (1986 and updates) (Table 4-2). The Western Pacific Railroad and Sacramento Northern Railroad segments (Table 4-2) within the study area have been previously found to be ineligible for inclusion in the NRHP and therefore required no further study for this project (JRP et al., 1994; JRP, 1995).

Three other properties were also identified that, while they do not appear to be eligible under Criterion C as representative examples of a type, period, or method of construction, or as works of a master, appear to retain sufficient integrity to warrant formal evaluation during the Tier 2 phase of the project. These

Table 4-1
Properties Previously Determined Eligible for Listing in the National Register of Historic Places and Which are Historical Resources Under CEQA

Table 4-2
Properties Previously Determined Ineligible for Listing in the National Register of Historic Places and Which are Not Historical Resources Under CEQA

Name	Address	OHP Status Code	Map Ref No.
Sacramento Northern Railroad Segment	Not applicable	6	2
Western Pacific Railroad Segment	Not applicable	6	3
Bridge 19C0104	Brewer Road, branch of Curry Creek	6	n/a
Bridge 19C0124	Locust Road east of SR 65, Curry Creek	6	n/a

properties are located within the Central Segment of Alternatives 1, 2, and 3. Site-specific research conducted on these properties may produce information that possibly may support eligibility under Criteria A or B. Those resources (Assessor's Parcel Number [APN] 35-260-011, 35-260-014 and 017-130-036) are identified in Attachment 3.

Properties which were determined eligible for listing in the National Register of Historic Places as a result of the current study and are historical resources under CEQA: None.

Properties which were determined ineligible for listing in the National Register of Historic Places as a result of the current study and which are not historical resources under CEQA: None.

Toni Webb of JRP, who meets the Professionally Qualified Staff Standards in Section 106 PA Attachment 1 as an Architectural Historian or above, has determined that the only other properties present within the APE for the Tier 1 studies, including state-owned resources, meet the criteria for Section 106 PA Attachment 4 (Properties Exempt from Evaluation).

5.0 FINDINGS

No known archaeological resources exist in within the common areas of the proposed corridor alignment alternatives. Four built environment resources were previously determined ineligible for listing in the NRHP and are not historical resources for the purposes of CEQA: two bridges and two railroad segments. One built environment resource was previously determined eligible for listing in the NRHP and is a historical resource for the purposes of CEQA: Reclamation District 1000.

Tier 1 of the project comprises the acquisition of land to preserve for future construction of the Placer Parkway. Land acquisition, in and of itself, does not create a potential for effect. Under the authority of FHWA, Caltrans has determined a finding of No Historic Properties Affected is appropriate for this undertaking in accordance with Stipulation IX.A. and 36 CFR 800.4(d)(1) of the Section 106 PA.

It is possible, however, that buried archaeological materials remain undetected within the study area, and that built environment resources within the APE meet the other NRHP criteria. Additional research will be conducted during Tier 2 of the proposed undertaking to identify any additional cultural resources within the selected alternative and to determine project effects.

Attn: Gary Sweeten

Dear Mr. Fong

The Federal Highway Administration (FHWA) and California Department of Transportation (Caltrans) are working with the Placer County Transportation Planning Agency (PCTPA) on the Placer Parkway Project. PCTPA proposes to identify and acquire right-of-way for the purpose of preserving a corridor for a future Placer Parkway, an east-west connection between State Route (SR) 65 near Lincoln in Placer County and SR 70/99 in southern Sutter County. Our agencies are working together to produce a Tier 1 Environmental Impact Statement (EIS), pursuant to the National Environmental Policy Act (NEPA) that will evaluate several corridor alternatives and will lead to the selection of one corridor for right-of-way preservation.

As a Federal undertaking, this project also requires compliance with Section 106 of the National Historic Preservation Act (NHPA). Pursuant to 36 CFR 800, the regulations implementing Section 106 of the NHPA, we have prepared a draft Programmatic Agreement that will govern Section 106 compliance responsibilities associated with implementing this undertaking. If FHWA agrees with this proposed PA, please forward the attached documentation to the California State Historic Preservation Officer for his review. Caltrans and PCTPA staff are available to meet with the SHPO to explain the undertaking in more detail if that is helpful.

Should you require any additional project information, please contact Erick Wulf at (916) 274-0563 or erick.wulf@dot.ca.gov or Anmarie Medin at (916) 274-584 or anmarie.medin@dot.ca.gov. Thank you in advance for your assistance in this matter.

Sincerely,

Japtej S Gill

PROGRAMMATIC AGREEMENT

BETWEEN THE FEDERAL HIGHWAY ADMINISTRATION AND THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER REGARDING IMPLEMENTATION OF THE PLACER PARKWAY PROJECT, PLACER COUNTY, CALIFORNIA

WHEREAS, the Federal Highway Administration (FHWA) and the California Department of Transportation (Caltrans), in cooperation with the Placer County Transportation Planning Agency (PCTPA), propose to identify and acquire right-of-way for the purpose of preserving a corridor for a future Placer Parkway, an east-west connection between State Route (SR) 65 near Lincoln in Placer County and SR 70/99 in southern Sutter County (Undertaking); and,

WHEREAS, the FHWA is preparing a Tier 1 Environmental Impact Statement (EIS), pursuant to the National Environmental Policy Act (NEPA), 42 USC 4321 *et seq,* that will evaluate several corridor alternatives and will lead to the selection of one corridor for right-of-way preservation; and

WHEREAS, given the existing and projected rapid growth in and around the project study area, the FHWA has determined it is vital to identify a corridor as early as feasible so that local jurisdiction planning decisions can consider the future Placer Parkway and before new development reduces corridor options and/or increase right-of-way acquisition costs for the Undertaking; and,

WHEREAS, the FHWA has determined that a phased approach for compliance with Section 106 of the NHPA is appropriate for the Undertaking, such that completion of the identification of historic properties, determinations of specific effects in historic properties, and resolution of any adverse effects will be carried out as part of planning for and prior to the approval of specific Tier 2 undertakings; and,

WHEREAS, the FHWA has consulted with the California State Historic Preservation Officer (SHPO) pursuant to the 1 January 2004 *Programmatic Agreement among the Federal Highway Administration, the Advisory Council on Historic Preservation, the California State Historic Preservation Officer, and the California Department of Transportation Regarding Compliance with Section 106 of the National Historic Preservation Act, as it Pertains to the Administration of the Federal-Aid Highway Program in California* (PA), and where the PA so directs, in accordance with 36 CFR Part 800, the regulations that implement Section 106 of the National Historic Preservation Act (NHPA) (16 U.S.C. 470f), regarding the Undertaking's potential effects on historic properties; and,

WHEREAS, following the completion of Tier 1 EIS, the FHWA, as funding becomes available for design and construction, will conduct Tier 2 environmental studies to analyze the environmental impacts of different alignments within the selected corridor in order to determine the specific transportation facility 'footprint' within the corridor , including project-level compliance with the Section 106 process to determine specific impacts to historic properties as

well as opportunities for avoidance, minimization of harm, and appropriate mitigation, if required, for the Undertaking; and,

WHEREAS, the FHWA desires to enter into a Programmatic Agreement (Agreement) at this time in order to establish a framework for conducting Section 106 consultation for Tier 1 and Tier 2; and,

WHEREAS, Caltrans has participated in consultation and has been invited to be a signatory to this Agreement; and

WHEREAS, PCTPA has participated in consultation and has been invited to be a signatory to this Agreement; and

WHEREAS, the Advisory Council on Historic Preservation (ACHP) has been afforded the opportunity to participate in the Section 106 process and has not elected to participate; and,

WHEREAS, Caltrans, on behalf of the FHWA, has initiated consultation with the Shingle Springs Band of Miwok Indians, Todd Valley Miwok-Maidu Cultural Foundation, Maidu Elders Orgainzation, and Enteprise Rancheria of Maidu Indians, as well as with the following federally-recognized Indian Tribes: United Auburn Indian Community (Tribes).

WHEREAS, the FHWA has involved, and will continue to involve, the public and historic interest groups, as stipulated under NEPA and the NHPA in a manner consistent with the PA and Caltrans' public involvement procedures;

NOW, THEREFORE, the FHWA and the SHPO agree that, upon the FHWA's decision to proceed with the Undertaking, the FHWA shall ensure that the Undertaking is implemented in accordance with the following stipulations in order to take into account the effects of the Undertaking on historic properties; and further agree that these stipulations shall govern the Undertaking and all of its parts until this Agreement expires or is terminated.

STIPULATIONS

The FHWA will ensure that the following stipulations are implemented:

I. DEFINITIONS

The definitions set forth at 36 CFR § 800.16 are applicable throughout this Agreement.

II. TIER 1 PHASED IDENTIFICATION OF HISTORIC PROPERTIES

A. Area of Potential Effects

1. The Undertaking's area of potential effects (APE) for Tier 1 is situated in southwest Placer County, between Highways 65 and 70, north of Baseline Road and south of Sunset Boulevard West (attachment A to this Agreement).

2. If modifications to the Undertaking, subsequent to the execution of this Agreement, necessitate the revision of the APE, Caltrans will consult with the PCTPA, the FHWA, and the SHPO to facilitate mutual agreement on the subject revisions. If Caltrans, the PCTPA, the FHWA, and the SHPO cannot reach such agreement, then the parties of this Agreement shall resolve the dispute in accordance with stipulation VIII.C below. If Caltrans, the PCTPA, the FHWA, and the SHPO reach mutual agreement on the proposed revisions, then Caltrans will submit a final map of the revisions, consistent with the requirements of stipulations VIII.A and XVI.A of the PA, no later than 30 days following such agreement.

B. Phased Identification of Historic Properties

1. Areas Common to all Alternatives/Corridors: the FHWA shall ensure that PCTPA or its consultants inventory properties within the area(s) common to all Tier 1 corridors according to the following specifications:
   a. Archaeological Properties
      (1) Conduct an inventory of archaeological properties where access has been secured in areas that have not previously been surveyed and those areas deemed by Caltrans PQS in need of resurvey because of the age or condition of the previous survey. Archaeological properties will be identified in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms.
   b. Built Environment Properties
      (1) Conduct a limited inventory of built environment properties within the entire Tier 1 APE. Built environment properties that have the potential to meet NRHP Criterion C will be identified and evaluated in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms. Other built environment properties within the APE that meet the age and integrity criteria will be inventoried and evaluated during Tier 2 studies, as provided for in stipulation III of this Agreement.
2. Areas Unique to Specific Alternatives/Corridors: the FHWA shall ensure that PCTPA or its consultants inventory properties within the area(s) unique to specific Tier 1 alternatives/corridors according to the following specifications:
   a. Archaeological Properties
      (1) Complete a records search for the Tier 1 APE and prepare a predictive model utilizing environmental factors and historic land-use data to assess the archaeological sensitivity of the project corridors including potential for buried resources. Segments of Tier 1 alignments/corridors that are not in common will be inventoried for archaeological properties during Tier 2 studies, as provided for in stipulation III of this Agreement.
   b. Built Environment Properties
      (1) Conduct a limited inventory of built environment properties within the entire Tier 1 APE. Built environment properties that have the potential to meet NRHP Criterion C will be identified and evaluated

in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms. Other built environment properties within the APE that meet the age and integrity criteria will be inventoried and evaluated during Tier 2 studies, as provided for in stipulation III of this Agreement.

3. Tier 1 Reporting and SHPO Consultation
   a. The FHWA shall ensure that PCTPA or its consultants prepare documentation of their findings and determinations pursuant to stipulation XVI of the PA. The reports shall be submitted to Caltrans PQS for review and approval.pursuant to stipulation XVI of the PA.
   b. Eligibility determinations shall be submitted to SHPO pursuant to stipulation VIII.C(5) of the PA.

C. Phased Assessment of Effects

1. The FHWA shall assess the potential for Tier 1 of the Undertaking to effect historic properties in accordance with stipulation X of the PA. As Tier 1 is defined as acquisition of property, the FHWA anticipates there will be no adverse effects during Tier 1. The FHWA shall consult with SHPO on the effect finding pursuant to stipulation X of the PA.

III. TIER 2 PHASED SECTION 106 CONSULTATION

A. Area of Potential Effects: The objective of the Tier 1 EIS is to identify and preserve an approximate 500'- to 1,000'-wide corridor for acquisition. The Tier 1 EIS will focus on broad topics such as general location, mode choice, area-wide air quality and land use, and other environmental issues. Once the corridor is selected, the subsequent Tier 2 environmental review, relying on the work from the Tier 1 EIS, will provide a more detailed analysis of the environmental impacts for the future transportation facility alignment alternatives within the selected corridor. Once a Tier 2 preferred alternative is chosen, the FHWA and PCTPA will delimit an APE for the Tier 2 preferred alternative in accordance with stipulation VIII.A of the PA. If subsequent modifications to the APE are necessary, the FHWA shall follow the procedures of stipulation II.A(2) of this Agreement.

B. Phased Identification and Evaluation.

1. Archaeological Properties
   a. The FHWA shall ensure that PCTPA or its consultants conducts a pedestrian reconnaissance of all lands within the final APE for any Tier 2 preferred alternative. Archaeological properties will be identified and evaluated in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms.
2. Built Environment Properties
   a. The FHWA shall ensure that PCTPA or its consultants conducts an inventory of built environment properties within the final APE for any Tier 2 preferred alternative. Built environment properties will be

evaluated for NRHP eligibility in accordance with stipulation VIII.(B) and (C) of the PA, and documented on appropriate DPR 523 inventory forms.

3. Tier 2 Reporting and SHPO Consultation
   a. The FHWA shall ensure that PCTPA or its consultants prepare documentation of their findings and determinations pursuant to stipulation XVI of the PA. The reports will be submitted to Caltrans PQS for review and approval pursuant to stipulation XVI of the PA.
   b. Eligibility determinations shall be submitted to SHPO pursuant to stipulation VIII.C(5) of the PA.

C. **Assessment of Effects.** The FHWA will assess any Tier 2 preferred alternative for its potential to affect historic properties and will consult with the SHPO pursuant to stipulation IX and X of the PA. Should FHWA find that any Tier 2 preferred alternative will result in an adverse effect, FHWA shall consult with SHPO pursuant to stipulation XI of the PA.

D. **Applicable Requirements.** FHWA will conduct the Section 106 process during Tier 2 in accordance with stipulations of the PA and applicable requirements under Section 106 of the National Historic Preservation Act (16 U.S.C. § 470f) and the Section 106 regulations (36 C.F.R. Part 800), including any subsequent amendments thereto. Nothing in this Agreement is intended to supersede or modify any requirement contained in the Section 106 statute or the Section 106 regulations.

E. **Consulting Parties**. During Tier 2, the same party may be designated as a consulting party for more than one alternative. FHWA will ensure comments of all consulting parties are incorporated into the Section 106 consultation process as provided for in all applicable laws.

IV. TIER 2 SECTION 106 COMMITMENTS AND CONCEPTUAL MITIGATION

A. FHWA and PCTPA agree to implement and/or fund the activities listed in this section as part of any Tier 2 environmental studies. Additional commitments may be made, as appropriate, as an outcome of the Section 106 consultation process for any Tier 2 alternative.

B. **Avoidance and Minimization of Impacts**

1. In General. In accordance with the consultation process required under Section 106 and in accordance with other applicable laws, FHWA, PCTPA, and Caltrans will seek ways to avoid, minimize, and mitigate adverse impacts to the environment, including adverse effects to historic properties.
2. Context-Sensitive Solutions. FHWA, PCTPA, and Caltrans will apply the principles of context-sensitive solutions during project development, in accordance with applicable Caltrans policies. In accordance with those principles and where appropriate, FHWA, PCTPA, and Caltrans will develop any Tier 2 alternative with sensitivity to aesthetic values and the historic context, utilizing the services of professionals with experience in areas related to historic preservation.

C. Should implementation of any Tier 2 alternative result in adverse effects to a historic property important solely for its information value (Criterion D), FHWA will ensure a data recovery plan is prepared according to guidance in Attachment 6 of the PA and submitted to the SHPO for review in accordance with stipulation II.C(3) of this Agreement.

D. The FHWA will not authorize the execution of any Undertaking activity that may effect (36 CFR § 800.16(i)) historic properties in the Undertaking's APE prior to the completion of the Section 106 process provided for in this Agreement.

V. NATIVE AMERICAN CONSULTATION

The FHWA has consulted with the Tribes regarding the proposed Undertaking, will continue to consult with the Tribes, and will afford the Tribes, should the Tribe so desire, the further opportunity to more directly and actively participate in the implementation of the Undertaking; Should any specific Tribe desire to participate in this Agreement as herein set forth, the FHWA shall consult with them to reach consensus regarding the manner in which the Tribe may participate in the implementation of this Agreement and the Undertaking, and regarding any time frames or other matters that may govern the nature, scope, and frequency of such participation.

VI. TREATMENT OF HUMAN REMAINS

The Agreement parties agree that human burials and related items discovered during implementation of the terms of this Agreement and of the Undertaking will be treated in accordance with the requirements of § 7050.5(b) of the California Health and Safety Code. If, pursuant to § 7050.5(c) of the Code, the county coroner or medical examiner determines that the human remains are or may be of Native American origin, then the discovery shall be treated in accordance with the provisions of §§ 5097.98(a)-(d) of the California Public Resources Code.

VII. DISCOVERIES AND UNANTICIPATED EFFECTS

If the FHWA determines, after any future construction of the Undertaking has commenced, that the Undertaking will affect a previously unidentified property that may be eligible for the National Register, or affect a known historic property in an unanticipated manner, the FHWA will address the discovery or unanticipated effect in accordance with 36 CFR § 800.13(b)(3). The FHWA at its discretion may hereunder, and pursuant to 36 CFR § 800.13(c), assume any discovered property to be eligible for inclusion in the National Register.

VIII. ADMINISTRATIVE PROVISIONS

A. PROFESSIONAL QUALIFICATIONS AND STANDARDS

1. **Professional Qualifications**. All activities prescribed by stipulations II, III, IV, V, VI, and VII of this Agreement shall be carried out under the authority of the FHWA by or under the direct supervision of a person or persons meeting at a minimum the Secretary of Interior's *Professional Qualifications Standards* (48 FR 44738-39) (PQS) in the appropriate disciplines. However, nothing in this stipulation may be interpreted to preclude the FHWA or any

agent or contractor thereof from using the properly supervised services of persons who do not meet the PQS.

2. **Documentation Standards.** Written documentation of activities prescribed by stipulations II, III, IV, V, VI, and VII of this Agreement shall conform to *Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation* (48 FR 44716-44740) as well as to applicable standards and guidelines established by the SHPO.

3. **Curation and Curation Standards.** The FHWA shall ensure that, to the extent permitted under §§ 5097.98 and 5097.991 of the California Public Resources Code, the materials and records resulting from the activities prescribed by this Agreement are curated in accordance with 36 CFR Part 79. The FHWA will ensure that, to the extent permitted by applicable law and regulation, the views of the Most Likely Descendant(s) are taken into consideration when decisions are made about the disposition of other Native American archaeological materials and records.

B. **CONFIDENTIALITY.** The Agreement parties acknowledge that historic properties covered by this Agreement are subject to the provisions of section 304 of the NHPA, and section 6254.10 of the California Government Code (Public Records Act), relating to the disclosure of archaeological site information and, having so acknowledged, will ensure that all actions and documentation prescribed by this Agreement are consistent with said sections.

C. **RESOLVING OBJECTIONS.**

1. Should any Agreement party object to the manner in which the terms of this Agreement are implemented, to any action carried out or proposed with respect to the implementation of the Agreement, or to any documentation prepared in accordance with and subject to the terms of this Agreement, the FHWA shall immediately notify the other parties to this Agreement of those objections, and shall consult with the objecting party and with the other parties for no more than 14 days to resolve the objection. The FHWA shall reasonably determine when this consultation will commence. If the objection is resolved through such consultation, the action subject to dispute may proceed in accordance with the terms of that resolution. If, after initiating such consultation, the FHWA determines that the objection cannot be resolved through consultation, the FHWA shall forward all documentation relevant to the objection, including the FHWA's proposed response to the objection, to the ACHP, with the expectation that the ACHP will, within thirty (30) days after receipt of such documentation, do one of the following:

   a. advise the FHWA that the ACHP concurs in the FHWA's proposed response to the objection, whereupon the FHWA will respond to the objection accordingly. The objection shall thereby be resolved; or,

b. provide the FHWA with recommendations, which the FHWA will take into account in reaching a final decision regarding its response to the objection. The objection shall thereby be resolved; or,

c. notify the FHWA that the objection will be referred for comment, pursuant to 36 CFR § 800.7(c), and proceed to refer the objection and comment. The FHWA shall take the resulting comment into account, in accordance with 36 CFR § 800.7(c)(4) and section 110(1) of the NHPA. The objection shall thereby be resolved.

2. Should the ACHP not exercise one of the foregoing options within 30 days after receipt of all pertinent documentation, the FHWA may assume the ACHP's concurrence in its proposed response to the objection and proceed to implement that response. The objection shall thereby be resolved.

3. The FHWA shall take into account any ACHP recommendation or comment provided in accordance with section C.1 of this stipulation, with reference only to the subject of the objection. The FHWA's responsibility to carry out all actions under this Agreement not the subject to the objection will remain unchanged.

4. At any time during the implementation of the measures stipulated in this Agreement, should an objection pertaining to such implementation be raised by a member of the public, the FHWA shall notify the Agreement parties in writing of the objection and take the objection into consideration. The FHWA shall consult with the objecting party and, if the objecting party so requests, with the other Agreement parties for no more than fifteen (15) days. Within ten (10) days following closure of this consultation period, the FHWA will render a decision regarding the objection and notify all consulting parties hereunder of its decision in writing. The objection will thereby be resolved. In reaching its decision, the FHWA will take into account any comments from the consulting parties regarding the objection, including the objecting party. The FHWA's decision regarding the resolution will be final.

5. The FHWA shall provide all Agreement parties, the ACHP when the ACHP has issued comments hereunder, and any parties that have objected pursuant to section C.4 of this stipulation, with a copy of its final written decision regarding any objection addressed pursuant to this stipulation.

6. The FHWA may authorize any action subject to objection under section C of this stipulation to proceed after the objection has been resolved in accordance with the terms of section C.

D. **AMENDMENTS:** Any Agreement party may propose that this Agreement be amended, whereupon the Agreement parties will consult for no more than 30 days to consider such amendment. The FHWA may extend this consultation period.

The amendment process shall comply with 36 CFR §§ 800.6(c)(1) and 800.6(c)(7). This Agreement may be amended only upon the written agreement of the signatory parties. If it is not amended, this Agreement may be terminated by either signatory party in accordance with section E of this stipulation.

E. TERMINATION

1. If this Agreement is not amended as provided for in section D.1 of stipulation VIII, above, or if either signatory party proposes termination of this Agreement for other reasons, the signatory party proposing termination shall, in writing, notify the other Agreement parties, explain the reasons for proposing termination, and consult with the other Agreement parties for at least 30 days to seek alternatives to termination. Such consultation shall not be required if the FHWA proposes termination because the Undertaking no longer meets the definition set forth at 36 CFR § 800.16(y).

2. Should such consultation result in an agreement on an alternative to termination, then the parties shall proceed in accordance with the terms of that agreement.

3. Should such consultation fail, the signatory party proposing termination may terminate this Agreement by promptly notifying the other Agreement parties in writing. Termination hereunder shall render this Agreement without further force or effect.

4. If this Agreement is terminated hereunder, and if the FHWA determines that the Undertaking will nonetheless proceed, then the FHWA shall either consult in accordance with 36 CFR § 800.6 to develop a new Agreement, or request the comments of the ACHP, pursuant to 36 CFR Part 800.

F. DURATION OF THE AGREEMENT

1. Unless terminated pursuant to section F of stipulation VIII above, or unless it is superseded by an amended Agreement, this Agreement will be in effect following execution by the signatory parties until the FHWA, in consultation with the other Agreement parties, determines that all of its stipulations have been satisfactorily fulfilled. This Agreement will terminate and have no further force or effect on the day that the FHWA notifies the other Agreement parties in writing of its determination that all stipulations of this Agreement have been satisfactorily fulfilled.

2. The terms of this Agreement shall be satisfactorily fulfilled within twenty (20) years following the date of execution by the signatory parties. If the FHWA determines that this requirement cannot be met, the Agreement parties will consult to reconsider its terms. Reconsideration may include the continuation of the Agreement as originally executed, amendment of the Agreement, or termination. In the event of termination, the FHWA will comply with section

F.4 of stipulation VIII, above, if it determines that the Undertaking will proceed notwithstanding termination of this Agreement.

3. If the Undertaking has not been implemented within twenty (20) years following execution of this Agreement by the signatory parties, this Agreement shall automatically terminate and have no further force or effect. In such event, the FHWA shall notify the other Agreement parties in writing and, if it chooses to continue with the Undertaking, shall reinitiate review of the Undertaking in accordance with 36 CFR Part 800.

G. **EFFECTIVE DATE.** This Agreement will take effect on the date that it has been fully executed by the FHWA and the SHPO.

EXECUTION of this Agreement by the FHWA and the SHPO, its transmittal by the FHWA to the ACHP in accordance with 36 CFR § 800.6(b)(1)(iv), and subsequent implementation of its terms, shall evidence, pursuant to 36 CFR § 800.6(c), that this Agreement is an agreement with the ACHP for purposes of section 110(1) of the NHPA, and shall further evidence that the FHWA has taken into account the effects of the Undertaking on historic properties and has afforded the ACHP an opportunity to comment on the Undertaking and its effects on historic properties.

SUMMARY OF FINDINGS

The Federal Highway Administration (FHWA) and the California Department of Transportation (Caltrans), in conjunction with the South Placer Regional Transportation Authority (SPRTA), propose to identify and preserve or acquire right-of-way for a future Placer Parkway, which would link State Route (SR) 65 in Placer County to SR 70/99 in Sutter County (Maps 1 and 2). The FHWA is the federal lead agency for the National Environmental Policy Act (NEPA), and SPRTA is the lead agency for the California Environmental Quality Act (CEQA). The project is using federal funding and is therefore subject to review under the January 2004 *Programmatic Agreement (PA) (Appendix A) among the Federal Highway Administration, the Advisory Council on Historic Preservation, the California State Historic Preservation Officer, and the California Department of Transportation Regarding Compliance with Section 106 of the National Historic Preservation Act, as it Pertains to the Administration of the Federal-Aid Highway Program in California* (Section 106 PA).

This report documents the results of an archaeological resources investigation conducted for the Parkway Corridor Preservation project (Placer Parkway), the proposed preservation of a transportation right-of-way (ROW) through Sutter and Placer Counties, California (Figure 1-1). SPRTA and FHWA propose to preserve the ROW for a new or upgraded east-west connector between SR 65 and SR 70/99 serving cities and unincorporated areas across south Sutter County and southwestern Placer County.

URS Corporation (URS) prepared this Archaeological Survey Report (ASR) to document archaeological resource identification efforts in the Area of Potential Effects (APE) in accordance with applicable sections of the National Historic Preservation Act (NHPA) and the implementing regulations of the Advisory Council on Historic Preservation (ACHP).

As outlined in the Programmatic Agreement for the Parkway project, the ASR investigation consisted of background and archival research, contact with the Native American Heritage Commission (NAHC) and members of the local Native American community as identified by the NAHC, intensive pedestrian reconnaissance of the common alignment of the Parkway corridor alternative alignments, and the development of a predictive model to assess the relative archaeological sensitivity of the project alternatives.

No archaeological resources were identified in the common alignment portion of the Parkway project's APE. The predictive model for the alignment alternatives of the APE ranked the corridors for their relative archaeological sensitivity using environmental factors known to influence past human activity in the study area. This analysis determined that Alternative 1 is the most archaeologically sensitive alignment, followed in descending order by Alternative 3, Alternative 2, Alternative 4, and Alternative 5. Based on this analysis, Alternative 5 is the least sensitive alignment in terms of potential archaeological resources.

ARCHAEOLOGICAL SURVEY REPORT
PLACER PARKWAY CORRIDOR PRESERVATION
TIER 1 EIS/PROGRAM EIR

1.0 INTRODUCTION

1.1 TIER 1 EIS/PROGRAM EIR

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

1.2 CORRIDOR SELECTION AND PRESERVATION

The concept for the Parkway is over a decade old. Placer County's 1994 General Plan depicts a "plan line" for it. Two planning studies helped to refine the concept:

- DKS Associates, 2000, Placer Parkway Interconnect Study/Conceptual Plan
- DKS Associates, 2001, Project Study Report (Project Development Support) for Placer Parkway

Placer Parkway is cited as a high-priority regional transportation project by the Sacramento Area Council of Governments (SACOG) 2025 Metropolitan Transportation Plan and the 2027 Placer County Regional Transportation Plan. The project vicinity and surrounding area include some of the fastest growing communities in the Sacramento region. A number of large urban development proposals are being considered by Placer and Sutter counties. New development is expected to add a significant amount of residential, commercial, industrial, and educational uses.

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included

representatives from planning and public works departments of all affected cities and counties, environmental, business, agricultural, development, and homeowner interests (the Study Advisory Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report will analyze these five corridor alternatives along with a No-Build Alternative.

Other potential transportation modes such as bus rapid transit may be developed in the corridor in the future, although they are not proposed as part of the current project. The width of the corridor for Placer Parkway is to vary from approximately 500 feet in the Eastern and Western segments to approximately 1,000 feet in the Central Segment. Depending upon the alternative, the corridor's length ranges from a minimum of 14.2 miles to a maximum of 16.2 miles. The selected corridor would contain the roadway, including the median, travel lanes, shoulder, associated access ramps and a no-development buffer zone.

Corridor acquisition may not be completed until after Tier 2, as funding becomes available. Portions of the selected corridor would be preserved as a no-development buffer zone. The buffer would be maintained as a zone where development is either not permitted or is severely restricted. This is intended to restrict access to the proposed interchanges, protect the rural character of agriculturally designated areas in the vicinity of the Parkway as far as possible subject to future development, and to maximize opportunities to incorporate adjacent sensitive areas. It is intended that the buffer would be owned and managed in the future to achieve these objectives. For subsequent Tier 2 (project-level) environmental reviews, the size of this buffer zone could be considered flexible for agriculturally designated land undergoing urban development. In the Tier 2 environmental review, the specific buffer size and location would be determined. This determination would be based on performance standards on a case-by-case basis, depending on the land use needs of future approved development, and taking into account the primary objective of restricting future access to the Parkway.

Project proponents are considering employment of several land management and control mechanisms in order to ensure that the buffer would be effectively maintained as an area where development would either not be permitted, and where construction of any additional access onto the Parkway would not be allowed. These mechanisms could include land use controls, land purchase/leases, general plan amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, urban growth boundaries, etc. "Layering" or using several of these methods would provide more assurance that the buffers would be permanent, or at least more difficult to undo.

1.3 TECHNICAL STUDY OBJECTIVE

This Archaeological Survey Report has been prepared to support the Environmental Impact Statement/ Program Environmental Impact Report. It presents a Tier 1/Program level assessment of potential impacts related to archaeological resources for five corridor alternatives and the No-Build Alternative as described in Chapter 2.

The scope of work performed for this report is based on the Caltrans Local Assistance Procedures Manual (Caltrans, 2006), as modified for purposes of Tier 1/Program analysis by agreement of Caltrans and the Caltrans Environmental Handbook (Caltrans, 2004) on preparing an archaeological survey. In addition, the evaluation considered guidance from the Federal Highway Administration (FHWA), Environmental Checklists for Draft and Final Environmental Documents (FHWA, 1998a; FHWA, 1998b).

This report is organized as follows:

Chapter 2 The Proposed Action
Chapter 3 Sources Consulted
Chapter 4 Background

Chapter 5 Inventory Methods
Chapter 6 Study Findings and Conclusions
Chapter 7 References

This report also includes figures and tables, which show the project location, each build alternative, and pertinent technical information prepared to evaluate the build alternatives.

Throughout this document, the Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

2.0 THE PROPOSED ACTION

The Proposed Action for the Placer Parkway Corridor Preservation Project is to select and preserve a 500- to 1,000-foot-wide corridor in the project study area, within which the future four- or six-lane Placer Parkway may be constructed. The ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction, and operation of the Parkway. Although the action taken at Tier 1 on the Parkway Corridor Preservation Project is limited, the underlying project whose effects are studied in this document is the Parkway. To the extent feasible at this early stage, the Tier 1 EIS/EIR addresses the potential effects of construction and operation of the future roadway.

2.1 THE PROJECT STUDY AREA

The project study area is an area of approximately 33,460 acres located in Placer and Sutter counties, with a small section located in Sacramento County (see Figures 1-1 and 2-1). The portion of the study area in Sacramento County is located in the extreme southwestern corner of the study area and does not include any of the proposed corridor alignment alternatives. It extends from SR 70/SR 99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego roads.

For the purposes of the analysis the study area is divided into three segments:

- Western Segment: the Western Segment extends from SR 70/99 to Pleasant Grove Road in Sutter County.
- Central Segment: the Central Segment extends from Pleasant Grove Road in Sutter County to approximately 2,300 feet north of Pleasant Grove Creek in Placer County.
- Eastern Segment: the Eastern Segment extends from approximately 2,300 feet north of Pleasant Grove Creek to SR 65 in Placer County.

2.2 CORRIDOR ALTERNATIVES

The following subsections describe the corridor alternatives, which are depicted on Figure 2-1, and are numbered according to location from south to north in the study area.

2.2.1 The No-Build Alternative

Under the No-Build Alternative, the project would not be implemented. A Placer Parkway corridor would not be selected/preserved, and the future Placer Parkway would not be constructed.

2.2.2 Alternative 1 – the Red Alternative

Alternative 1 would extend from SR 70/99 approximately ½ mile north of Riego Road, eastward approximately 1 mile north of Baseline Road to approximately Watt Avenue, proceeding north and transitioning in an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment alternative is 16.2 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.3 Alternative 2 – the Orange Alternative

Alternative 2 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed northeast, then in a northerly direction

south of Pleasant Grove Creek, transitioning to an easterly direction before it reaches Sunset Boulevard West, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.4 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.4 Alternative 3 – the Blue Alternative

Alternative 3 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed north along the Sutter/Placer County Line, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.6 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.5 Alternative 4 – the Yellow Alternative

Alternative 4 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.3 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.2.6 Alternative 5 – the Green Alternative

Alternative 5 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 4,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.2 miles long. This alternative would include five interchanges, as described in Section 2.3.3.

2.3 PARKWAY DESIGN ASSUMPTIONS

Although the Parkway would be designed and construction-level impacts analyzed during Tier 2, for the purpose of this report and the Tier 1 EIS/Program EIR, several assumptions have been made about potential design and configuration concepts. These assumptions would be subject to further development and refinement, and specific decisions about design of the roadway would be made during the Tier 2 process. For example, the number, location, and design of over-crossings would be determined at the time of final Parkway design, in consultation with local jurisdictions. The following sections outline assumptions for the future roadway.

Preliminary costs estimates for the Parkway range from $600 to $650 million (2005 dollars). This includes costs for right-of-way, design, construction, and environmental mitigation for the four- to six-lane facility. The funding situation has spurred interest in exploring other more creative funding options. These include a county-wide sales tax, more developer contributions, and tolling facilities. The Technical Report and Tier 1 EIS/Program EIR do not make any assumptions about funding sources.

2.3.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane facility. A preliminary conceptual cross section (see Figure 2-2) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/ Program EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

2.3.2 Conceptual Roadway Elevation

As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on either side of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways or trails.

Throughout the project study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These over-crossings would not connect to the Parkway. Parkway access would be via the interchanges described below.

2.3.3 Interchange Concepts

The analysis assumes that the location of interchanges (see Figure 2-1) is as follows.

- SR 70/99 (at ½ mile north of Riego Road or at Sankey Road)

- One or two locations to be determined in southern Sutter County
- Fiddyment Road
- Foothills Boulevard
- SR 65 at Whitney Ranch Parkway

The following discussion outlines concepts and assumptions for the six interchanges that could potentially serve the Parkway.

2.3.3.1 Western Segment

Within the Western Segment of the Parkway, a high-speed, freeway-to-freeway type interchange would connect the Parkway with SR 70/99 at one of following potential locations depending on the project alternative (see Section 2.2). Placer Parkway would terminate at SR 70/99.

- **Placer Parkway/SR 70/99 Interchange at North of Riego Road.** This alternative concept uses "braided" ramps to eliminate weaving problems or conflicts with the future SR 70/99 at Riego Road interchange being developed by Sutter County and Caltrans.

- **Placer Parkway/SR 70/99 Interchange at Sankey Road.** Under this alternative concept, the existing two-lane Sankey Road would be realigned to the south of Placer Parkway and the proposed freeway-to-freeway interchange, extending from approximately ¼ mile west of SR 70/99 to approximately ¼ mile east of the Union Pacific railroad tracks. There would be no direct access to SR 70/99 or Placer Parkway from the realigned Sankey Road.

Depending on the final alignment selected, one or two additional interchanges would also be located in south Sutter County. Conceptual locations are identified for purposes of this Tier 1/Program analysis (see Figure 2-1). The actual location of these interchanges would be developed in the Tier 2 phase, based on Sutter County requirements.

2.3.3.2 Central Segment

Within the Central Segment of the Parkway, there would not be any access proposed as part of the Project in the 7-mile segment between Fiddyment Road and Pleasant Grove Road. Please see Section 2.4 regarding a potential connection to a future extension of Watt Avenue (Figure 2-3) which could be proposed and constructed by others in the Central Segment; such an interchange is not part of the Parkway.

2.3.3.3 Eastern Segment

Within the Eastern Segment of the Parkway, a signalized high-speed freeway-to-freeway and local access interchange would connect the Parkway to SR 65 at Whitney Ranch Parkway (Figure 2-1). From SR 65 eastward Placer Parkway would terminate and become Whitney Ranch Parkway east of the SR 65 exit ramp intersection. Traffic signals would be provided at the exit ramp terminals. This interchange would be approximately 1 mile north of a planned SR 65/Sunset Boulevard interchange and 1.2 miles south of the existing Twelve Bridges interchange.

As part of this interchange, auxiliary lanes would be required on SR 65 in both directions to enhance traffic operations on the north side of the future SR 65/Sunset Boulevard interchange. The southbound SR 65 exit-ramp at Sunset Boulevard is being designed to accommodate an additional auxiliary lane required for the future Placer Parkway/Whitney Ranch Parkway interchange to minimize the reconstruction of this ramp in the future. Within the Eastern Segment of the Parkway, from SR 65

westward, two interchanges with local roadways would be constructed, one at Foothills Boulevard and one at Fiddyment Road, as depicted on Figure 2-1.

The future interchange on Placer Parkway at Fiddyment Road would be located near the existing intersection of Fiddyment Road and Sunset Boulevard West. To provide acceptable traffic operations, additional distance needs to be provided between the Fiddyment Road/Sunset Boulevard West intersection and the Fiddyment Road/Placer Parkway westbound off-ramp intersection. Therefore, Sunset Boulevard West will need to be realigned to the north as it nears Fiddyment Road.

2.3.4 Landscaping Concept

For the purposes of this environmental analysis, preliminary landscaping concepts have been developed for Placer Parkway. These are entirely conceptual and would be subject to further refinement during the Tier 2 environmental process. It is anticipated that landscaping would be used to reflect local topography and vistas in the study area and complement the varying character of land adjacent to the Parkway corridor. Landscape design would vary within the Parkway's three segments depending on corridor width and type and density of surrounding land uses. Landscaping would be used within the median and the Parkway buffer zone to enhance the aesthetics of the Parkway, and would be used to provide screening and enhance local and long-distance views. Where appropriate, more concentrated plantings would be considered to buffer the Parkway from future adjacent land uses that may be incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Landscape design would likely include a mix of compatible native and non-native plants that may require some irrigation. Where possible and depending on availability, feasibility and cost, recycled water would be used for irrigation.

During a future design phase, lighting elements would be designed for safety and would consider the proposed landscaping plan in order to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower-voltage lighting, and proposing lighting fixtures that conform with the visual character of the area).

2.4 POTENTIAL WATT AVENUE INTERCHANGE

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Parkway via a new interchange (see Figure 2-3). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/Program EIR. However, the connection of Placer Parkway to a potential Watt Avenue interchange could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/Program EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges with Placer Parkway.

2.5 AGENCY PERMITS AND APPROVALS

The Proposed Action would preserve a preferred corridor for a future transportation facility. In the future, permits and approvals would be obtained from appropriate agencies prior to construction of the Parkway. These permits and approvals may include specific design or mitigation requirements that would be incorporated into the project.

2.6 SUBSEQUENT TIER 2 INFORMATION

As noted earlier, the design and construction of Placer Parkway — including its interchanges and over-crossings, and ancillary features such as stream crossings, safety devices, stormwater management structures, and similar improvements — would be evaluated in a subsequent Tier 2 environmental review process, once a corridor has been identified.

3.0 SOURCES CONSULTED

3.1 SUMMARY OF METHODS AND RESULTS

The study area for Placer Parkway encompasses a total area of 35,443.31 acres within Sutter and Placer counties, California (Figure 2-1). The study area encapsulates all of the original alignment alternatives from which the current corridor and alternatives were derived. The total acreage of the current alternative corridors combined is 3,987.65 acres.

The archaeological records search for the initial Parkway screening exercise was conducted in June 2003 and included the entire study area as well as areas within a ¼-mile radius of the study area boundary. Because the archaeological records for Sutter County are housed separately from those in Placer and Sacramento counties, two separate record searches were conducted for the project. For Sutter County, a record search request was submitted to the Northeast Information Center (NEIC) of the California Historical Resources Information System (CHRIS). The record search was conducted by the staff of the NEIC (File #D03-28) and was delivered to URS on June 30, 2003. A similar request was sent to the North Central Information Center (NCIC) of the CHRIS for the Placer and Sacramento County components of the project. The record search was conducted by the staff of the NCIC (File No. PLA-03-57/SAC-03-44) and delivered to URS on June 12, 2003.

The record searches at the NCIC and NEIC included searches of archaeological site and historic property files, the National and California Registers of Historic Places, the Historic Property Data File for their respective counties, California Historic Landmarks, California Points of Historic Interest, Caltrans Local Bridge Survey, and historic General Land Office Maps.

The records search results were used to develop corridor alignment alternatives routed to avoid and/or minimize potential impacts to various resources including historic and prehistoric archaeological sites. As such, no previously identified archaeological sites occur within the corridors subject to the current investigation. The corridor alignment alternatives selection process was also used to locate, to the extent possible given other environmental constraints, the corridor alignment alternatives within areas previously subjected to archaeological inventory. Previous archaeological inventory studies that include lands bisected by the project include:

- Peak & Associates, 1986b. *Cultural Resource Assessment of the Sunset Motor Sport Park, Placer County, California*.
- Weigel, Lawrence, 1982. *First Addendum Archaeological Survey Report for the Proposed Roseville Bypass Project*. California Department of Transportation

- Wesson, A. and B. Hatoff, 2001. *Roseville Energy Facilities Cultural Resources. Appendix J-1*. URS Corporation.

- Wiant, Wayne, 1982. *Archaeological Reconnaissance of the Proposed Roseville Bypass Project*. California Department of Transportation.

Because the screening process was used to avoid historic and prehistoric archaeological sites, none of these efforts resulted in the identification of archaeological sites within the corridor alignment alternatives.

Since the record search and screening efforts were conducted, three additional studies have been conducted that include tracts of land traversed by the common alignment alternatives (see Section 5.2). These studies were completed for the Amoruso Property (ECORP, 2006), the Placer Ranch Project (Hale, 2004), Reason Farms Retention Basin (URS, 2002), and the SR 65 Widening Project (Norton, 1998). Given the recent dates of completion of these surveys, in agreement with Caltrans, the common corridor alignment alternative through these parcels was not re-inventoried for archaeological resources. None of these efforts identified archaeological resources within any of the project alignment alternatives.

This section briefly describes the known archaeological sites identified in the record search for the Tier 1 Archaeological Survey Report.

CA-PLA-136

Unfortunately, the site record for CA-Pla-136 on file at the NCIC is difficult to read due to the poor quality of the reproduction (the whereabouts of the original is unknown). It appears that the site was identified in April of 1960, and at the time of recordation contained a milling slab (i.e., metate) and possibly two handstones (i.e., manos).

CA-PLA-137

URS Corporation recorded this site with historic resources in 2001. The site was originally recorded by Mott in 1961. A subsequent attempt to relocate this resource by URS Corporation in the location plotted on the master maps at the NCIC has proved unsuccessful. Heavy grass cover obscured native soils during the survey. Surface vegetation was scraped back in several locations within the area mapped as Locus B, revealing dark-colored sand, but no cultural material. The original site form indicates that artifacts including a metate and several manos and pestles had been unearthed due to plowing on both the northern and southern sides of Pleasant Grove Creek.

CA-PLA-138H

Derr describes CA-PLA-138H as a prehistoric site with fragments of ground stone (bowl mortar), pestle fragments, mano fragments, a possible chopper, some core tools, and flakes (two obsidian, too small to date/source) as well as fire-fractured rock. The 515-meter by 60-meter site area (at an elevation of 90 to 95 feet) was slated for development as of 1999, when it was recorded (it was previously recorded in 1994). Note: although identified in the record search, this site is outside of the Parkway study area.

CA-PLA-147

CA-PLA-147, recorded in 1999 by Derr, is described as a site with a scatter of prehistoric artifactual materials. Artifactual materials observed include preform mano, metate, and complete mano, located in the northern, central, and western portions of the site, as well as flaked fragments of basalt and slate, located in the northwestern area. Remarks on the site record state that the 35-meter by 50-meter site was

thought to have been intensively used during prehistoric times, and there is a possibility that at a greater depth, burials may be present. Currently, there are signs of disturbance, and artifacts that were previously identified are missing.

CA-PLA-429

Recorded by Peak and Associates in 1994, CA-PLA-429 is described as an area with two prehistoric artifacts located on the surface: one bifacially shaped mano fragment, and one basalt debitage fragment. The site was originally recorded in 1981 when Foothill found two chopping tools, basalt flakes, and fire-cracked rocks (one shaped pestle midsection, one percussion-flaked cobble tool). Note: although identified in the record search, this site is outside of the Parkway study area.

CA-PLA-730H

Peak and Associates recorded this site in 1989. The historic site is described as part of the foundation for the old Pleasant Grove School. The foundation is made of unmodified rough rocks in a rectangular shape. The cornerstone on the northeast is missing. In addition to the foundation, the site also contains a depression, 3 feet by 4 feet, which may have been a privy pit. The privy pit is located 7 feet from the foundation.

CA-PLA-944H

Dan Osanna recorded CA-PLA-944H in 1999. The site is 110 feet by 140 feet, with an elevation of 87 feet. The site contains a concrete barn foundation (in the middle of a cultivated field) comprised of four parallel foundation walls. The foundation walls are 92 feet long. Approximately 90 feet from the barn foundation is a small well casing and pumphouse foundation. The pumphouse foundation is shaped in a "U," and the 1-foot-diameter well casing is surrounded by a concrete foundation (4 feet on each side). Additional elements identified include barbed wire fragments, metal strapping, and tin sheeting.

CA-PLA-945H

Recorded by Dan Osanna and Ric Windmiller in 1999, the 110-foot by 65-foot site has an elevation of 84 feet, and is located in a plowed field next to Baseline Road. The site consists of a scatter of historic trash. Artifacts include ceramic fragments glazed brown, bottle fragments of clear glass, and earthenware fragments of white ironstone. The age of the historic trash is estimated to be between 1848 and 1914.

CA-PLA-968H

Recorded by PAR in 2001, the historic site contains a depression (reportedly the site of a well) with fragments of a windmill. In addition, there are fragments of white improved earthenware, glass, and metal. Farther away (approximately 490 meters) there are fragments of three windmills (may be related to the site). The age of the resources is circa late 1930s. The site is 92 feet above mean sea level and is 145 feet by 100 feet. The site has a low degree of integrity, because 95 percent of the windmill remains have been removed and the well has collapsed.

CA-PLA-969H

Discovered in 2001 by PAR, the resources present on the 77-meter by 43-meter site, with an elevation of 100 feet, are as follows: a set of concrete footings (66 set in six rows); a water spigot with adjoining concrete foundation, and a structure foundation (three sections) and an in situ piece of machinery. The resources are historic, circa 1953. The site is located on a working ranch (formerly a turkey ranch) and has been disturbed by livestock activity.

CA-PLA-974H

Derr recorded this site in 1991, encompassing an area 22 feet by 17 feet at an elevation of 140 feet. The site contains historic artifacts; namely, an animal feeding station with feed troughs (though the troughs are unconfirmed). The troughs appear to be moved, and one cement trough is broken. There is also a well, and electrical power source, mostly likely for a pump. The record notes that the site does not appear to be disturbed. Note: although identified in the record search, this site is outside of the Parkway study area.

CA-PLA-975H

The site was recorded by Derr in 1991, and is stated to be historic. The 5-foot by 5-foot site has an elevation of 145 feet. Artifacts on the site include an iron pipe (upright in soil) that is 10 inches in diameter, located within a depression. The record states this is probably a well that extends approximately 16 feet deep and 28 inches above ground. There is no water inside. The metal is ¼-inch-thick and has vertical breaks/slits in various locations. The site appears undisturbed. Note: although identified in the record search, this site is outside of the Parkway study area.

CA-PLA-977H

CA-PLA-977H, recorded in 1995 by PAR, is described as a historic farm complex with the following elements: a residential foundation (wood remnants and rusted stove); concrete foundation (three-sided) with pieces of lumber and siding/roofing (metal); a fallen windmill (metal) with troughs, concrete footings and pads; and a concrete pad with wood posts, lumber, and siding/roofing (metal). The 863-foot by 250-foot site has an elevation of 108 feet and is bisected by a barbed wire fence and wood post. The historic site is dated between 1880 and 1945. The site has been impacted by livestock, target shooting, and damage from the wind.

CA-PLA-I086H

Recorded in 1989 by Kosta & Ruskin, this historic site is 40 meters by 30 meters with an elevation of 115 feet, and contains mixed scatter surrounding two leaved willows. The artifacts stated in the record are as follows: fencing (barbed wire); tractor leaf-spring; porcelain doll hand and arm; fragments of glass bottles, ceramics, handpainted porcelain, unglazed stoneware, and earthenware; a variety of metal (nails, stakes, chain link, buttons); and roofing slate.

CA-PLA-I087H

Kosta & Ruskin recorded this historic site in 1989. The 20-meter by 30-meter site, with an elevation of 125 feet, consists of a historic water well with a small scatter of mixed historic fragments. The artifacts include fragments of an aqua culinary bottle (gothic style), shards of bottles (alcohol beverage types); square nails; and fragments of white earthenware vessels. The site has been disturbed by plowing.

CA-PLA-1104

CA-PLA-l104, recorded in 1989 by Kosta & Ruskin is described as a scatter of groundstone/lithic and associated discoloration of soil on a 58-meter by 56-meter site with an elevation of 100 feet. This discoloration may result from the presence of subsurface midden deposits. The prehistoric artifacts are as follows: groundstone mano, groundstone fragment, andesite flake (primary), projectile point fragment (mid-section), primary flake (silica cemented conglomerate composed of small siliceous gravels), and primary flake (fine-grained quartzite).

CA-PLA-1126H

Recorded by Derr in 1999, CA-PLA-1126H is a historic site located on a ranch. The historic site contains a house (known to exist in the 1940s), driveway, well, and small barn, along with a larger barn and related foundations. The foundations are all that remains; there are several small piles of broken foundation from the house. Note: although identified in the record search, this site is outside of the Parkway study area.

P-31-001215

PAR Environmental Services, Inc., recorded the site in 2001. The historic site has foundation and structure pads dating from the 1930s. The site has an imbedded post (the top is missing), metal fragments scattered, two can lids, burnt wood fragments, as well as clear and aqua-colored glass bottle fragments. The base of a clear bottle has an angular "G" over a "C" embossed on it, which is stated in the record to be the maker's mark.

P-31-001216

PAR recorded this site in 2001, which is comprised of privy pits and trash scatters, in a farm's dump, adjacent to a dirt road. The site has a shallow, water-filled area, where fenceposts and bales of barbed wire have been tossed. There are approximately 150 fenceposts and five types of barbed wire (both modern and historic types). In addition, there is part of a windmill (made of pipes) nearby. Approximately 100 meters north are scattered auto tires (about 10) and a metal wheel rim. Approximately 200 meters north are additional barbed wire bales. South of the site (approximately 200 meters) is an oil drum.

P-31-001217

Recorded in 2001 by PAR, the site has a scatter of debris along the drainage bed of the Pleasant Grove Creek. Historic artifacts were observed among modem pieces of debris, snagged by nearby trees. The artifacts are fragments and are listed as follows: solarized bottle glass (one), olive glass bottle (one), bright green bottle glass (one), aqua glass bottle (multiple), clear glass bottle (multiple), porcelain (one), and white improved earthenware (10+).

P-31-001218

Recorded by PAR in 2001, P-31-001218 is a site with three historic windmill components, comprised of fragments of a wooden beam with steel or iron braces or clamps. The other fragments include large metal supports (mostly pipe and L-shaped beams). South of the metal fragments are the remains of a section of fence that ran east-west. The three windmill components are located close to a dirt road, and may be related to the Fiddyment 2 site (nearby).

REF 3

The site was recorded in 2002 by URS Corporation. The site is comprised of a concrete structural foundation and several pieces of abandoned farm machinery and equipment. The foundation is situated to the south of a grove of black locusts and a single elm and approximately 220 feet south on an unmarked dirt road. Portions of the concrete foundation are intact at its northern and southern perimeters. The portion of the foundation at the southwestern comer is 2.5 feet in height and 4 inches thick, and is capped at its northernmost edge by a piece of wood with round nails. The portion of foundation marking the northern perimeter is 30 feet in length. Concrete debris is scattered just beyond the northern boundary of the foundation. Post-field research indicates the age of the resources range from 1882 to 1931.

Although a number of archaeological resources have been identified in the larger study area as evidenced in the record search data provided above, the general archaeological sensitivity of the current archaeological APE for both prehistoric and historic archaeological resources is low. This supposition is based on the fact that while resources have been identified, relatively few archaeological sites have been identified given the total acreage of land subjected to archaeological survey.

Furthermore, given that the current project APE (see Section 5.1 and also Appendix B) was designed to both avoid known archaeological resources as well as maximize, to the extent possible given other environmental constraints, the placement of the corridors within lands previously subjected to archaeological inventory efforts, the likelihood of archaeological resources within the current APE is reduced.

3.2 SUMMARY OF OTHERS WHO WERE CONSULTED

A request for a review of the Sacred Lands File was sent to the Native American Heritage Commission (NAHC) on May 27, 2003.

A search of the Sacred Lands File by the staff of the NAHC did not indicate the presence of Native American cultural resources in the immediate study area. A letter from the NAHC reporting these findings as well as providing a list of local Native American individuals and organizations was sent to URS on June 6, 2003, and is included, with responses, as Appendix C.

Other sources of information consulted for the Parkway cultural resources investigations included the Placer County Historical Society, Lincoln Arts and Culture Foundation, Roseville Historical Society, Community Memorial Museum, Placer County Museum, Sutter County Historical Society, and Rocklin Historical Society.

3.3 SUMMARY OF NATIVE AMERICAN CONSULTATION

On three occasions (June 16, 2003, October 13, 2003, and March 6, 2006) letters requesting information and comment were sent to the Native American individuals identified on the NAHC contact list for Placer, Sacramento, and Sutter counties. In addition to the letters, telephone calls were made in August of 2003 notifying, when possible, these same individuals about the project. The list provided by the NAHC comprised:

- Harvey Angle, Chairperson, Enterprise Rancheria of Maidu Indians
- Rose Enos
- David Keyser, United Auburn Indian Community of the Auburn Rancheria
- Joe Marine
- Jeff Murray, Cultural Resources Manager Shingle Springs Band of Miwok Indians
- Martha Noel, Maidu Elders Organization
- Sam Starkey, United Auburn Indian Community of the Auburn Rancheria
- Christopher Suehead, Cultural Representative Todd Valley Miwok-Maidu Cultural Foundation
- Jessica Tavares, Chairperson, United Auburn Indian Community of the Auburn Rancheria

On October 21, 2003 a response was received from Greg Baker, Tribal Administrator, United Auburn Indian Community of the Auburn Rancheria (Auburn Rancheria). Mr. Baker requested that a copy of the technical report be provided to the United Auburn Indian Community of the Auburn Rancheria. The

letter also instructed URS Corporation to contact Dr. Shelley McGinnis of Analytical Environmental Services (AES). No other responses were received.

Contact with was made Dr. McGinnis and a decision was made to hold a formal meeting between representatives of the Auburn Rancheria, South Placer Regional Transportation Authority (SPRTA), the Federal Highway Administration (FHWA), Caltrans, and URS Corporation. This meeting was held on January 9, 2004 and was used to provide the Auburn Rancheria with project specifics including levels of effort for the Tier 1 investigation as well as potential avenues of investigation during Tier 2.

4.0 BACKGROUND

4.1 ENVIRONMENTAL SETTING

The study area is comprised of 35,443.31 acres of an irregular shape, bounded by SR 65 near Rocklin on the east and SR 70/99 in the west (Figure 1-1). Baseline Road is adjacent to part of the southern boundary and Sunset Boulevard along the north. The majority of the study area is located in western Placer County. A substantial area is in eastern Sutter County, and a small portion is in northern Sacramento County.

The Sacramento Valley through which the current project passes can be characterized as a low-elevation flatland bisected by river channels, creeks, and sloughs. The region cannot, however, be described as topographically featureless. Four types of topography are recognized within the Sacramento Valley: (1) low hills and dissected alluvial uplands; (2) low alluvial plains and fans; (3) floodplains and natural levees; and (4) flood basins.

The westernmost portion of the study area is located within a 100- or 500-year floodplain and is predominately in rice cultivation, which results in areas that are submerged in shallow water during all or part of the year. The central portion of the study area is comprised of a patchwork of seasonally flooded habitat and drier annual grasslands/agricultural areas, which are either dry-farmed, irrigated for crops, or used for livestock grazing. As the study area approaches the foothills of the Sierra-Nevada Mountains in the eastern portion of the study area, habitat is almost entirely comprised of grassland, some of it cultivated. Scattered throughout the entire study are various wetlands and vernal pool complexes.

The following habitat types are present in the project study area:

Cultivated Rice Fields and Other Seasonally Flooded Habitat. Rice fields in the study area have frequently been leveled and terraced to facilitate seasonal inundation necessary to cultivate rice. Fields are typically inundated during the growing season from late May to early August. Some fields may be flooded again during the winter months to attract waterfowl. Native vegetation is typically excluded from cultivated rice fields. Many species of migratory waterfowl may congregate in rice fields during the winter, depending on flooding cycles and management practices. Such species include snow goose (*Chen caerulescens*), greater white-fronted goose (*Anser albifrons*), northern shoveler (*Anas clypeata*), and bufflehead (*Bucephala albeola*). The habitat also supports giant garter snake (*Thamnophis gigas*), a federal and state-listed threatened species, and ruddy duck (*Oxyura jamaicensis*).

Other Agricultural Habitats. Non-irrigated pasture and/or irrigated croplands comprise the majority of other agricultural habitats in the study area. These may include a mix of perennial grasses and legumes that may be used for grazing of livestock, or seed-producing grasses such as barley, rye and wheat that are planted in the fall and harvested in the spring. Many species of birds and rodents have adapted to use these habitats, and as a result larger birds of prey (hawks, falcons) also use these areas for hunting.

Annual Grassland. Annual grassland is comprised of upland areas that have not been previously cultivated. Typical species include ryegrass (*Lolium* sp.), barley (*Hordeum* sp.), ripgut brome (*Bromus diandrus*), and filaree (*Erodium* sp.). Grassland provides habitat for wildlife species such as western meadowlark (*Sturnella neglecta*), red-tailed hawk (*Buteo jamaicensis*), killdeer (*Charadrius vociferous*), western fence lizard (*Sceloporus occidentalis*), voles (*Microtus* sp.), deer mice (*Peromyscus maniculatus*), coyote (*Canis latrans*), and other species. Annual grasslands are often associated with vernal pools, as discussed below.

Vernal Pools and Other Seasonal Wetlands. Vernal pool complexes are areas that contain vernal pools of varying sizes and densities. They are seasonal flooded depressions that are underlain with a subsurface

layer that limits water infiltration. The seasonal ponding and drying associated with vernal pools supports a unique community of plants and animals. Vernal pool vegetation is dominated by species such as coyote thistle (*Eryngium vaseyi*), popcorn flower (*Plagiobothrys stipitatus*), downingia (*Downingia pusilla*), quaking grass (*Briza minor*) and buttercup (*Ranunculus bonariensis*). Invertebrates, including listed vernal pool fairy shrimp (*Branchinecta lynchi*) and vernal pool tadpole shrimp (*Lepidurus packardi*) may occupy vernal pools and other seasonal wetlands in the project study area.

Two types of vernal pools occur in Placer County: northern hardpan vernal pools, and northern volcanic mudflow vernal pools (Brussard, 1999). The average pool size of northern volcanic mudflow types is typically small (<100 m^2), the pools are irregularly spaced and do not form large pool complexes. These pools have characteristically shallow soils, <30 cm deep, and are underlain by impervious mudflow welded tuff. They have a "flashy hydrology," filling and refilling many times over the wet season. Northern hardpan pools are typically found in complexes in areas of hummocky ground on old terraces above the recent river floodplains and below the foothills. These pools are often larger than northern volcanic mudflow pool, and can be more than 1 acre. They have a less flashy hydrology, with pools remaining filled longer than volcanic mudflow vernal pools.

Seasonal and/or Perennial Stream. These habitats are contained within the ordinary high water mark of seasonal or perennial streams, creeks, or rivers. There are four such stream systems in the study area: Pleasant Grove Creek, Orchard Creek, Curry Creek, and Steelback Creek. Each of these creeks has multiple branches and/or tributaries. In places, stream features have been converted to channelized irrigation ditches, which is common in areas developed for agricultural purposes. Channel conditions within the study area are generally degraded.

Prior to development within the watershed, Pleasant Grove Creek and its tributaries were seasonal streams, however, summer flows are now maintained by irrigation runoff. Pleasant Grove Creek has the largest drainage network within the study area. It originates in the far Eastern Segment of the study area and flows westward, where it terminates in the Pleasant Grove Creek Drainage Canal. Sections of Pleasant Grove Creek in the Central Segment are surrounded by well developed riparian forest, as described in the Riparian Woodland section, below. Fish species likely to occur in Pleasant Grove Creek include California roach (*Lavinia symmetricus*), Sacramento sucker (*Catostomus occidentalis*) smallmouth bass (*Micropterus dolomieui*) and spotted bass (*Micropterus punctulatus*).

Orchard Creek, a tributary to Auburn Ravine, is located in the northeastern corner of the study area. It flows westward under Fiddyment Road north of the study area and then joins Auburn Ravine. Curry Creek has several tributaries that originate in the southeastern corner of the study area and flow to the west; the creek intersects the Pleasant Grove Creek Drainage Canal, and terminates in the Western Segment of the study area. Recent field observations indicate that at least some areas of Curry Creek and its tributaries have been channelized and embanked to the edge of the channel and that there is a lot of fine sediment depositing in the channel.

A fourth stream system, Steelhead Creek, exists south of Curry Creek. It originates near the southern edge of the study area and terminates into the Natomas East Main Drainage Canal.

Riparian Woodland. Riparian woodland borders most of the central part of Pleasant Grove Creek. Less developed (fewer large trees) riparian areas occur adjacent to tributaries of Pleasant Grove Creek and limited areas of Curry Creek. Typical woody species include Goodding's willow (*Salix gooddingii*), Fremont cottonwood (*Populus fremontii*), and valley oak (*Quercus lobata*). Large trees in or adjacent to riparian areas are considered habitat for state listed Swainson's hawk. Understory riparian vegetation containing elderberry bushes (*Sambucus* species) is considered habitat for federally threatened Valley elderberry longhorn beetles (*Desmocerus californicus dimorphus*). The well-developed riparian woodland supports a high diversity of resident and migratory bird species, such as scrub jay (*Aphelocoma*

coerulescens), black-crowned night heron (*Nycticorax nycticorax*), ruby-crowned kinglet (*Regulus calendula*), Wilson's warbler (*Wilsonia pusilla*), Lincoln's sparrow (*Melospiza lincolnii*), great horned owl (*Bubo virginianus*), and Bullock's oriole (*Icterus bullockii*).

Wetlands. Freshwater marsh habitats are characterized by saturated or periodically flooded soils that support some combination of rushes (*Juncus* spp.), sedges (*Cyperus* spp.), cattail (*Typha* spp.) and bulrush (*Scirpus* spp.). Bird species such as mallard (*Anas platyrhynchos*), American widgeon (*Anas americana*) and red-winged blackbirds (*Agelaius pheoniceus*) can be found in freshwater marsh habitat throughout the study area.

4.2 CULTURAL SETTING

4.2.1 Ethnography

The study area is within the ethnographic territory of the Nisenan, one of three Maiduan speaking tribelets inhabiting the northeastern half of the Sacramento Valley and the adjoining western slopes of the Sierra Nevada. Also known as the Southern Maidu, the Nisenan inhabited the five named villages in the general vicinity of the project area: *Pichiku* near present day Roseville; *Bamuma* near present day Lincoln and *Wollok; Leuch;* and *Wishuna* along the eastern edge of the Sacramento River (Wilson and Towne, 1978: Figure 1).

Ethnographic data on the Nisenan have been presented within several original works specifically focused upon them (Beals, 1933; Faye, 1923; Gifford, 1927; Kroeber, 1929; Littlejohn, 1928; Ritter and Schulz, 1972; Uldall and Shipley, 1966); however, the primary reference is found within Kroeber's (1925) overview of California Indians. A synthesis of Nisenan ethnography has been written by Wilson and Towne (1978), who also compiled a bibliography devoted to general Maidu ethnography (1972). An early account of Nisenan life is found within Powers' (1877) study of California Indians.

The Nisenan were the southernmost of three groups (Konkow, Nisenan, and Maidu) who spoke a Maiduan language. Maiduan is one of California's four Penutian languages, the others being Wintuan, Utian, and Yokutsan. Ethnographic groups speaking non-Maiduan Penutian languages within California include the Wintu, Nomlaki, and Patwin (Wintuan), the Costanoan and the Miwok (Utian), and the Yokuts (Yokutsan) (Shipley, 1978:82-85).

The Nisenan specifically inhabited the area within the American, Bear, Yuba, and lower Feather River watersheds. The region is bordered by the Sierran Crest on the east and by the Sacramento River on the west. The northern boundary is ill-defined due to linguistic and cultural similarities between the Nisenan and their northern neighbors, the Konkow. The southern boundary is also vaguely defined, being situated somewhere between the American and Cosumnes Rivers (Kroeber, 1925; Levy, 1978; Riddell, 1978; Wilson and Towne, 1978).

As stated above, within the general vicinity of the study area, the Nisenan inhabited a village near Roseville (*Pichiku*), another near Lincoln (*Bamuma*) and three along the eastern edge of the Sacramento River (*Wollok*, *Leuchi*, and *Wishuna*). It is unknown whether these were permanent settlements, although references describe them as "major villages" (Wilson and Towne, 1978, Figure 1). Nisenan villages varied considerably in size, with a large village containing from 40 to 50 houses and more than 500 people. A typical settlement within the lowland areas of the Nisenan territory would be situated upon natural rises along the major rivers and streams (Kroeber, 1925:395; Powers, 1877:316; Wilson and Towne, 1978:388). Structures occurring within major villages would include brush shelters, sweat house(s), acorn granaries, a dance house, as well as the above mentioned houses (Kroeber, 1925:407-409; Wilson and Towne, 1978:388-389).

The principal subsistence activities of the Nisenan were hunting, fishing, and the gathering of wild plants. Subsistence practices relied upon a large variety of food sources, rather than being dependent on a limited number of staples. Typical of California groups, acorns from various species of oak were eaten, as were the nuts from bull and sugar pine, and buckeye. Other plants consumed included wild fruits and berries, various seeds, roots, and bulbs. Most animal species were eaten with the exception of canine species, grizzly bears, vultures, amphibians, and reptiles (Kroeber, 1925:409-411; Wilson and Towne, 1978:389-390).

The Nisenan were organized similarly to many California Indians in that a certain territory was identified as belonging to a group and that group recognized themselves as a unit (i.e., tribelet). Several affiliated villages may have occurred within the tribelet territory. Each village, and often a group of allied villages, had a headman, whose duty was to advise the members of the community. No larger levels of political organization occurred beyond these village affiliations (Kroeber, 1925:396-398; Wilson and Towne, 1978:393).

Warfare, though rare, did occur. Fighting is known to have occurred between Nisenan tribelets as well as with non-Nisenan peoples. Generally, conflict occurred following trespass or similar territorial violations. An example of inter-tribelet conflict involved Nisenan from the Roseville area in the 1820s. Evidently, men from the Auburn/Nevada City area were killed in the Roseville vicinity. The hatred and distrust between these peoples lasted for several years, as evidenced by the report that the Nisenan attributed an epidemic in 1833 to bad air, sent to the valley by revengeful hill dwelling shamans (Wilson and Towne, 1978:388 citing Payen, 1961:23; Wilson, 1957-1963).

The Nisenan were affected little by the Spanish and Mexican incursions into California's interior (Wilson and Towne, 1978:396). They were, however, greatly impacted by the above mentioned epidemic, which ravaged parts of California during the 1830s. Believed to have been brought by fur trappers, this pestilence often killed the population of entire villages. It is estimated that 75 percent of the population died as a result of the epidemic, with many of the survivors retreating to mountain locations (Cook, 1955).

The Nisenan who survived the epidemic were among the California groups most affected by the Gold Rush of 1849. It was within Nisenan territory that John Marshall discovered gold at Coloma in 1848. Soon afterwards, hoards of fortune seekers descended upon Nisenan and adjoining territories. Within a short span of time, the lands of the Nisenan were overrun and the wholesale killing of Nisenan by whites began (Chartkoff and Chartkoff, 1984:279-282; Powers, 1877:317; Wilson and Towne, 1978:396).

In the early 1870s the Nisenan adopted the religious cults that swept through much of northern California following the inception of the Ghost Dance by the Paviotso near Walker Lake, Nevada in 1868. Unlike northwestern California, where the cults persisted well into the twentieth century, the Nisenan abandoned the movement in the 1890s (Du Bois, 1939; Kroeber, 1932).

4.2.2 Prehistory

The study area lies directly adjacent to one of the most intensively archaeologically studied areas in California, the Sacramento/San Joaquin River Delta and adjoining sections of the Sacramento and San Joaquin Valleys. Beginning in the last decade of the nineteenth century, avocational archaeologists recovered thousands of artifacts from numerous sites in the Delta vicinity. A general synthesis of these early works is found in Schenk and Dawson (1929).

The next series of excavations in the general region were conducted by student crews from Sacramento Junior College (SJC). Beginning in 1931, various sites adjacent to the Cosumnes River and Deer Creek confluence were excavated. Joined a few years later by crews from the University of California (UC), the

SJC archaeologists continued their excavations within the Delta region. These efforts culminated in the milestone works of Lillard and Purves (1936) and Lillard, Heizer, and Fenenga (1939), both of which identified a sequence of cultural change within the Delta and adjacent vicinities.

The cultural sequence identified by Lillard and his colleagues (1936; 1939) contained three cultural periods (Early, Intermediate/Transitional, Late), which were based upon changes observed within the mortuary patterns and grave furniture recovered from their sample of sites. Lillard, Heizer, and Fenenga (1939) believed that the sequence represented a single cultural progression, the Early Period evolving into the Transitional Period, the Transitional Period evolving into the Late Period.

As more archaeological work was conducted within central California during the 1940s and 1950s, the cultural sequence developed by Lillard and his colleagues (1936; 1939) was refined and expanded to accommodate the additional data. The most significant of these revisions was Beardsley's (1954) Temporal and Areal Relationships in Central California Archaeology, in which the Central California Taxonomic System (CCTS) was formally developed.

As archaeologists in central California attempted to incorporate their data into the CCTS, the limitations of Beardsley's system became apparent. Alterations to the CCTS began appearing in the literature of the discipline, with the doctoral dissertation of Fredrickson (1973) being of the most consequence.

After many debates and numerous revisions, the cultural sequence for the central California region, first defined by Lillard and his colleagues (1936; 1939), currently stands as follows:

4.2.2.1 Windmiller Pattern (ca. 3000 B.C. – 500 B.C.)

The artifact assemblage characteristic of this cultural manifestation includes a variety of flaked stone, ground stone, baked clay, and shell items reflecting exploitation of diverse subsistence resources and acquisition of materials from distant geographic areas through trade. The burial pattern of Windmiller cemeteries and grave plots is unique in that virtually all of the interments are ventrally extended, with the head oriented to the west. The primary exception to this burial pattern is that aged females were buried in a flexed position. Social stratification can be inferred from the burial practices of Windmiller peoples. Males appear to generally have higher status than females, as evidenced in their deeper and artifactually richer graves. Social status may have been at least partially inherited, for some female, child, and infant burials contained elaborate grave furniture, while others lacked such wealth (Moratto, 1984:201-207).

4.2.2.2 Berkeley Pattern (ca. 500 B.C. – A.D. 500)

The Berkeley Pattern represents a gradual shift in adaptation and material culture that appears to have originated within the San Francisco Bay region. The subsistence practices of Berkeley peoples differs from that of the Windmiller peoples in that the use of acorns for food seems to have increased dramatically. The reliance on acorns is evidenced in the increase in mortars and pestles recovered from Berkeley Pattern sites. Other differences in material culture include the occurrence of an extensive bone tool kit, unique knapping techniques, and certain types of shell beads and pendants within Berkeley Pattern sites. Burial practices of Berkeley peoples also differed from those of Windmiller Pattern sites. No longer were corpses placed into graves extended towards the west. Instead, Berkeley Pattern burials are flexed with variable orientation (Moratto, 1984:207-211).

4.2.2.3 Augustine Pattern (ca. A.D. 500 – A.D. 1880)

The Augustine Pattern reflects local innovation in technology, as well as the incorporation of new developments with traits of the Berkeley Pattern. The artifact assemblages of Augustine Pattern sites indicate an increased reliance on hunting, gathering, and fishing. Acorns appear to have become

particularly important. Many burials continue to be flexed, however, cremation becomes the mortuary practice for high-status burials. Extensive trade networks developed to accommodate the resource and social needs of the burgeoning populations (Moratto, 1984:211-214).

4.2.3 History

Although it was not until after the discovery of gold at Sutter's Mill in 1848 that Euro-American people began entering the region en masse, the general area was visited by non-native peoples prior to that year. Gabriel Moraga, under the flag of Spain, led an expedition from Mission San Jose up to the Cosumnes and Feather Rivers in 1808. In 1813, Jose Arguello reached the Cosumnes River, where he battled a band of hostile Miwok. Narciso Duran and Luis Arguello left San Francisco in 1817 and passed through the region on their expedition. Arguello is credited with naming the Feather River, his El Rio de Las Plumas (Beck and Haase, 1974; McGowan, 1961).

Following the Spanish entrance, this region of California was visited by American trappers looking for new areas to exploit. Beck and Haase (1974) indicate that Jedediah Smith, Joseph Walker, and Ewing Young passed through the region on their journeys through California.

Captain John Sutter was granted his roughly 1,000 square mile "New Helvetia" ranch near present day Sacramento in 1839. It was from Sutter's Mill, near present day Coloma, that John Marshall discovered gold in 1848. Soon afterwards the famous gold rush began and the region became quickly populated with prospectors, entrepreneurs, and others seeking easy fortunes (Bean, 1977; Lavender, 1972; McGowan, 1961).

Local histories following on from Marshall's gold discovery for Placer and Sutter counties and Reclamation District 1000 are presented below.

4.2.3.1 Sutter County Portion of the APE

One of the smaller counties in the state, Sutter County is situated in the heart of the Sacramento and Feather River valleys. Settlement patterns in the southernmost portion of Sutter County followed a similar development pattern as southwestern Placer County. As unsuccessful miners staked out homesteads and started farming the region's grasslands, small hamlets were established in the outer regions of the county (Yuba City and Marysville, 2006).

One such community in the vicinity of the study area was Pleasant Grove, located 20 miles southeast of Yuba City. Initially known as Gouge Eye, the town of Pleasant Grove developed in the late 1860s around Charles Bishop's general store, at the present day intersection of Howsley and Pleasant Grove roads. When the post office was constructed in 1867, Gouge Eye was renamed Pleasant Grove Creek, which was later shortened to its present name in 1875. The town grew quickly in the early years, and by the late 1880s included shoemaker, doctor, town hall, barber, fraternal organizations like the Pleasant Grove Odd Fellows, a hotel, salon, blacksmiths, and general store. Early settlers included Ephraim Johnson, who purchased a 240-acre farm in 1878 just south of Pleasant Grove (south of the present day intersection of Pleasant Valley and Sankey roads and outside of the architectural APE) where he constructed a residence. Over the years he added 440 acres to his property, farming wheat, oats and barley on this land as well as more than 3,000 acres of leased land. By the mid 1880s, the town included a population of 100 people living on large farms. Grain, primarily wheat, and livestock formed the principal crops during this period, which continued into the first half of the twentieth century, while rice became an important crop in later years. Unlike the fruit regions of the county to the north and southeast, the area within the APE remained rooted in the production of grain throughout the twentieth century (Wagner, 2006; Crawford and Hurd, 1935; Lowe et al., 1990:59).

4.2.3.2 Placer County Portion of the APE

Placer County was created in 1851 from portions of Sutter and Yuba counties, two of California's original counties. Bordered by Sacramento County to the south, Lake Tahoe to the east, and Bear River to the north, many of the county's communities owe their origins to the gold rush. Nevertheless, in the southwestern portion of the county, or "the valley," gold was never found in any quantity, so beginning in the 1850s, former miners staked out homesteads and started farming the region's undulating grasslands (Davis, 1975:11,15; 1964). Even with gold mining as the major industry in the county through the 1880s, in the area around Roseville and Lincoln, farming continued to be the economic mainstay, along with timber harvesting. Bypassed by gold prospectors on their way to the goldfields, local farmers quickly built up large land holdings in the area (Abeloe, 1966:265).

One of the first areas to be settled in the vicinity of the study area was the Dry Creek District, which extends east, south and west of present-day Roseville, followed by Pleasant Grove District (located northwest of Roseville, extending west to Sutter County) where Stephen A. Boutwell, William Dunlap and others acquired large tracts of land (Davis, 1975:19; 1964:1-2). Local farmers quickly built up large land holdings along the various creeks that flow west into the American Basin. Called the "plains" by early prospectors on their way to the goldfields, early settlers came to the area in the 1850s. The region was eventually named the Pleasant Grove District after the creek which passed through. The Fiddyment family also settled in this district in 1856 when Elizabeth Jane Fiddyment and her young son, Walter F. Fiddyment Jr., joined her family on their large farm. Mrs. Fiddyment went on to become a large landholder, reportedly owning more than 13,000 acres in Placer County, while her son turned to raising sheep and cattle. The Fiddyment family maintained a strong presence in the region, expanding their holdings and improving their ranch complexes. Walter eventually became one of the largest grain and stock ranchers in the county, while his sons and grandsons went into the poultry business on the family land (Davis, 2002:10; U.S. Census Bureau, 1870; PAR Environmental Services, Inc., 2001; EIP Associates, 2004:4.8-3 through 4.8-6).

To the northeast of the Fiddyments, a New England farmer, George Whitney, settled on 180 acres about 3 miles northeast of present-day Rocklin in 1857. In this unoccupied and open land he established the Spring Valley Ranch, also known as the Whitney Ranch, where he successfully bred sheep. Between 1861 and 1873 he acquired numerous parcels of land, some under the Pre-emption Law of 1841, some former homesteaded lands purchased outright, and some from the Southern Pacific Railroad, ranging in size from 40 to 2,000 acres. The Whitney Ranch grew to encompass more than 20,000 acres of land in the Sacramento Valley, 2,000 acres of land at the confluence of the Feather and Sacramento Rivers (in Sutter County), 15,000 acres of private land within Tahoe National Forest, and grazing rights for sheep on 50,000 acres of railroad and government land. In addition to stock raising, the Whitney Ranch also produced wheat, with 1,200 acres in production in 1872. After 1875, Whitney's son, Joel Parker Whitney, began cultivating all available grain land on the ranch, eventually planting more than 8,000 acres of wheat. The ranch exported its grain crops and livestock from Whitney Station (located near the present day intersection of Sunset and Industrial boulevards), 3 miles west of the Whitney Ranch (Thompson and West, 1882:246-47; Donaldson, 1958:C2-3).

The construction and development of the railroad industry in the 1860s and 1870s played a significant role in the development of the region. The construction of the California Central Railroad (CCRR), an 18½-mile line that would linkup the cities of Marysville and Sacramento by means of a connection with Sacramento Valley Railroad, and later the Central Pacific Railroad, which was absorbed into Southern Pacific railway system, led to the establishment of Lincoln and Roseville (Tuturo, 2004:262-263; Lardener and Brock, 1924:1043; Thompson and West, 1882:273; Hart, 1978:363; Davis, 1975:29). Agriculture remained first in the region's economy into the twentieth century, with Roseville eventually becoming the shipping and trading center for southern Placer County. Despite this, the area's population remained low,

even after the construction of the state highway (LRN 3) from Sacramento (through Roseville) to Lincoln in 1909 (Caltrans, no date; California Highway Commission, 1922:201; Department of Public Works, California Highway Commission, 1922).

While agricultural production continues to be an important land use in southwestern Placer County, the region began undergoing extensive development following World War II as the accelerated growth rate in the greater Sacramento metropolitan area began impacting surrounding communities. The completion of SR 65 in the westernmost portion of the APE in 1971, and the growth of Lincoln, Roseville and Rocklin that began in the 1960s, has impacted the rural character of western Placer County. Suburban housing and commercial developments just south of the project area and industrial development dating from the late 1960s along Industrial Boulevard occupy much of the land that was once open range. Since 1980 new employment centers have been established in an emerging area of high-tech companies locating along the SR 65 corridor, and many new commercial and residential developments have been constructed.

4.2.3.3 Reclamation District 1000

In the forty-year period from 1870 to 1910, Sutter, Placer and other mid-valley counties remained sparsely populated and some actually declined in population. A completely new pattern emerged between 1910 and 1930 as large numbers of new settlers came to the Sacramento Valley, many attracted by improved flood control systems, irrigation, and the promising development of fruit and nut orchards. Unlike wheat farming or dairying, orchard culture provided a viable family income from relatively small parcels of land. Agrarian visionaries foresaw vast parts of the region populated with small prosperous farms living on 10- to 20-acre farms. Through reclamation and irrigation of the Sacramento Valley during the late nineteenth and early twentieth centuries, the number of people and individual farms expanded tremendously in the fruit growing regions of Sutter and Yuba counties during this period (McGowan, 1961:1; Jelinek, 1924:55-58, 61-63).

With the influx of population in Sutter County in the late nineteenth century, the state sought to control seasonal flooding while promoting agriculture in the American Basin. Great strides had already been made with construction of a series of levees, river gauges to monitor water levels and the establishment reclamation districts. The region had been devastated by major floods in 1861-1862 and again in 1875, and while the government had severely restricted hydraulic mining in the mid 1880s, the region was still vulnerable to damage from mining debris and flooding. Use of much of the land in the southernmost portion of the county was limited to seasonal grazing and some farming on higher ground, and for fishing and hunting (USGS, 1892, 1910a, 1910b; Dames & Moore, 1995:40-41; Gordon, 1988:68-70). New reclamation efforts in the first decade of the twentieth century spurred the state legislature to create Reclamation District No. 1000 (RD 1000) in 1911. It later became part of the Sacramento Valley Flood Control Project. Located in northeastern Sacramento and southern Sutter counties, this district consisted of an area of approximately 55,130 acres, located east of the Sacramento River and extending to the Western Pacific Railroad tracks (currently part of the Southern Pacific). It included drainage canals, pumps, levees, ditches, pumping plants and a system of roads. After drainage and construction of levees, the Natomas Consolidated Company land surveyed and subdivided the land.

Part of the construction included the Natomas East Main Drainage Canal, which is crossed by the western ends of all of the project's alternatives reaching SR 70/99. To promote RD 1000 by demonstrating land productivity, Natomas Consolidated leased large acreage blocks for wheat and grain crop production, thus establishing a pattern of large acreage, single-crop land use. The company also built a 60-mile network of roads across RD 1000 to provide access to drainage canals for construction and maintenance, as well as to serve farm roads to parcels within the district's various subdivisions. This network was originally comprised of dirt roads (roughly two lanes wide) that the Natomas Company graded. Most of these roads were paved with macadam or concrete during the 1920s and 1930s. They generally followed the township

and section survey lines and the drainage canals to form large regularly spaced grids in the landscape (Dames & Moore, 1995:29-32, 40-41, 62, and 99; Bonte, 1931:181 and 183; USGS, 1994, 1953a; Commissioner of Public Works, 1905; House Document Number 81, 1911). Despite these improvement efforts, selling land in the district was a slow process into the 1940s (Dames & Moore, 1995:14).

5.0 INVENTORY METHODS

5.1 INTRODUCTION

Because the current undertaking consists only of the preservation of a transportation ROW, the archaeological APE for this Tier 1 investigation consists of the area within the boundaries of the corridor alignment alternatives. Furthermore, because the project has yet to be designed, the APE is currently limited to the ground surface only and there is no vertical APE. An APE encompassing areas that potentially would be disturbed by construction activity, as well as areas that potentially would be used for construction excavation, will be developed and assessed in Tier 2.

The APE for the project is depicted on Figure 5-1 (sheets 1 through 4). The approved APE is provided in Appendix B.

In accordance with stipulation of the Parkway PA (Appendix A), only the alignment common to all build alternatives (Figure 5-2) was subject to archaeological pedestrian reconnaissance. The common alignment occurs primarily in the Eastern Segment of the study area, although a small section of common alignment also is found in the eastern extent of the Central Segment.

As depicted in Figure 2-1, the remaining portions of the APE are comprised of a series of interconnected corridor alternatives. Archaeological issues in these corridors, as agreed upon by the signatories and concurring parties of the PA, were addressed through the use of environmental factors including length of stream corridor, area above floodplain, and area of farm land to rank the archaeological sensitivity of the project alternatives. The results of the ranking efforts would then be used in the Tier 1 EIS/EIR.

The ASR study consisted of background and archival research, contact with the Native American Heritage Commission (NAHC) and local Native American groups and individuals identified by the NAHC, an intensive archaeological pedestrian reconnaissance of the previously unsurveyed portion of the common alignment where access had been secured, and the development and use of a predictive model based on environmental factors to assess the relative archaeological sensitivity of the project alternatives.

The majority of the common alignment has been previously investigated in the recent past. As depicted on Figure 5-2, the corridor bisects a number of areas currently under environmental review for other development project proposals. Environmental review of these projects has included archaeological investigations, and the results of these investigations have been used in this report to characterize the baseline conditions of the corridor analysis.

Mark R. Hale, URS Senior Project Archaeologist, prepared this Archaeological Survey Report (ASR) to document cultural resources identification efforts in the project's Area of Potential Effect (APE). Pedestrian archaeological reconnaissance was led by URS Senior Project Archaeologist Mr. Hale. Mr. Hale holds a B.A. in Anthropology from the University of California, Berkeley, and has completed his course work, completed his research, and defended his thesis for an M.A. in cultural resources management from Sonoma State University. He has more than 20 years of professional experience in conducting and managing cultural resources. Project oversight was provided by Mr. Brian Hatoff (URS Senior Archaeologist). Mr. Hatoff received both his B.A. and his M.A. in Anthropology from the University of California, Davis; is a Registered Professional Archaeologist, and has more than 30 years of professional experience in California and the Great Basin.

5.2 COMMON ALIGNMENT

As mentioned above, an agreement between FHWA, OHP, Caltrans, and SPRTA states that only the "common alignment" of the Parkway need be physically inventoried for archaeological resources for

preparation of the Tier 1 EIS/EIR. The common alignment occurs primarily in the Eastern Segment of the study area; however, a portion also occurs in the eastern portion of the Central Segment (Figure 5-2).

Given the recent dates of archaeological surveys on several parcels through which the common alternative passes, with Caltrans approval, some parcels were not reinventoried for archaeological resources. These parcels are:

- Amoruso Property (Brookfield) (ECORP Consulting 2006)
- Placer Ranch (Hale, 2004)
- Reason Farms Retention Basin (Hale, 2002)
- SR 65 Widening Project (Norton, 1998)

Prior to the initiation of field efforts, letters requesting access were sent to relevant landowners. Figure 5-2 identifies the parcels found within the common alignment. Landowners did not respond to request for access to conduct surveys on two properties: Macor Incorporated Property APN.017-061-044 and Whitney Industrial Park APN.017-061-045. It should be noted, however, that although access to these two parcels has not been secured for the current effort, the majority of both had been previously inventoried with negative results (Derr, 1997; McGowan Seldner, 1985). Furthermore, based on past surveys within the immediate vicinity of these parcels (see Section 3.0), the overall archaeological sensitivity of these parcels is low. This supposition is based on the fact that intensive archaeological surveys have for the most part proved negative.

The survey corridor, comprised of parcels within the common alignment, was subjected to an archaeological pedestrian reconnaissance following the guidelines proposed by King (1978). Specifically, the previously unsurveyed portions of the common alignment where access had been secured were visually inspected using 20-meter (66-foot) parallel transects.

In general, ground visibility within the surveyed are of the common alignment was poor. At the time of the survey, dense growth of grasses obscured the ground surface. To help alleviate the situation, in areas where non-agricultural vegetation obscured the ground surface, approximately 20 cm by 20 cm patches were occasionally cleared with hand tools or footwear to increase ground visibility. Attention was focused on potential vernal pools and alongside minor drainages, rodent burrow spoils, vehicle tracks, recently graded exposures, and erosion gullies. Recently excavated and graded areas adjacent to the survey area were also inspected (i.e., Sunset Boulevard extension).

5.3 ALTERNATIVES

5.3.1 Predictive Model

As indicated previously, signatories to the PA agreed that only the common alignment of the Parkway needed to be inventoried for archaeological resources prior to the preparation of the Tier 1 EIS/EIR. The portion of the archaeological APE outside of the common alignment consists of the remaining five interconnected corridor alignment alternatives described in Chapter 2. The draft PA outlines that a predictive model would be used to assess the various alternatives for their relative archaeological sensitivity. These data could then be used in the Tier 1 EIS/EIR to make conclusions about potential impacts to archaeological resources.

For the current investigation, the predictive model is a GIS-based application that assesses the relative sensitivity of each alternative corridor based on various, common environmental factors known to influence past human activity in the project vicinity. This is based on the assumption (see Bettinger, 1977) that:

> "… culture systems are adaptations to their environments, and, as such, their subsistence and settlement patterns are structured to fit the existing patterns of regional resource distribution."

Although some, including Bettinger, have used such models to predict site locations and/or densities within a given area with varying levels of success, this was not attempted herein for it is believed that there is insufficient data at this time to make more than general statements of archaeological sensitivity for the current APE. In fact, Bettinger warns that:

> "Predicting the density of archaeological sites is a difficult proposition at best. Frequently the information necessary for the proper computations is unavailable, requiring more assumptions than are desirable" (Bettinger, 1977:222).

It should also be noted that the corridor chosen for preservation would ultimately be subjected to intensive pedestrian reconnaissance during Tier 2.

The environmental factors used in this investigation are those known to influence (either attract or deter) past human activity in the study area based on archaeological evidence, ethnographic data, and historic land-use information.

As the project's corridor alignment alternatives are located in relatively close proximity to each other, the environmental setting does not differ significantly between alternatives. For this reason many commonly used environmental factors such as slope and exposure cannot effectively differentiate between alignments. Further complicating matters is the fact that environmental conditions in the study area were significantly altered in the twentieth century. Vast tracts were reclaimed, stream courses altered, and wetlands were drained to create valuable farmland. Riparian vegetation was removed in order to increase sunlight to farmlands. As such, it should be noted herein, that the modeling in this report was based on available data. It should also be noted that environmental factors were not ranked and calculations were not adjusted based on the corridors' lengths.

Given the basic human need for water, within the Sacramento Valley as elsewhere in the world, both prehistoric and historic settlement tended to intensify around perennial water sources. Besides providing direct sustenance to human populations, water also provides sustenance to both plant and animal resources used by human populations.

The majority of previously recorded prehistoric sites within the region are situated along the perennial watercourses that flow toward the Sacramento and American Rivers (as well as along these two major waterways). Prior to the construction of the levees and diversion canals that were constructed in the early part of the twentieth century, local hydrology was well suited to support a myriad of floral and faunal species important to the diet of prehistoric populations and the ethnographic Nisenan. Many previously investigated archaeological sites in the region, including those where only surface observations were possible, have produced faunal remains from riparian-adapted species. Similarly, baked clay net weights with impressions of tule wrapping have been noted in site collections, providing evidence for use of this plant by native populations. The presence of bone and antler fishhooks, harpoon toggles, fish spears, and net weights of stone and clay among sites in the region also attest to the importance of water–based resources.

Early historic populations likewise tended to focus settlement near perennial waterways. In fact, many early historic homesteads were placed atop prehistoric deposits as evidenced by numerous multi-component archaeological deposits as well as the non-native vegetation including palm, olive, black walnut, English walnut, plum, peach, apricot, apple, pomegranate, and various citrus often noted on archaeological site forms from the region.

Given the above circumstances, proximity to stream courses clearly elevates sensitivity in the study area. The total length in miles of existing stream course within each corridor alignment alternative was thus one factor used to assess the archaeological sensitivity of the project alternatives. A similar approach of using length of stream corridor (converted to "fish miles") was used in the landmark study by Baumhoff (1963) to analyze prehistoric settlement. It should be noted, however, that there is currently no evidence that any of the streams bisecting the current APE historically supported runs of anadromous fish (GANDA, 2006).

Proximity to perennial stream courses can also provide insight into the issue of buried archaeological resources (i.e., those with no surface manifestation). Buried archaeological resources are of concern as it is well recognized that natural cycles of soil erosion and deposition have buried archaeological resources, often deeply (Meyer and Rosenthal, 1997; Rosenthal and Meyer, 2004a, 2004b). Implementation of a project with ground-disturbing activities could inadvertently expose such a resource, possibly resulting in both unanticipated impacts and project delays.

Assessment of the potential for the current project to encounter buried archaeological deposits is somewhat problematic given that the project has not yet been designed. As described previously, the project consists of selecting and preserving a corridor for the future Placer Parkway. During Tier 2, when specific project components can be analyzed, the issue of buried archaeological resources can be addressed more intensively.

For this Tier 1 analysis, the total length of stream course is also used to rank the likelihood of each alternative to contain buried archaeological resources. As indicated by Rosenthal (2005) distance to water has proven to be an important predictor of archaeological site locations throughout central California" and as such, it is adjacent to areas of surface water that they focus their geoarchaeological investigations. For this study, it is assumed that the greater the total length of stream corridor within an alternative, the greater the potential for the presence of buried archaeological resources as well as those exhibiting surface manifestations.

Although other water-oriented environmental features, including wetlands, vernal pools, and riparian habitat, may have once drawn both prehistoric and historic populations, for purposes of the current analysis it was determined that the current altered distribution in the region prevented the meaningful use of such features as determinants of archaeological sensitivity.

Although the presence of water is a natural draw for both prehistoric and historic populations, this can also present an obstacle to settlement in areas where the risk of flooding is high. The majority of previously recorded prehistoric and pre-reclamation-era historic archaeological sites in the region are situated above historic floodplains including such areas as natural levees along the watercourses, upon "high spots" within natural floodplains, and in the uplands above the floodplains. This pattern is apparently driven by the human preference for inhabiting high, dry ground located in close proximity to water.

As current reclamation, irrigation, and flood control efforts have drastically altered the natural flood patterns, the use of current flood mapping data (e.g., 100-, 200-, and 500-year floods) is of limited value. For example, most prehistoric and pre-reclamation historic archaeological sites would have received little impact from flooding prior to the construction of dams and levees on the Sacramento and American Rivers and their respective tributaries. Today, however, seasonal flooding routinely inundates many sites. In this region, this is perhaps most evident in the large number of sites recorded along Dry Creek near Roseville. These sites become flooded when water backs up because it is restricted through the Natomas East Main Drainage Canal.

As a means to identify pre-reclamation floodplains, historic sources were consulted. Pre-reclamation reports and maps (Commission of Engineers, 1904; Commissioner of Public Works, 1895; Hall, 1887)

reveal that the margin of the floodplain prior to the reclamation and flood control projects of the historic and modern eras was located at approximately 30 feet above mean sea level. Based on available GIS-ready FEMA topographic data, an elevation of 33 feet (i.e., 10 meters) above mean sea was determined to be the approximate break between floodplain and non-floodplain. The total amount of acreage at or above this elevation was used for the assessment of general archaeological sensitivity of the alternative corridors

As much of the study area was converted to agricultural use following the reclamation efforts of the early twentieth century, it was determined that identifying those areas potentially most attractive to agricultural pursuits would be an appropriate avenue of investigation. As developed land was avoided during the screening process, however, the project alternatives are comprised nearly entirely of agricultural lands, including both dry and irrigated farming, and grazing. Although grazing has and continues to occur in the study area it is a much less intensive agricultural pursuit than the raising of crops (farming), which is more likely to remain physically evident over time.

The California Department of Conservation (CDC) has classified soils in terms of their desirability as farmland. Several categories are recognized and mapped, including Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and Farmland of Local Importance. In addition to these, both Grazing and Urban Built-up lands are also mapped. Using these available data, total acreage of farmland was tabulated to assess the archaeological sensitivity of the project alternatives.

Environmental data were entered into URS' Geographical Information System (GIS) using ArcGIS 8.3 software, which consists of the following modules: ArcMap, ArcCatalog, and ArcToolbox. The development of a GIS for the project involved a series of tasks, including collection of spatial data from a variety of sources; importation of that data into ArcGIS 8.3; projection of the data into Stateplane Feet NAD 83 Zone II; development of new data from pertinent existing data or input from project team members; creation of metadata for each data layer; map and figure creation displaying the data in a useful manner; data version control and maintenance; and input into an analysis program called Community VIZ by Moore, Iacofano Goltsmith (MIG) and URS Corporation. URS created the figures and numeric data presented below.

Spatial data were collected from a variety of sources. Aerial photography was obtained from AIRPHOTO USA. Images of the project area were taken in April 2001 and again in November 2002. The color images have a 2-foot pixel ground sample distance. The 2002 images are used as the base for most maps. Several existing GIS data layers were gathered from Placer County, Sutter County, Sacramento County, City of Roseville, DKS Associates, North Fork Associates, Sacramento Area Council of Governments (SACOG), CH2M Hill, Federal Emergency Management Agency (FEMA), United State Geological Survey (USGS), U.S. Fish and Wildlife Service (USFWS), California Department of Fish and Game (CDFG), California Historical Resources Information System, and California Department of Conservation. Project team members created some data by aerial photograph interpretation, input from resource specialists, or through analyzing existing data.

Based on the data collected and displayed on maps created through GIS, total land areas were determined (in acres or length) for the environmental factors described above. Specifically, the total length of stream course, the total amount of land above historic floodplain (i.e., equal to or greater than 10-meter [33-foot] elevation), and the total amount of farmland were the environmental factors used to differentiate the archaeological sensitivity of the various corridors.

5.3.2 General Land Office Plat Maps

To further assess the historic archaeological sensitivity of the various project corridors, General Land Office surveyor's plat maps were also consulted. The United States Public Land Survey (USPLS) system

was established in 1785 with the Geographer of the United States as the director. This began the system of subdividing land areas into regular parcels, generally Townships comprised of 36 sections, each section being one square mile. Divisions of these parcels, often 160-acre quarter sections, could then be sold to provide income for the Federal treasury. In May of 1796 the post of Surveyor General was established, who was given the power to deputize surveyors to carry out land surveys. In April of 1812 the General Land Office (GLO) was established within the Department of the Treasury and in 1849 the GLO was reassigned to the Department of the Interior.

In the latter half of the nineteenth century, the GLO was responsible for surveying the largely unsettled lands of the western United States in response of an ever-increasing number of homesteaders. Having the lands surveyed made it easier to locate and legally describe the homesteaded parcels.

The value of GLO plat maps is that they depict historic features that may be represented in the archaeological record. Data retrieved from these maps is used here to complement the environmental parameters discussed in the previous section. It should be noted that although GLO plat maps are valuable tools, their accuracy is somewhat limited. According to the Iowa State University GLO Project "modern surveyors describe the GLO survey as one with low accuracy and lack of precision" (http://www.glo.gis.iastate.edu/pinfo/info_faq.html#21). The web site goes on to say that "probably the most important reason that the surveys were not as concerned with accuracy as surveys are today is because the price of land was low ... Low land prices did not warrant any delay in the survey procedure."

It should also be pointed out that GLO surveyors were only required to survey (i.e., follow) section lines. As such, the surveyors tended to only plot the features they encountered along the section line being followed. This is perhaps most evident in the case for minor roadways where only the section of road crossing the section line is plotted. Although the complete course of some, more major roadways are depicted on GLO maps, this may be simply a case of "plotting" the alignment by drawing a line to connect the sections of road actually encountered (i.e., a case of connecting the dots).

As a means to identify potential historic archaeological resources and thus assess the archaeological sensitivity of the project alternatives, the GLO plat maps (USDI 1855a, 1855b, 1868, 1871) were pieced together to form one map. The Parkway alignments were then overlaid on the composite GLO plat map. Although the accuracy of the GLO maps is limited, by using the section grid lines as reference points a satisfactory overlay can be produced and the location of potential historic archaeological resources identified.

6.0 STUDY FINDINGS AND CONCLUSIONS

As a means to determine the potential effects of the project on archaeological resources, a number of tasks were completed. As previously discussed, these comprised archival research, Native American consultation, a pedestrian reconnaissance of the common corridor alignment alternatives, and the development and use of a predictive model to determine the general archaeological sensitivity of the five corridor alignment alternatives. Because the screening process was used to avoid archaeological sites, no previously recorded historic or prehistoric archaeological sites occur within the APE for the project.

6.1 COMMON CORRIDOR ALIGNMENT ALTERNATIVES

An archaeological survey of previously unsurveyed portions of the common corridor alignment alternative was conducted on June 2-3, 2006. All areas within the archeological APE were subjected to intensive pedestrian survey using transects spaced no more than 20 meters (66 feet) apart.

Prehistoric sites in the general vicinity typically are manifested by darkened midden soils, often with some amount of shell, ground-stone artifacts, fire-affected rock, animal bone, and chips and tools of obsidian and/or cryptocrystalline silicates. Historic–era sites range from remnants of late nineteenth and early twentieth century homesteads including structural remains, trash deposits, privies and cisterns to mid-twentieth century refuse scatters. No prehistoric or historic archaeological materials, evidence of archaeological deposits, or indications of occupation were found on the surface within the APE.

It is Caltrans' policy to avoid cultural resources whenever possible. At this time no further archaeological work is necessary within the common corridor alignment alternatives. The selected corridor alignment alternative will be subjected to pedestrian archaeological inventory during Tier 2 efforts.

6.2 REMAINING CORRIDOR ALTERNATIVE ALIGNMENTS

6.2.1 Predictive Model

Using environmental factors known to both attract and deter past human settlement in the project vicinity, the relative archaeological sensitivity of the remaining corridor alignment alternatives was determined. Specifically, the total length of stream course, the total amount of land above the historic floodplain (i.e., at or above an elevation of 10 meters [33 feet] above msl), and the total amount of farmland were the environmental factors used to determine the archaeological sensitivity of the various corridors.

As depicted in Figure 2-1, each alternative shares some portion of its length with other alternatives. Rather than present the calculations for the portions of each alternative by segment, for ease of analysis and presentation, the data for each alternative have been collapsed and tabulated together (Table 6-1). Data for the Eastern Segment are not included in these calculations, as it comprises the common alignment that was subjected to archaeological pedestrian reconnaissance as described previously.

As can be seen in Table 6-1, Alternative 1 contains the greatest length of stream course, the most acreage above floodplain, and the most acreage of farmland. Using the criteria described above, Alternative 1 is the most archaeologically sensitive alignment alternative. Alternative 3 is the next most archaeologically sensitive alignment, ranking second in both total acreage above floodplain and total acreage of farmland and scoring third in total length of stream course. Alternative 2 follows, ranking second total length of stream course and third for both total land above floodplain and total acreage of farmland. Alternative 4 is next, ranking fourth for all identified criteria. Lastly, Alternative 5 ranks fifth for all categories, making it the least sensitive for archaeological resources.

Table 6-1
Predictive Model for Assessment of Archaeological Sensitivity of Project Alternatives (Excluding Common Alignment)

Alignment	Total Miles of Stream Corridor (Ranking)		Total Acreage Above Floodplain (Ranking)		Total Acreage of Farmland (Ranking)	
Alternative 1	3.0099	(1)	950.8	(1)	1238.4	(1)
Alternative 2	1.2942	(2)	868.8	(3)	1153.10	(3)
Alternative 3	0.9148	(3)	904.7	(2)	1188.1	(2)
Alternative 4	0.7720	(4)	782.4	(4)	953.7	(4)
Alternative 5	0.6906	(5)	778.2	(5)	945.0	(5)
Note: 1 = most sensitive 5 = least sensitive						

The total length of stream corridor, as described previously, can also provide insight to the potential for a corridor to contain buried archaeological deposits. Based on total stream corridor length, it can be predicted that Alternative 1 is the most likely corridor to contain buried archaeological resources while Alternative 5 is the least likely (Table 6-1).

As stated previously, the general archaeological sensitivity of the current archaeological APE for both prehistoric and historic archaeological resources is low. This is based on the fact that while resources have been identified, relatively few archaeological sites have been identified given the total acreage of land subjected to archaeological survey.

6.2.2 General Land Office Plat Maps

The current Placer Parkway project area is situated in lands contained within four Townships, specifically T10N/R4E, T11N/R4E, T11N/R5E, and T11N/R6E. These Townships were mapped by the GLO in 1855 (T11N/R5E, T11N/R6E), 1868 (T11N/R4E), and 1871 (T10N/R4E).

As can be seen on Figure 6-1, the common corridor alignment of Placer Parkway is situated in the northwestern corner of T11N/R6E and passes into the northeastern corner of T11N/R5E in a westerly direction before turning southward towards what is labeled on the plat map as Dry Creek (today's Pleasant Grove Creek). South of the Pleasant Grove Creek crossing (labeled on GLO map as Dry Creek), the corridor begins dividing into the five project alternatives. It is from this point southwestward that the current exercise is focused. The various historic features intercepted by Placer Parkway corridor alignment alternatives are discussed below.

It should be noted herein that various mapping inaccuracies, as discussed in Section 5.2.2, are depicted on Figure 6-1. Perhaps the clearest is along the section line separating Townships T11N/R4E and T11N/R5E. As is quite apparent, the course of Dry Creek and the unnamed road paralleling the north side of the stream on one map do not align with the same features on the adjacent map. A discrepancy of approximately one-quarter mile exists between how these features were mapped on their respective GLO plat maps. Other incongruities include the lack of a connection between the course of Pleasant Grove/Dry Creek between Townships T11N/R5E and T11N/R6E; the course of Slough/Dry Slough, also between Townships T11N/R5E and T11N/R6E; and the numerous sections of road plotted as sections of dashed lines that have neither a beginning nor an end and do not appear to connect to anything. These small sections of road, all occurring in the immediate vicinity of a section line, are prime examples of the surveyor only plotting what was encountered along the section line being followed.

6.2.2.1 Roads

As can be seen on Figure 6-1, the paths of several historic roadways are bisected by the corridor alignment alternatives. Although the common alignment is not part of the sensitivity exercise, it can be seen on Figure 6-1 that the corridor bisects an unnamed road in the northwestern corner of Section 8 of T11N/R6E, as well as another, less fully plotted and also unnamed road in Section 7 of T11N/R6E, and Section 12 of T11N/R5E.

A northwest-to-southeast–trending roadway is intersected by all corridor alignment alternatives as they begin branching out south of Dry Creek in Section 15 of T11N/R5E. This unnamed roadway parallels the south side of Dry Creek, appearing to cross the stream in Section 9 of T11N/R5E). It thus appears that this unnamed road may have crossed Dry Creek at the same location as the Sacramento and Nevada Road discussed below.

Further west, within the central section of the project area, all the alternative corridors also bisect the course of the Sacramento and Nevada Road. The course of the Sacramento and Nevada Road is nearly due north/south across the project area. According to Hoover et al. (1990:259), the Sacramento and Nevada Road was used by freight teams traversing the Sacramento Valley. With the building of the California Central Railroad through this area in the 1860s, staging and teaming along the Sacramento and Nevada Road, as well as elsewhere in the valley, became unnecessary.

Within Township T11N/R4E, another "Road" is plotted in the project area. As depicted, this north-south–trending road appears to go no further south than the northeastern corner of Section 26. This is likely an omission of the GLO surveyor as discussed in Section 5.2.2, as just barely visible in the northeast corner of Section 2 of T10N/R4E is the Marysville Road. It is possible that the Marysville Road extending northward from the GLO plat map of T10N/R4E is the same as the "Road" discussed above. If these sections of plotted road connect, as inferred here, all corridor alternative alignments of the Parkway intersect this potential resource.

What is labeled as a Stage Road is bisected by all of the alternative alignments in the western end of the project area in Township T11N/R4E. Running north to south where the corridor alignment alternatives bisect its path, this Stage Road begins turning to the northwest at the border between Sections 16 and 21. A branch of this unnamed Stage Road extends southeastward, perhaps connecting with the aforementioned Marysville Road.

A number of smaller, unnamed, and not fully plotted road segments occur within or immediately adjacent to various project alternatives. For example, Alternative 1 bisects a small section of road in Sections 33 and 34 of T11N/R5E. Although only a small section of this unnamed road is depicted, it is clearly on a course to intersect the Sacramento and Nevada Road near the course of Alternative 2. Other similar, only partially plotted road segments are depicted in Sections 21 and 22 of T11N/R4E, Sections 24 and 25 of T11N/R4E, Sections 27 and 34 of T11N/R4E, and Sections 35 and 36 of T11N/R4E.

As all alternatives intersect all of the major roads, or at least can be comfortably inferred to intersect them, as well as bisect a number of not fully plotted ancillary roads, no one corridor alternative alignment is more or less archaeologically sensitive then another, based solely upon the roads intersected along their length.

6.2.2.2 "House"

Besides the aforementioned roads, only one other potential historic archaeological resource was identified from the GLO maps within any of the potential corridor alignment alternatives of the Parkway project. Labeled as a "house" on the GLO plat map for Township T11N/R4E, the potential resource is situated in

the southeast quadrant of Section 23 directly within the path of the corridor alignment alternative common to both Alternatives 4 and 5, where it intersects Sankey Road at its easternmost point. No other information is known about the structure other than it was present by 1868. Air photos of this location reveal that the vicinity is currently under cultivation.

Intact remnants of this structure would likely represent an important cultural resource. Unfortunately, this section of the project area has not been previously subjected to an intensive archaeological pedestrian reconnaissance. As such, it is unknown whether remnants of this structure occur within the current APE. The potential presence of this structure elevates the archaeological sensitivity of both Alternatives 4 and 5.

Although a potential historic archaeological resource was identified in Alternatives 4 and 5, elevating the archaeological sensitivity of both of these corridor alignment alternatives, given the limitations in the original GLO mapping and the fact that the area has been plowed, this finding does not outweigh the sensitivity of the alternative corridors as determined in Section 6.2.1.

Attn: Gary Sweeten

Dear Mr. Fong

The Federal Highway Administration (FHWA) and California Department of Transportation (Caltrans) are working with the Placer County Transportation Planning Agency (PCTPA) on the Placer Parkway Project. PCTPA proposes to identify and acquire right-of-way for the purpose of preserving a corridor for a future Placer Parkway, an east-west connection between State Route (SR) 65 near Lincoln in Placer County and SR 70/99 in southern Sutter County. Our agencies are working together to produce a Tier 1 Environmental Impact Statement (EIS), pursuant to the National Environmental Policy Act (NEPA) that will evaluate several corridor alternatives and will lead to the selection of one corridor for right-of-way preservation.

As a Federal undertaking, this project also requires compliance with Section 106 of the National Historic Preservation Act (NHPA). Pursuant to 36 CFR 800, the regulations implementing Section 106 of the NHPA, we have prepared a draft Programmatic Agreement that will govern Section 106 compliance responsibilities associated with implementing this undertaking. If FHWA agrees with this proposed PA, please forward the attached documentation to the California State Historic Preservation Officer for his review. Caltrans and PCTPA staff are available to meet with the SHPO to explain the undertaking in more detail if that is helpful.

Should you require any additional project information, please contact Erick Wulf at (916) 274-0563 or erick.wulf@dot.ca.gov or Anmarie Medin at (916) 274-584 or anmarie.medin@dot.ca.gov. Thank you in advance for your assistance in this matter.

Sincerely,

Japtej S Gill

PROGRAMMATIC AGREEMENT

BETWEEN THE FEDERAL HIGHWAY ADMINISTRATION AND THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER REGARDING IMPLEMENTATION OF THE PLACER PARKWAY PROJECT, PLACER COUNTY, CALIFORNIA

WHEREAS, the Federal Highway Administration (FHWA) and the California Department of Transportation (Caltrans), in cooperation with the Placer County Transportation Planning Agency (PCTPA), propose to identify and acquire right-of-way for the purpose of preserving a corridor for a future Placer Parkway, an east-west connection between State Route (SR) 65 near Lincoln in Placer County and SR 70/99 in southern Sutter County (Undertaking); and,

WHEREAS, the FHWA is preparing a Tier 1 Environmental Impact Statement (EIS), pursuant to the National Environmental Policy Act (NEPA), 42 USC 4321 *et seq,* that will evaluate several corridor alternatives and will lead to the selection of one corridor for right-of-way preservation; and

WHEREAS, given the existing and projected rapid growth in and around the project study area, the FHWA has determined it is vital to identify a corridor as early as feasible so that local jurisdiction planning decisions can consider the future Placer Parkway and before new development reduces corridor options and/or increase right-of-way acquisition costs for the Undertaking; and,

WHEREAS, the FHWA has determined that a phased approach for compliance with Section 106 of the NHPA is appropriate for the Undertaking, such that completion of the identification of historic properties, determinations of specific effects in historic properties, and resolution of any adverse effects will be carried out as part of planning for and prior to the approval of specific Tier 2 undertakings; and,

WHEREAS, the FHWA has consulted with the California State Historic Preservation Officer (SHPO) pursuant to the 1 January 2004 *Programmatic Agreement among the Federal Highway Administration, the Advisory Council on Historic Preservation, the California State Historic Preservation Officer, and the California Department of Transportation Regarding Compliance with Section 106 of the National Historic Preservation Act, as it Pertains to the Administration of the Federal-Aid Highway Program in California* (PA), and where the PA so directs, in accordance with 36 CFR Part 800, the regulations that implement Section 106 of the National Historic Preservation Act (NHPA) (16 U.S.C. 470f), regarding the Undertaking's potential effects on historic properties; and,

WHEREAS, following the completion of Tier 1 EIS, the FHWA, as funding becomes available for design and construction, will conduct Tier 2 environmental studies to analyze the environmental impacts of different alignments within the selected corridor in order to determine the specific transportation facility 'footprint' within the corridor , including project-level compliance with the Section 106 process to determine specific impacts to historic properties as

well as opportunities for avoidance, minimization of harm, and appropriate mitigation, if required, for the Undertaking; and,

WHEREAS, the FHWA desires to enter into a Programmatic Agreement (Agreement) at this time in order to establish a framework for conducting Section 106 consultation for Tier 1 and Tier 2; and,

WHEREAS, Caltrans has participated in consultation and has been invited to be a signatory to this Agreement; and

WHEREAS, PCTPA has participated in consultation and has been invited to be a signatory to this Agreement; and

WHEREAS, the Advisory Council on Historic Preservation (ACHP) has been afforded the opportunity to participate in the Section 106 process and has not elected to participate; and,

WHEREAS, Caltrans, on behalf of the FHWA, has initiated consultation with the Shingle Springs Band of Miwok Indians, Todd Valley Miwok-Maidu Cultural Foundation, Maidu Elders Orgainzation, and Enteprise Rancheria of Maidu Indians, as well as with the following federally-recognized Indian Tribes: United Auburn Indian Community (Tribes).

WHEREAS, the FHWA has involved, and will continue to involve, the public and historic interest groups, as stipulated under NEPA and the NHPA in a manner consistent with the PA and Caltrans' public involvement procedures;

NOW, THEREFORE, the FHWA and the SHPO agree that, upon the FHWA's decision to proceed with the Undertaking, the FHWA shall ensure that the Undertaking is implemented in accordance with the following stipulations in order to take into account the effects of the Undertaking on historic properties; and further agree that these stipulations shall govern the Undertaking and all of its parts until this Agreement expires or is terminated.

STIPULATIONS

The FHWA will ensure that the following stipulations are implemented:

I. DEFINITIONS

The definitions set forth at 36 CFR § 800.16 are applicable throughout this Agreement.

II. TIER 1 PHASED IDENTIFICATION OF HISTORIC PROPERTIES

A. Area of Potential Effects

1. The Undertaking's area of potential effects (APE) for Tier 1 is situated in southwest Placer County, between Highways 65 and 70, north of Baseline Road and south of Sunset Boulevard West (attachment A to this Agreement).

2. If modifications to the Undertaking, subsequent to the execution of this Agreement, necessitate the revision of the APE, Caltrans will consult with the PCTPA, the FHWA, and the SHPO to facilitate mutual agreement on the subject revisions. If Caltrans, the PCTPA, the FHWA, and the SHPO cannot reach such agreement, then the parties of this Agreement shall resolve the dispute in accordance with stipulation VIII.C below. If Caltrans, the PCTPA, the FHWA, and the SHPO reach mutual agreement on the proposed revisions, then Caltrans will submit a final map of the revisions, consistent with the requirements of stipulations VIII.A and XVI.A of the PA, no later than 30 days following such agreement.

B. Phased Identification of Historic Properties

1. Areas Common to all Alternatives/Corridors: the FHWA shall ensure that PCTPA or its consultants inventory properties within the area(s) common to all Tier 1 corridors according to the following specifications:
   a. Archaeological Properties
      (1) Conduct an inventory of archaeological properties where access has been secured in areas that have not previously been surveyed and those areas deemed by Caltrans PQS in need of resurvey because of the age or condition of the previous survey. Archaeological properties will be identified in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms.
   b. Built Environment Properties
      (1) Conduct a limited inventory of built environment properties within the entire Tier 1 APE. Built environment properties that have the potential to meet NRHP Criterion C will be identified and evaluated in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms. Other built environment properties within the APE that meet the age and integrity criteria will be inventoried and evaluated during Tier 2 studies, as provided for in stipulation III of this Agreement.
2. Areas Unique to Specific Alternatives/Corridors: the FHWA shall ensure that PCTPA or its consultants inventory properties within the area(s) unique to specific Tier 1 alternatives/corridors according to the following specifications:
   a. Archaeological Properties
      (1) Complete a records search for the Tier 1 APE and prepare a predictive model utilizing environmental factors and historic land-use data to assess the archaeological sensitivity of the project corridors including potential for buried resources. Segments of Tier 1 alignments/corridors that are not in common will be inventoried for archaeological properties during Tier 2 studies, as provided for in stipulation III of this Agreement.
   b. Built Environment Properties
      (1) Conduct a limited inventory of built environment properties within the entire Tier 1 APE. Built environment properties that have the potential to meet NRHP Criterion C will be identified and evaluated

in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms. Other built environment properties within the APE that meet the age and integrity criteria will be inventoried and evaluated during Tier 2 studies, as provided for in stipulation III of this Agreement.

3. Tier 1 Reporting and SHPO Consultation
   a. The FHWA shall ensure that PCTPA or its consultants prepare documentation of their findings and determinations pursuant to stipulation XVI of the PA. The reports shall be submitted to Caltrans PQS for review and approval.pursuant to stipulation XVI of the PA.
   b. Eligibility determinations shall be submitted to SHPO pursuant to stipulation VIII.C(5) of the PA.

C. Phased Assessment of Effects

1. The FHWA shall assess the potential for Tier 1 of the Undertaking to effect historic properties in accordance with stipulation X of the PA. As Tier 1 is defined as acquisition of property, the FHWA anticipates there will be no adverse effects during Tier 1. The FHWA shall consult with SHPO on the effect finding pursuant to stipulation X of the PA.

III. TIER 2 PHASED SECTION 106 CONSULTATION

A. Area of Potential Effects: The objective of the Tier 1 EIS is to identify and preserve an approximate 500'- to 1,000'-wide corridor for acquisition. The Tier 1 EIS will focus on broad topics such as general location, mode choice, area-wide air quality and land use, and other environmental issues. Once the corridor is selected, the subsequent Tier 2 environmental review, relying on the work from the Tier 1 EIS, will provide a more detailed analysis of the environmental impacts for the future transportation facility alignment alternatives within the selected corridor. Once a Tier 2 preferred alternative is chosen, the FHWA and PCTPA will delimit an APE for the Tier 2 preferred alternative in accordance with stipulation VIII.A of the PA. If subsequent modifications to the APE are necessary, the FHWA shall follow the procedures of stipulation II.A(2) of this Agreement.

B. Phased Identification and Evaluation.

1. Archaeological Properties
   a. The FHWA shall ensure that PCTPA or its consultants conducts a pedestrian reconnaissance of all lands within the final APE for any Tier 2 preferred alternative. Archaeological properties will be identified and evaluated in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms.
2. Built Environment Properties
   a. The FHWA shall ensure that PCTPA or its consultants conducts an inventory of built environment properties within the final APE for any Tier 2 preferred alternative. Built environment properties will be

evaluated for NRHP eligibility in accordance with stipulation VIII.(B) and (C) of the PA, and documented on appropriate DPR 523 inventory forms.

3. Tier 2 Reporting and SHPO Consultation
   a. The FHWA shall ensure that PCTPA or its consultants prepare documentation of their findings and determinations pursuant to stipulation XVI of the PA. The reports will be submitted to Caltrans PQS for review and approval pursuant to stipulation XVI of the PA.
   b. Eligibility determinations shall be submitted to SHPO pursuant to stipulation VIII.C(5) of the PA.

C. **Assessment of Effects.** The FHWA will assess any Tier 2 preferred alternative for its potential to affect historic properties and will consult with the SHPO pursuant to stipulation IX and X of the PA. Should FHWA find that any Tier 2 preferred alternative will result in an adverse effect, FHWA shall consult with SHPO pursuant to stipulation XI of the PA.

D. **Applicable Requirements.** FHWA will conduct the Section 106 process during Tier 2 in accordance with stipulations of the PA and applicable requirements under Section 106 of the National Historic Preservation Act (16 U.S.C. § 470f) and the Section 106 regulations (36 C.F.R. Part 800), including any subsequent amendments thereto. Nothing in this Agreement is intended to supersede or modify any requirement contained in the Section 106 statute or the Section 106 regulations.

E. **Consulting Parties**. During Tier 2, the same party may be designated as a consulting party for more than one alternative. FHWA will ensure comments of all consulting parties are incorporated into the Section 106 consultation process as provided for in all applicable laws.

IV. TIER 2 SECTION 106 COMMITMENTS AND CONCEPTUAL MITIGATION

A. FHWA and PCTPA agree to implement and/or fund the activities listed in this section as part of any Tier 2 environmental studies. Additional commitments may be made, as appropriate, as an outcome of the Section 106 consultation process for any Tier 2 alternative.

B. **Avoidance and Minimization of Impacts**

1. In General. In accordance with the consultation process required under Section 106 and in accordance with other applicable laws, FHWA, PCTPA, and Caltrans will seek ways to avoid, minimize, and mitigate adverse impacts to the environment, including adverse effects to historic properties.
2. Context-Sensitive Solutions. FHWA, PCTPA, and Caltrans will apply the principles of context-sensitive solutions during project development, in accordance with applicable Caltrans policies. In accordance with those principles and where appropriate, FHWA, PCTPA, and Caltrans will develop any Tier 2 alternative with sensitivity to aesthetic values and the historic context, utilizing the services of professionals with experience in areas related to historic preservation.

C. Should implementation of any Tier 2 alternative result in adverse effects to a historic property important solely for its information value (Criterion D), FHWA will ensure a data recovery plan is prepared according to guidance in Attachment 6 of the PA and submitted to the SHPO for review in accordance with stipulation II.C(3) of this Agreement.

D. The FHWA will not authorize the execution of any Undertaking activity that may effect (36 CFR § 800.16(i)) historic properties in the Undertaking's APE prior to the completion of the Section 106 process provided for in this Agreement.

V. NATIVE AMERICAN CONSULTATION

The FHWA has consulted with the Tribes regarding the proposed Undertaking, will continue to consult with the Tribes, and will afford the Tribes, should the Tribe so desire, the further opportunity to more directly and actively participate in the implementation of the Undertaking; Should any specific Tribe desire to participate in this Agreement as herein set forth, the FHWA shall consult with them to reach consensus regarding the manner in which the Tribe may participate in the implementation of this Agreement and the Undertaking, and regarding any time frames or other matters that may govern the nature, scope, and frequency of such participation.

VI. TREATMENT OF HUMAN REMAINS

The Agreement parties agree that human burials and related items discovered during implementation of the terms of this Agreement and of the Undertaking will be treated in accordance with the requirements of § 7050.5(b) of the California Health and Safety Code. If, pursuant to § 7050.5(c) of the Code, the county coroner or medical examiner determines that the human remains are or may be of Native American origin, then the discovery shall be treated in accordance with the provisions of §§ 5097.98(a)-(d) of the California Public Resources Code.

VII. DISCOVERIES AND UNANTICIPATED EFFECTS

If the FHWA determines, after any future construction of the Undertaking has commenced, that the Undertaking will affect a previously unidentified property that may be eligible for the National Register, or affect a known historic property in an unanticipated manner, the FHWA will address the discovery or unanticipated effect in accordance with 36 CFR § 800.13(b)(3). The FHWA at its discretion may hereunder, and pursuant to 36 CFR § 800.13(c), assume any discovered property to be eligible for inclusion in the National Register.

VIII. ADMINISTRATIVE PROVISIONS

A. PROFESSIONAL QUALIFICATIONS AND STANDARDS

1. **Professional Qualifications**. All activities prescribed by stipulations II, III, IV, V, VI, and VII of this Agreement shall be carried out under the authority of the FHWA by or under the direct supervision of a person or persons meeting at a minimum the Secretary of Interior's *Professional Qualifications Standards* (48 FR 44738-39) (PQS) in the appropriate disciplines. However, nothing in this stipulation may be interpreted to preclude the FHWA or any

agent or contractor thereof from using the properly supervised services of persons who do not meet the PQS.

2. **Documentation Standards.** Written documentation of activities prescribed by stipulations II, III, IV, V, VI, and VII of this Agreement shall conform to *Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation* (48 FR 44716-44740) as well as to applicable standards and guidelines established by the SHPO.

3. **Curation and Curation Standards.** The FHWA shall ensure that, to the extent permitted under §§ 5097.98 and 5097.991 of the California Public Resources Code, the materials and records resulting from the activities prescribed by this Agreement are curated in accordance with 36 CFR Part 79. The FHWA will ensure that, to the extent permitted by applicable law and regulation, the views of the Most Likely Descendant(s) are taken into consideration when decisions are made about the disposition of other Native American archaeological materials and records.

B. **CONFIDENTIALITY.** The Agreement parties acknowledge that historic properties covered by this Agreement are subject to the provisions of section 304 of the NHPA, and section 6254.10 of the California Government Code (Public Records Act), relating to the disclosure of archaeological site information and, having so acknowledged, will ensure that all actions and documentation prescribed by this Agreement are consistent with said sections.

C. **RESOLVING OBJECTIONS.**

1. Should any Agreement party object to the manner in which the terms of this Agreement are implemented, to any action carried out or proposed with respect to the implementation of the Agreement, or to any documentation prepared in accordance with and subject to the terms of this Agreement, the FHWA shall immediately notify the other parties to this Agreement of those objections, and shall consult with the objecting party and with the other parties for no more than 14 days to resolve the objection. The FHWA shall reasonably determine when this consultation will commence. If the objection is resolved through such consultation, the action subject to dispute may proceed in accordance with the terms of that resolution. If, after initiating such consultation, the FHWA determines that the objection cannot be resolved through consultation, the FHWA shall forward all documentation relevant to the objection, including the FHWA's proposed response to the objection, to the ACHP, with the expectation that the ACHP will, within thirty (30) days after receipt of such documentation, do one of the following:

   a. advise the FHWA that the ACHP concurs in the FHWA's proposed response to the objection, whereupon the FHWA will respond to the objection accordingly. The objection shall thereby be resolved; or,

b. provide the FHWA with recommendations, which the FHWA will take into account in reaching a final decision regarding its response to the objection. The objection shall thereby be resolved; or,

c. notify the FHWA that the objection will be referred for comment, pursuant to 36 CFR § 800.7(c), and proceed to refer the objection and comment. The FHWA shall take the resulting comment into account, in accordance with 36 CFR § 800.7(c)(4) and section 110(1) of the NHPA. The objection shall thereby be resolved.

2. Should the ACHP not exercise one of the foregoing options within 30 days after receipt of all pertinent documentation, the FHWA may assume the ACHP's concurrence in its proposed response to the objection and proceed to implement that response. The objection shall thereby be resolved.

3. The FHWA shall take into account any ACHP recommendation or comment provided in accordance with section C.1 of this stipulation, with reference only to the subject of the objection. The FHWA's responsibility to carry out all actions under this Agreement not the subject to the objection will remain unchanged.

4. At any time during the implementation of the measures stipulated in this Agreement, should an objection pertaining to such implementation be raised by a member of the public, the FHWA shall notify the Agreement parties in writing of the objection and take the objection into consideration. The FHWA shall consult with the objecting party and, if the objecting party so requests, with the other Agreement parties for no more than fifteen (15) days. Within ten (10) days following closure of this consultation period, the FHWA will render a decision regarding the objection and notify all consulting parties hereunder of its decision in writing. The objection will thereby be resolved. In reaching its decision, the FHWA will take into account any comments from the consulting parties regarding the objection, including the objecting party. The FHWA's decision regarding the resolution will be final.

5. The FHWA shall provide all Agreement parties, the ACHP when the ACHP has issued comments hereunder, and any parties that have objected pursuant to section C.4 of this stipulation, with a copy of its final written decision regarding any objection addressed pursuant to this stipulation.

6. The FHWA may authorize any action subject to objection under section C of this stipulation to proceed after the objection has been resolved in accordance with the terms of section C.

D. **AMENDMENTS:** Any Agreement party may propose that this Agreement be amended, whereupon the Agreement parties will consult for no more than 30 days to consider such amendment. The FHWA may extend this consultation period.

The amendment process shall comply with 36 CFR §§ 800.6(c)(1) and 800.6(c)(7). This Agreement may be amended only upon the written agreement of the signatory parties. If it is not amended, this Agreement may be terminated by either signatory party in accordance with section E of this stipulation.

E. TERMINATION

1. If this Agreement is not amended as provided for in section D.1 of stipulation VIII, above, or if either signatory party proposes termination of this Agreement for other reasons, the signatory party proposing termination shall, in writing, notify the other Agreement parties, explain the reasons for proposing termination, and consult with the other Agreement parties for at least 30 days to seek alternatives to termination. Such consultation shall not be required if the FHWA proposes termination because the Undertaking no longer meets the definition set forth at 36 CFR § 800.16(y).

2. Should such consultation result in an agreement on an alternative to termination, then the parties shall proceed in accordance with the terms of that agreement.

3. Should such consultation fail, the signatory party proposing termination may terminate this Agreement by promptly notifying the other Agreement parties in writing. Termination hereunder shall render this Agreement without further force or effect.

4. If this Agreement is terminated hereunder, and if the FHWA determines that the Undertaking will nonetheless proceed, then the FHWA shall either consult in accordance with 36 CFR § 800.6 to develop a new Agreement, or request the comments of the ACHP, pursuant to 36 CFR Part 800.

F. DURATION OF THE AGREEMENT

1. Unless terminated pursuant to section F of stipulation VIII above, or unless it is superseded by an amended Agreement, this Agreement will be in effect following execution by the signatory parties until the FHWA, in consultation with the other Agreement parties, determines that all of its stipulations have been satisfactorily fulfilled. This Agreement will terminate and have no further force or effect on the day that the FHWA notifies the other Agreement parties in writing of its determination that all stipulations of this Agreement have been satisfactorily fulfilled.

2. The terms of this Agreement shall be satisfactorily fulfilled within twenty (20) years following the date of execution by the signatory parties. If the FHWA determines that this requirement cannot be met, the Agreement parties will consult to reconsider its terms. Reconsideration may include the continuation of the Agreement as originally executed, amendment of the Agreement, or termination. In the event of termination, the FHWA will comply with section

F.4 of stipulation VIII, above, if it determines that the Undertaking will proceed notwithstanding termination of this Agreement.

3. If the Undertaking has not been implemented within twenty (20) years following execution of this Agreement by the signatory parties, this Agreement shall automatically terminate and have no further force or effect. In such event, the FHWA shall notify the other Agreement parties in writing and, if it chooses to continue with the Undertaking, shall reinitiate review of the Undertaking in accordance with 36 CFR Part 800.

G. **EFFECTIVE DATE.** This Agreement will take effect on the date that it has been fully executed by the FHWA and the SHPO.

EXECUTION of this Agreement by the FHWA and the SHPO, its transmittal by the FHWA to the ACHP in accordance with 36 CFR § 800.6(b)(1)(iv), and subsequent implementation of its terms, shall evidence, pursuant to 36 CFR § 800.6(c), that this Agreement is an agreement with the ACHP for purposes of section 110(1) of the NHPA, and shall further evidence that the FHWA has taken into account the effects of the Undertaking on historic properties and has afforded the ACHP an opportunity to comment on the Undertaking and its effects on historic properties.

Appendix C
NAHC Summary of Findings

URS

Debbie Pilas-Treadway
Associate Program Analyst
Native American Heritage Commission
915 Capitol Mall, Room 364
Sacramento, CA 95814

27 May 2003

Dear Ms. Pilas-Treadway,

The Placer County Transportation Planning Agency (PCTPA) has engaged URS Corporation to assist PCTPA in identifying a right-of-way connecting western Placer County and southern Sutter County. This is envisioned as a new 15-mile parkway connecting existing state highways. URS is to identify preliminary alternative alignments and screen them according to technical and environmental criteria; prepare technical studies; prepare a Tier 1 EIS/EIR that will satisfy both Caltrans and FHWA requirements, and provide public outreach support. The environmental review of the project will satisfy both CEQA and NEPA. Our contact with the PCTPA is Mr. Stan Tidman (550 High Street, Suite 107 Auburn, CA 95603). Mr. Tidman can be reached at (530) 823-4033.

Among the tasks to be completed for the initial screening phase of the project are consultation with the Native American Heritage Commission (NAHC) and local Native American groups and individuals. As such, I am requesting any information the NAHC may have regarding properties, features, or materials within the project area that may be of concern to local Native Americans. Attached to this request are two maps. The first is a project map indicating the boundaries of the study area and the second is a map depicting the USGS 7.5' topographic quadrangles in which the study area is located. On this second map, a list of sections, as well as township and range data is included. Any comments you may have regarding this area would be greatly appreciated.

If you have any questions, please feel free to call me directly at (415)-243-3826. Thank you for your cooperation.

Sincerely,

URS

RE: Proposed 15 Mile Parkway Connecting Existing Highways; Sacramento, Placer and Sutter Counties.

Dear Mr. Hale:

A record search of the sacred land file has failed to indicate the presence of Native American cultural resources in the immediate project area. The absence of specific site information in the sacred lands file does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Enclosed is a list of Native Americans individuals/organizations who may have knowledge of cultural resources in the project area. The Commission makes no recommendation or preference of a single individual, or group over another. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated, if they cannot supply information, they might recommend other with specific knowledge. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact me at (916) 653-4038.

Sincerely,

Debbie Pilas-Treadway

Jessica Tavares
Chairperson
United Auburn Indian Community of the Auburn Rancheria
661 Newcastle Road, Suite 1
Newcastle, Ca 95658

Dear Jessica Tavares,

In June 2003, I requested information you may have regarding properties, features, or materials within the Placer Parkway Corridor Preservation Project study area that may be of concern to local Native Americans. I made follow-up calls concerning this request in August 2003.

We have not been able to confirm that you received our earlier materials, and want to be sure that this information did not go astray. We are interested in obtaining the views and concerns of the local Native American community concerning this proposed project. In the event you no longer retain our original request for information, below is found the text from that original request:

> The Placer County Transportation Planning Agency (PCTPA) has engaged URS Corporation to assist PCTPA in identifying a right-of-way connecting western Placer County and southern Sutter County. This is envisioned as a new 15-mile parkway connecting existing state highways. URS is to identify preliminary alternative alignments and screen them according to technical and environmental criteria; prepare technical studies; prepare a Tier 1 EIS/EIR that will satisfy both Caltrans and FHWA requirements, and provide public outreach support. The environmental review of the project will satisfy both CEQA and NEPA. Our contact with the PCTPA is Mr. Stan Tidman (550 High Street, Suite 107 Auburn, CA 95603). Mr. Tidman can be reached at (530) 823-4033.
>
> Among the tasks to be completed for the initial screening phase of the project are consultation with the Native American Heritage Commission (NAHC) and local Native American groups and individuals. As such, I am requesting any information you may have regarding properties, features, or materials within the project area that may be of concern to local Native Americans. Attached to this request are two maps. The first is a project map indicating the boundaries of the study area and the second is a map depicting the USGS 7.5' topographic quadrangles in which the study area is located. On this second map, a list of sections, as well as township and range data is included. Any comments you may have regarding this area would be greatly appreciated.

Subject: Impact to Cultural Resources on Project Site

Dear Mr. Hale,

We recently received a notification indicating that you are proposing a project that has the potential to impact Native American cultural sites. As you may know, under the California Environmental Quality Act and Section 106 of the National Historic Preservation Act, you are required to consult with Indian tribes that may have cultural affiliations or interest in your project. The United Auburn Indian Community is composed of Miwok and Maidu Indians with an ancestral territory encompassing Placer and Nevada Counties, and surrounding areas. We are concerned about projects that may impact our ancient burial grounds and village sites, and sites that have cultural and religious importance to us.

We request that a qualified archaeologist prepare a report documenting a field survey and records search of your project site before the project is approved. We would like to receive a copy of the report upon its completion. We will then review the report and determine if cultural resources of importance to us may be impacted.

Please contact our environmental consultant, Dr. Shelley McGinnis, of Analytical Environmental Services, at (916) 447-3479 if you have any questions regarding this matter.

Sincerely,

Greg Baker
Tribal Administrator

Subject: Placer Parkway Corridor Preservation Tier 1 EIS/EIR

Dear Mr. Hale,

This letter is in response to your letter dated November 18, 2003. The United Auburn **Indian Community has designated David Zweig of Analytical Environmental Services as** the tribal representative on all environmental and cultural resource issues. Mr. Zweig **would be pleased to meet with you as a representative of UAIC to discuss the proposed** Placer Parkway Corridor Preservation project.

You may contact Mr. Zweig directly to set up a meeting. He can be reached by phone (916-447-3479) or email (dzweig@analyticalcorp.com).

Sincerely,

Greg Baker

March 2 2006

Rose Enos
15310 Bancroft Road
Auburn, CA 95603

Dear Rose Enos,

In June and again in October of 2003, I sent out letters requesting information you may have regarding properties, features, or materials within the Placer Parkway Corridor Preservation Project study area that may be of concern to local Native Americans. I made telephone calls following the initial request in August 2003.

Although situated within the same study area, the corridor alignments have been revised slightly from those depicted in the original mailings. As such, I felt it prudent to re-solicit the local Native American community concerning this proposed project. In the event you no longer retain our original request for information, below is found the text from that original request:

> The Placer County Transportation Planning Agency (PCTPA) has engaged URS Corporation to assist PCTPA in identifying a right-of-way connecting western Placer County and southern Sutter County. This is envisioned as a new 15-mile parkway connecting existing state highways. URS is to identify preliminary alternative alignments and screen them according to technical and environmental criteria; prepare technical studies; prepare a Tier 1 EIS/EIR that will satisfy both Caltrans and FHWA requirements, and provide public outreach support. The environmental review of the project will satisfy both CEQA and NEPA. Our contact with the PCTPA is Mr. Stan Tidman (550 High Street, Suite 107 Auburn, CA 95603). Mr. Tidman can be reached at (530) 823-4033.
>
> Among the tasks to be completed for the initial screening phase of the project are consultation with the Native American Heritage Commission (NAHC) and local Native American groups and individuals. As such, I am requesting any information you may have regarding properties, features, or materials within the project area that may be of concern to local Native Americans.

Jeff Murray
Cultural Resources Manager
Shingle Springs Band of Miwok Indians
P.O. Box 1340
Shingle, CA 95682

Dear Jeff Murray,

In June and again in October of 2003, I sent out letters requesting information you may have regarding properties, features, or materials within the Placer Parkway Corridor Preservation Project study area that may be of concern to local Native Americans. I made telephone calls following the initial request in August 2003.

Although situated within the same study area, the corridor alignments have been revised slightly from those depicted in the original mailings. As such, I felt it prudent to re-solicit the local Native American community concerning this proposed project. In the event you no longer retain our original request for information, below is found the text from that original request:

> The Placer County Transportation Planning Agency (PCTPA) has engaged URS Corporation to assist PCTPA in identifying a right-of-way connecting western Placer County and southern Sutter County. This is envisioned as a new 15-mile parkway connecting existing state highways. URS is to identify preliminary alternative alignments and screen them according to technical and environmental criteria; prepare technical studies; prepare a Tier 1 EIS/EIR that will satisfy both Caltrans and FHWA requirements, and provide public outreach support. The environmental review of the project will satisfy both CEQA and NEPA. Our contact with the PCTPA is Mr. Stan Tidman (550 High Street, Suite 107 Auburn, CA 95603). Mr. Tidman can be reached at (530) 823-4033.

June 2007

SUMMARY OF FINDINGS

The Federal Highway Administration (FHWA) and the California Department of Transportation (Caltrans), in conjunction with the South Placer Regional Transportation Authority (SPRTA), propose to identify and preserve or acquire right-of-way for a future Placer Parkway, which would link State Route (SR) 65 in Placer County to SR 70/99 in Sutter County (Maps 1 and 2 in Appendix A). The FHWA is the federal lead agency for the National Environmental Policy Act (NEPA), and SPRTA is the lead agency for the California Environmental Quality Act (CEQA). The project is using federal funding and is therefore subject to review under the January 2004 *Programmatic Agreement (PA) (Appendix B) among the Federal Highway Administration, the Advisory Council on Historic Preservation, the California State Historic Preservation Officer, and the California Department of Transportation Regarding Compliance with Section 106 of the National Historic Preservation Act, as it Pertains to the Administration of the Federal-Aid Highway Program in California* (Section 106 (NHPA). The Section 106 PA is FHWA's approach for taking into account the effects of the Federal Aid Transportation Program on historic properties in California and for meeting compliance with Section 106 of the NHPA (36 CFR 800).

JRP Historical Consulting prepared this Historical Resources Evaluation Report (HRER) to evaluate historic buildings, structures, and objects within the Area of Potential Effect (APE) for the proposed project entitled "Placer Parkway Corridor Preservation Tier 1 Project, Placer and Sutter Counties, California" (Map 3 in Appendix A). This study provides a limited inventory and evaluation of buildings, structures, and objects in the APE that appear to be potentially eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) under Criterion C or 3.[1] The purpose of this document is to comply with applicable sections of the National Historic Preservation Act (NHPA) and the implementing regulations of the Advisory Council on Historic Preservation (ACHP) as these pertain to federally funded undertakings and their impacts on historic properties, as well as comply with CEQA as it applies to historic, built environment resources. Additionally, this information will assist the FHWA in determining which alternative(s) might trigger the need for compliance with Section 4(f) of the National Transportation Act. Additional research will be conducted during Tier 2 to identify properties eligible under the other NRHP and CRHR criteria.

Because of the long lead time for this project, JRP was asked to consider any buildings, structures or objects within the architectural APE that were constructed in or prior to 1975 as meeting the 50 year age requirement for eligibility. JRP found *no buildings, groups of buildings, or structures*, within the architectural (built environment) APE that appear to be potentially eligible for the NRHP, or CRHR, under Criterion C. Therefore, no building, object, or structure was formally evaluated on a California Department of Parks and Recreation (DPR) 523 form for this project. However, research did identify one resource within the architectural APE that was previously evaluated and found to be eligible for inclusion in the NRHP. In 1994 Reclamation District (RD) 1000 was determined eligible for the NRHP as a rural historic landscape (as a historic district) by a consensus between SHPO (State Historic Preservation Office, also known as the California Office of Historic Preservation or OHP) and the U.S. Army Corps of Engineers under Criterion A (1) at the state level of significance. The historic property's area of significance is reclamation and its historic context is the reclamation and flood control of the Sacramento River Basin within the Sacramento Flood Control Project during the period between 1911 and 1939. The historic district, including its contributing features, was found to retain historic integrity.[2] In addition,

[1] To meet Criterion C or 3, a resource must meet one of the following requirements: embody distinctive characteristics of a type, period or method of construction; represent the work of a master; possess high artistic values; represent a significant and distinguishable entity whose components may lack individual distinction.

[2] Dames & Moore, "Final Rural Historic Landscape Report for Reclamation District 1000 for the Cultural Resources Inventory and Evaluations for the America River Watershed Investigation, Sacramento and Sutter Counties, California," submitted to U.S. Army Corps of Engineers, Sacramento District, December 1995.

two county bridges (Bridge Nos. 19C0104 and 19C0124) and two railroad segments (Western Pacific and Sacramento Northern railroads) located within the architectural APE have been previously found to be not eligible for listing in the NRHP and thus required no further study for this project. These railroads, Map Reference Nos. 2 and 3, respectively, and bridges are shown on Map 3. The architectural APE encompasses a small portion of the easternmost section of RD 1000.

HISTORICAL RESOURCES EVALUATION REPORT
PLACER PARKWAY CORRIDOR PRESERVATION TIER 1 EIS/PROGRAM EIR

1.0 INTRODUCTION

1.1 TIER 1 EIS/PROGRAM EIR

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

1.2 CORRIDOR SELECTION AND PRESERVATION

The concept for the Placer Parkway is more than a decade old. Placer County's 1994 General Plan depicts a "plan line" for it. Two planning studies helped to refine the concept:

- DKS Associates, 2000, Placer Parkway Interconnect Study/Conceptual Plan
- DKS Associates, 2001, Project Study Report (Project Development Support) for Placer Parkway

Placer Parkway is cited as a high-priority regional transportation project by the Sacramento Area Council of Governments (SACOG) 2025 Metropolitan Transportation Plan and the 2027 Placer County Regional Transportation Plan. The project vicinity and surrounding area include some of the fastest growing communities in the Sacramento region. A number of large urban development proposals are being considered by Placer and Sutter Counties. New development is expected to add a significant amount of residential, commercial, industrial, and educational uses.

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included representatives from planning and public works departments of all affected cities and counties,

environmental, business, agricultural, development, and homeowner interests (the Study Advisory Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report will analyze these five corridor alternatives along with a No-Build Alternative.

Other potential transportation modes such as bus rapid transit may be developed in the corridor in the future, although they are not proposed as part of the current project. The width of the corridor for Placer Parkway is to vary from approximately 500 feet in the Eastern and Western segments to approximately 1,000 feet in the Central Segment. Depending upon the alternative, the corridor's length ranges from a minimum of 14.2 miles to a maximum of 16.2 miles. The selected corridor would contain the roadway, including the median, travel lanes, shoulder, associated access ramps, and a no-development buffer zone.

Corridor acquisition may not be completed until after Tier 2, as funding becomes available. Portions of the selected corridor would be preserved as a no-development buffer zone. The buffer would be maintained as a zone where development is either not permitted or is severely restricted. This is intended to restrict access to the proposed interchanges, protect the rural character of agriculturally designated areas in the vicinity of the Parkway as far as possible subject to future development, and to maximize opportunities to incorporate adjacent sensitive areas. It is intended that the buffer would be owned and managed in the future to achieve these objectives. For subsequent Tier 2 (project-level) environmental reviews, the size of this buffer zone could be considered flexible for agriculturally designated land undergoing urban development. In the Tier 2 environmental review, the specific buffer size and location would be determined. This determination would be based on performance standards on a case-by-case basis, depending on the land use needs of future approved development, and taking into account the primary objective of restricting future access to the Parkway.

Project proponents are considering employment of several land management and control mechanisms in order to ensure that the buffer would be effectively maintained as an area where development would either not be permitted, and where construction of any additional access onto the Parkway would not be allowed. These mechanisms could include land use controls, land purchase/leases, general plan amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, urban growth boundaries, etc. "Layering" or using several of these methods would provide more assurance that the buffers would be permanent, or at least more difficult to undo.

1.3 TECHNICAL STUDY OBJECTIVE

This Historical Resources Evaluation Report has been prepared to support the Tier 1 Environmental Impact Statement/Program Environmental Impact Report. It presents a Tier 1/Program level assessment of potential impacts related to Historical Resources for five corridor alternatives and the No-Build Alternative as described in Chapter 2. The scope of work performed for this report is based on the Caltrans Local Assistance Procedures Manual (Caltrans, 2006), as modified for purposes of Tier 1/ Program analysis by agreement of Caltrans and the Caltrans Environmental Handbook (Caltrans, 2004) on preparing a Historic Resources Evaluation Report. In addition, the evaluation considered guidance from the Federal Highway Administration (FHWA), Environmental Checklists for Draft and Final Environmental Documents (FHWA, 1998a; FHWA, 1998b).

This report is organized as follows:

Chapter 7 Preparer's Qualifications

This report also includes figures and tables, which show the project location, each build alternative, and pertinent technical information prepared to evaluate the build alternatives.

Throughout this document, the Placer Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

2.0 THE PROPOSED ACTION

The Proposed Action for the Placer Parkway Corridor Preservation Project is to select and preserve a 500- to 1,000-foot-wide corridor in the study area, within which the future four- or six-lane Placer Parkway may be constructed. The ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction, and operation of the Parkway. Although the action taken at Tier 1 on the Placer Parkway Corridor Preservation Project is limited, the underlying project whose effects are studied in this document is the Placer Parkway. To the extent feasible at this early stage, the Tier 1 EIS/EIR addresses the potential effects of construction and operation of the future roadway.

2.1 THE PROJECT STUDY AREA

The study area is an area of approximately 33,460 acres located in Sutter and Placer counties, with a small section located in Sacramento County (see Figures 1-1 and 2-1). The portion of the study area in Sacramento County is located in the extreme southwestern corner of the study area and does not include any of the proposed corridor alignment alternatives. It extends from SR 70/SR 99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego Roads.

For the purposes of the analysis the study area is divided into three segments:

- Western Segment: the Western Segment extends from SR 70/99 to Pleasant Grove Road in Sutter County.
- Central Segment: the Central Segment extends from Pleasant Grove Road in Sutter County to approximately 2,300 feet north of Pleasant Grove Creek in Placer County.
- Eastern Segment: the Eastern Segment extends from approximately 2,300 feet north of Pleasant Grove Creek to SR 65 in Placer County.

2.2 CORRIDOR ALTERNATIVES

The following subsections describe the corridor alternatives, which are depicted on Figure 2-1, and are numbered according to location from south to north in the study area.

2.2.1 The No-Build Alternative

Under the No-Build Alternative, the project would not be implemented. A Placer Parkway corridor would not be selected/preserved, and the future Placer Parkway would not be constructed.

2.2.2 Alternative 1 – the Red Alternative

Alternative 1 would extend from SR 70/99 approximately ½ mile north of Riego Road, eastward approximately 1 mile north of Baseline Road to approximately Watt Avenue, proceeding north and transitioning in an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment alternative is 16.2 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.3 Alternative 2 – the Orange Alternative

Alternative 2 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed northeast, then in a northerly direction south of Pleasant Grove Creek, transitioning to an easterly direction before it reaches Sunset Boulevard West, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.4 miles long. This alternative would include six interchanges, as described in Section 2.3.3 below.

2.2.4 Alternative 3 – the Blue Alternative

Alternative 3 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed north along the Sutter/Placer County Line, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.6 miles long. This alternative would include six interchanges, as described in Section 2.3.3 below.

2.2.5 Alternative 4 – the Yellow Alternative

Alternative 4 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.3 miles long. This alternative would include five interchanges, as described in Section 2.3.3 below.

2.2.6 Alternative 5 – the Green Alternative

Alternative 5 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 4,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.2 miles long. This alternative would include five interchanges, as described in Section 2.3.3 below.

2.3 PARKWAY DESIGN ASSUMPTIONS

Although the Parkway would be designed and construction-level impacts analyzed during Tier 2, for the purpose of this report and the Tier 1 EIS/Program EIR, several assumptions have been made about potential design and configuration concepts. These assumptions would be subject to further development and refinement, and specific decisions about design of the roadway would be made during the Tier 2 process. For example, the number, location, and design of over-crossings would be determined at the time of final Parkway design, in consultation with local jurisdictions. The following sections outline assumptions for the future roadway.

Preliminary costs estimates for the Parkway range from $600 to $650 million (2005 dollars). This includes costs for right-of-way, design, construction, and environmental mitigation for the four- to six-lane facility. The funding situation has spurred interest in exploring other more creative funding options. These include a county-wide sales tax, more developer contributions, and tolling facilities. The Technical Report and Tier 1 EIS/Program EIR do not make any assumptions about funding sources.

2.3.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane facility. A preliminary conceptual cross section (see Figure 2-2) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/Program EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

2.3.2 Conceptual Roadway Elevation

As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on either side of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways or trails.

Throughout the study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These over-crossings would not connect to the Parkway. Parkway access would be via the interchanges described below.

2.3.3 Interchange Concepts

The analysis assumes that the location of interchanges (see Figure 2-1) is as follows.

- SR 70/99 (at ½ mile north of Riego Road or at Sankey Road)
- One or two locations to be determined in southern Sutter County
- Fiddyment Road
- Foothills Boulevard
- SR 65 at Whitney Ranch Parkway

The following discussion outlines concepts and assumptions for the six interchanges that could potentially serve Placer Parkway.

2.3.3.1 Western Segment

Within the Western Segment of the Parkway, a high-speed, freeway-to-freeway type interchange would connect the Parkway with SR 70/99 at one of following potential locations depending on the project alternative (see Section 2.2). Placer Parkway would terminate at SR 70/99.

- **Placer Parkway/SR 70/99 Interchange at North of Riego Road.** This alternative concept uses "braided" ramps to eliminate weaving problems or conflicts with the future SR 70/99 at Riego Road interchange being developed by Sutter County and Caltrans.

- **Placer Parkway/SR 70/99 Interchange at Sankey Road.** Under this alternative concept, the existing two-lane Sankey Road would be realigned to the south of Placer Parkway and the proposed freeway-to-freeway interchange, extending from approximately ¼ mile west of SR 70/99 to approximately ¼ mile east of the Union Pacific railroad tracks. There would be no direct access to SR 70/99 or Placer Parkway from the realigned Sankey Road.

Depending on the final alignment selected, one or two additional interchanges would also be located in south Sutter County. Conceptual locations are identified for purposes of this Tier 1/Program analysis (see Figure 2-1). The actual location of these interchanges would be developed in the Tier 2 phase, based on Sutter County requirements.

2.3.3.2 Central Segment

Within the Central Segment of the Parkway, there would not be any access proposed as part of the Project in the 7-mile segment between Fiddyment Road and Pleasant Grove Road. Please see Section 2.4 regarding a potential connection to a future extension of Watt Avenue (Figure 2-3) which could be proposed and constructed by others in the Central Segment; such an interchange is not part of the Placer Parkway.

2.3.3.3 Eastern Segment

Within the Eastern Segment of the Parkway, a signalized high-speed freeway-to-freeway and local access interchange would connect the Parkway to SR 65 at Whitney Ranch Parkway (Figure 2-1). From SR 65 eastward Placer Parkway would terminate and become Whitney Ranch Parkway east of the SR 65 exit ramp intersection. Traffic signals would be provided at the exit ramp terminals. This interchange would be approximately 1 mile north of a planned SR 65/Sunset Boulevard interchange and 1.2 miles south of the existing Twelve Bridges interchange.

As part of this interchange, auxiliary lanes would be required on SR 65 in both directions to enhance traffic operations on the north side of the future SR 65/Sunset Boulevard interchange. The southbound SR 65 exit-ramp at Sunset Boulevard is being designed to accommodate an additional auxiliary lane required for the future Placer Parkway/Whitney Ranch Parkway interchange to minimize the reconstruction of this ramp in the future. Within the Eastern Segment of the Parkway, from SR 65

westward, two interchanges with local roadways would be constructed, one at Foothills Boulevard and one at Fiddyment Road, as depicted on Figure 2-1.

The future interchange on Placer Parkway at Fiddyment Road would be located near the existing intersection of Fiddyment Road and Sunset Boulevard West. To provide acceptable traffic operations, additional distance needs to be provided between the Fiddyment Road/Sunset Boulevard West intersection and the Fiddyment Road/Placer Parkway westbound off-ramp intersection. Therefore, Sunset Boulevard West will need to be realigned to the north as it nears Fiddyment Road.

2.3.4 Landscaping Concept

For the purposes of this environmental analysis, preliminary landscaping concepts have been developed for Placer Parkway. These are entirely conceptual and would be subject to further refinement during the Tier 2 environmental process. It is anticipated that landscaping would be used to reflect local topography and vistas in the study area and complement the varying character of land adjacent to the Parkway corridor. Landscape design would vary within the Parkway's three segments depending on corridor width and type and density of surrounding land uses. Landscaping would be used within the median and the Parkway buffer zone to enhance the aesthetics of the Parkway, and would be used to provide screening and enhance local and long-distance views. Where appropriate, more concentrated plantings would be considered to buffer the Parkway from future adjacent land uses that may be incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Landscape design would likely include a mix of compatible native and non-native plants that may require some irrigation. Where possible and depending on availability, feasibility and cost, recycled water would be used for irrigation.

During a future design phase, lighting elements would be designed for safety and would consider the proposed landscaping plan in order to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower-voltage lighting, and proposing lighting fixtures that conform with the visual character of the area).

2.4 POTENTIAL WATT AVENUE INTERCHANGE

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 2-3). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/Program EIR. However, the connection of Placer Parkway to a potential Watt Avenue extension could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/Program EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges with Placer Parkway.

2.5 AGENCY PERMITS AND APPROVALS

The Proposed Action would preserve a preferred corridor for a future transportation facility. In the future, permits and approvals would be obtained from appropriate agencies prior to construction of the Parkway. These permits and approvals may include specific design or mitigation requirements that would be incorporated into the project.

2.6 SUBSEQUENT TIER 2 INFORMATION

As noted earlier, the design and construction of Placer Parkway—including its interchanges and over-crossings, and ancillary features such as stream crossings, safety devices, stormwater management structures, and similar improvements—would be evaluated in a subsequent Tier 2 environmental review process once a corridor has been identified.

3.0 RESEARCH AND FIELD METHODS

JRP Historical Consulting (JRP) developed the Area of Potential Effects (APE) for the architectural survey for the "Tier 1: Placer Parkway Corridor Preservation, Placer and Sutter Counties, California" in December 2005 and May 2006 in consultation with URS Corporation (URS) and the California Department of Transportation (Caltrans). Consistent with Caltrans policies and general cultural resource practices to include the area directly affected by construction, the architectural (built environment) APE generally runs either with or one parcel beyond the proposed archaeological APE. Where the project bisects a parcel, the boundary is generally drawn to include the whole parcel; however, where the architectural (built environment) APE intersects large, vacant agricultural parcels where there is little potential for effects, the proposed architectural APE is generally aligned with the right of way. Only those resources located within the architectural APE line were included in the survey. The architectural (built environment) APE is shown on Map 3 (Index and Sheets 1-4) in Appendix A.

URS conducted a search of the records at the Northeast and North Central information centers in June 2003. The searches included cultural resources site and historic property files, the National Register of Historic Places, California Register of Historical Resources, the Historic Property Data File for their respective counties, California Historic Landmarks, California Points of Historic Interest, Caltrans Local Bridge Survey, and historic General Land Office and USGS maps.

While the Secretary of Interior sets the standard guidelines for review of potential National Register eligible buildings, structures, or features that are 50 years of age or older, this age limit has been extended to include resources constructed in 1975 or before to account for lead-time between preparation of environmental documentation and potential Placer Parkway construction in the selected corridor. JRP therefore treated any property constructed in or before 1975 as meeting the 50-year age requirement for eligibility in the NRHP. Buildings, structures, and features built after 1975 were not included in the survey. Once the APE was defined, JRP staff conducted a reconnaissance survey of the area on March 22, 2005 to account in the field for all the buildings, structures, and objects found within the architectural (built environment) APE that appeared to be built in or before 1975. JRP performed a thorough field survey on April 19, 2005, inspecting those resources that met the 50-year age requirement for this project and analyzing the resources for potential eligibility under Criterion C. Only those properties that appeared to have potential for eligibility under Criterion C would require formal evaluation and completion of a DPR 523 form. To be eligible for inclusion in the NRHP a property must have both significance and integrity to be considered eligible for listing on the National Register. Loss of integrity, if sufficiently great, will overwhelm the historical significance of a resource and render it ineligible. Likewise, a resource can have complete integrity, but if it lacks significance, it must also be considered ineligible. Integrity played a key factor in determining potential eligibility under Criterion C for this project.

JRP examined previous historic resource inventory and evaluation surveys and reports and conducted research at the California State Library; County Assessor's and Recorder's offices for Placer and Sutter counties; Shields Library at University of California, Davis; and the Bureau of Land Management State Office, Sacramento. In addition, background research was done through First American Real Estate Solutions commercial database, review of historic and current USGS topographic maps, Caltrans Historic Bridge Inventory (Appendix B), and other documents to confirm dates of construction.

4.0 HISTORIC OVERVIEW

The project area is located in southeastern Sutter County and southwestern Placer County, immediately north of the northernmost boundary of Sacramento County. The study's architectural APE stretches east from SR 65 (between the cities of Roseville and Lincoln) in Placer County, westward taking a southwesterly approach across the sparsely populated, unincorporated land of western Placer County into southern Sutter County and ending at SR 70/99. The vast majority of the architectural APE includes vacant, undulating agricultural lands crisscrossed by drainages and tributaries of Pleasant Grove and Curry (Steelhead) creeks. The study area developed as a rural, agricultural region beginning in the 1850s, a character that continues to this day. The following overview provides broad historical background regarding the regional and local history.

4.1 SUTTER COUNTY PORTION OF THE APE

The area now encompassed by Sutter County was explored and settled by Spain and Mexico, and later by pioneers from the United States, prior to California statehood. One of the smaller counties in the state, Sutter County is situated in the heart of the Sacramento and Feather river valleys. Settlement patterns in the southernmost portion of the county followed a similar development pattern as southwestern Placer County. John Sutter received the New Helvetia land grant from the Mexican government in 1841 where he established Hock Farm along the Feather River on this grant, south of present day Yuba City, and used it as a cattle ranch during the 1840s. Over the next decade, the small population in what became Sutter County was restricted to the region around and north of Hock Farm. With the discovery of gold and the establishment of Yuba City in 1849 and the incorporation of Marysville in February 1851, the population of the county began to rise. As unsuccessful miners staked out homesteads and started farming the region's grasslands, small hamlets were established in the outer regions of the county.[3]

One such community in the vicinity of the project area was Pleasant Grove, located twenty miles southeast of Yuba City. Initially known as Gouge Eye, the town of Pleasant Grove developed in the late 1860s around Charles Bishop's general store, at the present day intersection of Howsley and Pleasant Grove roads. When the post office was constructed in 1867, Gouge Eye was renamed Pleasant Grove Creek, which was later shortened to its present name in 1875. The town grew quickly in the early years, and by the late 1880s included a shoemaker, doctor, town hall, barber, fraternal organizations like the Pleasant Grove Odd Fellows, a hotel, salon, blacksmiths, and general store. Early settlers included Ephraim Johnson, who purchased a 240-acre farm in 1878 just south of Pleasant Grove (south of the present day intersection of Pleasant Valley and Sankey roads and outside of the architectural APE) where he constructed a residence. Over the years he added 440 acres to his property, farming wheat, oats and barley on this land as well as more than 3,000 acres of leased land. By the mid 1880s, the town included a population of 100 people living on large farms. Grain, primarily wheat, and livestock formed the principal crops during this period, which continued into the first half of the twentieth century, while rice became an important crop in later years. Unlike the fruit regions of the county to the north and southeast, the area within the architectural APE remained rooted in the production of grain throughout the twentieth century.[4]

4.2 PLACER COUNTY PORTION OF THE APE

Placer County was created in 1851 from portions of Sutter and Yuba Counties, two of California's original counties. Bordered by Sacramento County to the south, Lake Tahoe to the east, and Bear River to the north, many of the county's communities owe their birth to the gold rush.[5] Nevertheless, in the southwestern portion of the county, or "the valley," gold was never found in any quantity, so beginning in the 1850s, former miners staked out homesteads and started farming the region's undulating grasslands.[6] Even with gold mining as the major industry in the county through the 1880s, in the area around Roseville and Lincoln, farming continued to be the economic mainstay, along with timber harvesting. Bypassed by gold prospectors on their way to the goldfields, local farmers quickly built up large land holdings in the area.[7]

One of the first areas to be settled in the vicinity of the study area was the Dry Creek District, which extends east, south and west of present-day Roseville, followed by Pleasant Grove District (located northwest of Roseville, extending west to Sutter County) where Stephen A. Boutwell, William Dunlap and others acquired large tracts of land.[8] Local farmers quickly built up large land holdings along the various creeks that flow west into the American Basin. Called the "plains" by early prospectors on their way to the goldfields, early settlers came to the area in the 1850s. The region was eventually named the Pleasant Grove District after the creek which passed through. The Fiddyment family also settled in this district in 1856 when Elizabeth Jane Fiddyment and her young son, Walter F. Fiddyment Jr., joined her family on their large farm. Mrs. Fiddyment went on to become a large landholder, reportedly owning more than 13,000 acres in Placer County, while her son turned to raising sheep and cattle. The Fiddyment family maintained a strong presence in the region, expanding their holdings and improving their ranch complexes. Walter eventually became one of the largest grain and stock ranchers in the county, while his sons and grandsons went into the poultry business on the family land.[9] To the northeast of the Fiddyments, a New England farmer, George Whitney, settled on 180 acres about three miles northeast of present-day Rocklin in 1857. In this unoccupied and open land he established the Spring Valley Ranch, also known as the Whitney Ranch, where he successfully bred sheep. Between 1861 and 1873 he acquired numerous parcels of land, some under the Pre-emption Law of 1841, some former homesteaded lands purchased outright, and some from the Southern Pacific Railroad, ranging in size from 40 to 2,000 acres. The Whitney Ranch grew to encompass more than 20,000 acres of land in the Sacramento Valley, 2,000 acres of land at the confluence of the Feather and Sacramento rivers (in Sutter County), 15,000 acres of private land within Tahoe National Forest, and grazing rights for sheep on 50,000 acres of railroad and government land. In addition to stock raising, the Whitney Ranch also produced wheat, with 1,200 acres in production in 1872. After 1875, Whitney's son, Joel Parker Whitney, began cultivating all available grain land on the ranch, eventually planting more than 8,000 acres of wheat. The ranch

exported its grain crops and livestock from Whitney Station (located near the present day intersection of Sunset and Industrial boulevards), three miles west of the Whitney Ranch.[10]

The construction and development of the railroad industry in the 1860s and 1870s played a significant role in the development of the region. The construction of the California Central Railroad (CCRR), an 18½-mile line that would linkup the cities of Marysville and Sacramento by means of a connection with Sacramento Valley Railroad, and later the Central Pacific Railroad, which was absorbed into Southern Pacific railway system, led to the establishment of Lincoln and Roseville.[11] Agriculture remained first in the region's economy into the twentieth century, with Roseville eventually becoming the shipping and trading center for southern Placer County. Despite this, the area's population remained low, even after the construction of the state highway (LRN 3) from Sacramento (through Roseville) to Lincoln in 1909.[12]

While agricultural production continues to be an important land use in southwestern Placer County, the region began undergoing extensive development following World War II as the accelerated growth rate in the greater Sacramento metropolitan area began impacting surrounding communities. The completion of SR 65 in the westernmost portion of the APE in 1971, and the growth of Lincoln, Roseville and Rocklin that began in the 1960s, has impacted the rural character of western Placer County. Suburban housing and commercial developments just south of the project area and industrial development dating from the late 1960s along Industrial Boulevard occupy much of the land that was once open range.

4.3 RECLAMATION DISTRICT 1000

In the forty-year period from 1870 to 1910, Sutter, Placer and other mid-valley counties remained sparsely populated and some actually declined in population. A completely new pattern emerged between 1910 and 1930 as large numbers of new settlers came to the Sacramento Valley, many attracted by improved flood control systems, irrigation, and the promising development of fruit and nut orchards. Unlike wheat farming or dairying, orchard culture provided a viable family income from relatively small parcels of land. Agrarian visionaries foresaw vast parts of the region populated with small prosperous farms living on ten to twenty-acre farms. Through reclamation and irrigation of the Sacramento Valley during the late nineteenth and early twentieth centuries, the number of people and individual farms expanded tremendously in the fruit growing regions of Sutter and Yuba counties during this period.[13]

With the influx of population in Sutter County in the late nineteenth century, the state sought to control seasonal flooding while promoting agriculture in the American Basin. Great strides had already been made with construction of a series of levees, river gauges to monitor water levels, and the establishment of reclamation districts. The region had been devastated by major floods in 1861-1862 and again in 1875, and while the government had severely restricted hydraulic mining in the mid 1880s, the region was still vulnerable to damage from mining debris and flooding. Use of much of the land in the southernmost

portion of the county was limited to seasonal grazing and some farming on higher ground, and for fishing and hunting.[14] New reclamation efforts in the first decade of the twentieth century spurred the state legislature to create Reclamation District (RD) No. 1000 Rural Historic District (RD 1000) in 1911 (Figure 4-1). It later became part of the Sacramento Valley Flood Control Project. Located in northeastern Sacramento and southern Sutter counties, it consisted of 55,130 acres from the Sacramento River east to the Western Pacific Railroad (currently part of the Southern Pacific) tracks and included drainage canals, pumps, levees, ditches, pumping plants and a system of roads. After drainage and construction of levees, the Natomas Consolidated Company surveyed and subdivided the land. Part of the construction included the Natomas East Main Drainage Canal, which is crossed by the western ends of all of the project alternatives reaching SR 70/99. To promote RD 1000 by demonstrating land productivity, Natomas Consolidated leased large acreage blocks for wheat and grain crop production, thus establishing a pattern of large acreage, single-crop land use. The company also built a 60-mile network of roads across RD 1000 to provide access to drainage canals for construction and maintenance, as well as to serve farm roads to parcels within the district's various subdivisions. This network was originally comprised of dirt roads (roughly two lanes wide) that the Natomas Company graded. Most of these roads were paved with macadam or concrete during the 1920s and 1930s. They generally followed the township and section survey lines and the drainage canals to form large regularly-spaced grids in the landscape.[15] Despite these improvement efforts, selling land in the district was a slow process into the late 1940s.[16]

The California State Historic Preservation Office (SHPO) concurred that RD 1000 is significant within the context of reclamation and flood control within the Sacramento Valley during the early twentieth century. It noted that RD 1000 was one of the first large modern reclamation districts in the state and was the largest reclamation project in the country at the time of its initial construction. It provided flood control and also created large areas of productive agricultural land. The Natomas Company built and developed RD 1000's drainage system, including its levees, canals, and pumps, as well as its road system, and these features provided the framework for the spatial land pattern of the district. RD 1000 also served the goals of the region-wide early twentieth century Sacramento Flood Control Project, which was a product of more than 60 years of legislation and technical studies that provided the legal, institutional, and engineering framework to achieve flood control along the Sacramento River. The Sacramento Flood Control Project also supported improved navigation along the river and reclamation of land for productive agricultural uses and development. RD 1000 and its landscape features were considered representative of this important historical trend. OHP agreed that RD 1000 represented the emergence of modern corporations as land owners and developers of reclamation districts, and is representative of the use of large-scale land-moving gold dredging machinery employed for the transformation of the landscape into productive agricultural land. The historic district's primary contributing features are elements of the district's drainage system, road system, and large-scale land patterns, some of which pass through the project's architectural APE. SHPO considered them significant as manifestations of the early twentieth century reclamation and flood control efforts in the Sacramento Valley.[17]

4.4 CONCLUSION

Little change occurred in the study area during the second half of the twentieth century. Despite the construction of SR 70 and SR 65 around 1970, the region's growth was restricted to residential construction on large agricultural tracts. While commercial and industrial development in the northeastern portion (north of Roseville) of the architectural APE began in the late 1960s and continues today around Industrial Boulevard and SR 65, in the majority of the project area agriculture continues to dominate the landscape. Only in recent decades have residential subdivisions begun spreading west from Roseville and north from Sacramento County.

5.0 FINDINGS AND CONCLUSIONS

5.1 FINDINGS

The vast majority of the survey population identified for this study, those buildings, structures and objects that were constructed in or before 1975, are Ranch-, Minimal Traditional- or Contemporary-style residential structures predominantly built during the 1960s and 1970s. Figure 5-1 shows a typical post-1960 residence located on Phillip Road. These buildings are of standard twentieth century styles, types, and methods or construction and are ubiquitous in Northern California and in Sutter and Placer counties.

Of the handful of properties that were built in the first half of the twentieth century, most have been substantially altered by additions, replacement siding or windows, or have suffered severe damage from lack of maintenance and do not appear to retain sufficient integrity to warrant further investigation. Table 5-1 lists the only National Register-eligible property identified as a property in this study. The architectural APE also included two county-owned bridges along South Brewer and Lotus roads in Placer County and two railroads. Caltrans previously identified these bridges (19C0104 and 19C0124) as Category 5 structures (not eligible for listing in the National Register of Historic Places) in the California Historic Bridge Inventory (1986 and updates) (Table 5-2). The Western Pacific Railroad and Sacramento Northern Railroad segments (Table 5-2) within the project area have been previously found to be ineligible for inclusion in the NRHP and therefore required no further study for this project.[18]

The following properties were determined eligible for listing in the National Register of Historic Places as a result of the current study and are historical resources under CEQA: None.

The following properties were determined ineligible for listing in the National Register of Historic Places as a result of the current study and which are not historical resources under CEQA: None.

Toni Webb of JRP, who meets the Professionally Qualified Staff Standards in Section 106 PA Attachment 1 as an Architectural Historian or above, has determined that the only other properties present within the architectural (built environment) APE for the Tier 1 studies, including state-owned resources, meet the criteria for Section 106 PA Attachment 4 (Properties Exempt from Evaluation).

5.2 CONCLUSIONS

Research completed for this phase of the project did identify one resource, RD 1000, within the architectural (built environment) APE that was previously evaluated and found to be eligible for inclusion in the NRHP at the state level of significance under Criterion A. Additionally, JRP identified three other properties that, while they do not appear to be eligible under Criterion C as representative examples of a type, period, or method of construction, or as works of a master, appear to retain sufficient integrity to warrant formal evaluation during the Tier 2 phase of the project. Site-specific research conducted on these properties may produce information that possibly may support eligibility under Criteria A or B. Those resources (APN 35-260-011, 35-260-014 and 017-130-036) are identified on Map 3, Sheets 1 and 3, in Appendix A.

7.0 PREPARERS' QUALIFICATIONS

This project was conducted under the general direction of Rand Herbert (M.A.T. in History, University of California, Davis), a principal at JRP with more than 25 years experience conducting these types of studies. Mr. Herbert qualifies as a historian/architectural historian under the United States Secretary of the Interior's Professional Qualification Standards (as defined in 36 CFR Part 61).

JRP architectural historian Toni Webb was the project manager/lead historian for the project. Ms. Webb conducted research and field recordation, and prepared the contextual statement. Ms. Webb received a B.F.A. in Historic Preservation from the Savannah College of Art and Design and has more than 6 years of experience in public history and historic preservation. Based on her level of experience and education, Ms. Webb qualifies as an architectural historian under the Secretary of the Interior's Professional Qualification Standards (as defined in 36 CFR Part 61).

Research Assistant Steven J. Melvin (B.A. in History, University of Minnesota, Certificate in Public History, California State University, Chico; and is currently pursuing an M.A. in Public History from California State University, Sacramento) assisted with the research and preparation of the contextual statement.

Attn: Gary Sweeten

Dear Mr. Fong

The Federal Highway Administration (FHWA) and California Department of Transportation (Caltrans) are working with the Placer County Transportation Planning Agency (PCTPA) on the Placer Parkway Project. PCTPA proposes to identify and acquire right-of-way for the purpose of preserving a corridor for a future Placer Parkway, an east-west connection between State Route (SR) 65 near Lincoln in Placer County and SR 70/99 in southern Sutter County. Our agencies are working together to produce a Tier 1 Environmental Impact Statement (EIS), pursuant to the National Environmental Policy Act (NEPA) that will evaluate several corridor alternatives and will lead to the selection of one corridor for right-of-way preservation.

As a Federal undertaking, this project also requires compliance with Section 106 of the National Historic Preservation Act (NHPA). Pursuant to 36 CFR 800, the regulations implementing Section 106 of the NHPA, we have prepared a draft Programmatic Agreement that will govern Section 106 compliance responsibilities associated with implementing this undertaking. If FHWA agrees with this proposed PA, please forward the attached documentation to the California State Historic Preservation Officer for his review. Caltrans and PCTPA staff are available to meet with the SHPO to explain the undertaking in more detail if that is helpful.

Should you require any additional project information, please contact Erick Wulf at (916) 274-0563 or erick.wulf@dot.ca.gov or Anmarie Medin at (916) 274-584 or anmarie.medin@dot.ca.gov. Thank you in advance for your assistance in this matter.

Sincerely,

Japtej S Gill

PROGRAMMATIC AGREEMENT

BETWEEN THE FEDERAL HIGHWAY ADMINISTRATION AND THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER REGARDING IMPLEMENTATION OF THE PLACER PARKWAY PROJECT, PLACER COUNTY, CALIFORNIA

WHEREAS, the Federal Highway Administration (FHWA) and the California Department of Transportation (Caltrans), in cooperation with the Placer County Transportation Planning Agency (PCTPA), propose to identify and acquire right-of-way for the purpose of preserving a corridor for a future Placer Parkway, an east-west connection between State Route (SR) 65 near Lincoln in Placer County and SR 70/99 in southern Sutter County (Undertaking); and,

WHEREAS, the FHWA is preparing a Tier 1 Environmental Impact Statement (EIS), pursuant to the National Environmental Policy Act (NEPA), 42 USC 4321 *et seq,* that will evaluate several corridor alternatives and will lead to the selection of one corridor for right-of-way preservation; and

WHEREAS, given the existing and projected rapid growth in and around the project study area, the FHWA has determined it is vital to identify a corridor as early as feasible so that local jurisdiction planning decisions can consider the future Placer Parkway and before new development reduces corridor options and/or increase right-of-way acquisition costs for the Undertaking; and,

WHEREAS, the FHWA has determined that a phased approach for compliance with Section 106 of the NHPA is appropriate for the Undertaking, such that completion of the identification of historic properties, determinations of specific effects in historic properties, and resolution of any adverse effects will be carried out as part of planning for and prior to the approval of specific Tier 2 undertakings; and,

WHEREAS, the FHWA has consulted with the California State Historic Preservation Officer (SHPO) pursuant to the 1 January 2004 *Programmatic Agreement among the Federal Highway Administration, the Advisory Council on Historic Preservation, the California State Historic Preservation Officer, and the California Department of Transportation Regarding Compliance with Section 106 of the National Historic Preservation Act, as it Pertains to the Administration of the Federal-Aid Highway Program in California* (PA), and where the PA so directs, in accordance with 36 CFR Part 800, the regulations that implement Section 106 of the National Historic Preservation Act (NHPA) (16 U.S.C. 470f), regarding the Undertaking's potential effects on historic properties; and,

WHEREAS, following the completion of Tier 1 EIS, the FHWA, as funding becomes available for design and construction, will conduct Tier 2 environmental studies to analyze the environmental impacts of different alignments within the selected corridor in order to determine the specific transportation facility 'footprint' within the corridor , including project-level compliance with the Section 106 process to determine specific impacts to historic properties as

well as opportunities for avoidance, minimization of harm, and appropriate mitigation, if required, for the Undertaking; and,

WHEREAS, the FHWA desires to enter into a Programmatic Agreement (Agreement) at this time in order to establish a framework for conducting Section 106 consultation for Tier 1 and Tier 2; and,

WHEREAS, Caltrans has participated in consultation and has been invited to be a signatory to this Agreement; and

WHEREAS, PCTPA has participated in consultation and has been invited to be a signatory to this Agreement; and

WHEREAS, the Advisory Council on Historic Preservation (ACHP) has been afforded the opportunity to participate in the Section 106 process and has not elected to participate; and,

WHEREAS, Caltrans, on behalf of the FHWA, has initiated consultation with the Shingle Springs Band of Miwok Indians, Todd Valley Miwok-Maidu Cultural Foundation, Maidu Elders Orgainzation, and Enteprise Rancheria of Maidu Indians, as well as with the following federally-recognized Indian Tribes: United Auburn Indian Community (Tribes).

WHEREAS, the FHWA has involved, and will continue to involve, the public and historic interest groups, as stipulated under NEPA and the NHPA in a manner consistent with the PA and Caltrans' public involvement procedures;

NOW, THEREFORE, the FHWA and the SHPO agree that, upon the FHWA's decision to proceed with the Undertaking, the FHWA shall ensure that the Undertaking is implemented in accordance with the following stipulations in order to take into account the effects of the Undertaking on historic properties; and further agree that these stipulations shall govern the Undertaking and all of its parts until this Agreement expires or is terminated.

STIPULATIONS

The FHWA will ensure that the following stipulations are implemented:

I. DEFINITIONS

The definitions set forth at 36 CFR § 800.16 are applicable throughout this Agreement.

II. TIER 1 PHASED IDENTIFICATION OF HISTORIC PROPERTIES

A. Area of Potential Effects

1. The Undertaking's area of potential effects (APE) for Tier 1 is situated in southwest Placer County, between Highways 65 and 70, north of Baseline Road and south of Sunset Boulevard West (attachment A to this Agreement).

2. If modifications to the Undertaking, subsequent to the execution of this Agreement, necessitate the revision of the APE, Caltrans will consult with the PCTPA, the FHWA, and the SHPO to facilitate mutual agreement on the subject revisions. If Caltrans, the PCTPA, the FHWA, and the SHPO cannot reach such agreement, then the parties of this Agreement shall resolve the dispute in accordance with stipulation VIII.C below. If Caltrans, the PCTPA, the FHWA, and the SHPO reach mutual agreement on the proposed revisions, then Caltrans will submit a final map of the revisions, consistent with the requirements of stipulations VIII.A and XVI.A of the PA, no later than 30 days following such agreement.

B. Phased Identification of Historic Properties

1. Areas Common to all Alternatives/Corridors: the FHWA shall ensure that PCTPA or its consultants inventory properties within the area(s) common to all Tier 1 corridors according to the following specifications:
   a. Archaeological Properties
      (1) Conduct an inventory of archaeological properties where access has been secured in areas that have not previously been surveyed and those areas deemed by Caltrans PQS in need of resurvey because of the age or condition of the previous survey. Archaeological properties will be identified in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms.
   b. Built Environment Properties
      (1) Conduct a limited inventory of built environment properties within the entire Tier 1 APE. Built environment properties that have the potential to meet NRHP Criterion C will be identified and evaluated in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms. Other built environment properties within the APE that meet the age and integrity criteria will be inventoried and evaluated during Tier 2 studies, as provided for in stipulation III of this Agreement.
2. Areas Unique to Specific Alternatives/Corridors: the FHWA shall ensure that PCTPA or its consultants inventory properties within the area(s) unique to specific Tier 1 alternatives/corridors according to the following specifications:
   a. Archaeological Properties
      (1) Complete a records search for the Tier 1 APE and prepare a predictive model utilizing environmental factors and historic land-use data to assess the archaeological sensitivity of the project corridors including potential for buried resources. Segments of Tier 1 alignments/corridors that are not in common will be inventoried for archaeological properties during Tier 2 studies, as provided for in stipulation III of this Agreement.
   b. Built Environment Properties
      (1) Conduct a limited inventory of built environment properties within the entire Tier 1 APE. Built environment properties that have the potential to meet NRHP Criterion C will be identified and evaluated

in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms. Other built environment properties within the APE that meet the age and integrity criteria will be inventoried and evaluated during Tier 2 studies, as provided for in stipulation III of this Agreement.

3. Tier 1 Reporting and SHPO Consultation
   a. The FHWA shall ensure that PCTPA or its consultants prepare documentation of their findings and determinations pursuant to stipulation XVI of the PA. The reports shall be submitted to Caltrans PQS for review and approval.pursuant to stipulation XVI of the PA.
   b. Eligibility determinations shall be submitted to SHPO pursuant to stipulation VIII.C(5) of the PA.

C. Phased Assessment of Effects

1. The FHWA shall assess the potential for Tier 1 of the Undertaking to effect historic properties in accordance with stipulation X of the PA. As Tier 1 is defined as acquisition of property, the FHWA anticipates there will be no adverse effects during Tier 1. The FHWA shall consult with SHPO on the effect finding pursuant to stipulation X of the PA.

III. TIER 2 PHASED SECTION 106 CONSULTATION

A. Area of Potential Effects: The objective of the Tier 1 EIS is to identify and preserve an approximate 500'- to 1,000'-wide corridor for acquisition. The Tier 1 EIS will focus on broad topics such as general location, mode choice, area-wide air quality and land use, and other environmental issues. Once the corridor is selected, the subsequent Tier 2 environmental review, relying on the work from the Tier 1 EIS, will provide a more detailed analysis of the environmental impacts for the future transportation facility alignment alternatives within the selected corridor. Once a Tier 2 preferred alternative is chosen, the FHWA and PCTPA will delimit an APE for the Tier 2 preferred alternative in accordance with stipulation VIII.A of the PA. If subsequent modifications to the APE are necessary, the FHWA shall follow the procedures of stipulation II.A(2) of this Agreement.

B. Phased Identification and Evaluation.

1. Archaeological Properties
   a. The FHWA shall ensure that PCTPA or its consultants conducts a pedestrian reconnaissance of all lands within the final APE for any Tier 2 preferred alternative. Archaeological properties will be identified and evaluated in accordance with stipulation VIII.B and C of the PA, and documented on appropriate DPR 523 inventory forms.
2. Built Environment Properties
   a. The FHWA shall ensure that PCTPA or its consultants conducts an inventory of built environment properties within the final APE for any Tier 2 preferred alternative. Built environment properties will be

evaluated for NRHP eligibility in accordance with stipulation VIII.(B) and (C) of the PA, and documented on appropriate DPR 523 inventory forms.

3. Tier 2 Reporting and SHPO Consultation
   a. The FHWA shall ensure that PCTPA or its consultants prepare documentation of their findings and determinations pursuant to stipulation XVI of the PA. The reports will be submitted to Caltrans PQS for review and approval pursuant to stipulation XVI of the PA.
   b. Eligibility determinations shall be submitted to SHPO pursuant to stipulation VIII.C(5) of the PA.

C. **Assessment of Effects.** The FHWA will assess any Tier 2 preferred alternative for its potential to affect historic properties and will consult with the SHPO pursuant to stipulation IX and X of the PA. Should FHWA find that any Tier 2 preferred alternative will result in an adverse effect, FHWA shall consult with SHPO pursuant to stipulation XI of the PA.

D. **Applicable Requirements.** FHWA will conduct the Section 106 process during Tier 2 in accordance with stipulations of the PA and applicable requirements under Section 106 of the National Historic Preservation Act (16 U.S.C. § 470f) and the Section 106 regulations (36 C.F.R. Part 800), including any subsequent amendments thereto. Nothing in this Agreement is intended to supersede or modify any requirement contained in the Section 106 statute or the Section 106 regulations.

E. **Consulting Parties**. During Tier 2, the same party may be designated as a consulting party for more than one alternative. FHWA will ensure comments of all consulting parties are incorporated into the Section 106 consultation process as provided for in all applicable laws.

IV. TIER 2 SECTION 106 COMMITMENTS AND CONCEPTUAL MITIGATION

A. FHWA and PCTPA agree to implement and/or fund the activities listed in this section as part of any Tier 2 environmental studies. Additional commitments may be made, as appropriate, as an outcome of the Section 106 consultation process for any Tier 2 alternative.

B. **Avoidance and Minimization of Impacts**

1. In General. In accordance with the consultation process required under Section 106 and in accordance with other applicable laws, FHWA, PCTPA, and Caltrans will seek ways to avoid, minimize, and mitigate adverse impacts to the environment, including adverse effects to historic properties.
2. Context-Sensitive Solutions. FHWA, PCTPA, and Caltrans will apply the principles of context-sensitive solutions during project development, in accordance with applicable Caltrans policies. In accordance with those principles and where appropriate, FHWA, PCTPA, and Caltrans will develop any Tier 2 alternative with sensitivity to aesthetic values and the historic context, utilizing the services of professionals with experience in areas related to historic preservation.

C. Should implementation of any Tier 2 alternative result in adverse effects to a historic property important solely for its information value (Criterion D), FHWA will ensure a data recovery plan is prepared according to guidance in Attachment 6 of the PA and submitted to the SHPO for review in accordance with stipulation II.C(3) of this Agreement.

D. The FHWA will not authorize the execution of any Undertaking activity that may effect (36 CFR § 800.16(i)) historic properties in the Undertaking's APE prior to the completion of the Section 106 process provided for in this Agreement.

V. NATIVE AMERICAN CONSULTATION

The FHWA has consulted with the Tribes regarding the proposed Undertaking, will continue to consult with the Tribes, and will afford the Tribes, should the Tribe so desire, the further opportunity to more directly and actively participate in the implementation of the Undertaking; Should any specific Tribe desire to participate in this Agreement as herein set forth, the FHWA shall consult with them to reach consensus regarding the manner in which the Tribe may participate in the implementation of this Agreement and the Undertaking, and regarding any time frames or other matters that may govern the nature, scope, and frequency of such participation.

VI. TREATMENT OF HUMAN REMAINS

The Agreement parties agree that human burials and related items discovered during implementation of the terms of this Agreement and of the Undertaking will be treated in accordance with the requirements of § 7050.5(b) of the California Health and Safety Code. If, pursuant to § 7050.5(c) of the Code, the county coroner or medical examiner determines that the human remains are or may be of Native American origin, then the discovery shall be treated in accordance with the provisions of §§ 5097.98(a)-(d) of the California Public Resources Code.

VII. DISCOVERIES AND UNANTICIPATED EFFECTS

If the FHWA determines, after any future construction of the Undertaking has commenced, that the Undertaking will affect a previously unidentified property that may be eligible for the National Register, or affect a known historic property in an unanticipated manner, the FHWA will address the discovery or unanticipated effect in accordance with 36 CFR § 800.13(b)(3). The FHWA at its discretion may hereunder, and pursuant to 36 CFR § 800.13(c), assume any discovered property to be eligible for inclusion in the National Register.

VIII. ADMINISTRATIVE PROVISIONS

A. PROFESSIONAL QUALIFICATIONS AND STANDARDS

1. **Professional Qualifications**. All activities prescribed by stipulations II, III, IV, V, VI, and VII of this Agreement shall be carried out under the authority of the FHWA by or under the direct supervision of a person or persons meeting at a minimum the Secretary of Interior's *Professional Qualifications Standards* (48 FR 44738-39) (PQS) in the appropriate disciplines. However, nothing in this stipulation may be interpreted to preclude the FHWA or any

agent or contractor thereof from using the properly supervised services of persons who do not meet the PQS.

2. **Documentation Standards.** Written documentation of activities prescribed by stipulations II, III, IV, V, VI, and VII of this Agreement shall conform to *Secretary of the Interior's Standards and Guidelines for Archaeology and Historic Preservation* (48 FR 44716-44740) as well as to applicable standards and guidelines established by the SHPO.

3. **Curation and Curation Standards.** The FHWA shall ensure that, to the extent permitted under §§ 5097.98 and 5097.991 of the California Public Resources Code, the materials and records resulting from the activities prescribed by this Agreement are curated in accordance with 36 CFR Part 79. The FHWA will ensure that, to the extent permitted by applicable law and regulation, the views of the Most Likely Descendant(s) are taken into consideration when decisions are made about the disposition of other Native American archaeological materials and records.

B. **CONFIDENTIALITY.** The Agreement parties acknowledge that historic properties covered by this Agreement are subject to the provisions of section 304 of the NHPA, and section 6254.10 of the California Government Code (Public Records Act), relating to the disclosure of archaeological site information and, having so acknowledged, will ensure that all actions and documentation prescribed by this Agreement are consistent with said sections.

C. **RESOLVING OBJECTIONS.**

1. Should any Agreement party object to the manner in which the terms of this Agreement are implemented, to any action carried out or proposed with respect to the implementation of the Agreement, or to any documentation prepared in accordance with and subject to the terms of this Agreement, the FHWA shall immediately notify the other parties to this Agreement of those objections, and shall consult with the objecting party and with the other parties for no more than 14 days to resolve the objection. The FHWA shall reasonably determine when this consultation will commence. If the objection is resolved through such consultation, the action subject to dispute may proceed in accordance with the terms of that resolution. If, after initiating such consultation, the FHWA determines that the objection cannot be resolved through consultation, the FHWA shall forward all documentation relevant to the objection, including the FHWA's proposed response to the objection, to the ACHP, with the expectation that the ACHP will, within thirty (30) days after receipt of such documentation, do one of the following:

   a. advise the FHWA that the ACHP concurs in the FHWA's proposed response to the objection, whereupon the FHWA will respond to the objection accordingly. The objection shall thereby be resolved; or,

b. provide the FHWA with recommendations, which the FHWA will take into account in reaching a final decision regarding its response to the objection. The objection shall thereby be resolved; or,

c. notify the FHWA that the objection will be referred for comment, pursuant to 36 CFR § 800.7(c), and proceed to refer the objection and comment. The FHWA shall take the resulting comment into account, in accordance with 36 CFR § 800.7(c)(4) and section 110(1) of the NHPA. The objection shall thereby be resolved.

2. Should the ACHP not exercise one of the foregoing options within 30 days after receipt of all pertinent documentation, the FHWA may assume the ACHP's concurrence in its proposed response to the objection and proceed to implement that response. The objection shall thereby be resolved.

3. The FHWA shall take into account any ACHP recommendation or comment provided in accordance with section C.1 of this stipulation, with reference only to the subject of the objection. The FHWA's responsibility to carry out all actions under this Agreement not the subject to the objection will remain unchanged.

4. At any time during the implementation of the measures stipulated in this Agreement, should an objection pertaining to such implementation be raised by a member of the public, the FHWA shall notify the Agreement parties in writing of the objection and take the objection into consideration. The FHWA shall consult with the objecting party and, if the objecting party so requests, with the other Agreement parties for no more than fifteen (15) days. Within ten (10) days following closure of this consultation period, the FHWA will render a decision regarding the objection and notify all consulting parties hereunder of its decision in writing. The objection will thereby be resolved. In reaching its decision, the FHWA will take into account any comments from the consulting parties regarding the objection, including the objecting party. The FHWA's decision regarding the resolution will be final.

5. The FHWA shall provide all Agreement parties, the ACHP when the ACHP has issued comments hereunder, and any parties that have objected pursuant to section C.4 of this stipulation, with a copy of its final written decision regarding any objection addressed pursuant to this stipulation.

6. The FHWA may authorize any action subject to objection under section C of this stipulation to proceed after the objection has been resolved in accordance with the terms of section C.

D. **AMENDMENTS:** Any Agreement party may propose that this Agreement be amended, whereupon the Agreement parties will consult for no more than 30 days to consider such amendment. The FHWA may extend this consultation period.

The amendment process shall comply with 36 CFR §§ 800.6(c)(1) and 800.6(c)(7). This Agreement may be amended only upon the written agreement of the signatory parties. If it is not amended, this Agreement may be terminated by either signatory party in accordance with section E of this stipulation.

E. TERMINATION

1. If this Agreement is not amended as provided for in section D.1 of stipulation VIII, above, or if either signatory party proposes termination of this Agreement for other reasons, the signatory party proposing termination shall, in writing, notify the other Agreement parties, explain the reasons for proposing termination, and consult with the other Agreement parties for at least 30 days to seek alternatives to termination. Such consultation shall not be required if the FHWA proposes termination because the Undertaking no longer meets the definition set forth at 36 CFR § 800.16(y).

2. Should such consultation result in an agreement on an alternative to termination, then the parties shall proceed in accordance with the terms of that agreement.

3. Should such consultation fail, the signatory party proposing termination may terminate this Agreement by promptly notifying the other Agreement parties in writing. Termination hereunder shall render this Agreement without further force or effect.

4. If this Agreement is terminated hereunder, and if the FHWA determines that the Undertaking will nonetheless proceed, then the FHWA shall either consult in accordance with 36 CFR § 800.6 to develop a new Agreement, or request the comments of the ACHP, pursuant to 36 CFR Part 800.

F. DURATION OF THE AGREEMENT

1. Unless terminated pursuant to section F of stipulation VIII above, or unless it is superseded by an amended Agreement, this Agreement will be in effect following execution by the signatory parties until the FHWA, in consultation with the other Agreement parties, determines that all of its stipulations have been satisfactorily fulfilled. This Agreement will terminate and have no further force or effect on the day that the FHWA notifies the other Agreement parties in writing of its determination that all stipulations of this Agreement have been satisfactorily fulfilled.

2. The terms of this Agreement shall be satisfactorily fulfilled within twenty (20) years following the date of execution by the signatory parties. If the FHWA determines that this requirement cannot be met, the Agreement parties will consult to reconsider its terms. Reconsideration may include the continuation of the Agreement as originally executed, amendment of the Agreement, or termination. In the event of termination, the FHWA will comply with section

F.4 of stipulation VIII, above, if it determines that the Undertaking will proceed notwithstanding termination of this Agreement.

3. If the Undertaking has not been implemented within twenty (20) years following execution of this Agreement by the signatory parties, this Agreement shall automatically terminate and have no further force or effect. In such event, the FHWA shall notify the other Agreement parties in writing and, if it chooses to continue with the Undertaking, shall reinitiate review of the Undertaking in accordance with 36 CFR Part 800.

G. **EFFECTIVE DATE.** This Agreement will take effect on the date that it has been fully executed by the FHWA and the SHPO.

EXECUTION of this Agreement by the FHWA and the SHPO, its transmittal by the FHWA to the ACHP in accordance with 36 CFR § 800.6(b)(1)(iv), and subsequent implementation of its terms, shall evidence, pursuant to 36 CFR § 800.6(c), that this Agreement is an agreement with the ACHP for purposes of section 110(1) of the NHPA, and shall further evidence that the FHWA has taken into account the effects of the Undertaking on historic properties and has afforded the ACHP an opportunity to comment on the Undertaking and its effects on historic properties.

SUMMARY OF FINDINGS

The Federal Highway Administration (FHWA) and the California Department of Transportation (Caltrans), in conjunction with the South Placer Regional Transportation Authority (SPRTA), propose to identify and preserve or acquire right-of-way for a future Placer Parkway, which would link State Route (SR) 65 in Placer County to SR 70/99 in Sutter County (Maps 1 and 2 in Appendix A). The FHWA is the federal lead agency for the National Environmental Policy Act (NEPA), and SPRTA is the lead agency for the California Environmental Quality Act (CEQA). The project is using federal funding and is therefore subject to review under the January 2004 *Programmatic Agreement (PA) (Appendix B) among the Federal Highway Administration, the Advisory Council on Historic Preservation, the California State Historic Preservation Officer, and the California Department of Transportation Regarding Compliance with Section 106 of the National Historic Preservation Act, as it Pertains to the Administration of the Federal-Aid Highway Program in California* (Section 106 (NHPA). The Section 106 PA is FHWA's approach for taking into account the effects of the Federal Aid Transportation Program on historic properties in California and for meeting compliance with Section 106 of the NHPA (36 CFR 800).

JRP Historical Consulting prepared this Historical Resources Evaluation Report (HRER) to evaluate historic buildings, structures, and objects within the Area of Potential Effect (APE) for the proposed project entitled "Placer Parkway Corridor Preservation Tier 1 Project, Placer and Sutter Counties, California" (Map 3 in Appendix A). This study provides a limited inventory and evaluation of buildings, structures, and objects in the APE that appear to be potentially eligible for listing in the National Register of Historic Places (NRHP) or California Register of Historical Resources (CRHR) under Criterion C or 3.[1] The purpose of this document is to comply with applicable sections of the National Historic Preservation Act (NHPA) and the implementing regulations of the Advisory Council on Historic Preservation (ACHP) as these pertain to federally funded undertakings and their impacts on historic properties, as well as comply with CEQA as it applies to historic, built environment resources. Additionally, this information will assist the FHWA in determining which alternative(s) might trigger the need for compliance with Section 4(f) of the National Transportation Act. Additional research will be conducted during Tier 2 to identify properties eligible under the other NRHP and CRHR criteria.

Because of the long lead time for this project, JRP was asked to consider any buildings, structures or objects within the architectural APE that were constructed in or prior to 1975 as meeting the 50 year age requirement for eligibility. JRP found *no buildings, groups of buildings, or structures*, within the architectural (built environment) APE that appear to be potentially eligible for the NRHP, or CRHR, under Criterion C. Therefore, no building, object, or structure was formally evaluated on a California Department of Parks and Recreation (DPR) 523 form for this project. However, research did identify one resource within the architectural APE that was previously evaluated and found to be eligible for inclusion in the NRHP. In 1994 Reclamation District (RD) 1000 was determined eligible for the NRHP as a rural historic landscape (as a historic district) by a consensus between SHPO (State Historic Preservation Office, also known as the California Office of Historic Preservation or OHP) and the U.S. Army Corps of Engineers under Criterion A (1) at the state level of significance. The historic property's area of significance is reclamation and its historic context is the reclamation and flood control of the Sacramento River Basin within the Sacramento Flood Control Project during the period between 1911 and 1939. The historic district, including its contributing features, was found to retain historic integrity.[2] In addition,

[1] To meet Criterion C or 3, a resource must meet one of the following requirements: embody distinctive characteristics of a type, period or method of construction; represent the work of a master; possess high artistic values; represent a significant and distinguishable entity whose components may lack individual distinction.

[2] Dames & Moore, "Final Rural Historic Landscape Report for Reclamation District 1000 for the Cultural Resources Inventory and Evaluations for the America River Watershed Investigation, Sacramento and Sutter Counties, California," submitted to U.S. Army Corps of Engineers, Sacramento District, December 1995.

two county bridges (Bridge Nos. 19C0104 and 19C0124) and two railroad segments (Western Pacific and Sacramento Northern railroads) located within the architectural APE have been previously found to be not eligible for listing in the NRHP and thus required no further study for this project. These railroads, Map Reference Nos. 2 and 3, respectively, and bridges are shown on Map 3. The architectural APE encompasses a small portion of the easternmost section of RD 1000.

HISTORICAL RESOURCES EVALUATION REPORT
PLACER PARKWAY CORRIDOR PRESERVATION TIER 1 EIS/PROGRAM EIR

1.0 INTRODUCTION

1.1 TIER 1 EIS/PROGRAM EIR

The Federal Highway Administration (FHWA), the California Department of Transportation (Caltrans), and the South Placer Regional Transportation Authority (SPRTA) propose to select and preserve a corridor for the future construction of Placer Parkway, a new east-west roadway linking State Route (SR) 70/99 in Sutter County east to SR 65 in Placer County (see Figure 1-1).

The planning for Placer Parkway involves two phases: (1) the present action, selection of a corridor (titled the Placer Parkway Corridor Preservation Project), and (2) the future selection of a precise alignment within the corridor and a decision whether or not to build the Parkway. If a build alternative is selected and pursued after the second phase, the ultimate Placer Parkway project would be constructed and operated. Throughout this document the term "Proposed Action" is used to describe the selection of a corridor to preserve. The document generally uses the term "Parkway" to mean the ultimate roadway, including construction and operation, except where context indicates otherwise.

As stated, the action to be considered based on this Tier 1 analysis involves only the selection of a corridor to preserve, which has limited environmental effects by itself. However, the ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction and operation of the Parkway. In order to describe the effects of the ultimate Placer Parkway project to the greatest extent feasible at this early stage, the Tier 1 EIS/EIR also addresses the potential effects of construction and operation of the future roadway. This discussion of the roadway is necessarily limited, however, because only the general concepts of the roadway design and location are known at this time. If a corridor is selected and preserved at Tier 1, a subsequent Tier 2 analysis will evaluate the Parkway itself in detail—the specific roadway "footprint" within the selected corridor, including construction and operation of the roadway.

1.2 CORRIDOR SELECTION AND PRESERVATION

The concept for the Placer Parkway is more than a decade old. Placer County's 1994 General Plan depicts a "plan line" for it. Two planning studies helped to refine the concept:

- DKS Associates, 2000, Placer Parkway Interconnect Study/Conceptual Plan
- DKS Associates, 2001, Project Study Report (Project Development Support) for Placer Parkway

Placer Parkway is cited as a high-priority regional transportation project by the Sacramento Area Council of Governments (SACOG) 2025 Metropolitan Transportation Plan and the 2027 Placer County Regional Transportation Plan. The project vicinity and surrounding area include some of the fastest growing communities in the Sacramento region. A number of large urban development proposals are being considered by Placer and Sutter Counties. New development is expected to add a significant amount of residential, commercial, industrial, and educational uses.

A 2½-year screening and public outreach program that involved local jurisdictions (the Technical Advisory Committee); regional, state, and federal agencies; stakeholder groups that included representatives from planning and public works departments of all affected cities and counties,

environmental, business, agricultural, development, and homeowner interests (the Study Advisory Committee); and elected officials (the Policy Advisory Committee), resulted in the identification of five potential corridors for the Parkway. The Tier 1 Environmental Impact Statement/Program Environmental Impact Report will analyze these five corridor alternatives along with a No-Build Alternative.

Other potential transportation modes such as bus rapid transit may be developed in the corridor in the future, although they are not proposed as part of the current project. The width of the corridor for Placer Parkway is to vary from approximately 500 feet in the Eastern and Western segments to approximately 1,000 feet in the Central Segment. Depending upon the alternative, the corridor's length ranges from a minimum of 14.2 miles to a maximum of 16.2 miles. The selected corridor would contain the roadway, including the median, travel lanes, shoulder, associated access ramps, and a no-development buffer zone.

Corridor acquisition may not be completed until after Tier 2, as funding becomes available. Portions of the selected corridor would be preserved as a no-development buffer zone. The buffer would be maintained as a zone where development is either not permitted or is severely restricted. This is intended to restrict access to the proposed interchanges, protect the rural character of agriculturally designated areas in the vicinity of the Parkway as far as possible subject to future development, and to maximize opportunities to incorporate adjacent sensitive areas. It is intended that the buffer would be owned and managed in the future to achieve these objectives. For subsequent Tier 2 (project-level) environmental reviews, the size of this buffer zone could be considered flexible for agriculturally designated land undergoing urban development. In the Tier 2 environmental review, the specific buffer size and location would be determined. This determination would be based on performance standards on a case-by-case basis, depending on the land use needs of future approved development, and taking into account the primary objective of restricting future access to the Parkway.

Project proponents are considering employment of several land management and control mechanisms in order to ensure that the buffer would be effectively maintained as an area where development would either not be permitted, and where construction of any additional access onto the Parkway would not be allowed. These mechanisms could include land use controls, land purchase/leases, general plan amendments, zoning/overlay zoning changes, covenants/deed restrictions, agricultural/conservation easements, urban growth boundaries, etc. "Layering" or using several of these methods would provide more assurance that the buffers would be permanent, or at least more difficult to undo.

1.3 TECHNICAL STUDY OBJECTIVE

This Historical Resources Evaluation Report has been prepared to support the Tier 1 Environmental Impact Statement/Program Environmental Impact Report. It presents a Tier 1/Program level assessment of potential impacts related to Historical Resources for five corridor alternatives and the No-Build Alternative as described in Chapter 2. The scope of work performed for this report is based on the Caltrans Local Assistance Procedures Manual (Caltrans, 2006), as modified for purposes of Tier 1/ Program analysis by agreement of Caltrans and the Caltrans Environmental Handbook (Caltrans, 2004) on preparing a Historic Resources Evaluation Report. In addition, the evaluation considered guidance from the Federal Highway Administration (FHWA), Environmental Checklists for Draft and Final Environmental Documents (FHWA, 1998a; FHWA, 1998b).

This report is organized as follows:

Chapter 7 Preparer's Qualifications

This report also includes figures and tables, which show the project location, each build alternative, and pertinent technical information prepared to evaluate the build alternatives.

Throughout this document, the Placer Parkway Corridor Preservation Tier 1 Environmental Impact Statement/Program Environmental Impact Report is referred to as the Tier 1 EIS/EIR.

2.0 THE PROPOSED ACTION

The Proposed Action for the Placer Parkway Corridor Preservation Project is to select and preserve a 500- to 1,000-foot-wide corridor in the study area, within which the future four- or six-lane Placer Parkway may be constructed. The ultimate Placer Parkway project involves the selection of a specific roadway alignment, and the design, construction, and operation of the Parkway. Although the action taken at Tier 1 on the Placer Parkway Corridor Preservation Project is limited, the underlying project whose effects are studied in this document is the Placer Parkway. To the extent feasible at this early stage, the Tier 1 EIS/EIR addresses the potential effects of construction and operation of the future roadway.

2.1 THE PROJECT STUDY AREA

The study area is an area of approximately 33,460 acres located in Sutter and Placer counties, with a small section located in Sacramento County (see Figures 1-1 and 2-1). The portion of the study area in Sacramento County is located in the extreme southwestern corner of the study area and does not include any of the proposed corridor alignment alternatives. It extends from SR 70/SR 99 in the west to SR 65 in the east, with the northern boundary extending to Sunset Boulevard West and the southern boundary located adjacent to Baseline and Riego Roads.

For the purposes of the analysis the study area is divided into three segments:

- Western Segment: the Western Segment extends from SR 70/99 to Pleasant Grove Road in Sutter County.
- Central Segment: the Central Segment extends from Pleasant Grove Road in Sutter County to approximately 2,300 feet north of Pleasant Grove Creek in Placer County.
- Eastern Segment: the Eastern Segment extends from approximately 2,300 feet north of Pleasant Grove Creek to SR 65 in Placer County.

2.2 CORRIDOR ALTERNATIVES

The following subsections describe the corridor alternatives, which are depicted on Figure 2-1, and are numbered according to location from south to north in the study area.

2.2.1 The No-Build Alternative

Under the No-Build Alternative, the project would not be implemented. A Placer Parkway corridor would not be selected/preserved, and the future Placer Parkway would not be constructed.

2.2.2 Alternative 1 – the Red Alternative

Alternative 1 would extend from SR 70/99 approximately ½ mile north of Riego Road, eastward approximately 1 mile north of Baseline Road to approximately Watt Avenue, proceeding north and transitioning in an easterly direction before it reaches Sunset Boulevard West, then in an easterly direction connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment alternative is 16.2 miles long. This alternative would include six interchanges, as described in Section 2.3.3.

2.2.3 Alternative 2 – the Orange Alternative

Alternative 2 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed northeast, then in a northerly direction south of Pleasant Grove Creek, transitioning to an easterly direction before it reaches Sunset Boulevard West, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.4 miles long. This alternative would include six interchanges, as described in Section 2.3.3 below.

2.2.4 Alternative 3 – the Blue Alternative

Alternative 3 would extend from SR 70/99 approximately ½ mile north of Riego Road to an area between Pleasant Grove Road and Locust Road, where it would proceed north along the Sutter/Placer County Line, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 15.6 miles long. This alternative would include six interchanges, as described in Section 2.3.3 below.

2.2.5 Alternative 4 – the Yellow Alternative

Alternative 4 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 7,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.3 miles long. This alternative would include five interchanges, as described in Section 2.3.3 below.

2.2.6 Alternative 5 – the Green Alternative

Alternative 5 would extend from SR 70/99 at the current Sankey Road/SR 70/99 intersection, proceeding east and northeast, transitioning to an easterly direction approximately 4,000 feet south of Pleasant Grove Creek, then north crossing Phillip Road and Pleasant Grove Creek, transitioning into an eastern direction before it reaches Sunset Boulevard West, then in an easterly direction, connecting to SR 65 at Whitney Ranch Parkway. From its interchange with SR 70/99 to its interchange with SR 65, this corridor alignment is 14.2 miles long. This alternative would include five interchanges, as described in Section 2.3.3 below.

2.3 PARKWAY DESIGN ASSUMPTIONS

Although the Parkway would be designed and construction-level impacts analyzed during Tier 2, for the purpose of this report and the Tier 1 EIS/Program EIR, several assumptions have been made about potential design and configuration concepts. These assumptions would be subject to further development and refinement, and specific decisions about design of the roadway would be made during the Tier 2 process. For example, the number, location, and design of over-crossings would be determined at the time of final Parkway design, in consultation with local jurisdictions. The following sections outline assumptions for the future roadway.

Preliminary costs estimates for the Parkway range from $600 to $650 million (2005 dollars). This includes costs for right-of-way, design, construction, and environmental mitigation for the four- to six-lane facility. The funding situation has spurred interest in exploring other more creative funding options. These include a county-wide sales tax, more developer contributions, and tolling facilities. The Technical Report and Tier 1 EIS/Program EIR do not make any assumptions about funding sources.

2.3.1 Conceptual Roadway Configuration

The Parkway would be a high-speed, limited access roadway. Depending upon the timing of adjacent urban development proposals and funding, the Parkway may be designed and constructed incrementally in segments. These could be built as a four-lane (interim) roadway until a six-lane segment is warranted, or as the full six-lane facility. A preliminary conceptual cross section (see Figure 2-2) was developed to facilitate the Tier 1/Program evaluation. It illustrates both four-lane (two lanes in both directions) and six-lane (three lanes in both directions) configurations within the 500- to 1,000-foot corridor widths. The roadway would include a central median approximately 100 to 134 feet wide, depending on local conditions and reflecting Caltrans safety guidance. The Parkway would be designed and constructed to Caltrans standards, unless specific design exceptions are granted. For the purposes of the Tier 1 EIS/Program EIR, the Parkway's opening year is assumed to be 2020.

Access would be provided at the western and eastern ends of the Parkway, where existing areas of dense development are already located or planned. Access would be restricted for the 7-mile Parkway Central Segment. The analysis assumes no interchanges in this segment. (A possible future extension of Watt Avenue or another nearby roadway may be considered in the Central Segment as a separate project.)

2.3.2 Conceptual Roadway Elevation

As the study area is comprised of relatively flat terrain, the majority of the future Placer Parkway is assumed to be at-grade. As necessary, bridges would be used to span certain features and improvements such as the Union Pacific Railroad tracks along Industrial Boulevard, Pleasant Grove Creek, the Natomas East Main Drainage Canal, and floodplains. Generally, the approximate height of bridges is expected to range from 10 feet above streams to 30 feet above the railroad. Culverts would be used at smaller creek crossings as appropriate, depending on local conditions and permit requirements. The Pleasant Grove Creek floodplain would be crossed by bridges (one in each direction) supported by abutments located approximately 800 feet on either side of the creek to avoid the riparian habitat associated with the creek.

Within the 100-year floodplain, the roadway would be elevated such that the bottom of any new bridges would be above the 100-year water surface elevation. The roadway support structures and bridges would be designed to minimize environmental impact, not impede stream and flood flows, and allow for the unobstructed passage of potential future streamside uses such as maintenance equipment, bikeways or trails.

Throughout the study area, the assumptions for creek and floodplain crossings include typical engineering specifications:

- a maximum bridge span of approximately 150 feet;
- for bridge spans exceeding 150 feet, assume one column, approximately 4 feet in diameter, every 150 feet; and
- all columns placed outside of the ordinary high water (OHW) level.

To maintain existing and future local roadway connectivity (for emergency access, farming operations, and community access), over-crossings would be constructed to convey traffic over the Parkway. These over-crossings would not connect to the Parkway. Parkway access would be via the interchanges described below.

2.3.3 Interchange Concepts

The analysis assumes that the location of interchanges (see Figure 2-1) is as follows.

- SR 70/99 (at ½ mile north of Riego Road or at Sankey Road)
- One or two locations to be determined in southern Sutter County
- Fiddyment Road
- Foothills Boulevard
- SR 65 at Whitney Ranch Parkway

The following discussion outlines concepts and assumptions for the six interchanges that could potentially serve Placer Parkway.

2.3.3.1 Western Segment

Within the Western Segment of the Parkway, a high-speed, freeway-to-freeway type interchange would connect the Parkway with SR 70/99 at one of following potential locations depending on the project alternative (see Section 2.2). Placer Parkway would terminate at SR 70/99.

- **Placer Parkway/SR 70/99 Interchange at North of Riego Road.** This alternative concept uses "braided" ramps to eliminate weaving problems or conflicts with the future SR 70/99 at Riego Road interchange being developed by Sutter County and Caltrans.

- **Placer Parkway/SR 70/99 Interchange at Sankey Road.** Under this alternative concept, the existing two-lane Sankey Road would be realigned to the south of Placer Parkway and the proposed freeway-to-freeway interchange, extending from approximately ¼ mile west of SR 70/99 to approximately ¼ mile east of the Union Pacific railroad tracks. There would be no direct access to SR 70/99 or Placer Parkway from the realigned Sankey Road.

Depending on the final alignment selected, one or two additional interchanges would also be located in south Sutter County. Conceptual locations are identified for purposes of this Tier 1/Program analysis (see Figure 2-1). The actual location of these interchanges would be developed in the Tier 2 phase, based on Sutter County requirements.

2.3.3.2 Central Segment

Within the Central Segment of the Parkway, there would not be any access proposed as part of the Project in the 7-mile segment between Fiddyment Road and Pleasant Grove Road. Please see Section 2.4 regarding a potential connection to a future extension of Watt Avenue (Figure 2-3) which could be proposed and constructed by others in the Central Segment; such an interchange is not part of the Placer Parkway.

2.3.3.3 Eastern Segment

Within the Eastern Segment of the Parkway, a signalized high-speed freeway-to-freeway and local access interchange would connect the Parkway to SR 65 at Whitney Ranch Parkway (Figure 2-1). From SR 65 eastward Placer Parkway would terminate and become Whitney Ranch Parkway east of the SR 65 exit ramp intersection. Traffic signals would be provided at the exit ramp terminals. This interchange would be approximately 1 mile north of a planned SR 65/Sunset Boulevard interchange and 1.2 miles south of the existing Twelve Bridges interchange.

As part of this interchange, auxiliary lanes would be required on SR 65 in both directions to enhance traffic operations on the north side of the future SR 65/Sunset Boulevard interchange. The southbound SR 65 exit-ramp at Sunset Boulevard is being designed to accommodate an additional auxiliary lane required for the future Placer Parkway/Whitney Ranch Parkway interchange to minimize the reconstruction of this ramp in the future. Within the Eastern Segment of the Parkway, from SR 65

westward, two interchanges with local roadways would be constructed, one at Foothills Boulevard and one at Fiddyment Road, as depicted on Figure 2-1.

The future interchange on Placer Parkway at Fiddyment Road would be located near the existing intersection of Fiddyment Road and Sunset Boulevard West. To provide acceptable traffic operations, additional distance needs to be provided between the Fiddyment Road/Sunset Boulevard West intersection and the Fiddyment Road/Placer Parkway westbound off-ramp intersection. Therefore, Sunset Boulevard West will need to be realigned to the north as it nears Fiddyment Road.

2.3.4 Landscaping Concept

For the purposes of this environmental analysis, preliminary landscaping concepts have been developed for Placer Parkway. These are entirely conceptual and would be subject to further refinement during the Tier 2 environmental process. It is anticipated that landscaping would be used to reflect local topography and vistas in the study area and complement the varying character of land adjacent to the Parkway corridor. Landscape design would vary within the Parkway's three segments depending on corridor width and type and density of surrounding land uses. Landscaping would be used within the median and the Parkway buffer zone to enhance the aesthetics of the Parkway, and would be used to provide screening and enhance local and long-distance views. Where appropriate, more concentrated plantings would be considered to buffer the Parkway from future adjacent land uses that may be incompatible with the Parkway concept, and to prevent unwanted intrusion into shoulder or median areas. Landscape design would likely include a mix of compatible native and non-native plants that may require some irrigation. Where possible and depending on availability, feasibility and cost, recycled water would be used for irrigation.

During a future design phase, lighting elements would be designed for safety and would consider the proposed landscaping plan in order to minimize potential aesthetic impacts (e.g., shielding lighting elements, using lower-voltage lighting, and proposing lighting fixtures that conform with the visual character of the area).

2.4 POTENTIAL WATT AVENUE INTERCHANGE

The Placer County General Plan includes a number of new roadways that may be needed in Placer County, according to travel demand forecasts. An extension of Watt Avenue to Placer Parkway (from Baseline Road to a new Blue Oaks Boulevard Extension) is included as a planned future roadway in the Placer County General Plan. This extension could provide access onto the Placer Parkway via a new interchange (see Figure 2-3). A Watt Avenue extension and/or interchange is not part of the project or future Placer Parkway. It would be subject to independent future environmental analysis and review and is not being fully evaluated within this Technical Report or Tier 1 EIS/Program EIR. However, the connection of Placer Parkway to a potential Watt Avenue extension could affect future travel patterns in the area, including use of the Parkway. Based on direction from previous planning studies, this Technical Study and the Tier 1 EIS/Program EIR will evaluate each corridor alternative with and without a Watt Avenue interchange. This evaluation does not predetermine the construction or alignment of a potential Watt Avenue or nearby roadway extension or the precise locations of any potential interchanges with Placer Parkway.

2.5 AGENCY PERMITS AND APPROVALS

The Proposed Action would preserve a preferred corridor for a future transportation facility. In the future, permits and approvals would be obtained from appropriate agencies prior to construction of the Parkway. These permits and approvals may include specific design or mitigation requirements that would be incorporated into the project.

2.6 SUBSEQUENT TIER 2 INFORMATION

As noted earlier, the design and construction of Placer Parkway—including its interchanges and over-crossings, and ancillary features such as stream crossings, safety devices, stormwater management structures, and similar improvements—would be evaluated in a subsequent Tier 2 environmental review process once a corridor has been identified.

3.0 RESEARCH AND FIELD METHODS

JRP Historical Consulting (JRP) developed the Area of Potential Effects (APE) for the architectural survey for the "Tier 1: Placer Parkway Corridor Preservation, Placer and Sutter Counties, California" in December 2005 and May 2006 in consultation with URS Corporation (URS) and the California Department of Transportation (Caltrans). Consistent with Caltrans policies and general cultural resource practices to include the area directly affected by construction, the architectural (built environment) APE generally runs either with or one parcel beyond the proposed archaeological APE. Where the project bisects a parcel, the boundary is generally drawn to include the whole parcel; however, where the architectural (built environment) APE intersects large, vacant agricultural parcels where there is little potential for effects, the proposed architectural APE is generally aligned with the right of way. Only those resources located within the architectural APE line were included in the survey. The architectural (built environment) APE is shown on Map 3 (Index and Sheets 1-4) in Appendix A.

URS conducted a search of the records at the Northeast and North Central information centers in June 2003. The searches included cultural resources site and historic property files, the National Register of Historic Places, California Register of Historical Resources, the Historic Property Data File for their respective counties, California Historic Landmarks, California Points of Historic Interest, Caltrans Local Bridge Survey, and historic General Land Office and USGS maps.

While the Secretary of Interior sets the standard guidelines for review of potential National Register eligible buildings, structures, or features that are 50 years of age or older, this age limit has been extended to include resources constructed in 1975 or before to account for lead-time between preparation of environmental documentation and potential Placer Parkway construction in the selected corridor. JRP therefore treated any property constructed in or before 1975 as meeting the 50-year age requirement for eligibility in the NRHP. Buildings, structures, and features built after 1975 were not included in the survey. Once the APE was defined, JRP staff conducted a reconnaissance survey of the area on March 22, 2005 to account in the field for all the buildings, structures, and objects found within the architectural (built environment) APE that appeared to be built in or before 1975. JRP performed a thorough field survey on April 19, 2005, inspecting those resources that met the 50-year age requirement for this project and analyzing the resources for potential eligibility under Criterion C. Only those properties that appeared to have potential for eligibility under Criterion C would require formal evaluation and completion of a DPR 523 form. To be eligible for inclusion in the NRHP a property must have both significance and integrity to be considered eligible for listing on the National Register. Loss of integrity, if sufficiently great, will overwhelm the historical significance of a resource and render it ineligible. Likewise, a resource can have complete integrity, but if it lacks significance, it must also be considered ineligible. Integrity played a key factor in determining potential eligibility under Criterion C for this project.

JRP examined previous historic resource inventory and evaluation surveys and reports and conducted research at the California State Library; County Assessor's and Recorder's offices for Placer and Sutter counties; Shields Library at University of California, Davis; and the Bureau of Land Management State Office, Sacramento. In addition, background research was done through First American Real Estate Solutions commercial database, review of historic and current USGS topographic maps, Caltrans Historic Bridge Inventory (Appendix B), and other documents to confirm dates of construction.

4.0 HISTORIC OVERVIEW

The project area is located in southeastern Sutter County and southwestern Placer County, immediately north of the northernmost boundary of Sacramento County. The study's architectural APE stretches east from SR 65 (between the cities of Roseville and Lincoln) in Placer County, westward taking a southwesterly approach across the sparsely populated, unincorporated land of western Placer County into southern Sutter County and ending at SR 70/99. The vast majority of the architectural APE includes vacant, undulating agricultural lands crisscrossed by drainages and tributaries of Pleasant Grove and Curry (Steelhead) creeks. The study area developed as a rural, agricultural region beginning in the 1850s, a character that continues to this day. The following overview provides broad historical background regarding the regional and local history.

4.1 SUTTER COUNTY PORTION OF THE APE

The area now encompassed by Sutter County was explored and settled by Spain and Mexico, and later by pioneers from the United States, prior to California statehood. One of the smaller counties in the state, Sutter County is situated in the heart of the Sacramento and Feather river valleys. Settlement patterns in the southernmost portion of the county followed a similar development pattern as southwestern Placer County. John Sutter received the New Helvetia land grant from the Mexican government in 1841 where he established Hock Farm along the Feather River on this grant, south of present day Yuba City, and used it as a cattle ranch during the 1840s. Over the next decade, the small population in what became Sutter County was restricted to the region around and north of Hock Farm. With the discovery of gold and the establishment of Yuba City in 1849 and the incorporation of Marysville in February 1851, the population of the county began to rise. As unsuccessful miners staked out homesteads and started farming the region's grasslands, small hamlets were established in the outer regions of the county.[3]

One such community in the vicinity of the project area was Pleasant Grove, located twenty miles southeast of Yuba City. Initially known as Gouge Eye, the town of Pleasant Grove developed in the late 1860s around Charles Bishop's general store, at the present day intersection of Howsley and Pleasant Grove roads. When the post office was constructed in 1867, Gouge Eye was renamed Pleasant Grove Creek, which was later shortened to its present name in 1875. The town grew quickly in the early years, and by the late 1880s included a shoemaker, doctor, town hall, barber, fraternal organizations like the Pleasant Grove Odd Fellows, a hotel, salon, blacksmiths, and general store. Early settlers included Ephraim Johnson, who purchased a 240-acre farm in 1878 just south of Pleasant Grove (south of the present day intersection of Pleasant Valley and Sankey roads and outside of the architectural APE) where he constructed a residence. Over the years he added 440 acres to his property, farming wheat, oats and barley on this land as well as more than 3,000 acres of leased land. By the mid 1880s, the town included a population of 100 people living on large farms. Grain, primarily wheat, and livestock formed the principal crops during this period, which continued into the first half of the twentieth century, while rice became an important crop in later years. Unlike the fruit regions of the county to the north and southeast, the area within the architectural APE remained rooted in the production of grain throughout the twentieth century.[4]

4.2 PLACER COUNTY PORTION OF THE APE

Placer County was created in 1851 from portions of Sutter and Yuba Counties, two of California's original counties. Bordered by Sacramento County to the south, Lake Tahoe to the east, and Bear River to the north, many of the county's communities owe their birth to the gold rush.[5] Nevertheless, in the southwestern portion of the county, or "the valley," gold was never found in any quantity, so beginning in the 1850s, former miners staked out homesteads and started farming the region's undulating grasslands.[6] Even with gold mining as the major industry in the county through the 1880s, in the area around Roseville and Lincoln, farming continued to be the economic mainstay, along with timber harvesting. Bypassed by gold prospectors on their way to the goldfields, local farmers quickly built up large land holdings in the area.[7]

One of the first areas to be settled in the vicinity of the study area was the Dry Creek District, which extends east, south and west of present-day Roseville, followed by Pleasant Grove District (located northwest of Roseville, extending west to Sutter County) where Stephen A. Boutwell, William Dunlap and others acquired large tracts of land.[8] Local farmers quickly built up large land holdings along the various creeks that flow west into the American Basin. Called the "plains" by early prospectors on their way to the goldfields, early settlers came to the area in the 1850s. The region was eventually named the Pleasant Grove District after the creek which passed through. The Fiddyment family also settled in this district in 1856 when Elizabeth Jane Fiddyment and her young son, Walter F. Fiddyment Jr., joined her family on their large farm. Mrs. Fiddyment went on to become a large landholder, reportedly owning more than 13,000 acres in Placer County, while her son turned to raising sheep and cattle. The Fiddyment family maintained a strong presence in the region, expanding their holdings and improving their ranch complexes. Walter eventually became one of the largest grain and stock ranchers in the county, while his sons and grandsons went into the poultry business on the family land.[9] To the northeast of the Fiddyments, a New England farmer, George Whitney, settled on 180 acres about three miles northeast of present-day Rocklin in 1857. In this unoccupied and open land he established the Spring Valley Ranch, also known as the Whitney Ranch, where he successfully bred sheep. Between 1861 and 1873 he acquired numerous parcels of land, some under the Pre-emption Law of 1841, some former homesteaded lands purchased outright, and some from the Southern Pacific Railroad, ranging in size from 40 to 2,000 acres. The Whitney Ranch grew to encompass more than 20,000 acres of land in the Sacramento Valley, 2,000 acres of land at the confluence of the Feather and Sacramento rivers (in Sutter County), 15,000 acres of private land within Tahoe National Forest, and grazing rights for sheep on 50,000 acres of railroad and government land. In addition to stock raising, the Whitney Ranch also produced wheat, with 1,200 acres in production in 1872. After 1875, Whitney's son, Joel Parker Whitney, began cultivating all available grain land on the ranch, eventually planting more than 8,000 acres of wheat. The ranch

exported its grain crops and livestock from Whitney Station (located near the present day intersection of Sunset and Industrial boulevards), three miles west of the Whitney Ranch.[10]

The construction and development of the railroad industry in the 1860s and 1870s played a significant role in the development of the region. The construction of the California Central Railroad (CCRR), an 18½-mile line that would linkup the cities of Marysville and Sacramento by means of a connection with Sacramento Valley Railroad, and later the Central Pacific Railroad, which was absorbed into Southern Pacific railway system, led to the establishment of Lincoln and Roseville.[11] Agriculture remained first in the region's economy into the twentieth century, with Roseville eventually becoming the shipping and trading center for southern Placer County. Despite this, the area's population remained low, even after the construction of the state highway (LRN 3) from Sacramento (through Roseville) to Lincoln in 1909.[12]

While agricultural production continues to be an important land use in southwestern Placer County, the region began undergoing extensive development following World War II as the accelerated growth rate in the greater Sacramento metropolitan area began impacting surrounding communities. The completion of SR 65 in the westernmost portion of the APE in 1971, and the growth of Lincoln, Roseville and Rocklin that began in the 1960s, has impacted the rural character of western Placer County. Suburban housing and commercial developments just south of the project area and industrial development dating from the late 1960s along Industrial Boulevard occupy much of the land that was once open range.

4.3 RECLAMATION DISTRICT 1000

In the forty-year period from 1870 to 1910, Sutter, Placer and other mid-valley counties remained sparsely populated and some actually declined in population. A completely new pattern emerged between 1910 and 1930 as large numbers of new settlers came to the Sacramento Valley, many attracted by improved flood control systems, irrigation, and the promising development of fruit and nut orchards. Unlike wheat farming or dairying, orchard culture provided a viable family income from relatively small parcels of land. Agrarian visionaries foresaw vast parts of the region populated with small prosperous farms living on ten to twenty-acre farms. Through reclamation and irrigation of the Sacramento Valley during the late nineteenth and early twentieth centuries, the number of people and individual farms expanded tremendously in the fruit growing regions of Sutter and Yuba counties during this period.[13]

With the influx of population in Sutter County in the late nineteenth century, the state sought to control seasonal flooding while promoting agriculture in the American Basin. Great strides had already been made with construction of a series of levees, river gauges to monitor water levels, and the establishment of reclamation districts. The region had been devastated by major floods in 1861-1862 and again in 1875, and while the government had severely restricted hydraulic mining in the mid 1880s, the region was still vulnerable to damage from mining debris and flooding. Use of much of the land in the southernmost

portion of the county was limited to seasonal grazing and some farming on higher ground, and for fishing and hunting.[14] New reclamation efforts in the first decade of the twentieth century spurred the state legislature to create Reclamation District (RD) No. 1000 Rural Historic District (RD 1000) in 1911 (Figure 4-1). It later became part of the Sacramento Valley Flood Control Project. Located in northeastern Sacramento and southern Sutter counties, it consisted of 55,130 acres from the Sacramento River east to the Western Pacific Railroad (currently part of the Southern Pacific) tracks and included drainage canals, pumps, levees, ditches, pumping plants and a system of roads. After drainage and construction of levees, the Natomas Consolidated Company surveyed and subdivided the land. Part of the construction included the Natomas East Main Drainage Canal, which is crossed by the western ends of all of the project alternatives reaching SR 70/99. To promote RD 1000 by demonstrating land productivity, Natomas Consolidated leased large acreage blocks for wheat and grain crop production, thus establishing a pattern of large acreage, single-crop land use. The company also built a 60-mile network of roads across RD 1000 to provide access to drainage canals for construction and maintenance, as well as to serve farm roads to parcels within the district's various subdivisions. This network was originally comprised of dirt roads (roughly two lanes wide) that the Natomas Company graded. Most of these roads were paved with macadam or concrete during the 1920s and 1930s. They generally followed the township and section survey lines and the drainage canals to form large regularly-spaced grids in the landscape.[15] Despite these improvement efforts, selling land in the district was a slow process into the late 1940s.[16]

The California State Historic Preservation Office (SHPO) concurred that RD 1000 is significant within the context of reclamation and flood control within the Sacramento Valley during the early twentieth century. It noted that RD 1000 was one of the first large modern reclamation districts in the state and was the largest reclamation project in the country at the time of its initial construction. It provided flood control and also created large areas of productive agricultural land. The Natomas Company built and developed RD 1000's drainage system, including its levees, canals, and pumps, as well as its road system, and these features provided the framework for the spatial land pattern of the district. RD 1000 also served the goals of the region-wide early twentieth century Sacramento Flood Control Project, which was a product of more than 60 years of legislation and technical studies that provided the legal, institutional, and engineering framework to achieve flood control along the Sacramento River. The Sacramento Flood Control Project also supported improved navigation along the river and reclamation of land for productive agricultural uses and development. RD 1000 and its landscape features were considered representative of this important historical trend. OHP agreed that RD 1000 represented the emergence of modern corporations as land owners and developers of reclamation districts, and is representative of the use of large-scale land-moving gold dredging machinery employed for the transformation of the landscape into productive agricultural land. The historic district's primary contributing features are elements of the district's drainage system, road system, and large-scale land patterns, some of which pass through the project's architectural APE. SHPO considered them significant as manifestations of the early twentieth century reclamation and flood control efforts in the Sacramento Valley.[17]

4.4 CONCLUSION

Little change occurred in the study area during the second half of the twentieth century. Despite the construction of SR 70 and SR 65 around 1970, the region's growth was restricted to residential construction on large agricultural tracts. While commercial and industrial development in the northeastern portion (north of Roseville) of the architectural APE began in the late 1960s and continues today around Industrial Boulevard and SR 65, in the majority of the project area agriculture continues to dominate the landscape. Only in recent decades have residential subdivisions begun spreading west from Roseville and north from Sacramento County.

5.0 FINDINGS AND CONCLUSIONS

5.1 FINDINGS

The vast majority of the survey population identified for this study, those buildings, structures and objects that were constructed in or before 1975, are Ranch-, Minimal Traditional- or Contemporary-style residential structures predominantly built during the 1960s and 1970s. Figure 5-1 shows a typical post-1960 residence located on Phillip Road. These buildings are of standard twentieth century styles, types, and methods or construction and are ubiquitous in Northern California and in Sutter and Placer counties.

Of the handful of properties that were built in the first half of the twentieth century, most have been substantially altered by additions, replacement siding or windows, or have suffered severe damage from lack of maintenance and do not appear to retain sufficient integrity to warrant further investigation. Table 5-1 lists the only National Register-eligible property identified as a property in this study. The architectural APE also included two county-owned bridges along South Brewer and Lotus roads in Placer County and two railroads. Caltrans previously identified these bridges (19C0104 and 19C0124) as Category 5 structures (not eligible for listing in the National Register of Historic Places) in the California Historic Bridge Inventory (1986 and updates) (Table 5-2). The Western Pacific Railroad and Sacramento Northern Railroad segments (Table 5-2) within the project area have been previously found to be ineligible for inclusion in the NRHP and therefore required no further study for this project.[18]

The following properties were determined eligible for listing in the National Register of Historic Places as a result of the current study and are historical resources under CEQA: None.

The following properties were determined ineligible for listing in the National Register of Historic Places as a result of the current study and which are not historical resources under CEQA: None.

Toni Webb of JRP, who meets the Professionally Qualified Staff Standards in Section 106 PA Attachment 1 as an Architectural Historian or above, has determined that the only other properties present within the architectural (built environment) APE for the Tier 1 studies, including state-owned resources, meet the criteria for Section 106 PA Attachment 4 (Properties Exempt from Evaluation).

5.2 CONCLUSIONS

Research completed for this phase of the project did identify one resource, RD 1000, within the architectural (built environment) APE that was previously evaluated and found to be eligible for inclusion in the NRHP at the state level of significance under Criterion A. Additionally, JRP identified three other properties that, while they do not appear to be eligible under Criterion C as representative examples of a type, period, or method of construction, or as works of a master, appear to retain sufficient integrity to warrant formal evaluation during the Tier 2 phase of the project. Site-specific research conducted on these properties may produce information that possibly may support eligibility under Criteria A or B. Those resources (APN 35-260-011, 35-260-014 and 017-130-036) are identified on Map 3, Sheets 1 and 3, in Appendix A.

7.0 PREPARERS' QUALIFICATIONS

This project was conducted under the general direction of Rand Herbert (M.A.T. in History, University of California, Davis), a principal at JRP with more than 25 years experience conducting these types of studies. Mr. Herbert qualifies as a historian/architectural historian under the United States Secretary of the Interior's Professional Qualification Standards (as defined in 36 CFR Part 61).

JRP architectural historian Toni Webb was the project manager/lead historian for the project. Ms. Webb conducted research and field recordation, and prepared the contextual statement. Ms. Webb received a B.F.A. in Historic Preservation from the Savannah College of Art and Design and has more than 6 years of experience in public history and historic preservation. Based on her level of experience and education, Ms. Webb qualifies as an architectural historian under the Secretary of the Interior's Professional Qualification Standards (as defined in 36 CFR Part 61).

Research Assistant Steven J. Melvin (B.A. in History, University of Minnesota, Certificate in Public History, California State University, Chico; and is currently pursuing an M.A. in Public History from California State University, Sacramento) assisted with the research and preparation of the contextual statement.

Attn: Gary Sweeten

Dear Mr. Fong

The Federal Highway Administration (FHWA) and California Department of Transportation (Caltrans) are working with the Placer County Transportation Planning Agency (PCTPA) on the Placer Parkway Project. PCTPA proposes to identify and acquire right-of-way for the purpose of preserving a corridor for a future Placer Parkway, an east-west connection between State Route (SR) 65 near Lincoln in Placer County and SR 70/99 in southern Sutter County. Our agencies are working together to produce a Tier 1 Environmental Impact Statement (EIS), pursuant to the National Environmental Policy Act (NEPA) that will evaluate several corridor alternatives and will lead to the selection of one corridor for right-of-way preservation.

As a Federal undertaking, this project also requires compliance with Section 106 of the National Historic Preservation Act (NHPA). Pursuant to 36 CFR 800, the regulations implementing Section 106 of the NHPA, we have prepared a draft Programmatic Agreement that will govern Section 106 compliance responsibilities associated with implementing this undertaking. If FHWA agrees with this proposed PA, please forward the attached documentation to the California State Historic Preservation Officer for his review. Caltrans and PCTPA staff are available to meet with the SHPO to explain the undertaking in more detail if that is helpful.

Should you require any additional project information, please contact Erick Wulf at (916) 274-0563 or erick.wulf@dot.ca.gov or Anmarie Medin at (916) 274-584 or anmarie.medin@dot.ca.gov. Thank you in advance for your assistance in this matter.

Sincerely,

Japtej S Gill

PROGRAMMATIC AGREEMENT

BETWEEN THE FEDERAL HIGHWAY ADMINISTRATION AND THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER REGARDING IMPLEMENTATION OF THE PLACER PARKWAY PROJECT, PLACER COUNTY, CALIFORNIA

WHEREAS, the Federal Highway Administration (FHWA) and the California Department of Transportation (Caltrans), in cooperation with the Placer County Transportation Planning Agency (PCTPA), propose to identify and acquire right-of-way for the purpose of preserving a corridor for a future Placer Parkway, an east-west connection between State Route (SR) 65 near Lincoln in Placer County and SR 70/99 in southern Sutter County (Undertaking); and,

WHEREAS, the FHWA is preparing a Tier 1 Environmental Impact Statement (EIS), pursuant to the National Environmental Policy Act (NEPA), 42 USC 4321 *et seq,* that will evaluate several corridor alternatives and will lead to the selection of one corridor for right-of-way preservation; and

WHEREAS, given the existing and projected rapid growth in and around the project study area, the FHWA has determined it is vital to identify a corridor as early as feasible so that local jurisdiction planning decisions can consider the future Placer Parkway and before new development reduces corridor options and/or increase right-of-way acquisition costs for the Undertaking; and,

WHEREAS, the FHWA has determined that a phased approach for compliance with Section 106 of the NHPA is appropriate for the Undertaking, such that completion of the identification of historic properties, determinations of specific effects in historic properties, and resolution of any adverse effects will be carried out as part of planning for and prior to the approval of specific Tier 2 undertakings; and,

WHEREAS, the FHWA has consulted with the California State Historic Preservation Officer (SHPO) pursuant to the 1 January 2004 *Programmatic Agreement among the Federal Highway Administration, the Advisory Council on Historic Preservation, the California State Historic Preservation Officer, and the California Department of Transportation Regarding Compliance with Section 106 of the National Historic Preservation Act, as it Pertains to the Administration of the Federal-Aid Highway Program in California* (PA), and where the PA so directs, in accordance with 36 CFR Part 800, the regulations that implement Section 106 of the National Historic Preservation Act (NHPA) (16 U.S.C. 470f), regarding the Undertaking's potential effects on historic properties; and,

WHEREAS, following the completion of Tier 1 EIS, the FHWA, as funding becomes available for design and construction, will conduct Tier 2 environmental studies to analyze the environmental impacts of different alignments within the selected corridor in order to determine the specific transportation facility 'footprint' within the corridor , including project-level compliance with the Section 106 process to determine specific impacts to historic properties as

well as opportunities for avoidance, minimization of harm, and appropriate mitigation, if required, for the Undertaking; and,

WHEREAS, the FHWA desires to enter into a Programmatic Agreement (Agreement) at this time in order to establish a framework for conducting Section 106 consultation for Tier 1 and Tier 2; and,

WHEREAS, Caltrans has participated in consultation and has been invited to be a signatory to this Agreement; and

WHEREAS, PCTPA has participated in consultation and has been invited to be a signatory to this Agreement; and

WHEREAS, the Advisory Council on Historic Preservation (ACHP) has been afforded the opportunity to participate in the Section 106 process and has not elected to participate; and,

WHEREAS, Caltrans, on behalf of the FHWA, has initiated consultation with the Shingle Springs Band of Miwok Indians, Todd Valley Miwok-Maidu Cultural Foundation, Maidu Elders Orgainzation, and Enteprise Rancheria of Maidu Indians, as well as with the following federally-recognized Indian Tribes: United Auburn Indian Community (Tribes).

WHEREAS, the FHWA has involved, and will continue to involve, the public and historic interest groups, as stipulated under NEPA and the NHPA in a manner consistent with the PA and Caltrans' public involvement procedures;

NOW, THEREFORE, the FHWA and the SHPO agree that, upon the FHWA's decision to proceed with the Undertaking, the FHWA shall ensure that the Undertaking is implemented in accordance with the following stipulations in order to take into account the effects of the Undertaking on historic properties; and further agree that these stipulations shall govern the Undertaking and all of its parts until this Agreement expires or is terminated.

STIPULATIONS

The FHWA will ensure that the following stipulations are implemented:

I. DEFINITIONS

The definitions set forth at 36 CFR § 800.16 are applicable throughout this Agreement.

II. TIER 1 PHASED IDENTIFICATION OF HISTORIC PROPERTIES

A. Area of Potential Effects

1. The Undertaking's area of potential effects (APE) for Tier 1 is situated in southwest Placer County, between Highways 65 and 70, north of Baseline Road and south of Sunset Boulevard West (attachment A to this Agreement).

2. If modifications to the Undertaking, subsequent to the execution of this Agreement, necessitate the revision of the APE, Caltrans will consult with the PCTPA, the FHWA, and the SHPO to facilitate mutual agreement on the subject revisions. If Caltrans, the PCTPA, the FHWA, and the SHPO cannot reach such agreement, then the parties of this Agreement shall resolve the dispute in accordance with stipulation VIII.C below. If Caltrans, the PCTPA, the FHWA, and the SHPO reach mutual agreement on the proposed revisions, then Caltrans will submit a final map of the revisions, consistent with the requirements of stipulations VIII.A and XVI.A of the PA, no later than 30 days following such agreement.

B. Phased Identification of Historic Properties
